Dutch Process. First used in 1622 and still regarded as yielding the best product. In this method thin spirals or grids of pure sheet lead are placed in small, glazed earthen pots containing a little weak acetic acid (wood vinegar). The charged pots are placed in a brick shed and packed in moist spent tanbark; the building is eventually filled with tiers of pots separated by loose flooring. Soon after filling active fermentation sets in accompanied by rise of temperature (55°–60° C.—131°–140° F.), water and acetic-acid vapors attack the lead producing the basic acetate, which in turn yields to the carbon dioxide arising from the fermenting bark and slowly changes it into the basic carbonate form. The regenerated acetic acid again attacks the metallic lead producing a fresh supply of acetate.

About three months are required for the operation, but the time may be shortened by using horse manure mixed with the tanbark, but there is danger in this case of developing hydrogen sulphide which discolors the product. When the corrosion period is completed, the grids are bulky, grayish-white, and porcelain-like in appearance. By crushing and screening the grids any unchanged lead is separated and may be used in a new corrosion operation. The coarse white powder is ground wet under an edge-runner mill and levigated. Any neutral lead acetate present is removed by the wash liquid, which is used until it becomes saturated and finally precipitated with soda ash or carbon dioxide. The moist white powder from the settling tanks is dried on unglazed tiles at 80° C. (176° F.). The yield is usually 1¼ tons of white lead from 1 ton of metal. For making the paste with linseed oil it is best to start with somewhat moist white lead, and during the grinding the oil gradually forces the water out of the mass.

German or Chamber Process. This consists in producing the same conditions existing in the Dutch process by artificial means. Use is made of brick chambers arranged with shelves for supporting the sheet lead, provided with steam pipes and means of introducing acetic-acid vapor and carbon dioxide. Corrosion takes place best at 38° C. (100° F.), but there is difficulty in

regulating the flow of water vapor and gas, consequently the product is inferior to that of the older process.

French Process. This depends on the precipitation of the basic carbonate from a solution of basic acetate by carbon dioxide. The basic acetate is made by boiling neutral-lead acetate solution with litharge until saturated, the cloudy liquid is clarified by settling and the clear part drawn off into another vessel where carbon dioxide is introduced through pipes. White lead separates as a heavy precipitate and neutral-lead acetate is left in solution. After filtering off the liquid which returns to the process the precipitate is washed, drained, and dried. The lead made by this process is cheaper but inferior to that of the Dutch process.

Electrolytic Process. On decomposing sodium-nitrate solution in a wooden cell, provided with a lead anode, a copper kathode, and a porous diaphragm, nitric acid is freed at the anode and forms lead nitrate, while the sodium liberated at the kathode produces caustic soda. The net result of these changes is the production of insoluble lead hydroxide and sodium nitrate. The former is treated with sodium bicarbonate and yields basic carbonate of lead, while the latter returns to the decomposing cell.

Microscopic examination of high-grade white lead shows it to be composed of minute amorphous particles; granular or crystalline forms are a sign of inferiority and disclose a lack of covering power and opacity. There are a number of white-lead substitutes, but none of any value except sublimed white lead, a sulphate form with nonpoisonous qualities and fair covering power but inferior lasting quality. The most frequent adulterant of white lead is barium sulphate, either in the natural form of barytes, or the artificial blanc fixe. Both are distinctly inferior to white lead in covering power and combining capacity with oil. Other cheap white minerals, such as gypsum and china clay, are sometimes used in water-color mixtures. A sure sign of purity in white lead is the complete solubility of the dry powder in acetic acid.

WHITE LEG. See PHLEGMASIA.

WHITELOCKE, hwīt'lōk, BULSTRODE (1605–75). An English lawyer and statesman, born in London. He was educated at St. John's College, Oxford; read law in the temple, and in 1626 was called to the bar and elected member of Parliament for Stafford. In 1640 he was elected to the Long Parliament from Marlow, and, as chairman of the Impeachment Committee, conducted the prosecution of the Earl of Strafford. He was also one of the Oxford commissioners appointed to treat with Charles I; an opponent of Presbyterianism in the Westminster Assembly, 1643; Governor of Windsor, 1644; Commissioner of the Great Seal, 1649; and in 1653 went as Ambassador to Sweden. He refused to take part in the trial of the King. In 1656 he was Speaker of the House of Commons; was one of Cromwell's lords, and after Cromwell's death Commissioner of the Great Seal to Richard Cromwell. He left the manuscripts of an autobiography and other works, the most noteworthy of which are *Memorials of the English Affairs from the Beginning of the Reign of King Charles I to the Happy Restoration of King Charles II* (1682; new ed., 4 vols., 1853); *Journal of the Swedish Embassy in 1653 and 1654* (1772; new ed., 1855); and *Memorials of the English Affairs from the Supposed Expedition of Brute to this Island to the End of the Reign of James I.* Consult R. H. Whitelock, *Memoirs, Biographical and Historical, of Bulstrode Whitelocke* (London, 1860).

WHITE MOUNTAIN BUTTERFLY. A delicate, brownish, satyrine butterfly (*Œneis semidea*), which occupies a very restricted range above 5000 feet elevation in the White Mountains of New Hampshire, most abundantly about half a mile from the summit of Mount Washington. It also occurs in the Rocky Mountains of Colorado, and some of its varieties or close relatives in Alaska and on Mount Katahdin, Me. Its larvæ feed upon a species of sedge during midsummer, and pupate, it is believed, for two years. A closely allied butterfly (*Œneis aello*) occurs in the Alps in Switzerland. Consult S. H. Scudder, *The Butterflies of New England* (Cambridge, 1889).

WHITE MOUNTAINS. A rugged group of monadnocks occupying the north-central part of New Hampshire, where they cover an area of about 1300 square miles (Map: New Hampshire, G, H 4). They belong to the older or crystalline belt of the Appalachian system, and represent the only part of this mountain axis that has not been reduced to a lowland, then uplifted, dissected, and glaciated. The White Mountains proper extend from Squam Lake in the south to the transverse valley of the Androscoggin and Ammonoosuc rivers on the north. North of that depression there is another highland region which belongs rather to the Green Mountain system of Vermont. Several small and distant outlying monadnocks are, however, regarded as belonging to the White Mountain group, such as Mount Kearsarge and Mount Monadnock in south New Hampshire, and Saddleback Mountain and Mount Katahdin in Maine.

The group is divided into two main portions by a grand and rugged defile known as the Crawford Notch, the valley of the Saco River. West of this notch the principal group is called the Franconia Mountains, whose highest point, Mount Lafayette, has an altitude of 5269 feet. The highest peaks, however, rise to the east of the notch in the Presidential Range, so called because its chief summits are named after Presidents of the United States. The culminating peak is Mount Washington (q.v.), 6293 feet high. Other summits with their altitudes are Mount Adams, 5805 feet; Mount Jefferson, 5725 feet; Mount Clay, 5554 feet; Boot Spur, 5520 feet; Mount Monroe, 5390 feet; and Mount Madison, 5380 feet high. The White Mountains are composed largely of igneous rocks and are bordered on the eastern side by Carboniferous sediments. The soil is poor and gravelly, but the slopes and lower peaks are forest-covered, only the higher peaks raising their bare, rocky summits above the timber line. Besides the main notch there are several other deep river valleys which give the group a more rugged character than that of the average Appalachian mountain scenery; indeed, east of the Rocky Mountains the White Mountains are equaled in height and ruggedness only by the Black and Unaka Mountains of North Carolina. Of the narrow waterways the best known is the Flume at Franconia Notch. The varied scenery has for over a century attracted large numbers of visitors. One of the most celebrated natural features of the region is the "Old Man of the Mountain," a remarkably regular human profile 80 feet high formed by three outjutting rocks on Profile Mountain. The White

Mountains are noted as a resort of hay-fever sufferers. Among the towns and resorts of the region are Lancaster, Littleton, Bethlehem, Gorham, North Conway, and Berlin.

WHITE PLAINS. A city and the county seat of Westchester Co., N. Y., 22 miles northeast of the centre of New York City, on the New York Central and the New York, Westchester and Boston railroads (Map: New York, B 2). It has many attractive residences, a public library, the Westchester County Law Library, White Plains Hospital, the Burke Foundation, and a fine county courthouse. Bloomingdale Asylum for the Insane occupies a fine site overlooking the city. Pop., 1900, 7899; 1910, 15,949; 1915 (State census), 19,287.

Here on Oct. 28, 1776, during the Revolutionary War, was fought the battle of White Plains, or Chatterton Hill. On October 12 General Howe occupied Throggs Neck in Westchester County, but was held here for six days by an American force on the mainland, while Washington rapidly evacuated all of Manhattan Island, except Fort Washington, and on the 23d concentrated his forces at White Plains. Howe, unable to make a rear attack, sent 4000 men against the outpost on Chatterton Hill, west of the Bronx River, and compelled the 1400 Americans stationed here under General McDougall to withdraw to Washington's camp, the English losing 229 men, and the Americans about 140. Howe delayed his attack on the main American army, and on the evening of the 31st Washington took up an unassailable position at North Castle. White Plains was incorporated as a town in 1788. Consult Shonnard and Spooner, *History of Westchester County* (New York, 1900).

WHITE POWDER. See Explosives.

WHITE PRECIPITATE. Mercur-ammonium chloride, NH_2HgCl. A white, pulverulent compound, prepared by precipitating mercuric chloride with ammonium hydroxide in a cold solution. It is regarded as ammonium chloride in which two hydrogen atoms are placed with one of mercury. As an officinal compound in the pharmacy it is used externally in the form of an ointment for skin diseases.

WHITE RIVER. A river of Arkansas (Map: Arkansas, D 2, 3). It rises in the Boston Mountains near the west border of Arkansas, about 50 miles south of the Arkansas-Missouri line, flows northward into Missouri, then turns southeastward and continues that course to the southeast corner of Arkansas County, Ark., where the channel divides, one stream entering the Arkansas River and the other the Mississippi. It is about 400 miles long.

WHITE RIVER. The chief tributary of the Wabash in Indiana (Map: Indiana, B, C 7). It is formed by the confluence of the East and West Branches. The West Branch rises near the Ohio-Indiana line, flows west, then southwest to its junction with the East Branch. The latter is formed by the union of several streams in Bartholomew County, and flows south and west. From the confluence, near Petersburg, the main stream continues the southwest direction 50 miles to its junction with the Wabash above Mount Carmel, Ill. Total length, including the West Fork, 350 miles. The river is navigable only to Martinsville, some distance below Indianapolis, and on the East Fork to Rockford.

WHITE RIVER. A tributary of the Missouri. It rises in northwest Nebraska, and after a northeasterly and then easterly course through South Dakota, empties into the Missouri near Oacoma (Map: South Dakota, D, E 4). It flows through the Bad Lands. Length, 325 miles.

WHITERUMP, or Spot Rump. The Hudsonian godwit. See Godwit.

WHITE RUSSIA. A term indefinitely used of portions of western Russia, and indicating only a general ethnographic division. The name was given by Catharine II to the governments of Vitebsk and Mohilev, but was abolished as a political designation by Nicholas I.

WHITE SEA (Russian *Bieloye More*). A large arm of the Arctic Ocean extending southwestward into north Russia as far as the Sixty-fourth parallel of latitude (Map: Russia, E 1). It is irregular in shape, ranging from 35 to 150 miles in width and about 500 miles long and is frequently conceived as having an inner and outer part. The inner portion consists of three large bays or sections, Kandalak Bay in the northwest, and Dvina and Onega bays in the southeast. The principal rivers entering the White Sea are the Dvina, the Mezen, and the Onega, all from the southeast but the sea receives the surplus waters of a large number of lakes dotting the low and level coast region to the west. In the north and east the country is higher and the coasts are bolder. In spite of the fact that the White Sea is ice-bound from September to June, while dense fogs are frequent, the volume of trade and navigation is considerable. Russia has recently developed the use of the White Sea. Already Petrograd is connected with Archangel, the chief port on the Dvina delta and with Soroka on the west shore. By means of canals connecting the Dvina with the Volga and the latter with the Dneiper a continuous waterway is established between the White Sea and the Caspian and Black seas.

WHITE SHARK. See Man-Eater Shark.

WHITESIDE, James (1804–76). An Irish judge, born at Delgany, County Wicklow. He graduated B.A. at Trinity College, Dublin, in 1832. Called to the Irish bar in 1830, he was made a queen's counsel in 1842. An eloquent speaker, he distinguished himself in the defense of Daniel O'Connell (q.v.) in 1843 and of William Smith O'Brien (q.v.) in 1848, and in the Yelverton case in 1861. Elected a Conservative member of Parliament in 1851, he represented Dublin University in 1859–66, became Solicitor-General for Ireland in 1852, and held the attorney generalship in 1858–66. In the latter year he was appointed Chief Justice of the Queen's Bench in Ireland. Whiteside was author of *Italy in the Nineteenth Century* (3 vols., 1848), and *Early Sketches of Eminent Persons* (1870).

WHITE SKIN. See Lungworm.

WHITE SLAVERY. The terms "white slave" and "white slavery" have been used occasionally for some decades and very frequently in recent years to designate enforced prostitution. In the United States the term "commercialized vice" is sometimes used, though this is synonymous with white slavery only in that it signifies prostitution for gain. White slavery does not include individual voluntary prostitution whether professional or occasional. It signifies the business of procuration by whatever means effected and the enforced service of the prostitute, for the profit of her procurer, protector, or "owner." It implies the transportation and the transfer of control of procured women. Investigations have shown that the

traffic is extensive throughout Europe and America and parts of Asia, Africa, and Australia; and while certain regular methods and channels have been revealed the existence of a closely organized system for its promotion has not been proven.

The earliest notable attacks upon the traffic in women were made in the seventies in England through the addresses of Mrs. Josephine Butler and in France and Switzerland through the vigorous appeal of Pastor T. Borel in his *The White Slavery of Europe.* In 1877 was held at Geneva the first congress of the International Abolitionist Federation, which since has held regular sessions seeking to destroy state regulation of vice. Such regulation and the regular traffic in women are believed to be mutually dependent. In the late seventies at Brussels occurred revelations of scandalous complicity of the police in the traffic and subsequent investigations have uniformly shown that a proportion of the profits of the business are regularly used to secure police protection.

Efforts to secure international agreement to repress the trade were first successful in 1886 when Belgium and Holland entered upon such an agreement. Two years later Holland and Austria-Hungary signed a similar treaty. Then came in 1899, at London, the first session of the Congress for the Suppression of the White-Slave Traffic. It maintains an International Bureau and various national committees; it has held congresses at Frankfort in 1902, at Paris in 1906, at Madrid in 1910, and at London in 1913. The Bureau publishes, monthly, *La Traite des Blanches.* These congresses formulated an international treaty designed for the suppression of the commerce in women, which was signed in May, 1904, by the representatives of France, Germany, Great Britain, Italy, Russia, Sweden, Denmark, Belgium, Holland, Spain, Portugal, Norway, and Switzerland. In 1908 the United States signified its adherence to this treaty.

In the United States investigations of the Committee of Fifteen in 1901, in New York, revealed the existence of white slavery. Similar conditions were disclosed by the Committee of Fourteen, formed in 1905, whose Research Committee published a very notable report *The Social Evil in New York City* (1910). Meanwhile had occurred, in 1907–08, inquiries by the Commissioner-General of Immigration and the New York State Commission on Immigration. The interest of the entire country was deeply stirred by the astonishing evidence secured by the Federal Immigration Commission, which published *Importing Women for Immoral Purposes* (1909). The consequence of these investigations was the enactment by Congress in 1910 of the White Slave Traffic Act, or Mann Act, regulating both foreign and interstate traffic in women. Under this act there had been 1203 convictions up to December, 1915. Subsequently various States enacted similar laws prohibiting any such transportation within their borders.

Consult: E. R. A. Seligman (ed.), *The Social Evil* (New York, 1912); Jane Addams, *A New Conscience and an Ancient Evil* (ib., 1912); G. J. Kneeland, *Commercialized Prostitution in New York City* (ib., 1913); William Burgess, *The World's Social Evil* (Chicago, 1914). From 1912 to 1915 reports of vice commissions in Chicago, Syracuse, Baltimore, New Orleans, and other cities were published. See PROSTITUTION.

WHITE SLAVE ACTS. See PROSTITUTION; WHITE SLAVERY.

WHITE SULPHUR SPRINGS. A health and pleasure resort in Greenbrier Co., W. Va., 142 miles southeast of Charleston, on the Chesapeake and Ohio Railroad (Map: West Virginia, D 4). It is surrounded by picturesque mountain scenery, in a region noted for its numerous mineral springs. The popularity of White Sulphur Springs as a watering place dates from the Revolutionary period, and thousands of visitors are attracted there annually.

WHITE SWELLING. See JOINTS, DISEASES OF THE.

WHITE TERROR. A name given to the reign of violence initiated in southern France by the returned émigrés, after the second restoration of the Bourbons, in revenge for their sufferings during the Red Terror of Revolutionary times and under the Empire. In Marseilles, Nîmes, Toulouse, and Avignon a number of Protestants who were looked upon as the special adherents of Napoleon were murdered. Judicial persecutions were also of frequent occurrence. See FRANCE.

WHITETHROAT. A European warbler (*Sylvia communis*, or *cinerea*), plentiful during summer in the greater part of England and Ireland, which has an energetic song, and is very lively and amusing as a cage bird, and very easily tamed. Its plumage is brown, of various shades; the breast and belly are brownish white, tinged with rose color in the male. Other closely allied species are the lesser whitethroat (*Sylvia curruca*) and the garden whitethroat or orphean warbler (*Sylvia hortensis*). In the United States the name usually refers to the white-throated sparrow. See SPARROW.

WHITE TOWER. The oldest portion of the Tower of London, a massive square structure 116 by 96 feet, 92 feet high, with walls 13 to 15 feet thick. Its site was once occupied by bastions built by King Alfred in 885. The present tower was built in 1078 by William the Conqueror. The White Tower has many historical associations. In it Richard II abdicated in 1399. It contains the fine Norman Chapel of St. John, and an important collection of old armor.

WHITE VITRIOL. See ZINC.

WHITE WALNUT. See BUTTERNUT.

WHITEWASH. See CHALK.

WHITEWATER. A city in Walworth Co., Wis., 50 miles southwest of Milwaukee, on the Chicago, Milwaukee and St. Paul Railroad (Map: Wisconsin, E 6). It is the seat of a State normal school, and has a public library and a fine city hall. There are manufactures of condensed milk, dairy supplies, flour, beer, lumber, brick, tiling, machine-shop products, etc. Pop., 1900, 3405; 1910, 3224.

WHITEWAY, SIR WILLIAM VALLANCE (1828–1908). A Newfoundland statesman, born at Totnes, Devonshire, England. He went to Newfoundland in 1843, and was admitted to the bar in 1852. In 1858 he entered the Newfoundland Legislature as a Liberal, from 1865 to 1869 was Speaker of the Assembly, and in the latter year was a delegate to Ottawa in an unsuccessful attempt to arrange terms for the entrance of Newfoundland into the Canadian Confederation. In 1873–78 he was Solicitor-General, and in 1878–85 was Premier and Attorney-General. He was again returned as Prime Minister and Attorney-General in 1893 and 1895, and retired in 1897. He was later identified with the forma-

tion of a new political party favoring the union of Newfoundland with Canada.

WHITE WHALE, or BELUGA. An Arctic cetacean (*Delphinapterus leucas*), of the family Delphinidæ, and closely allied to the narwhal. It is pure white in color, 12 to 18 feet long, whalelike in form, with a rather swollen muzzle and a mouth filled with numerous conical teeth. The animal swims rather slowly, but easily captures fishes in the tide rips of rivers and bays. They are gregarious, and may be seen in herds of 40 or 50, which often gambol around boats; they abound in most parts of the Arctic seas, and are found as far south as Great Britain and Nova Scotia. The Greenlanders take this whale with harpoons or with nets. Its flesh affords them a valuable supply of food, and is eaten by most of the inhabitants of Arctic coasts; it affords also a considerable quantity of the very finest oil, and the skin is made into leather, known to the trade as porpoise hide. Living specimens have occasionally been exhibited in public aquariums. See WHALE.

WHITEWOOD. See CANELLA; LIME TREE; TULIP TREE.

WHIT'FIELD or **WHITFELD,** HENRY (c.1597–?1660). An English clergyman. The place and date of his birth are not known with certainty. He took orders and is said to have been appointed minister of Ockley, Surrey, in 1616. He defended the nonconformist divines during Laud's persecution, and finally joined them. He emigrated to New Haven in 1639, and was one of the founders of Guilford, Conn. He returned to England (1650) and was minister at Winchester. He wrote: *Some Helpes to Stirre up to Christian Duties* (3d ed., 1636); *The Light Appearing More and More Toward the Perfect Day, or a Farther Discovery of the Present State of the Indians in New England Concerning the Progress of the Gospel Among Them* (1651; in Sabin's *Reprints*, New York, 1865); *Strength Out of Weakness*, on the same topic (1652, also in Sabin's *Reprints*).

WHITFIELD, ROBERT PARR (1828–1910). An American geologist, born at New Hartford, N. Y. From 1856 to 1876 he was an assistant in the New York State Geological Survey. He was appointed to the United States Geological Survey in 1872 and was instructor in geology at the Rensselaer Polytechnic Institute (1872–75), and professor (1875–78). He was appointed curator of the geological department of the American Museum of Natural History, New York, in 1877.

WHIT'GIFT, JOHN (c.1530–1604). An Archbishop of Canterbury. He was born at Great Grimsby, according to one account in 1530, according to another in 1533. He was educated at Cambridge, and in 1555 he was elected a fellow of Peterhouse. He took orders in 1560, and was made chaplain to the Bishop of Ely and rector of Teversham, Cambridgeshire. In 1563 he was appointed Lady Margaret professor of divinity. In 1567 he became master of Pembroke Hall; in the course of the same year was appointed to the mastership of Trinity College, and soon afterward obtained the regius professorship of divinity. He was appointed dean of Lincoln in 1571, Bishop of Worcester in 1577, and Archbishop of Canterbury in 1583.

On becoming master of Trinity he revised the statutes of the university so that the heads of houses were able to eject Thomas Cartwright from the Lady Margaret professorship on the score of his Puritanism. After becoming primate, Whitgift labored assiduously to secure uniformity of discipline in the Church. He had the full confidence of Queen Elizabeth, who placed all the Church patronage of the crown, including the bishoprics, at his disposal, and he was armed with full powers for carrying out his design. He required the clergy to subscribe not only to the royal supremacy, the liturgy, and the Thirty-nine Articles, but also to a set of additional articles framed mainly with the view of purging the Church of Puritanism. He was made a Privy Councilor in 1586, and in that capacity drew up a set of statutes for cathedral churches, to make their services conform to the principles of the Reformation. On the accession of King James he seems to have been much alarmed for the stability of the system which he had spent his life in rearing. Anxiety upon this account is said to have hastened his end, in his palace at Lambeth, London. He founded a magnificent hospital and a grammar school at Croydon. His works were edited by John Ayre and published by the Parker Society (Cambridge, 1851–53). Consult: his *Life*, written by Sir George Paule (London, 1612), and by Strype (ib., 1718, new ed., Oxford, 1822); also W. F. Hoak, *Lives of the Archbishops of Canterbury*, vol. v (London, 1895); W. H. Frere, *The English Church, 1558–1625* (ib., 1904).

WHITING, hwīt'ĭng. A city in Lake Co., Ind., 17 miles south-southeast from the centre of Chicago, on the Elgin, Joliet and Eastern, the Indiana Harbor Belt, the New York Central, the Pere Marquette, the Baltimore and Ohio, and the Pennsylvania railroads (Map: Indiana, C 1). It has manufactories of oilcloth and linoleum, asphalt pavement, and chemicals, and has an important station of the Standard Oil Company. Whiting contains a Carnegie library and a fine park. It was first incorporated in 1897. Pop., 1900, 3983; 1910, 6587.

WHITING. A fish of the genus *Merlucius*, family Merluciidæ, closely related to the cods, but differing among other characters in the absence of a barbel on the lower jaw. The common whiting (*Merlucius vulgaris*) is abundant in the seas of northern Europe, and particularly on the west coasts of Great Britain, where it frequently attains a weight of four pounds. In the United States the name is applied to the silver hake (*Merlucius bilinearis*); to the sand or deep-water whitings of the genus *Menticirrhus* (see KINGFISH); and to the harvest fish and certain whitefish (qq.v.). See SAND SUCKER.

WHITING. See CHALK.

WHITING, hwīt'ĭng, ARTHUR (1861–). An American pianist and composer, born at Cambridge, Mass. He studied pianoforte with W. H. Sherwood and afterward with Chadwick and J. C. D. Parker, finishing at the Munich Music School under Rheinberger. In 1895 he settled in New York. From 1907 he gave annually five university concerts of an educational character at various leading universities and colleges. His compositions include: *Bagatelle; Fantasy with Orchestra;* two concertos for piano and orchestra; *Concert-étude; Valse-caprice;* pianoforte pieces, a church service in A, songs, anthems, and organ music.

WHITING, LILIAN (1859–). An American journalist and author, born at Niagara Falls, N. Y. She was literary editor of the Boston *Traveller* from 1880 to 1890, was editor of

the Boston *Budget* in 1890–93, and afterward spent much of her time in Europe. Her publications include: *The World Beautiful* (3 series, 1894, 1896, 1898); *A Study of the Life and Character of Elizabeth Barrett Browning* (1899); *Kate Field: A Record* (1899); *The World Beautiful in Books* (1901); *Boston Days* (1902); *The Florence of Landor* (1905); *Land of Enchantment* (1906); *Italy* (1907); *Paris, the Beautiful* (1908); *Louise Chandler Moulton: Poet and Friend* (1909); *The Brownings* (1911); *Athens* (1913); *The Lure of London* (1914); *Women Who Have Ennobled Life* (1915).

WHITING, William Henry Chase (1825–65). An American soldier, born in Mississippi. He graduated first in his class at West Point in 1845, entered the corps of engineers, was employed for several years in constructing defenses and in directing internal improvements, and was promoted captain in 1858. He resigned from the army in February, 1861, and on the outbreak of the Civil War entered the Confederate service, and as chief engineer joined the Army of the Shenandoah, then under Joseph E. Johnston. On July 21, 1861, during the first battle of Bull Run (q.v.), he commanded, after the death of General Bee, the Third Brigade of Johnston's army, whose timely arrival was instrumental in determining the fortune of the day. In August, 1861, he was promoted brigadier general, and in the spring of 1862 took a conspicuous part in the campaign against McClellan. He was placed in command of the Military District of Cape Fear, Department of North Carolina, in December, 1862; was promoted major general in February, 1863; commanded a division of Beauregard's army at Petersburg in June, 1864; was present during both the attacks on Fort Fisher (though his subordinate, Colonel William Lamb, exercised the actual command), and in the second, on January 15, 1865, was mortally wounded, dying as a prisoner in Fort Columbus, New York harbor, on March 10.

WHITING POUT. See Bib Pout.

WHITLOCK, Brand (1869–). An American municipal reformer, diplomat, and author. He was born at Urbana, Ohio, and was educated in the public schools and by private tutors. He was early a reporter for Toledo papers and for three years was political correspondent for the Chicago *Herald*. Between 1893 and 1897 he served as secretary to Governor Altgeld and then as clerk in the office of the Secretary of State (Ill.). He had also studied law under Senator J. M. Palmer and had been admitted to the bar in 1894. Settling in Toledo in 1897, he established a successful practice, and at the same time became known as a writer of prose and verse. His books describing corrupt political and unfair economic conditions attracted wide notice. Between 1905 and 1911 he was four times elected mayor of Toledo on an independent ticket, but he declined a fifth nomination. His administration was remarkably successful and progressive; a new charter was obtained, having provisions for the initiative, referendum, recall, and direct nominations. In 1913 Whitlock was appointed Minister to Belgium by President Wilson. When the European war broke out his burdens were increased by the assumption of representation for seven additional countries and his position was made delicate by the German occupation of Belgium. By the way that he carried through his task he won an international reputation for tact, zeal, and efficiency. His efforts greatly facilitated the Belgian relief efforts of the United States. He published: *The Thirteenth District* (1902); *Her Infinite Variety* (1904); *The Happy Average* (1904); *The Turn of the Balance* (1907); *Abraham Lincoln* (1908); *The Gold Brick* (1910); *On the Enforcement of Law in Cities* (1910 and 1913); *Forty Years of it* (1914), an autobiography.

WHIT'LOW, or Paronychia. See Felon; Nail.

WHIT'MAN. A town in Plymouth Co., Mass., 21 miles south by east of Boston, on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, F 4). It is primarily an industrial place, having manufactures of boots and shoes, tacks and nails, steel and wooden shanks, paper and wooden boxes, foundry products, fuse plugs, etc. There are a public library, the Rogers Home for Aged Women, and Whitman Park. Pop., 1900, 6155; 1910, 7292; 1915 (State census), 7520.

WHITMAN, Charles Otis (1842–1910). An American zoölogist, born at Woodstock, Maine, and educated at Bowdoin College (A.B., 1868) and at Leipzig (Ph.D., 1878). In 1880–81 he was professor of zoölogy at the Imperial University, Tokyo, Japan. In 1882 he studied at the Naples Zoölogical Station. He was assistant in zoölogy at Harvard University from 1883 to 1885; director of the Allis Lake Laboratory at Milwaukee from 1886 to 1889; professor of zoölogy at Clark University from 1889 to 1892; and subsequently head professor of zoölogy in the University of Chicago. In 1887, in connection with Edward Allis, he founded and afterwards edited the *Journal of Morphology*. From 1888 to 1908 he was director of the Marine Biological Laboratory at Woods Hole, Mass. In 1897 he held the presidency of the American Society of Naturalists. His work in embryology is shown in memoirs on the development and anatomy of certain leeches, worms, fishes, etc. He did much to advance methods of microscopical technique, by publishing *Methods of Research in Microscopical Anatomy and Embryology* (1885). Among his more general researches are those entitled: *The Kinetic Phenomena of the Egg During Maturation and Fecundation (Ökinesis)* (1887); *The Seat of Formative and Regenerative Energy* (1888); *Spermatophores as a Means of Hypodermic Impregnation* (1891); *The Inadequacy of the Cell Theory of Development* (1893); *Evolution and Epigenesis* (1895); *Animal Behavior* (1898) His latest work was an elaborate study of heredity in pigeons, which was unfinished at his death but was continued under the auspices of the Carnegie Institution.

WHITMAN, Charles Seymour (1868–). An American lawyer and Governor, born at Norwich, Conn. He was educated at Amherst (A.B., 1890) and at New York University, from which he graduated in law in 1894. Settling in New York City, he built up a successful practice as a criminal lawyer. In 1901–03 he was assistant corporation counsel of New York and in 1904–07 was a city magistrate, part of this time being Republican president of a Democratic Board of Magistrates. As magistrate he effected many reforms, including the creation of the night courts. In 1907 Governor Hughes appointed him a judge of the Court of Special Sessions to fill an unexpired term, and in 1909 he received the nomination for dis-

trict attorney of New York county on a Fusion ticket. His election was remarkable in that the head of the ticket was defeated. A great success in this office led to his being reëlected in 1913 without opposition. Probably the most important trial conducted by him was that which concerned Police Lieutenant Charles Becker, charged with the murder of a gambler named Rosenthal. The conviction of Becker in 1912 was regarded throughout the nation as a great blow to the conspiracy between criminals and certain grafting members of the New York police, and Whitman received high praise for his courage and ability. In 1914 he won the Republican nomination for Governor and was elected despite the opposition of Roosevelt, the Democrats, the Progressives, and Sulzer. His success as a prosecutor was hardly repeated as chief executive of the State. His administration was criticized because of his taxation programme, his apparent indifference to the legal promotion of social justice, and his failure to lead the Legislature. In 1916 he supported Justice Hughes for the Republican presidential nomination.

WHITMAN, FRANK PERKINS (1853–). An American physicist. He was born at Troy, N. Y., graduated from Brown University in 1874, and studied also at the Massachusetts Institute of Technology and at Johns Hopkins. He taught in the English and Classical School at Providence, R. I., in 1874–78, and served as professor of physics in the Rensselaer Polytechnic Institute in 1880–85, and in Western Reserve University after 1886. In 1898 he was a vice president of the American Association for the Advancement of Science. His contributions to scientific journals deal mainly with color, color vision, and physiological optics.

WHITMAN, MARCUS (1802–47). An American pioneer and missionary, born at Rushville, N. Y. He studied medicine at the Berkshire Medical Institution at Pittsfield, Mass., and practiced for four years in Canada. In 1834 he offered himself for missionary work to the American Board of Commissioners for Foreign Missions. In 1835, with Samuel Parker, he was sent to explore the Oregon country, but turned back at Green River. In 1836 he married, and with three other missionaries, H. H. Spalding and his wife, and W. H. Gray, started westward. The party took the first wagon across the Rocky Mountains, reached the Columbia River on May 21, and located near the site of the present Walla Walla, Wash. Other missionaries came out and four stations were organized. Friction ensued, and numerous quarrels were reported to the board, which voted in 1842 to discontinue the southern branch of the work. Whitman immediately started East, and after suffering much inconvenience reached Boston, March 30, 1843, and secured a reversal of the board's resolution. On Nov. 29, 1847, the Cayuse Indians attacked the station, murdered Whitman, his wife, and 12 other persons, and took the other residents prisoners. The prisoners were afterwards released by the influence of the chief factor of the Hudson's Bay Company. In 1864–65 the statement was made by H. H. Spalding that Whitman's visit to the East in 1842–43 was made for political reasons, and that by a visit to Washington and interviews with President Tyler, Secretary Webster, and others, he prevented the cession to England of the American claim to Oregon (q.v.), and prevented Oregon from being traded for a codfishery on Newfoundland. This belief has gained wide circulation, but Prof. E. G. Bourne, in *Essays in Historical Criticism* (New York, 1901), presented an elaborate documentary study which seems to disprove the claim. Consult: W. A. Mowry, *Marcus Whitman and the Early Days of Oregon* (Boston, 1901); E. G. Bourne, "Legend of Marcus Whitman," in *Essays in Historical Criticism* (New York, 1901); Myron Eells, *Marcus Whitman: Pathfinder and Patriot* (ib., 1909); W. J. Marshall, *The Acquisition of Oregon and the Long Suppressed Evidence about Marcus Whitman* (2 vols., Seattle, 1911).

WHITMAN, SARAH HELEN POWER (1803–78). An American poet, born in Providence, R. I. Her *Hours of Life, and Other Poems* appeared in 1853, and a posthumous volume of verse in 1879. She became best known, however, for her association with Poe, with whom, about 1848, she entered into a conditional engagement of marriage, soon broken off. In 1860 she published a work in his defense, entitled *Edgar Allan Poe and His Critics.* In 1828 she had married John W. Whitman, who died in 1833.

WHITMAN, SIDNEY (?–). An English journalist and political writer, born in London. He was educated at King's College School, and in Germany and Belgium. He represented the New York *Herald* at Constantinople during the Armenian outbreak in 1896, and at the Turkish headquarters at Elassona in 1897, and accompanied the Turkish mission from the Black Sea through Kurdistan, Anatolia, and Syria to the Mediterranean in 1897–98. Whitman also represented the *Herald* at Moscow during the Revolution in 1905–06. His publications include: *Metrical Translation of Grillparzer's Medea* (1878); *Fetish Worship in the Fine Arts* (1885); *Conventional Cant* (1887); *Imperial Germany* (1888); *The Realm of the Hapsburgs* (1893); *Teuton Studies* (1895); *Story of Austria* (1898); *Reminiscences of the King of Roumania* (1899); *Conversations with Prince Bismarck* (1900); *Life of the Emperor Frederick* (1900); *My Reminiscences of Prince Bismarck* (1902); *German Memories* (1912); *Turkish Memories* (1914); *The War on German Trade* (1914).

WHITMAN, WALT (originally WALTER) (1819–92). An American poet, born at Westhills, L. I., May 31, 1819, and educated in public schools at Brooklyn and New York. He learned carpentry, and also printing, forming in the composing room associations with printers and journalists that continued through life. At 17 he was teaching in Long Island and writing for newspapers and magazines. In 1839 he was editor and publisher of a weekly at Huntington, L. I. This enterprise failing, he spent some years in printing offices, contributing to periodicals, making long pedestrian tours, generally following the great western rivers, and going into Canada. That he wrote fiction we know only by the preservation of a title, *Frank Evans,* a temperance tale. For a year he edited the Brooklyn *Eagle.* This varied life acquainted him with all sorts and conditions of men, and he seems to have fraternized with what he calls "powerful uneducated persons" of every kind, being by instinct a democrat, and entering heartily into the life of the people. It is said he drove an omnibus for a time, though more from charity than liking, and he achieved local success as a political stump speaker. In 1850,

returning from wanderings that had carried him to New Orleans, he started in Brooklyn *The Freeman*, a short-lived organ of the Free-Soil party. Then for three years he tried carpentry, building and selling workingmen's houses, and gradually accumulated the materials that made up the first collection of *Leaves of Grass* (1855). This was a modest little book of 94 pages, and, so far as it attracted attention, seems to have provoked mirth, until Emerson made it the occasion of praise and challenged for it the attention of the thoughtful public, which it has since held increasingly throughout the English-speaking world, in editions that grew to several times the bulk of its humble beginning. The remainder of Whitman's life was given to the elaboration of this book. The incidents of the remaining 37 years of his life are these: During the second year of the Civil War the wounding of his brother in the battle of Fredericksburg led him to volunteer as an army nurse, and he served until the close of the war, in Washington and Virginia. The immediate literary result of this is *Drum Taps* (1865), best described in his own words as "a little book containing life's darkness and blood-dripping wounds and psalms of the dead." This is now incorporated in the *Leaves of Grass*. In 1867 he published *Memoranda During the War*, made up chiefly of letters written to the New York *Times*, from which he drew his chief support. His letters to his mother during the war were posthumously printed as *The Wound Dresser* (1898). His labors in the field brought on a serious illness in 1864, from which it is believed he never recovered completely. In recognition of his services, he was given a clerkship in the Treasury Department (1865–73), after having been dismissed by the Interior Department, on account of his *Leaves of Grass*. His Washington life was terminated by a slight paralytic stroke (1873). He moved to Camden, N. J., the residence of his brother George, and remained there until his death (March 27, 1892) in honorable poverty and serene cheerfulness, much sought by literary pilgrims, especially Europeans who discerned in him a distinctively American quality. He was never married. The works of this period, many of them incorporated in successive editions of the *Leaves*, were, notably: *Passage to India* (1871); *Democratic Vistas* (1870), prose; *After All Not to Create Only* (1871); *As Strong as a Bird on Pinions Free* (1872); *Two Rivulets* (1876); *Specimen Days and Collect* (1882), prose; *November Boughs* (1888); and *Goodby My Fancy* (1891). In 1892 appeared the *Autobiographia*. William Rossetti published in England a selection of his poems in 1868, which began his influence there, the work being continued by Dowden, Symonds, Stevenson, and others. Definitive editions of the prose works and of the *Leaves of Grass* were issued in 1892 in two volumes. Ten years after Whitman's death an elaborate, complete edition was published in New York in 10 volumes.

The intense individualism of Whitman's nature was strengthened rather than modified by environment. He knew little of the life that came through books, but much of that life of the masses which to most of his literary contemporaries was as foreign as classical culture was to him. Perhaps he was sometimes willfully eccentric. Certainly, in laboring to be natural, he stripped himself sometimes of more than the garment of convention. There was some excuse for those who found that he became indecent in his endeavors not to be smug. In subject, the *Leaves of Grass* were from the beginning distinctively American, dealing with moral and social conditions and with political questionings. "These United States themselves are essentially the greatest poem," he had said in the preface, and he finds elsewhere that his country's crowning glory is to be spiritual and heroic. It is then the glorification of democracy, of the average man, the assertion of his right to be himself, the freedom of the individual, and at the same time the ideal of democratic brotherhood which this freedom implies, that are his themes and his inspiration. With this passionate devotion to human nature goes a hatred like that of Rousseau for conventions, and parallel with this, in the style, there is a feeling for poetic beauty and a hatred for conventionality of expression. He has an instinct of rhythm, words come in felicitous collocations, but when they do not come he does not seek them. The result of his efforts was one of the ironies of literary history. The democratic reader, for whom Whitman wrote, made of it nothing at all; for him poetry must needs be conventional to be comprehensible. So Whitman writing of and for the multitude finds himself the admiration of a cultured coterie, appreciated only by a literary aristocracy. Yet more people are coming to understand and to enjoy him. He was willing to wait to be understood through the growth of the taste for himself and what he represented. His cult has been mainly confined to a small group of open-minded lovers of poetry and to those in search of new literary sensations. It may be added that only the pruriency against which he protests could find his work immoral. It is often indelicate and totally frank, but it is as lacking in sensuality, even in its most crude and unconventional expression, as was the poet's own life. Although as a whole his unmetrical matter comes under no present definition of poetry, and although a large portion of it has no possible poetic significance, yet there remains a small body of his verse that reveals a richness of poetic imagination unexcelled in America and that promises to last as long as anything in existing American poetry.

WHITMAN COLLEGE. An institution for higher learning founded in 1859 at Walla Walla, Washington, by Rev. Cushing Eells, as a memorial to Dr. Marcus Whitman (q.v.). The institution was opened for students in 1866, and was originally under the control of the Congregational denomination, but for many years it has been free of denominational control. The curriculum embraces only the liberal arts, and the degrees conferred are A.B., B.S., in addition to the corresponding master's degree for resident graduate work. The value of the grounds and buildings is $500,000, there is a productive endowment of about $800,000 and an annual income of $85,000. The Conservatory of Music is controlled by the board of trustees of the college, but has its own faculty and is under separate administration. The student enrollment in 1916 was 257 in the college and 190 in the conservatory. The library contains about 26,000 bound volumes. The president is Steven B. L. Penrose, A.M., D.D.

WHIT'NEY, ADELINE DUTTON TRAIN (MRS. A. D. T. WHITNEY) (1824–1906). An American author, born in Boston, Mass. She was married at 19 to Seth D. Whitney, of Milton, Mass. She was a cousin of George Francis Train (q.v.). Mrs. Whitney was the author of many popular books for girls, including *Faith Gartney's Girlhood* (1863), *A Summer in Leslie Goldthwaite's Life* (1866), etc.

WHITNEY, ASA (1791–1874). An American mechanical engineer and manufacturer. He was born in Townsend, Mass., and in his youth learned the trade of blacksmith and machinist. After engaging in the manufacture of machinery in several States he became master machinist (1830) and superintendent (1833) of the Mohawk and Hudson Railroad. From 1839 to 1841 he was a canal commissioner of the State of New York, and in 1842 went into partnership with Matthew Baldwin in the manufacture of locomotives at Philadelphia. In 1847 he patented a process for making cast-iron annealed car wheels, and engaged in their manufacture on a large scale, subsequently introducing other improvements which increased the strength of the wheels and contributed materially to the safety of railway travel. Mr. Whitney served for a year as president of the Reading Railroad. He left $50,000 to the University of Pennsylvania for the founding of a chair of dynamical engineering.

WHITNEY, CASPAR (1862–). An American sportsman and editor. He was born in Boston, and graduated from St. Matthew's College in California. For ten years he devoted his time to exploring, hunting, and traveling in North and South America, and in Asia. Between 1888 and 1900 he served on Harper's staff at different times as war correspondent and as writer on outdoor sports. Later he was editor of the *Outing Magazine* (1900–09), *Collier's Outdoor America* (1909), and the *Outdoor World* (after 1913). He published *A Sporting Pilgrimage* (1895); *On Snow Shoes to the Barren Grounds* (1896); *Hawaiian America* (1899); *Jungle Trails and Jungle People* (1905); *The Flowing Road* (1912).

WHITNEY, ELI (1765–1825). An American inventor, famous for his invention of the cotton gin. He was born at Westboro, Mass., and was educated at Yale College, where he graduated in 1792. He then went to Georgia as a teacher, where he found a generous patron in the widow of General Nathanael Greene, of the Revolutionary army, on whose estate he resided, and studied law. While here he had opportunity to display his inventive genius, and at the request of some neighbors of Mrs. Greene he attempted to devise a machine for separating the seed from the fibre of the green seed cotton. He set to work under great disadvantages, having to make his own tools, and even to draw his own wire, while rumors of his success led some lawless people to break into his workshop and steal his machine before he could obtain a patent for it. Forming a partnership with one Miller in 1793, he went to Connecticut to manufacture cotton gins, but litigation in defense of his rights consumed all his profits and $50,000 voted him by the State of South Carolina. Finally, in 1798 he got a government contract for the manufacture of firearms, which he carried out with ingenious machinery so arranged as to secure absolute interchangeability of parts. His manufactory of firearms was located at Whitneyville, Conn., and was maintained with success. Whitney had but little material reward from the gin, which immediately proved one of the most important inventions connected with the cotton manufacture. See COTTON; COTTON GIN.

WHITNEY, GERTRUDE VANDERBILT (MRS. HARRY PAYNE WHITNEY) (?–). An American sculptor. She was born in New York City, the daughter of Cornelius Vanderbilt (1843–99) (q.v.), and in 1896 was married to Harry Payne Whitney, son of William C. Whitney (q.v.). After a distinguished social career, she studied sculpture with James E. Fraser and Andrew O'Connor. Her work is characterized by energetic and realistic workmanship and good decorative feeling, but shows a certain heaviness of treatment. Good examples are the well-known "Titanic Memorial," to be erected in Potomac Park, Washington, D. C.; the "Aztec Fountain" (Pan-American Union, Washington); the Arlington Hotel fountain (Washington), and the "Fountain of El Dorado," exhibited at San Francisco in 1915. A member of the Association of Women Painters and Sculptors, Mrs. Whitney inaugurated competitions for women sculptors, and she did much to encourage young artists through the Society of Friends of Young Artists, which she organized. During the European War she established and maintained a hospital for the wounded at Neuilly, France, for which she was awarded a gold medal by the French Foreign Office in 1915.

WHITNEY, SIR JAMES PLINY (1843–1914). A Canadian lawyer and public official. He was born at Williamsburg, Ontario. Admitted to the bar in 1876, he practiced his profession at Morrisburgh and was made king's counsel in 1890. He was elected a Conservative member of the Ontario Legislature in 1888, was leader of the Conservative Opposition therein in 1896–1905, and in 1905–14 was Premier of Ontario. He was chairman of the Ottawa Interprovincial Conference in 1910. In 1908 he was knighted.

WHITNEY, JOSIAH DWIGHT (1819–96). An American geologist, born at Northampton, Mass., the brother of William D. Whitney (q.v.). He was educated at Yale College, and in 1840 was employed on the New Hampshire geological survey. After serving in similar surveys of Ohio, the Lake Superior region, Iowa, and Wisconsin, he became State geologist of California, occupy-

ing this office from 1860 to 1874. In 1865 he was called to the chair of geology at Harvard University. Through his travels and studies in the principal mining regions of the United States, Whitney became the foremost authority of his day on economic geology, and he was able to perform a great service in the development of the mineral resources of the country. The best known of his writings are: *The Mineral Wealth of the United States* (1854); *A Report on the Upper Mississippi Land Region* (1862); *The Geological Survey of California* (1864–70); *The Yosemite Guide-Book* (1869); with J. W. Foster, *Report on the Geology of the Lake Superior Land District* (1851–52); and with James Hall, *Geological Report on Ohio* (1858).

WHITNEY, MOUNT. A peak of the Sierra Nevada (q.v.), in eastern California, in about lat. 36° 35′ N., and long. 113° 17′ W. (Map: California, G 6). It is the highest mountain in the United States, exclusive of Alaska, having an altitude of 14,502 feet. Its east slope, which rises nearly 11,000 feet above the valley, is very precipitous. The mountain was named in honor of Prof. Josiah Dwight Whitney.

WHITNEY, WILLIAM COLLINS (1841–1904). An American politician and Cabinet officer, born in Conway, Mass., and educated at Yale and at Harvard. He settled in New York City, where he was admitted to the bar. In 1871 he was prominent in organizing the Young Men's Democratic Club, and was active in the movement against the Tweed Ring. From 1875 to 1882 he was Corporation Counsel of the City of New York, and during his administration of the office the work of the city's Law Department was completely reorganized and simplified in such a manner as to save thousands of dollars annually. He was active in 1882 in the State campaign which resulted in the election of Grover Cleveland as Governor, and from 1885 to 1889, during Cleveland's first administration as President, was Secretary of the Navy. Under his control considerable progress was made in building the new navy. He afterward engaged in extensive financial enterprises in New York, and in 1892 successfully managed the Cleveland presidential campaign.

His sons Harry Payne Whitney and Payne Whitney inherited their father's large capitalistic interests. The former married Gertrude Vanderbilt (see WHITNEY, GERTRUDE VANDERBILT) and the latter married Helen Hay, a daughter of John Hay and a writer of verse.

WHITNEY, WILLIAM DWIGHT (1827–94). An American Sanskrit scholar and philologist, brother of Josiah D. Whitney (q.v.). He was born at Northampton, Mass., and graduated at Williams College in 1845. During the next few years he was clerk in the Northampton Bank, but began to show a marked interest in natural science and in languages. In 1849, as assistant subagent, he accompanied the United States Geological Survey to Lake Superior, and on this expedition he began the study of Sanskrit in his leisure hours. On his return in the autumn of the same year he studied Sanskrit at Yale under Salisbury. In 1850 he went to Germany and spent three winters at Berlin under Weber, the summers being devoted to work under Roth at Tübingen. In 1853 he returned to America, and in 1854 was appointed to a chair of Sanskrit and comparative philology at Yale where he remained as professor until his death. The American Oriental Society owes much to him for his prolonged services as corresponding secretary, editor of the society's journal, and president. He was also first president (1869) of the American Philological Association. In 1881, because of his services to scholarship, he was admitted to the Prussian order Pour le Mérite, succeeding Carlyle. Among his publications are: *Language and the Study of Language* (1867; 7th ed., 1910); *German Grammar* (1867; 6th ed., 1888); *Oriental and Linguistic Studies* (1872–74); *The Life and Growth of Language* (1875; new ed., 1902); *Essentials of English Grammar* (1877; new ed., 1892); *Compendious German and English Dictionary* (with A. H. Edgren, 1877; new ed., 1905); *Sanskrit Grammar*, the best work on the subject up to that time (1879; 3d ed., 1896; Ger. trans. by Zimmer); *Roots, Verb-forms, and Primary Derivatives of the Sanskrit Language* (1885; Ger. trans. by Zimmer); *Practical French Grammar* (1886); and translations with commentaries of the *Sûrya Siddhânta*, *the Atharva Veda Prâtiçâkhyâ* and the *Taittiriya Prâtiçâkhya* (in vols. vi, viii, and ix, of the *Journal of the American Oriental Society*). With Roth he edited the *Atharva Veda* (1856), and made a translation of this work, edited after his death by C. R. Lanman (2 vols., 1905). He also made noteworthy contributions to the *Sanskrit Dictionary* of Böhtlingk and Roth (St. Petersburg, 1852–76), and an *Index Verborum to the Published Text of the Atharva Veda* (1881). He was editor in chief of the *Century Dictionary* (1889–91). In his work on *Max Müller and the Science of Language* (1892) Whitney attacks Müller's views regarding this subject. (See PHILOLOGY.) A complete bibliography of his writings is given in the *Journal of the American Oriental Society*, vol. xix (New Haven, 1897), a memorial in his honor.

WHITNEY, WILLIS RODNEY (1868–). An American chemical engineer. He was born in Jamestown, N. Y., and graduated at the Massachusetts Institute of Technology in 1890, and then studied at Leipzig (Ph.D., 1894). Meanwhile he had become an instructor in the Institute of Technology, where in 1904 he was appointed nonresident associate professor of theoretical chemistry and in 1908 nonresident professor of theoretical chemistry. His gifted faculty for research, especially in electrochemistry, led to the perfection of the metallic electric-lamp filaments and the development of wrought tungsten. In 1904 he became director of the research laboratory of the General Electric Company in Schenectedy, N. Y., where with unique equipment he carried on his investigations. He was president in 1909 of the American Chemical Society, whose *Journal of Industrial and Engineering Chemistry* he helped to edit, and in 1911 of the American Electrochemical Society. In 1915 he was appointed to the Naval Consulting Board. Besides contributing to technical journals and publishing scientific addresses he translated Le Blanc's *Electro-Chemistry* (1896).

WHITON, hwī'ton, JAMES MORRIS (1833–). An American Congregational clergyman and author. He was born in Boston, and graduated at Yale in 1853. He was rector of the Hopkins Grammar School, New Haven (1854–64), principal of Williston Seminary, Easthampton, Mass. (1876–78), and professor of ethics at Meadville Theological School (1893–94). At other times he held various Congregational pastorates, in Lynn, Mass., Newark, N. J., New York City, and Haworth, N. J. In 1896 he be-

came a member of the staff of the *Outlook*. His principal publications are an edition of select orations of Lysias (1875); *Is "Eternal" Punishment Endless?* (1876); *Beyond the Shadow* (1884); *Gloria Patri*, a dialogue on the Trinity (new ed., 1904); *Miracles and Supernatural Religion* (1903); *Interludes in a Time of Change* (1909); *Getting Together—Essays by Friends in Council* (1913).

WHITRIDGE, FREDERICK WALLINGFORD (1852–). An American lawyer, publicist, and capitalist, born at New Bedford, Mass. After graduating from Amherst (1874) and from Columbia Law School (1878), he settled in New York City in the practice of law, eventually becoming head of the firm of Whitridge, Butler, and Rice. At Columbia he was a lecturer from 1883 to 1894, first on administrative law and later on constitutional and political history. He also became president of several important electric traction lines in New York and its suburbs, and a director in other enterprises. On the occasion of the marriage of King Alfonso XIII in 1906, he was selected as special ambassador to Spain. Besides contributing to leading reviews on political and economic subjects, he wrote *One American's Opinion of the European War: An Answer to Germany's Appeals* (1914).

WHIT'SUNTIDE'. The English name of the season of Pentecost (q.v.).

WHITTAKER, EDMUND TAYLOR (1873–). A British mathematician, born at Birkdale, Lancashire. He was educated at Trinity College, Cambridge, of which he was a fellow from 1896 to 1907. He served as secretary to the Royal Astronomical Society in 1901–06, and was Royal Astronomer of Ireland in 1906–12. Thenceforth he held the chair of mathematics at Edinburgh University. In 1905 he was elected a fellow of the Royal Society. Besides various memoirs his publications include: *A Course of Modern Analysis* (1902); *Treatise on Analytical Dynamics* (1904); *The Theory of Optical Instruments* (1907); *A History of the Theories of Æther and Electricity* (1910).

WHIT'TIER. A city in Los Angeles Co., Cal., 17 miles southeast of Los Angeles, on the Southern Pacific and the Pacific Electric railroads (Map: California, G 9). It is the seat of Whittier College, and has a Carnegie library. Oil is produced extensively, and there are important walnut and citrus fruit-growing interests. Whittier was founded in 1887 by a colony of Friends. Pop., 1900, 1590; 1910, 4550.

WHITTIER, JOHN GREENLEAF (1807–92). An American poet, born in Haverhill, Mass. He was a descendant of an emigrant to New England in 1638, whose children became members of the Society of Friends. His life as a youth was spent on his father's farm. He early showed a talent for verse and published his first poem at the age of 18, in the *Free Press*, an antislavery paper edited by William Lloyd Garrison. To obtain a better education, he learned the art of making slippers, and supported himself during two terms at the Haverhill Academy (1827–28), and then for a short time taught school. In 1829 he became editor of the *American Manufacturer*, published in Boston, and from January to June of the following year was editor of the Haverhill *Gazette*. In July, 1830, he was made editor of the *New England Review*, at Hartford, Conn., a post which he held till ill health obliged him to resign in January, 1832. Here he published his first volume of prose sketches and poems, *Legends of New England* (1831), and was active as a supporter of the great Whig, Henry Clay. On his return to Haverhill he worked on his father's farm, contributed to the Haverhill *Gazette*, wrote *Justice and Expediency* (1833), an antislavery pamphlet, and was a delegate to the antislavery convention in Philadelphia, in December, 1833. He represented his district in the Massachusetts Legislature in 1835 and 1836. In 1836 he removed to Amesbury, Mass., a small town east of Haverhill, and here he lived many years. He was well known as a leading antislavery man and did much work in aid of the movement. In 1836–37 he served for a few months as one of the secretaries of the Antislavery Society in New York, and in 1838 went to Philadelphia, where, until 1840, he edited the *Pennsylvania Freeman*. In May, 1838, his printing office was sacked and burned by a mob. On his return to Massachusetts he published poems designed to arouse public sentiment against slavery, and in addition to these spirited lyrics wrote many poems descriptive of simple New England life. Many verses of this sort had from time to time appeared from his hand, but these, published in 1843 as *Lays of My Home*, were the first that brought him any money. He edited also, at Lowell, Mass., for six months (1844–45), the *Middlesex Standard*. In 1849 he published a volume of antislavery verses entitled *Voices of Freedom*. From 1847 to 1859, while living at Amesbury, he contributed editorial articles to the *National Era* of Washington, the antislavery paper in which Mrs. Stowe's *Uncle Tom's Cabin* first appeared, and on the establishment of the *Atlantic Monthly* in 1857 he became a frequent contributor. He was a member of the Massachusetts Electoral College in 1860 and 1864, but thereafter took little active part in public life. His later years were spent with relatives at Oak Knoll, Danvers, Mass., but he died at Hampton Falls, N. H., while on a visit. He never married. Aside from his poetry, Whittier was a real force in the practical antislavery politics of Massachusetts.

Whittier's literary work, though never abundant, was very constant. It usually appeared in periodicals, and few years of his life were unmarked by literary production. The following are titles of his separate works in prose, aside from those already cited and collected editions: *The Stranger in Lowell* (1845); *Supernaturalism in New England* (1847); *Leaves from Margaret Smith's Journal* (1849); *Old Portraits and Modern Sketches* (1850); *Literary Recreations and Miscellanies* (1854). In verse notable titles are: *Moll Pitcher* (1832); *Mogg Megone* (1836); *Songs of Labor* (1850); *A Sabbath Scene* (1853), a poem descriptive of the workings of the Fugitive Slave Law; *The Chapel of the Hermits* (1853); *The Panorama* (1856); *Home Ballads and Poems* (1860); *In War Time* (1863); *National Lyrics* (1865); *Snow-Bound* (1866), probably his best work; *Maud Muller* (1866); *The Tent on the Beach* (1867); *Among the Hills* (1868); *Miriam* (1871); *The Pennsylvania Pilgrim* (1872); *Hazel Blossoms* (1874), including poems by his sister, Elizabeth Whittier; *Mabel Martin* (1875); *The Vision of Echard* (1878); *The King's Missive* (1881); *The Bay of Seven Islands* (1883); *Poems of Nature* (1886); *Saint Gregory's Guest* (1886); and *At Sundown* (1892). These were collected into the *Complete Poetical and Prose Works* (1888–89),

revised and annotated by the poet, in seven volumes. He ranks as one of the foremost American poets—a writer of simplicity, sincerity, directness, and fervor. His verse is often disfigured by faulty rhyming, and much of it is merely occasional, but even this body of poetry is redeemed by his unfailing sincerity and earnestness. In poems dealing with New England life Whittier may be said to have achieved permanence. No American poet has better depicted the scenes of rural life, with finer eye for truth of detail or more impressive delicacy of sentiment, than has Whittier in such scenes as those of *Snow-Bound*, a poem which has caused him to be regarded as a sort of American Burns, though in respect to lyrical quality the similarity of the two poets is not striking. A selection of his verses which would show his quality, lyric, descriptive, and moral, most characteristically and at its best, would include such poems as "Ichabod," "Barbara Frietchie," "Skipper Ireson's Ride," "The Pipes at Lucknow," "Laus Deo," "The Eternal Goodness" (a psalm), "In School Days," "Maud Muller," "The Barefoot Boy," "The Swan Song of Parson Avery," and "Snow-Bound."

More, in *Shelburne Essays*, Third Series (ib., 1907); Bliss Perry, "Whittier for To-Day," in *Park Street Papers* (Boston, 1908); G. R. Carpenter, *John Greenleaf Whittier* (ib., 1914); I. K. Eastburn, *Whittier's Relation to German Life and Thought*, published by the University of Pennsylvania (Philadelphia, 1916).

WHIT'TINGHAM, CHARLES (1795–1876). An English printer, born at Mitcham, Surrey. He was taken into partnership with his uncle, Charles Whittingham, founder of the Chiswick Press, in 1824. During the next four years the press issued Irving's *Knickerbocker's History of New York* (1824), Pierce Egan's *Life of an Actor* (1825), and Singer's *Shakespeare* (10 vols., 1825). In 1829 the younger Whittingham began to issue independently a series of books distinguished for excellence and beauty of workmanship. The first to appear was *A Sunday Book*. This was followed by Bacon's and Peele's works, *The Canterbury Tales*, *The Compleat Angler*, Holbein's *Dance of Death*, and others. Upon the death of the elder Whittingham in 1840 both businesses devolved upon the nephew. He began block-color printing in 1840, and in 1843 introduced the old-fashioned style of book production. *The Diary of Lady Willoughby* (1844) is an example of the latter innovation. Other works of this later period were: Shaw's *Elizabethan Architecture* (1843); the notes to Samuel Rogers's *Italy* (1843); and Lord Vernon's *Dante* (1854). In 1869 Whittingham retired.

WHIT'TINGHAM, WILLIAM ROLLINSON (1805–79). An American bishop of the Episcopal church. He was born in New York City, and graduated at the General Theological Seminary there in 1825. Two years later he was ordained, and a little later became rector of St. Luke's Church, New York. In 1835 he became professor of Church history in the seminary, and in 1840 Bishop of Maryland. He was universally considered the most learned bishop of the time in his church, especially in Church history and canon law; and his uncompromising adherence to principle, even on an unpopular side, won him further respect. He was generally a supporter of the High Church party. Consult William Francis Brand, *Life of William Rollinson Whittingham* (New York, 2 vols., 1883).

WHIT'TINGTON, RICHARD ("DICK") (c.1359–1423). An English merchant, mayor of London. He was the third son of Sir William Whittington, who was probably a native of Gloucestershire. Nothing is known of his early life. In 1379 Whittington was a mercer in London, in 1393 he was an alderman, and in 1397, 1398, 1406, and 1419 mayor of London. He advanced large sums of money to the crown and enjoyed the King's confidence. His liberality appears to have been unbounded. At his death he left the bulk of his property to charity and for completing those works which had been begun under his own superintendence. But his fame is due mainly to the popular romance of which he became the hero. According to this legend the lad Whittington went to London and found employment as a scullion. To the freight of an outgoing vessel he contributed his cat, which was sold for a large sum in Barbary. Meanwhile the boy, wearying of ill-usage, started from the city, but hearing the Bow bells, which seemed to say

> Turn again, Whittington,
> Lord Mayor of London,

he went back to his work, soon, from the returning ship, received the price of his cat, married his lady fair, and, living happily, rose to the prophesied post. There is, however, no foundation for this tale nor for the accounts of his being made a knight and of his burning the King's bonds for large sums due him. The *Lives* by Lysons (1860) and Besant and Rice (1881 and 1894) are uncritical and treat the legends as facts. Both the facts and the legends can be found in H. B. Wheatley's edition of the *History of Sir Richard Whittington* (published for the Villon Society, London, 1885).

WHITTREDGE, hwĭt'rĕj, WORTHINGTON (1820–1910). An American landscape and portrait painter. He was born in Springfield, Ohio, and studied with James Beard in New York, and at first practiced portrait and landscape painting in Cincinnati. In 1849 he went to Düsseldorf, where he studied for three years under Andreas Achenbach. He also worked in Belgium and Holland, and in 1855 he went to Rome, residing there until his return to the United States in 1859. In 1866, with Sandford Gifford and Kensett, he accompanied General John Pope on his western tour of inspection, and brought back many sketches. His work shows a sincere and sympathetic feeling for nature and is good in color. Although detailed and somewhat constrained in construction, he invested all that he saw with a wholesome charm, and some of his landscapes are the very best of the Hudson River school (q.v.). His paintings include: "Old Hunting

Ground" (1864); "View of the Rocky Mountains from the River Platte" (1868, Century Club, New York); "Trout Brook" (1875); "House on the Hudson River" (1863, New York Public Library); "Over the Hill" (1906); "Evening in the Woods" and "Camp Meeting" (both in the Metropolitan Museum). In 1861 he was elected a member of the National Academy of Design, of which he was president in 1875–76. The latter part of his life was spent in Summit, N. J.

WHIT'WORTH, Sir Joseph (1803–87). An English mechanical engineer, born at Stockport. He settled in Manchester in 1833 as a toolmaker, made numerous and valuable inventions in metal working and other machinery, and while thus engaged learned to construct absolutely plane surfaces of metal and to determine surface and other inequalities by micrometric methods. The result was to raise the standard of workmanship. Whitworth played an important part in the securing of uniformity of screw threads, and his system of standard threads by which interchangeability and ready reproduction of parts was secured was widely employed. (See Screw.) The request of the government that Whitworth should design the machinery for the manufacture of military rifles was declined, but he was induced to undertake a series of experiments to determine the most efficient construction of such weapons. He evolved a rifle with hexagonal barrel and small calibre (.45 inch) which fired an elongated projectile; but in spite of satisfactory tests it did not meet with the approval of the War Office, though 10 years later a somewhat similar weapon was adopted. From small arms, Whitworth turned his attention to larger ordnance, and made numerous improvements, many of which also failed at the time to meet with the approval of the British authorities. His invention of compressed cast steel for ordnance (q.v.) has been generally utilized in the construction of heavy guns. In 1869 Whitworth was made a baronet, after having received in the previous year the Albert medal of the Society of Arts and the Legion of Honor of France. His large works at Manchester were made into a stock company in 1874, and in 1897 the company was united with the Elswick Works, founded by Sir William Armstrong (q.v.). Whitworth was a liberal benefactor of education; in 1868 he provided 30 scholarships in mechanics, and after his death his executors carried out his expressed wishes and turned over to Whitworth Park and Institute, Owens College, and other charitable and educational institutions in Manchester and elsewhere, funds aggregating about $2,900,000. Whitworth was the author of papers in the journals of the engineering societies; of (with Wallis) *The Industry of the United States in Machinery, Manufactures, and Useful and Ornamental Arts* (1854); *Miscellaneous Papers on Mechanical Subjects* (1858); *Miscellaneous Papers on Practical Subjects;* and *Guns and Steel* (1873). Consult *Memoirs,* in *Proceedings of the Institution of Civil Engineers* (London, 1889), and contemporary volumes of proceedings of other learned societies and scientific journals.

WHITWORTH GUN AND PROJECTILE. An obsolete muzzle-loading system of cannon in which the cross sections of the oblong projectile and of the bore of the gun were corresponding twisted hexagons. By this device the muzzle-loading projectile was given a motion of rotation around its longer axis, thus securing greater accuracy than that obtained with spherical projectiles. This idea was first applied to the infantry bullet. See Guns, Naval; Projectiles.

WHOOPER. 1. A swan. 2. A crane.

WHOOPING COUGH, or Pertussis. An infectious and sometimes epidemic disease, mostly attacking children, especially in the spring and autumn. Its earliest symptoms, which usually appear five or six days after exposure to infection, are those of a common cold, as hoarseness, a watery discharge from the eyes and nose, oppression of the chest, a short, dry cough, and more or less feverishness. This stage, which is called the catarrhal, lasts a week or 10 days, when the fever remits, and the cough begins to be followed by the peculiar whoop which characterizes the disease, and which is caused by the inspiration of air through the contracted cleft of the glottis. (See Larynx.) The disorder may now be regarded as fully developed, and consists of paroxysms of severe coughing, which usually terminate in the expectoration of glairy mucus, or in vomiting. During the fit of coughing the face becomes red or livid, the eyes project, and the child seizes some person or object for support. These paroxysms occur at uncertain intervals, but usually about every two hours, and between them the child returns to play, takes food with good appetite, and exhibits little or no sign of illness. The disease reaches its height at about the end of the fourth week, after which the paroxysms diminish in frequency, and the patient shows signs of improvement. The second stage may last from two to eight weeks, and is succeeded by what may be termed the convalescent stage, the duration of which is variable.

Pathology has failed to throw any direct light upon its seat. In 1906 Bordet and Gengou, Belgian bacteriologists, discovered a bacillus which is regarded as the cause of whooping cough. The organism resembles the influenza bacillus, but it is somewhat larger and is obtained from the sputum of pertussis patients in the catarrhal stages, or in the first week of the paroxysmal stage of the disease. The sputum must be planted on a special blood, agar, glycerin, potato medium, and the bacilli isolated from other organisms having similar morphological and staining characteristics. The proportion of death to recoveries in cases of whooping cough has not been satisfactorily determined, although it is known that the affection is a very dangerous disease and a scourge of childhood. When there is a severe epidemic the mortality is often very great; the deaths in the majority of cases occur among the poorer classes. This mortality is, in reality, due rather to the bronchitis and pneumonia, which are frequent complications of whooping cough, than to the disease itself. In adults, whooping cough with its threatening complications is sometimes dangerous.

A number of vaccines have been prepared, but the reports as to their value are conflicting. They are said to have prophylactic as well as curative properties. Proper nourishment, if necessary supplemented with olive or codliver oil, plenty of fresh air, and sanitary surroundings are powerful aids in treatment. An abdominal bandage or support will prevent injury during the paroxysm, and very often shortens the attack. Patients should not come in contact with other children.

WHORTLEBERRY. See Huckleberry.

WHYDAH or **WHIDAH** (hwīd'ä) **BIRD.** Mistaken spellings of *widow bird* (q.v.).

WHYMPER, hwĭm'pẽr, EDWARD (1840–1911). An English traveler, born in London. He was trained as a draftsman on wood. In 1860 he was sent by a London publisher to sketch the Alpine peaks. In 1861 he reached the summit of Mount Pelvoux, and in 1864 ascended the Point des Ecrins. In 1865 he scaled the Matterhorn, until then found inaccessible. In 1867 and 1872 he visited Greenland. One result of his explorations was the collection of rare fossil plants now in the British Museum. His discovery of magnolia cones demonstrated the former existence of luxurious vegetation in Greenland. He visited the Ecuadorian Andes in 1879–80, and succeeded in reaching the summit of Chimborazo. During this journey he discovered the Andean glaciers and made further collections of fossil, plant, and animal specimens. In 1901–05 he explored the mountains of the Great Divide region in Canada. In addition to his *Scrambles amongst the Alps in the Years 1860–69* (1871, illustrated by himself; 5th ed., 1900), he described his travels in *Travels among the Great Andes of the Equator* (1892); *Chamonix and Mont Blanc* (1896; 15th ed., 1910); *Zermatt and the Matterhorn* (1897; 14th ed., 1910).

WHYTE, ALEXANDER (1837–). A Scottish Free Church clergyman and theologian, born at Kirriemuir (Thrums), Forfarshire. He was educated at Aberdeen University, and at New College, Edinburgh. Installed as colleague in Free St. John's, Glasgow, in 1866, he was transferred in 1870 to Free St. George's, Edinburgh, where he was colleague and successor to Dr. R. S. Candlish (q.v.). After 1909 he was also principal of New College, holding, besides, the chair of New Testament literature. His publications include: *Characters and Characteristics of William Law* (1893); *Bunyan Characters* (3 vols., 1894); *Samuel Rutherford and Some of his Correspondents* (1894); *Appreciation of Jacob Behmen* (1895); *Lancelot Andrewes and his Private Devotions* (1895); *Santa Teresa* (1897); *Father John of Cronstadt* (1898); *An Appreciation of Browne's Religio Medici* (1898); *Cardinal Newman* (1901); *Bishop Butler* (1904); *Thomas Shepard, Pilgrim Father and Founder of Harvard* (1909).

WHYTE, VIOLET. See STANNARD, HENRIETTA ELIZA VAUGHAN.

WHYTE'-MEL'VILLE, GEORGE JOHN. See MELVILLE, GEORGE JOHN WHYTE-.

WIARTON. A town in Bruce County, Ontario, Canada, situated on Georgian Bay, and on the Grand Trunk Railway, 140 miles northwest (direct) of Toronto (Map: Ontario, D 4). The town has a variety of manufactures. Pop., 1901, 2433; 1911, 2266.

WIBERT OF RAVENNA. See GUIBERT.

WICHERN, vĭk'ẽrn, JOHANN HEINRICH (1808–81). The founder of home missions in Germany. He was born at Hamburg, studied theology at Göttingen and Berlin, and, settling in his native city, devoted himself to missionary work among the poor. He started a Sunday school which proved very successful, and in 1833 opened his *Rauhes Haus* (q.v.). Wichern traveled through Germany, preaching and establishing hospitals, schools, homes, and rescue stations. Through his exertions the Protestant synod at Wittenberg in 1848 appointed a central committee for home missions. In 1851 the Prussian government made him inspector of prisons and houses of correction, and in 1858 general superintendent. In 1872 he retired because of illness. He published: *Die innere Mission der deutschen evangelischen Kirche* (1849); *Die Behandlung der Verbrecher und entlassenen Sträflinge* (1853); *Der Dienst der Frauen in der Kirche* (1858).

WICHERT, vĭk'ẽrt, ERNEST (1831–1902). A German dramatist and novelist, born at Insterburg. With his play *Unser General York* (1858) Wichert won his first success, and from that time produced both plays and novels which established his reputation as a sound playwright and interesting story teller. Among his numerous dramas *Ein Schritt vom Wege* (1871), *Der Freund des Fürsten* (1879), and *Post Festum* (1890) may be mentioned as the best. His fiction, ranking for the most part higher than his comedies, includes: *Ein hässlicher Mensch* (1868); *Die Arbeiter* (1873); *Die Taube auf dem Dache* (1892); and *Die Schwestern* (1896). Perhaps his best work is seen in his *Litauische Geschichten* (1881). His collected works were published in 18 vols. (1896–1902).

WICHITA, wĭch'ĭ-tą. A tribe of Caddoan stock (q.v.), formerly ranging over the country between the Washita and Upper Red rivers, including the Wichita Mountains, in southern Oklahoma, and now gathered in a reservation on the north side of Washita in the vicinity of Anadarko. According to tradition, they, as well as their confederates, the Waco (q.v.) and Tawaconi, are direct offshoots of the Pawnee (q.v.), all these tribes speaking the same language with but slight dialectic differences. They call themselves Kitikitĭsh and sometimes Tawéhash, of which their popular name may be a derivative. By the French they were called Pani Piqué, Tattooed Pawnee, their common designation among other tribes being Tattooed People, in allusion to the tribal custom of tattooing upon the face, arms, and breast, particularly among the women. Like all the Caddoan tribes, the Wichita were agricultural and semisedentary, occupying villages of large dome-shaped houses built of grass laid over a framework of poles. On temporary outings they used the ordinary skin tipi. They had a number of interesting ceremonials, most of which they still retain, including a gift dance, a thanksgiving or green-corn dance, and a great ceremonial foot race in which every one able to run participated. They were peaceable and industrious and are one of the few tribes which have always kept peace with the whites.

They are identical with the people of Quivira visited by Coronado in 1542. About 1780 they were living about the present Wichita Falls, Tex. At a later period they fixed their village on the north fork of Red River, in the Wichita Mountains, where they were visited by a government expedition in 1834, resulting in a treaty of friendship the next year, soon after which they removed to the site of the present Fort Sill. In 1859 they were assigned to their present reservation, but on the outbreak of the Civil War were compelled to take refuge in Kansas, camping about the present site of Wichita on the Arkansas, where they remained until 1867. They are now citizens. From an estimated total of over 3000 in 1804 the confederated bands have decreased to 692 in 1872 and 318 in 1910.

WICHITA. A city and the county seat of Sedgwick Co., Kans., 213 miles by rail southwest of Kansas City, on the Arkansas River, and on the Atchison, Topeka, and Santa Fe, the Missouri Pacific, the Chicago, Rock Island, and

Pacific, the St. Louis and San Francisco, the Midland Valley, the Arkansas Valley Interurban, and the Kansas City, Mexico, and Orient railroads (Map: Kansas, E 7). It has attractive residences, imposing business blocks, and fine public buildings. The city is the seat of Fairmount College (Congregational), opened in 1892, and the Friends' University. Other educational institutions include the Mount Carmel Academy, a handsome high school, 28 elementary public schools, and four parochial schools, three business colleges, and several schools of art and music. Prominent institutions include the State Masonic Home, Children's Home, Y. M. C. A. and Y. W. C. A., and the Wichita, Wesley, and St. Francis hospitals. The city contains the Kansas sanitarium. The Forum, maintained by the city, is a large meeting hall with a seating capacity of nearly 8000 persons. The Carnegie library, with some fine mural paintings, the First Presbyterian Church, St. Mary's Cathedral (Catholic), and the Scottish Rite Masonic Cathedral are noteworthy. Riverside Park, the most prominent of the public parks, contains 146 acres, and has a fine zoo. Wichita is favored with excellent transportation facilities, and has considerable commercial and industrial importance. The large stock yards and packing houses, which occupy the northern end of the city, handled in 1915, 201,836 head of cattle, 104,000,000 pounds of pork, and 8000 head of horses and mules. Wichita is also one of the greatest broom corn markets in the world, and in addition carries on an extensive trade in poultry and poultry products, lumber, flour, and alfalfa. In recent years oil and gas have been found in abundance and the fields are being developed rapidly. There are extensive flouring and alfalfa mills, foundries and machine shops, stove works, grain elevators, farm implement manufactories, automobile works, car shops, etc. A large wholesale and jobbing trade is carried on here. In 1915 there were 320 industrial establishments, with a capital of about $15,000,000 and products valued at nearly $35,000,000. The city has adopted the commission form of government; the mayor is commissioner of public safety, and is assisted by four other commissioners. Wichita was settled in 1870, and was incorporated the following year. Pop., 1900, 24,671; 1910, 52,450; 1915 (U. S. est.), 67,847.

WICHITA (wĭch'ĭ-tą) **FALLS.** A city and the county seat of Wichita Co., Tex., 114 miles northwest of Fort Worth, on the Missouri, Kansas, and Texas, the Wichita Valley, and the Fort Worth and Denver City railroads (Map: Texas, C 3). It is an important manufacturing centre, having flour mills and elevators, an oil refinery, and manufactories of automobile trucks, window glass, fruit jars, brooms, candy, stoves, pottery, etc. Pop., 1900, 2480; 1910, 8200; 1915 (U. S. est.), 11,499.

WICHITA MOUNTAINS. A group of mountains in the southern part of Oklahoma between the Washita and Red rivers (Map: Oklahoma, C 4). They form a western outlier of an interrupted system of ancient, denuded rock masses extending across Oklahoma into south Arkansas, and rise abruptly from the surrounding plain to a height of nearly 1000 feet above it. The group consists of a number of isolated conical granite peaks surrounded by outcrops of folded Paleozoic strata.

WICK. A seaport, capital of Caithness, Scotland, at the mouth of Wick Water, and at the head of Wick Bay, 18½ miles south of John o' Groat's House (Map: Scotland, E 1). Wick is the headquarters of the herring fishery and its kindred industries in Scotland. There are two harbors and an extensive breakwater. Pop. (parliamentary borough), 1901, 7881; 1911, 7326.

WICKED BIBLE. See BIBLE, CURIOUS EDITIONS OF.

WICK'ERSHAM, GEORGE WOODWARD (1858–). An American lawyer and cabinet officer, born in Pittsburgh. He studied at Lehigh University, and graduated in law from the University of Pennsylvania in 1881. He practiced his profession at Philadelphia (1880–82) and after 1882 in New York City, where he gained success as a corporation lawyer in the firm of Strong & Cadwallader. He was counsel for the companies which reorganized and partly constructed the traction lines of Chicago, for those which built the New York subways, and for the contractors who drilled the Pennsylvania Railroad tunnels under East River. As legal adviser he participated in the reorganization of the Mexican railway system and in much litigation respecting railway management in the United States. From 1909 to 1913, while Attorney-General in the cabinet of President Taft, he applied the administration's trust policy with ability and success. The most important cases prosecuted under him before the Supreme Court were the Standard Oil Company and the American Tobacco Company cases, decided in favor of the government in 1911. (See TRUSTS; UNITED STATES, *History.*) Other important prosecutions were against the electric lamp, bathtub, beef, sugar, and powder trusts. Wickersham believed in federal regulation of industrial combinations and considered the Sherman Antitrust Law sufficient, without further amendment, to prevent restraint of trade through monopoly.

WICK'LOW. A maritime county of the province of Leinster, Ireland (Map: Ireland, E 6). Area, 781 square miles. The land rises abruptly from the sea, and a large part of the county is mountainous and barren. About one-half is pasture land, and cattle raising is the chief occupation, though some oats and potatoes are raised. Pop., 1901, 60,824; 1911, 60,603. County town, Wicklow.

WICKRAM, vĭk'rȧm, JÖRG (?–c.1560). A German author, born probably at Colmar, in Alsatia, where he founded in 1549 a Meistersinger school. The only other event of his life of which we have definite record is that in 1555 he became town clerk at Burgheim in the Breisgau. The best of his dramas are *Der verlorne Sohn* (1540) and *Tobias* (1551). He is better known, however, as the first writer of prose fiction in the German Reformation period, and in his tales he expressed the new social ideas which were prevalent. Aside from his novels, *Ritter Galmy aus Schottland* (1539), *Der Knabenspiegel* (1554), *Der irrereitende Pilger* (1556), and *Der Goldfaden* (1557), his most important work and one of the first German novels, he published a collection of witty tales entitled *Das Rollwagen-Büchlein* (1555), which contains his best-known and most interesting work. Consult Erich Schmidt, *Zu Jörg Wickram*, in *Archiv für Litteraturgeschichte*, vol. vii (Leipzig, 1876), and Scherer, *Die Anfänge des deutschen Prosaromans und Jörg Wickram von Colmar* (Strassburg, 1877).

WICK'STEED, PHILIP HENRY (1844–).

An English Unitarian clergyman, lecturer, and author, born at Leeds. He was educated at University College, Manchester, and at New College, London, and in 1874–97 had charge of the Little Portland Street Chapel, London. In 1887 he began to lecture for the University Extension movement, speaking principally on poetry and economics. His publications include: *Dante: Six Sermons* (1880); *The Alphabet of Economic Science* (1888); *Henrik Ibsen* (1892); translation and notes to Dante's *Paradiso* (Temple edition); *The Common Sense of Political Economy* (1910); *Dante and Aquinas* (1913).

WICKY. See KALMIA.

WIC'LIF, JOHN (c.1320–84). A noted English reformer, often styled the Morning Star of the Reformation. He was born probably near Richmond, in Yorkshire. The known facts of his life are singularly few and meagre. He seems to have belonged to a well-to-do family of the lower nobility and to have been sent as a youth to the University of Oxford. He became a fellow and not long before 1360 master of Balliol College. He was made rector of the neighboring parish of Fillingham (1361–69), of Ludgarshall (1369–74), and of Lutterworth (1374–84). In 1365 he appears as King's chaplain, if this is the proper translation of *peculiaris regis clericus*, and from this date he enters into close relations with the government, especially with the King's son John (of Gaunt), defending the right of the state to deprive unrighteous clergy of their goods. In 1375 he was a member of a royal commission to confer with legates of the Pope at Bruges. Attention was first called to his views on theological questions in the year 1376, and in 1377 he was summoned to give account of his teaching at St. Paul's in London by Bishop Courtenay, but popular riots resulted and nothing was done. At a second hearing at Lambeth in 1378 he was protected by the Queen Mother and allowed to withdraw with only a gentle admonition. From this time until two years before his death in 1384 he continued to write and teach at Oxford, elaborating his views with more clearness and winning many supporters. His doctrines were carried to Prague and served there as the basis of the revolt under John Huss. They were formally condemned at the Council of Constance (1415) and repudiated by all parties down to the Reformation. In accordance with a decree of the Council of Constance, his body, buried at Lutterworth, was disinterred in 1428 by Richard Fleming (q.v.), burned, and the ashes thrown into the river Swift.

The activities of Wiclif may be classified as political, theological, and evangelical, but these are all closely connected by a common principle of thought. The one creative idea which governed all his action, and which may be regarded as Wiclif's contribution to the Reformation, is the right of the individual to form his opinions on the basis of Scripture and reason, and then to carry out these opinions in association with other individuals as seems best to him and them. Although he describes himself as a realist and worked according to the formal methods of the mediæval realistic school of thought, his conclusions are largely tinged by the new nominalistic writing of William of Ockham and Marsiglio of Padua. The essence of this new thought was the comparative unimportance of traditions in church or state, and the corresponding right of the members of the body politic or religious to govern themselves as they saw fit. Such ideas fell in naturally with the newly developed nationalistic feeling in all countries, and more especially in England. If it was true that Englishmen owed their first duty to England, then there must be some way of showing that such national loyalty was consistent with fidelity to the Christian faith. Wiclif's first public service was in furnishing to the government just such a demonstration as this. In 1365 the Pope, then living in France, had renewed a long-neglected claim on England for the tribute promised by King John 150 years before as a part of his bargain with Rome. Money given to the papacy seemed to be money taken from England to serve her enemy, France, and the government sought a valid excuse for refusing the demand. Wiclif's pamphlet, *Determinatio quædam de Dominio*, supplied the need. In it he showed that a nation had the same rights of self-preservation as an individual; that the papacy, being a spiritual power, could not lawfully exercise sovereignty over an independent country; and, finally, that King John had had no right to make any such bargain without the consent of the people of England. The same points are clearly seen in another pamphlet written 11 years later in reply to an inquiry from Parliament whether the nation would be justified in refusing to pay "Peter's pence" during a time of domestic need. Wiclif takes here the broad ground that all such contributions were acts of charity, and hence not subject to demand; they might rightfully be withheld when the nation had need of the money to provide for the maintenance of religion at home. On both these occasions Wiclif was led on to express opinions on the nature and the present perversions of the papal office which could not be overlooked, and in 1377 Pope Gregory XI issued bulls against him. This placed Wiclif fairly in the position of a condemned heretic, but there was no power in England strong enough to enforce them against a man who had made himself the champion of national rights as against all foreign aggression. They fell flat and unquestionably weakened the papal cause in England. Though the attitude of the government changed with the shifting of parties consequent upon the death of Edward III and the accession of Richard II, Wiclif continued to enjoy the protection that had carried him so far and was allowed to end his days in peace.

The principles governing Wiclif in these political questions are laid down by him chiefly in his two great treatises, *De Dominio Divino* and *De Civili Dominio*, in which he tried to show the limits of human lordship and especially of the lordship of the Church over temporal things. In these, as in his other writings, the appeal is throughout to Scripture as the highest expression of the divine law, and in opposition to the man-made statutes of the Roman church. From this supreme authority of Scripture Wiclif went on naturally to the importance of teaching it to every Christian, and so to the duty of giving it to the world in the common tongue. It seems now to be clear that before Wiclif's time there had been no systematic attempt to translate the whole Bible into English, and hence the vast importance of the version known as Wiclif's Bible, though it is not probable that he did more than a fragment of the work of translation himself. Aside from its value as a contribution to the growing standard of English prose, this English Bible was the chief agency in spreading the ideas that form the practical side of Wiclif's

activity. He tried to meet the need of the times by sending out the Bible in the hands of young men not in clerical orders, nor even, so far as we know, equipped with any professional learning, though probably often youths who had listened to his teaching at Oxford. These "poor priests" were to imitate as far as possible the conditions of the Apostles. They went forth on foot, in a russet gown, with scrip and staff, and, according to the reports of friends and enemies alike, the people heard them gladly. They were instructed to preach only the plain, straightforward word of God. The description of the "persone of a town" in the prologue to the *Canterbury Tales* corresponds to his ideal.

What the heresies of Wiclif were is shown by the charges brought forward at the several trials. They may all be regarded as growing out of the one fundamental notion of a divine law—*lex Christi*—superior to all earthly laws and not intrusted to any human person or institution. It is obvious that in the last resort this divine law is only to be found in the individual conscience using all the means, intellectual, spiritual, and emotional, that it can command. This was Wiclif's real and sufficient offense. In speculative theology the test came, as throughout the Reformation period, on the question of the sacramental observances, and especially of the Eucharist. Realist as he claimed to be, Wiclif could not accept the doctrine that in the consecration of the elements the accidents were separated from the substance they represented, and he therefore had to deny the doctrine of transubstantiation. He claimed to believe in an actual presence of the body of Christ in the Host, but it was somewhat like Luther's later conception of consubstantiation. His view of the Church was that it consisted of the body of the followers of Christ, and that therefore it could not be controlled by any person or group of persons, such as the Pope and the cardinals. Authority in the Church could only be claimed by righteous men. It was the business of temporal authorities to see to it that Christ's law be obeyed, and to recall the rulers of the Church to obedience if they failed. The control of the temporalities of the Church lay in the hand of the civil rulers, who ought to withdraw them if they were abused.

However subversive of existing institutions these principles of Wiclif might be, they would, perhaps, have been overlooked if he had not aroused the bitterest personal enmities by his unsparing application of them to the evils of society. Both the mendicant orders and the Episcopal Order felt themselves threatened by the growing contempt for organized authority, and were only too ready to connect the social upheavals of the time (1381) with this religious agitation. The sympathy of the ruling classes was diverted from Wiclif in his last years, but it is clear that his teaching was held in reverence by many of the lower and middle classes. "Lollardry," as the following of Wiclif came to be called, was doubtless very widely spread and maintained itself for about a generation after Wiclif's death as a powerful religious and political factor in the English people.

Bibliography. The definitive edition of Wiclif's Latin works is being published by the Wyclif Society (London, 1883 et seq., 34 vols. issued up to 1912); also *Select English Works of John Wyclif*, edited by T. Arnold (3 vols., Oxford, 1869–71); *English Works of John Wyclif, Hitherto Unprinted*, edited by F. D. Matthew for the Early English Text Society (London, 1880); *Wyclif's Translation of the Bible*, edited by Forshall and Madden (4 vols., Oxford, 1850); *New Testament, with Glossary*, edited by W. W. Skeat (Cambridge, 1879). For his life, etc., consult: G. V. Lechler, *John Wycliffe and his English Precursors*, English translation by Peter Lorimer (2 vols., London, 1878; new ed., abridged, ib., 1904); Augustus Jessopp, *Coming of the Friars* (8th ed., ib., 1889); J. WICOPY, wīk'ō-pī. See LEATHERWOOD.

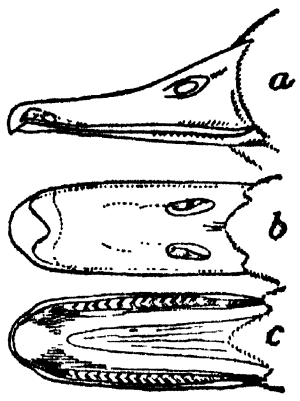
WIDAL, vē-dȧl', (GEORGES) FERNAND ISIDORE (1862–). A French bacteriologist, born at Dellys, Algiers. He studied in Paris, where he became a hospital physician in 1893 and in 1895 professor agrégé in the medical faculty. In 1906 he was elected a member of the Academy of Medicine. Widal became known especially for his work on bacterial agglutination and its application to the diagnosis of typhoid fever. He also was the first in France (with André Chantemesse) to advocate vaccination against typhoid fever (see TYPHOID FEVER). He published *Etude sur l'infection puerpérale* (1889); *La cure de déchloruration dans le mal de Bright* (1906); *Maladies des veines et des lymphatiques* (1911).

WIDAL REACTION. See TYPHOID FEVER; WIDAL, FERNAND.

WIDDIN, or **WIDIN**, vĭd-ĕn'. An ancient town and the capital of a department in the Kingdom of Bulgaria, situated on the right bank of the Danube, about 100 miles north-northwest of Sofia (Map: Balkan Peninsula, D 2). It is surrounded by marshes and its inaccessibility formerly gave it great strategical importance. There are still preserved the ancient walls and the citadel. A new quarter is growing up along the river. Widdin manufactures gold and silverware, tobacco, and spirits. Pop., 1905, 16,183. Widdin was a very strong Turkish fortress, and constituted an important strategic point in the last Russo-Turkish War.



WIDENER, wīd'nĕr, PETER A. BROWN (1834–1915). An American capitalist, born in Philadelphia. He started life as a butcher and later owned a chain of markets. Engaging in Republican politics he was elected treasurer of Philadelphia in 1874. He became interested in street railways, and was associated with William L. Elkins in the early development of American electric traction systems. Later he acquired large holdings in the United States Steel Corporation, the American Tobacco Company, and the Standard Oil Company. He endowed the Widener Memorial School for Crippled Children

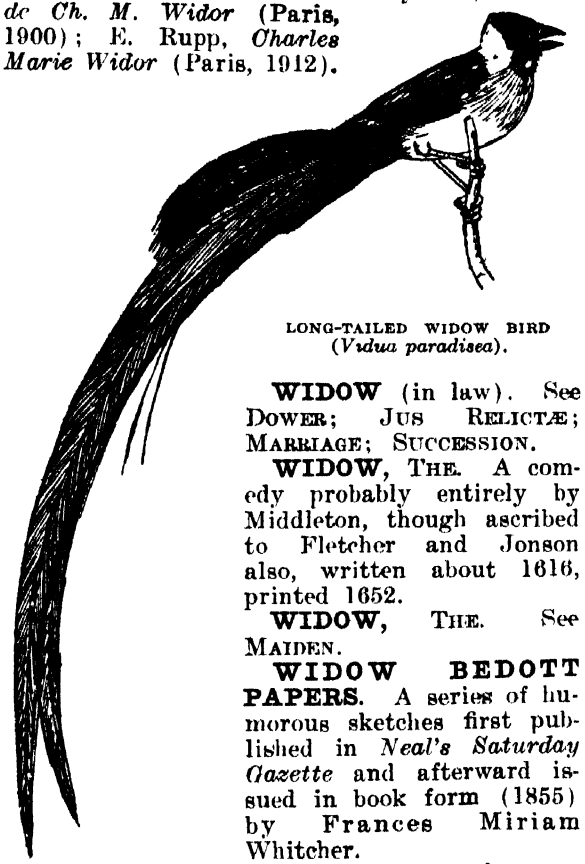
at Philadelphia and Longport, N. J., and gave the building for the Free Public Library of Philadelphia. Widener housed in his home at Elkins Park, near Philadelphia, one of the finest private art collections in the United States. His fortune was estimated at about $35,000,000 at the time of his death.

WIDERSPENSTIGEN ZÄHMUNG, vē'dĕr-shpĕn'stĭ-gen tsā'mụng, DER (Ger. *The Taming of the Shrew*). An opera by Götz (q.v.), first produced in Mannheim, Oct. 11, 1874; in the United States, Jan. 4, 1886 (New York).

WIDE, WIDE WORLD, THE. A popular novel by Susan Warner (q.v.), written under the name of Elizabeth Wetherell (1850).

WIDGEON, or **WIGEON** (from OF. *vigeon*, widgeon, from Lat. *vipo*, sort of small crane). One of two river ducks of the genus *Mareca*, allied to the gadwall and teal, and common throughout the Arctic regions. The European widgeon (*Mareca penelope*) is seen in temperate latitudes only in winter, when it flies in large flocks, and is a favorite with gunners. Its whole length is about 19 inches. The forehead and top of the head in the male are white; the cheeks and hind part of the neck reddish chestnut; the upper parts grayish white, crossed with irregular zigzag lines of black; the tail nearly black; the wing coverts white, tipped with black; the primaries dark brown; speculum green, edged with black; the throat pale rufous; the breast and belly white. The female is very different, the head and neck rufous brown, speckled with dark brown; the back varied with two shades of brown, darker in the centre, and paler in the edges of the feathers. Widgeons feed during the daytime, and chiefly on water plants. The note is a shrill whistle, whence its French name *siffleur*, and the English names, "whew duck" and "whewer." The American widgeon or baldpate (*Mareca americana*) is much like the European, but the upper parts are finely waved transversely with black and reddish brown; the under parts are mostly white; the top of the head is almost white; the wing coverts are white, the greater tipped with black. It is common in winter in the interior of the United States, and its flesh is highly esteemed. It breeds regularly from Minnesota northward, and occasionally much farther south. See DUCK.

BILL OF A WIDGEON.



a, profile; *b*, upper side; *c*, under side; showing serrations. (*Mareca americana.*)

WIDIN. See WIDDIN.

WIDMANN, vĭt'män, JOSEPH VIKTOR (1842–1911). A Swiss author, born at Nennowitz, Moravia, and educated at Heidelberg and Jena. He became director of a girls' boarding school at Bern in 1868, but left this work in 1880, when he was made literary editor of the *Berner Bund*. His writings include verse, dramas, and novels. His best works are the dramatic epic poems *Maikäferkomödie* (1897; 12th ed., 1912) and *Die Heilige und die Tiere* (1905; 10th ed., 1912). Among others may be named *Erasmus von Rotterdam* (1865); *Arnold von Brescia* (1867); *Buddha* (1869); *Spaziergänge in den Alpen* (1885); *Jenseits von Gut und Böse* (1893); *Die Muse des Aretin* (1902); and *Du schöne Welt* (Frauenfeld, 1907).

WID'NES. A municipal borough in Lancashire, England, at the head of the Mersey estuary, 13 miles southeast of Liverpool (Map: England, D 3). It is a great chemical manufacturing centre and also has iron foundries and copper works. Pop., 1901, 28,580; 1911, 31,541.

WIDOR, vē'dôr', CHARLES MARIE (1845–). A French organist and composer, born at Lyons. He studied at home under his father, and at Brussels under Lemmens on the organ and Fétis for composition, and in 1860 succeeded his father as organist at St. François. In 1870 he became organist at St. Sulpice, Paris. He succeeded César Franck as organ professor in 1890, and Dubois in 1896 as professor of counterpoint, fugue, and composition at the Paris Conservatory. Under the pen name "Aulétès" he was the musical critic of *L'Estafette*. He was also director and conductor of the society La Concordia. He is an acknowledged virtuoso on the organ and a skillful improviser, and his compositions for the organ rank high. His compositions include the two-act ballet *La Korrigane* (1880); music to the play *Conte d'Avril* (1885); to *Les Jacobites* (1885); the operas *Maître Ambros* (1896); *Nerto* (not produced), and *Les Pêcheurs de St. Jean* (1905); the pantomime *Jeanne d'Arc* (1890); masses; anthems; *La Nuit de Walpurgis* for chorus and orchestra (1880); two symphonies for orchestra (F, A); two series of symphonies for organ; and considerable chamber music. He wrote *Technique of the Modern Orchestra* (1906) as a supplement to Berlioz's Treatise. Consult H. Reynaud, *L'œuvre de Ch. M. Widor* (Paris, 1900); E. Rupp, *Charles Marie Widor* (Paris, 1912).

LONG-TAILED WIDOW BIRD (*Vidua paradisea*).

WIDOW (in law). See DOWER; JUS RELICTÆ; MARRIAGE; SUCCESSION.

WIDOW, THE. A comedy probably entirely by Middleton, though ascribed to Fletcher and Jonson also, written about 1616, printed 1652.

WIDOW, THE. See MAIDEN.

WIDOW BEDOTT PAPERS. A series of humorous sketches first published in *Neal's Saturday Gazette* and afterward issued in book form (1855) by Frances Miriam Whitcher.

WIDOW BIRD. One of the group of weaver birds (subfamily Viduinæ), dwelling in western Africa, and remarkable for the gay plumage

and long tails of the males, the females being plain brown. The name was given originally by the Portuguese settlers to a species (*Chera procne*) which, excepting a buff and scarlet wing bar, is wholly black, the color and long train suggesting the garb of a widow. One of the most remarkable species is illustrateed herewith. Its body is not larger than that of a small finch. The head, throat, back, and wings are greenish brown, the nape and under parts dark yellow, and the breast deep red. The long tail is curious. The middle pair of feathers have the webs greatly widened, and through the twisting of the shafts of their inferior surfaces are vertically opposed; the next pair are produced to the length of about a foot, and droop in a graceful curve; each has attached to its base a long hairlike filament. This and other species are often kept in Europe as cage birds for their song as well as their plumage. Erroneous spellings of this name are "whydah bird" and "vida bird."

WIDOW'S QUARANTINE. See QUARANTINE.

WIDOW'S TEARS, THE. A coarse but humorous comedy by Chapman (1612). Its source is Petronius' story of the Ephesian widow.

WIDUKIND, wĭd'ụ-kĭnd. See WITTEKIND.

WIECK, vēk, FRIEDRICH (1785–1873). A German musical instructor, born at Pretzsch, near Wittenberg. Having at first studied theology at Wittenberg, he turned to music, established a piano factory and music store at Leipzig, but soon devoted himself entirely to teaching the pianoforte according to a rational method of his own, which presently brought him considerable reputation and was successfully put to the test by the brilliant achievements of his daughters KLARA (wife of Robert Schumann) and MARIE (1832–). In 1840 he removed to Dresden, where he also gave vocal instruction. Most of his extensive pedagogical experiences may be found incorporated in the publication *Klavier und Gesang* (3d ed., 1878). Consult A. von Meichsner, *Friedrich Wieck und seine Töchter* (Leipzig, 1875); A. Kohut, *Friedrich Wieck* (Dresden, 1888); V. Joss, *Friedrich Wieck und sein Verhältnis zu Robert Schumann* (ib., 1900); id., *Der Musikpädagoge Friedrich Wieck und seine Familie* (ib., 1902).

WIED, HERMANN, COUNT OF. See HERMANN, COUNT OF WIED.

WIED, vēt, MAXIMILIAN, PRINCE OF (1782–1867). A German naturalist, born at Neuwied. He undertook two journeys of scientific investigation, one through Brazil (1815–17) and one through the United States (1832–34). These he described in *Reise nach Brasilien in den Jahren 1815–17* (2 vols., 1819–20), with atlas; *Abbildungen zur Naturgeschichte Brasiliens* (15 parts, 1823–31); *Beiträge zur Naturgeschichte von Brasilien* (4 vols., 1824–33); *Reise in das innere Nord-America in den Jahren 1832 bis 1834* (2 vols., 1839–41), with maps.

WIED, WILLIAM OF. See WILLIAM OF WIED, PRINCE.

WIEDEMANN, vē'de-män, (KARL) ALFRED (1856–). A German Egyptologist, son of Gustav Wiedemann (q.v.). He was born in Berlin, and was educated at Berlin, Leipzig, Tübingen, and Paris. He became professor of Egyptology at Bonn in 1891. He wrote: *Aegyptische Geschichte* (1884; supplement, 1888); *Die Religion der alten Aegypter* (1890; Eng. trans., 1897); *Die Toten und ihre Reiche im Glauben der alten Aegypter* (1900; 3d ed., 1910), translated from first edition under the title *The Ancient Egyptian Doctrine of the Immortality of the Soul* (1895); *Unterhaltungslitteratur der alten Aegypter* (2d ed., 1903); *Altägyptische Sagen und Märchen* (1906); *Der Tierkult der alten Aegypter* (1912).

WIEDEMANN, GUSTAV HEINRICH (1826–99). A German physicist and chemist. He was born in Berlin and studied at the university in that city, where in 1851 he became a privatdocent. In 1854 he was appointed professor at Basel; in 1863 he was called to the Polytechnic School at Brunswick; in 1886 he went to Karlsruhe, and in 1871 he became professor of physical chemistry at Leipzig, taking the chair of physics in 1887. He carried on many researches in magnetism and electricity and studied the conduction of heat and electricity by solids, electrolysis, magnetic properties of bodies, and devised a number of species of original apparatus. He was the author of *Die Lehre vom Galvanismus und Elektromagnetismus*, the third edition of which was published in four volumes under the title of *Lehre von der Elektricität* (1881–85), and a fourth edition in 1893. Wiedemann, at the death of Poggendorff (q.v.) in 1877, assumed the direction of the *Annalen der Physik und Chemie*, to which he added the *Beiblätter* as a supplement. This publication, which soon became known as *Wiedemann's Annalen*, is a classic in physical science.

WIEDERSHEIM, vē'dērz-hīm, ROBERT ERNST EDUARD (1848–). A German comparative anatomist, born at Nürtingen, Württemberg. He studied at Lausanne, Tübingen, Würzburg, and at Freiburg, where in 1877 he became professor of anatomy. His most important works are his textbooks of vertebrate comparative anatomy, *Lehrbuch der vergleichenden Anatomie der Wirbelthiere* (1882; 2d ed., 1886). In 1884 he published a *Grundriss*, which passed through four editions, and in 1902 appeared as *Vergleichende Anatomie der Wirbeltiere* (2d ed., 1906). His *Grundriss* was translated by Parker (1886; 2d ed., 1897) as *Comparative Anatomy of Vertebrates*, of which the third edition (1907) was prepared from the 1906 and 1907 editions of Wiedersheim's *Vergleichende Anatomie*. Among his other important works are *Der Bau des Menschen als Zeugniss für seine Vergangenheit* (1887; 4th ed., 1908); *Das Gliedmassenskelett der Wirbelthiere* (1892).

WIEGAND, THEODOR GERHARD (1864–). A German classical scholar, born at Bendorf. He studied at the universities of Munich and Freiburg. At various times he travéled in Belgium, England, Denmark, Italy, Greece, and Turkey. In 1896 and later he took part in the excavations at Priene (q.v.). In 1899 he conducted excavations at Miletus and in 1910 at Samos. In 1912 he became director of the Collection of Ancient Statues in Berlin. His works, besides numerous papers in the learned periodicals, include: *Die Puteolanische Bauinschrift sachlich erläutert* (1894); *Milet, Ergebnisse der Ausgrabungen und Untersuchungen* (1890), with others; *Die archaische Porosarchitektur der Akropolis von Athen* (1904); *Priene* (1904), with H. Schrader.

WIELAND, vē'länt, CHRISTOPH MARTIN (1773–1813). A German epic poet, one of the most important authors of the classic period of German literature, born at Oberholzheim, near

Biberach, in Württemberg. He went to Tübingen (1750) to study law, but was more interested in literature and the classics, and returned to his family much affected by the mystical piety of Klopstock, as he tells us in his *Empfindungen eines Christen*, but also under the spell of the skeptical French philosophy of the time. At Zurich he was welcomed (1752) by Bodmer (q.v.), who called his attention to biblical epical themes and enlisted his aid in a controversy with the Anacreontic school of Gleim (q.v.). In the course of this occupation Wieland was attracted to Greek literature and in poetic contributions to the psychology of modern love broke irretrievably with the Puritans of Zurich. In 1759 he went to Bern to accept a position as private tutor. Here his light heart betrayed him into love adventures; but in 1760 he obtained an office in Biberach. In intimate association with the fascinating Sophie von La Roche, who played an important part in Goethe's life, Wieland hovered for a time on the brink of thoughtless hedonism, but presently outgrew this, married a homekeeping wife (1765), and later became a model paterfamilias amid his 14 children. During these years Wieland was writing fiction that made him a favorite with the German nobility and an Ichabod to his former associates. The versified *Nadine* (1769) is Greek in its joy of life, the prose *Don Silvio von Rosalva* (1764) is a satire on idealism, and the *Comic Tales* (*Komische Erzählungen*, 1766) pass the border line of frivolity. The study of Fielding and other English novelists appears in *Agathon* (1767) and the versified tale *Musarion* (1768); and the influence of Shakespeare is also unmistakable. After obtaining a professor's chair in the University of Erfurt (1769), Wieland now attempted in *Der goldene Spiegel* a description of an ideal state (1772), which so pleased the Duchess Anna Amalia, that she invited him in 1772 to Weimar to become tutor to the young Prince Karl August and his brother. At Weimar he remained honored and respected till death. The added dignity naturally produced greater literary seriousness. His critical quarterlies, *Der Deutsche Merkur* (1773–95), *Attisches Museum* (1796–1804), and *Neues Attisches Museum* (1808–09), spread and confirmed his influence, now toward a serene optimism, purer taste, and the diffusion of culture. Thus he moderated with discriminating sympathy the excesses of the writers of the period of Storm and Stress (q.v.). The first important work of the Weimar period was *Die Abderiten* (1774), a satirical novel in the interest of political cosmopolitanism. Then Goethe, and soon afterward Herder, came to Weimar and gave new wings to Wieland's genius, leading him back to verse and to the unworked mine of mediæval Germany, whence he drew the inspiration of *Geron der Adelige* and of his best-known epic, the romantic *Oberon* (1780). His later romances, *Peregrinus Proteus* (1791) and *Aristipp* (1800), are of inferior interest, and his most valuable contributions to literary culture in the last 30 years of his life were his translations of the *Satires* and *Epistles* of Horace (1782–86), the *Letters* of Cicero (1808–12), the *Dialogues* of Lucian (1788), and parts of Xenophon, Aristophanes, and Euripides. He took an active part in critical journalism up to 1809, and from 1794 to 1802 superintended an edition of his *Works* (45 vols.). His death was that of a calm Epicurean. Of all the Weimar galaxy he is the most recreative, delightful, and genial, though others be more philosophical, serious, versatile, or profound. Wieland first called German attention generally to Shakespeare, 22 of whose dramas he translated (1762–66), and to the Middle Ages; he first made stylistic elegance and refinement natural to German verse and prose.

Bibliography. Wieland's complete *Works* are edited by Gruber (53 vols., Leipzig, 1818–28, and in 40 vols., Berlin, 1867–75). A critical edition under the auspices of the Prussian Academy of Sciences was issued in 1909–15. Of selections the editions are numerous. His *Letters* are collected in *Ausgewählte Briefe an verschiedene Freunde* (Zurich, 1815–16); *Auswahl denkwürdiger Briefe* (Vienna, 1815); *Briefe an Sophie von La Roche* (Berlin, 1820); and Hassencamp, *Neue Briefe Wielands, vornehmlich an Sophie von La Roche* (Stuttgart, 1894). The *Abderiten* is translated by Christmas as *The Republic of Fools* (London, 1861); the *Oberon* by Sotheby (3d ed., ib., 1826). Consult also: J. G. Gruber, *Christoph Martin Wieland* (2 vols., Leipzig, 1827–28); L. E. Hallberg, *Wieland* (Paris, 1869); H. C. F. Pröhle, *Lessing, Wieland, Heinse* (Berlin, 1877); L. F. Ofterdingen, *Christoph Martin Wielands Leben und Wirken in Schwaben und in der Schweiz* (Heilbronn, 1877); Ernst Ranke, "Zur Beurtheilung Wielands," in *Festgabe zum neunzigsten Geburtstag Leopolds von Ranke* (Marburg, 1885); Ludwig Hirzel, *Wieland und Martin und Regula Künzli* (Leipzig, 1891); Karl Walter, *Chronologie der Werke C. M. Wielands, 1750–1760* (Griefswald, 1904); E. Stadler, *Wielands Shakespeare* (Strassburg, 1910).

WIELICZKA, vyĕ-lĭch'kȧ. A town in the Crownland of Galicia, Austria, 7 miles southeast of Cracow, on a branch of the Austrian state railway (Map: Austria, F 2). The population is Polish, and in 1910 numbered 6724. The town is important only for its rock-salt mines, which are the most famous in the world, and in large part supply the Austro-Hungarian monarchy. These mines, reaching a depth of 982 feet, form a subterranean town, extending about 2½ miles from east to west and about 4000 feet from north to south. The galleries traverse seven levels and aggregate 77 miles in length. Some of the halls are very large and contain statues and other decorations carved from the salt. There are several ponds. Eleven shafts lead down to the mines. About 1400 workmen are employed. There were produced, in 1912, 79,874 metric tons of rock salt. It is not known how long the mines have been in operation, but there is evidence that they were worked as early as 1044. From the possession of the Poles the mines fell to Austria in 1772; in 1809 they were shared by Austria and the Dukedom of Warsaw, and in 1814 went again to Austria alone. There were inundations in 1868 and 1879. The land on which the town of Wieliczka stands has settled somewhat. Consult Eduard Windakiewicz, *Das Steinsalz-Bergwerk in Wieliczka* (Freiberg, 1896).

WIEN, Max (1866–). A German physicist. He was born at Königsberg, where he attended the university, and he also studied at Freiburg and Berlin. In 1891 he became an assistant to W. C. Röntgen at Würzburg, was appointed a privatdocent there in 1893, and in 1898 was called to the Aachen Technische Hochschule. He accepted a professorship in the Danzig Technische Hochschule in 1904, but after

1911 held the chair of physics at Jena. His investigations deal particularly with acoustics. In 1888 he constructed a resonator for measuring the strength of tones.

WIEN, WILHELM (1864–). A German physicist, born at Gaffken, near Fischhausen, East Prussia. He was educated at Göttingen, Heidelberg, and Berlin, served as an assistant in the Imperial Physical-Technical Institute at Charlottenburg in 1890–96, and in 1892 became also a privatdocent at Berlin. Afterward he was professor successively in the Technische Hochschule at Aachen, at Giessen, and at Würzburg (from 1900). He lectured at Columbia University in 1913. His investigations deal largely with theories of radiation, and for his work in this field he received the Nobel prize in physics in 1911. Wien published *Lehrbuch der Hydrodynamik* (1900) and *Neuere Probleme der Theoretischen Physik* (1913).

WIENBARG, vēn'bärk, LUDOLF (1802–72). A German author, born at Altona. He studied theology and philosophy at the universities of Bonn and Kiel, taught at The Hague, and was instructor in æsthetics and literature at Kiel University. Afterward he devoted himself to literature and became associated with the Young Germany party, giving it its name. His writings on æsthetics and literary history were a great power in their time. Among his publications are: *Æsthetische Feldzüge* (1834), his best work; *Holland in den Jahren 1831 und 1832* (1833); *Die neueste Litteratur* (1835); *Geschichtliche Vortrage über altdeutsche Sprache und Litteratur* (1838); and *Geschichte Schleswigs* (1862). Consult Victor Schweizer, *Ludolf Weinbarg: Beiträge zur jungdeutschen Aesthetik* (Leipzig, 1896).

WIENER, vē'nēr, LEO (1862–). An American Slavic scholar. Born at Bielostok, Russia, he studied medicine at Warsaw University, attended the Polytechnic in Berlin, and came to the United States in 1882. He was a teacher of languages in Missouri and at the New England Conservatory of Music, Boston, until 1896 and afterward at Harvard, where he became professor of Slavic languages and literatures in 1911. Besides translating and editing the *Complete Works* of Count Leo Tolstoy (24 vols., 1904–05), he published Morris Rosenfeld's *Songs from the Ghetto* (1898; enlarged ed., 1900), with prose translation; *The History of Yiddish Literature in the Nineteenth Century* (1899); *Anthology of Russian Literature* (2 vols., 1902–03); *An Interpretation of the Russian People* (1915); *Commentary to the Germanic Laws and Mediæval Documents* (1915).

WIENER-NEUSTADT, vē'nēr-noi'shtät. A town of Lower Austria, situated 28 miles south of Vienna (Map: Austria, D 3). The town is overlooked by the old castle of the dukes of Babenberg, now occupied by the military academy, founded by Maria Theresa in 1762. The castle contains a fine Gothic chapel of the fifteenth century. There are extensive manufactures of machinery, flour, brass goods, locomotives, bells, glycerin, sugar, pottery, paper, leather, and ammunition. Pop., 1900, 28,438; 1910, 32,869.

WIENIAWSKI, vē-nyäf'skĭ, HENRI (1835–80). A Polish violinist, born in Lublin. He was a pupil of Clavel and of Massart at the Paris Conservatory, and his progress was so rapid that when only 11 years old he won the first prize. In 1848 he went with his mother to Russia and gave his first concerts in St. Petersburg and Moscow. In 1849 he returned to Paris, reëntered the Conservatory, and took up the study of harmony under Colet, obtaining the second prize for that subject in 1850. At the age of 18 he went on a tour through Poland, Russia, Belgium, Holland, Germany, and England, and was everywhere received with enthusiasm. In 1860 he was appointed solo violinist to the Emperor of Russia, and two years later professor at the Conservatory of St. Petersburg. Together with Anton Rubinstein he toured the United States in 1872. After his return to Europe he succeeded Vieuxtemps as professor at the Brussels Conservatory in 1875. He died in Moscow. Most of his compositions remain in manuscript. His published works consist of two concertos, several fantasias, salon pieces, and violin studies.

WIENIAWSKI, JOSEPH (1837–1912). A Russian pianist and composer, born at Lublin. At the age of 10 he entered the Paris Conservatory, where he studied for three years under Zimmermann and Marmontel. From 1865 to 1869 he was professor at the Moscow Conservatory, from which he resigned to establish his own music school. In 1876 he accepted a professorship in the Brussels Conservatory, which he held till his death. He made extensive tours with his brother Henri, the famous violinist. Among his works the more important are an overture, *Guillaume le Taciturne;* a piano concerto; a string quartet; *Fantaisie et Fugue;* 24 études.

WIERSBITSKI, OTTO VON CORVIN-. See CORVIN-WIERSBITSKI.

WIERTZ, vērtz, ANTOINE JOSEPH (1806–65). A Belgian painter, born at Dinant. He showed a wonderful precocity in art, and at 14 he began to study at the Academy of Antwerp under Herreyns and Van Brée, making Rubens his model. In 1832 he won the Prix de Rome. At Rome he modeled his art upon Michelangelo, and as the fruit of his assiduous reading of Homer he produced, in 1835, an enormous canvas, the "Combat Over the Body of Patroclus," 30 feet in length, with more than a dozen life-size figures. The picture produced a deep impression, and Thorvaldsen pronounced the young artist a giant. On his return Wiertz settled first at Liége, supporting himself by portrait painting, and in 1848 went to Brussels. There he painted his masterpiece, "The Triumph of Christ." In 1850 the government built for him after his own design a gigantic studio, now known as the Musée Wiertz, in which all his historical, allegorical, and ideal pictures are united, and which he bequeathed to the nation. There he executed the most remarkable of his purely ideal creations and his realistic pictures, the most original and interesting of all his works. There he also carried on chemical experiments, resulting in the discovery of a new process of painting, combining the advantages of oil and fresco, which he called *peinture mate*, or painting with a dull surface. Always seeking to give visible expression to an idea, Wiertz's undisciplined imagination often indulged in morbid representations, the mere titles of which will indicate their character: "A Second after Death," "The Child Burned," "Precipitate Inhumation," "The Suicide," "Hunger, Folly, and Crime," "A Scene in Hell," "Thoughts and Visions of a Head Cut off." Among his many literary productions, brought out in swift suc-

cession, may be cited *L'éloge de Rubens* (1840), and *L'école flamande de peinture* (1863), which was crowned by the Royal Academy of Belgium. For his biography consult: Watteau (Brussels, 1865) and Labare (ib., 1867); and Atkinson, in the *Portfolio* (London, 1875).

WIESBADEN, vēs'bä'den; *locally*, commonly vīs'bä'den. A city of Prussia, in the Province of Hesse-Nassau, previous to 1866 the capital of Nassau, 6 miles north of Mainz (Map: Germany, C 3). Altitude, 385 feet. It is a charming city and one of the most fashionable and popular summer resorts of Europe, with 29 saline springs whose temperature ranges from 104° to 156° F. The number of visitors in 1907 was 180,000. The climate is moderate.

Wiesbaden lies for the most part in a fan shape, the streets of the town proper stretching away from the Wilhelmstrasse, which, in a straight line nearly north and south, separates the town proper from the Kurhaus, the adjacent pleasure grounds, and the attractive residence section on the east. The Wilhelmstrasse is the leading boulevard and the centre of local life. Here, towards its northern end, on the right, is the fine Kursaalplatz, containing two cascades, with the Old Colonnade on the north, the New Colonnade and the splendid modern Royal Theatre on the south, and the Kurhaus on the east. The Kurhaus was erected in 1809–10. It is dignified by Greek colonnades combining both Doric and Ionic features, and contains a handsome main room. In the rear are a large fountain and basin marking the entrance to the beautiful Kurhaus Park. Northwest of the Kursaalplatz is the modern Trinkhalle, with a pavilion and colonnades. Here is the celebrated Kochbrunnen (temperature 156° F.). Southwest, in the old part of the town, may be seen the fragment of a Roman wall—the Heidenmauer—over 60 feet long. The adjacent Michelsberg is now crowned by a sightly modern synagogue. Eastward and adjacent to the Wilhelmstrasse are the market place, where are to be found the modern brick Markt-Kirche (Protestant), a striking Gothic structure (1853–62); the royal palace (1837–40), with interesting statuary by Schwanthaler; and the fine modern late-Renaissance town hall (1884–88). The last contains the Fischbach Textile Museum.

The museum, situated near by on the Wilhelmstrasse towards its southern end, contains antiquities, natural-history specimens, the royal collections of paintings, and a library. The antiquities include Roman, Alemannian, and Frankish relics. Its noteworthy Jupiter Column dates from 221 A.D. To the southeast of the museum are the splendid Renaissance Augusta Victoria Baths. On the extreme western edge of the city is the new conspicuous Ring Kirche (Protestant). Not far distant, to the southeast of the Neroberg on the north, is a striking Greek chapel—a mausoleum completed for a Russian grand duchess in 1855.

There are in the city an agricultural institute and experiment station, music and architectural schools, special medical schools, and a chemical laboratory. The Nassau Art Union has a permanent display of paintings. Wiesbaden is provided with a municipal hospital, several celebrated eye institutions, and a military hospital (in a modern building in the Italian style). There is a large trade in wine. Pop., 1900, 86,111; 1910, 109,002, about one-third Roman Catholics.

Wiesbaden is the Mattiacum of the Romans—a fortress said to have dated from the time of Drusus. Its waters were known to Pliny (*Hist. Nat.*, xxi, 2). Consult Heyl, *Wiesbaden und seine Umgebungen* (27th ed., Wiesbaden, 1908).

WIESELER, vē'ze-lēr, FRIEDRICH (1811–92). A German archæologist and philologist, born at Altencelle, Hanover, and educated at Göttingen and Berlin. In 1854 he was appointed professor of archæology and philology at Göttingen. Here he became known for his archæological seminar, the first of its kind in Germany (1847). His researches took him through many parts of Europe, as well as Asia Minor, and he was the first to date correctly the silver objects discovered at Hildesheim (q.v.). His publications include: *Conjectanea in Æschyli Eumenides* (1839); *Ueber die Thymele des griechischen Theaters* (1847); *Das Satyrspiel* (1848); and *Theatergebäude und Denkmäler des Bühnenwesens bei den Griechen und Römern* (1851); but his most comprehensive and valuable contribution to literature is his new adaptation and continuation of Karl Otfried Müller's *Denkmäler der alten Kunst* (1854–56). Consult *Biographisches Jahrbuch* (Berlin, 1900).

WIESNER, vēs'nēr, JULIUS (1838–). An Austrian botanist, born at Tschechen, near Brünn, and educated there and at Vienna. He was professor of the anatomy and physiology of plants and director of the institute of plant physiology at the University of Vienna from 1873 to 1909, when he retired. He became known through his investigations of chlorophyll, of vegetable cell tissue, of the relation between light and vegetation, of the laws of plant growth, and the possibilities of plant movement. He wrote: *Die Rohstoffe des Pflanzenreiches* (2 vols., 1873; 3d ed., 1914); *Die natürliche Einrichtung zum Schutze des Chlorophylls* (1876); *Die Entstehung des Chlorophylls in der Pflanze* (1877); *Das Bewegungsvermögen der Pflanzen* (1881); *Elemente der wissenschaftlichen Botanik* (3 vols., 1881–89; later eds.); *Pflanzenphysiologische Mitteilungen aus Buitenzorg* (1894); *Studien über den Einfluss der Schwerkraft auf die Richtung der Pflanzenorgane* (1902); *Der Lichtgenuss der Pflanzen* (1907); *Natur-Geist-Technik* (1910); *Biologie der Pflanzen* (3d ed., 1913).

WIFE. See HUSBAND AND WIFE.

WIFE FOR A MONTH. A comedy by John Fletcher, produced before 1623, printed in 1647.

WIFE-HATER BIBLE. See BIBLE, CURIOUS EDITIONS OF.

WIFFEN, wif'en, BENJAMIN BARRON (1794–1867). An English editor and biographer. A younger brother of Jeremiah Holmes Wiffen, known for a translation of Tasso's *Jerusalem Delivered* (1824), he was born of Quaker parentage at Woburn, Bedfordshire. Having become interested in Spanish literature, he visited Spain in 1839 and again in 1842, and did much to rescue from oblivion the works of early Spanish reformers. With the assistance of Don Luís de Usóz y Río he published the collection of *Obras antiguas de los Españoles Reformados* (20 vols., 1847–65). He also wrote the *Life and Writings of Juan de Valdés* (1865) to accompany the English translation of the works of Valdés by J. T. Betts, besides other biographical sketches. Consult Eduard Boehmer, *Bibliotheca Wiffeniana* (2 vols., London, 1874 and 1883), and S. R. Pattison, *The Brothers Wiffen* (ib., 1880).

WIG (abbrev. of *periwig*, a variant of Eng. *peruke*, Fr. *perruque*, It. *perrucca*, Sp. *peluca*, from Lat. *pilus*, a hair). A close-fitting skullcap of false hair worn to conceal baldness or to adorn the head. The custom dates from remote antiquity. Many wigs have been found on Egyptian mummies, and in the British Museum is one, probably a woman's, dating from about 1500 B.C., found near the small temple of Isis at Thebes. According to Xenophon, Astyages wore an immense wig. Several of the Roman emperors wore wigs. That of the entirely bald Otho could not be distinguished from natural hair. Domitian, who boasted of his early baldness, appears on all his medals with a fine and perfectly fitting head of hair. Caracalla, during his campaigns on the Danube, had his hair cut close, and wore a blond wig in order to please the Germans. The fashionable women of Rome preferred the fine, blond hair of the Gauls and Germans to their own coarse black locks, and it was a blond wig that Ovid describes the Empress Messalina as wearing on her nocturnal escapades. In the sixteenth century false hair began to be extensively used by the ladies of Europe, and Queen Elizabeth is said to have had 80 different coiffures, or *transformations* as they are called to-day. The violent protest of the clergy against long hair whether false or natural banished wigs for a time, but they came in again under Louis XIII, who wore one to hide his baldness. During the reign of Louis XIV, wigs assumed monumental proportions and about 1660 even ecclesiastics began to wear them. King and courtiers alike had their heads clipped in order to display the huge manes characteristic of the period. For more than a century no gentleman of fashion could appear without a wig, and as much as $15 an ounce was paid in England for fine qualities of hair, and wigs were made at a cost of six or seven hundred dollars. Towards the end of the eighteenth century they began to be superseded by the queue with hair powder (q.v.). Clergymen and military officers long clung to the style and it has not yet been discarded on the English bench. The full-bottomed wig is worn by the Speaker of the House of Commons. The wig of English judges has flaps formed of precise curls hanging down in front and resembles the wig of Queen Anne. The undress wig of the judges and that of barristers and advocates are relics of the old tie wig, in which the lower part of the wig is tied. In Queen Anne's reign the fashion became most extreme in England. She patronized the full-bottomed wig, an immense headdress which parted into two bunches of ringlets, one on each breast, and floated down the back and shoulders. See HAIRDRESSING; HAIR MANUFACTURES.

WIGAN, wĭg'an. A manufacturing town and parliamentary borough in Lancashire, England, on the Douglas, 15½ miles south-southeast of Preston (Map: England, D 3). An ancient town, irregularly built, Wigan has made rapid architectural and municipal progress. The twice restored parish church of All Saints is a stately edifice, dating from the fourteenth century. There are fine modern public buildings. The Mining and Technical College is educationally important. It has extensive collieries and important iron and cotton industries, while screws, nails, railroad wagons, and lubricants are extensively produced. Pop., 1901, 60,770; 1911, 89,152.

WIGEON. See WIDGEON.

WIGFALL, LOUIS TREZEVANT (1816–74). An American soldier and politician, born in Edgefield District, S. C. He was educated at the College of South Carolina, but served as lieutenant of volunteers in the Seminole War before graduating. Later he was admitted to the bar and removed to Marshall, Tex., in 1846. He served in the Lower House of the Texas Legislature in 1849–50, and in the Senate in 1857–58 and 1859–60. In 1860 he was elected to the United States Senate and became at once a defiant advocate of secession. He was expelled July 11, 1861, when he did not appear at the extra session. Meanwhile he had served as an aid to General Beauregard at the bombardment of Fort Sumter, and on April 13 made his way to the fort to counsel surrender, as further resistance was useless. He became colonel of the Second Infantry in the Confederate army August 28, and at the same time served as Representative in the Confederate Congress. He was promoted brigadier general in October, 1861, but resigned Feb. 20, 1862, to take his seat in the Confederate Senate, of which he remained a member until the end of the war. Then he lived in England for several years and on his return took up his residence in Baltimore.

WIGGIN, wĭg'ĭn, KATE DOUGLAS (1859–). An American author, whose maiden name was Smith. She was born in Philadelphia, whence her family removed to Hollis, Me. After graduating from Abbott Academy (Andover, Mass.) in 1878, she went to California, where she studied kindergarten methods and gained success as a teacher, organizing the first free kindergartens on the Pacific coast. In 1880 she was married to S. B. Wiggin, a California lawyer. He died in 1889 and six years later she became the wife of George C. Riggs. They lived in New York and at Hollis, Me. *The Birds' Christmas Carol*, a story published in 1888, was the first to attract attention to Kate Douglas Wiggin, and it continued to be very popular. Her other chief successes were *Rebecca of Sunnybrook Farm* (1903) and *New Chronicles of Rebecca* (1907) and the Penelope series—*A Cathedral Courtship* (1893); *Penelope's English Experiences* (1893), *Penelope's Progress* (1898), *Penelope's Experiences in Ireland* (1901), and *Penelope's Postscripts* (1915). Other stories were widely read. They include: *The Story of Patsy* (1889); *Timothy's Quest* (1890); *Marm Lisa* (1896); *Diary of a Goose Girl* (1902); *Mother Carey's Chickens* (1911); *The Story of Waitstill Baxter* (1913). With her sister, Nora Archibald Smith, well known as a kindergartner, she edited various books for children, and wrote *Froebel's Gifts* (1895), *Froebel's Occupations* (1896), and *Kindergarten Principles* (1896). Bowdoin College honored her with the degree of Litt.D. Consult F. T. Cooper, *Some American Story Tellers* (New York, 1911).

WIGGINS, CARLETON (1848–). An American landscape and cattle painter. He was born in Orange Co., N. Y., and studied in New York at the National Academy of Design and with George Inness, and in Paris, and settled in New York. His landscapes are executed in broad flowing lines, with a rich low-toned color scheme, and often contain cattle, solidly and realistically portrayed. Good examples are: "Young Holstein Bull" (Metropolitan Museum,

New York); "Cattle in Pond" and "Sheep and Landscape" (Brooklyn Museum); "Lake and Mountains" and "Moonrise on the Lake" (Art Institute, Chicago); "October" (Corcoran Art Gallery, Washington); "Evening after a Shower" (National Gallery, Washington); also "The Plow Horse" (Lotos Club, New York). Wiggins was elected to the National Academy of Design in 1906. For his son, see WIGGINS, GUY CARLETON.

WIGGINS, GUY CARLETON (1883–). An American landscape painter, son and pupil of Carleton Wiggins (q.v.). He was born in Brooklyn and made his residence in New York, a city which often provides subjects for his paintings, as "The Metropolitan Tower" (Metropolitan Museum, New York); "Columbus Circle, Winter" (National Gallery, Washington); and "Riverside Drive" (1915). His work shows the influence of Impressionism, as may be seen especially in "Berkshire Hills, June" (Brooklyn Museum).

WIGGINS, JOSEPH (1832–1905). An English mariner, born at Norwich. He rounded out a successful career as a sea captain by utilizing a portion of the Northeast Passage (q.v.). He was the pioneer in demonstrating the practicability of trade relations by sea between the North Sea countries and the northern portions of Siberia. Beginning his voyages in 1874, he twice reached the Ob River, and five times carried cargoes to the Yenisei River, up which stream he once navigated his ship 2000 miles. He facilitated the construction of the Trans-Siberian railway by carrying to that country a large cargo of rails. He was honored by the Czar for his pioneer work, which Baron Nordenskiöld described as an "Event rivaling in importance the return of the first fleet loaded with merchandise from India." Consult H. Johnson, *Life and Voyages of Joseph Wiggins* (London, 1907).

WIGGLESWORTH, wĭg'lz-wûrth, MICHAEL (1631–1705). A New England clergyman and poet, born in England. He was brought to Charlestown at the age of seven, but was soon taken to New Haven. He graduated at Harvard (1651), served as tutor there (1652–54), preaching occasionally in Charlestown, and afterward in Malden, where he was settled as pastor from 1657 till his death. In 1663 he went to Bermuda in search of health. During this time he studied medicine, and, having resumed preaching in 1686, practiced both professions thereafter. He is best known for his *Day of Doom* (1662), a poem on the Day of Judgment, according to views of his time. This poem was popular for more than 100 years in America, but is now regarded chiefly as a literary curiosity. Wigglesworth wrote also *God's Controversy with New England* (1662; first published 1871 by the Massachusetts Historical Society), and *Meat Out of the Eater, or Meditations Concerning the Necessity, End, and Usefulness of Affliction to God's Children* (1669), also very popular. Minor poems were usually appended to the *Day of Doom*, and are in a modern edition (1867). Consult the *Life* by John Ward Dean, with letters of Wigglesworth and a catalogue of his library (Albany, 1871).

WIGHT, wīt, ISLE OF. An island in the English Channel, included in Hampshire, and separated from the mainland of England by the Solent (q.v.) (Map: England, E 6). It is 56 miles in circuit, and has an area of 145 square miles. Pop., 1901, 82,387; 1911, 88,186. The soil of the northern half of the island is for the most part a stiff clay, growing oats; of the southern, a red loam which produces crops of barley. Red wheat is grown in other parts of the island. The chalk downs afford admirable pasturage for sheep, celebrated for the pureness of their wool. They furnish the London market with spring lamb. The chief exports are wool, corn, flour, cement stones (septaria), and white glass-house sand. Newport is the capital; the other towns are Ryde, Cowes, and Ventnor, all exceedingly popular summer resorts. Near Cowes is Osborne, formerly a favorite residence of Queen Victoria, and after her death presented to the nation by Edward VII. It is now used as a college for naval cadets. Cowes is noted as the great English yachting centre. There is railway communication between Ryde and Ventnor, and between Cowes and Newport. The chief physical feature of the island, to which it owes its shape and much of its beauty, is an undulating range of chalk downs, extending from the Culver cliffs on the east to the Needles on the west, rising to its greatest elevation in Mottiston Down, 661 feet above the sea. The river Medina, rising near the southern extremity of the island, flows north through a gap in this range, expands into a tidal estuary below Newport, and flows into the Solent at Cowes. A second range of chalk downs, of greater elevation—St. Boniface Downs, 783 feet; etc.—rises at the southern point of the island, and expands into a broad promontory, the southern face of which forms the picturesque district known as the Undercliff, or "back of the island," in which is situated Ventnor. The whole of this part of the island is sheltered from cold winds, and enjoys a well-merited reputation as a residence for invalids suffering from consumption or any other pulmonary disease. Its remarkable healthfulness is attested by the death rate of the district, which is the lowest in the kingdom; while the mildness of its climate is borne witness to by the luxuriance of the myrtles and other exotics which live through the winter without protection.

The great variety of strata displayed within so small an area renders the Isle of Wight one of the best available localities for the geological student. In Alum Bay, at the western extremity of the island, the rapid succession of vertical layers of sands and clays of bright and varied hue produces a singular and beautiful effect. Isolated masses of chalk, which in consequence of their superior hardness have survived the marine and atmospheric waste, form the well-known Needles, at the western opening of the Solent, and the picturesque rocks of Freshwater Bay. The cliffs of the Undercliff are of the upper greensand or firestone, underlying the chalk. Below this comes the gault or blue marl. To the action of the land springs upon this formation the landslips to which the back of the island owes its beauty are due. The lower greensand succeeds the gault, occupying the greater part of the area between the north and south chalk downs. This presents a wall of cliff to the sea, diversified with many narrow picturesque gorges, locally known as chines. The fresh-water Wealden formation is the lowest visible in the island. Bones of the colossal iguanodon and other saurians are found in this formation. The antiquities include sepulchral barrows on the downs, Saxon burial places in several localities, the remains of a Roman

villa, with a tessellated pavement, at Carisbrooke, and the scanty remains of Quarr Abbey, near Ryde, now incorporated in the monastery of the French Benedictines from Solesmes. Carisbrooke Castle is a fine ruin, occupying a commanding position.

The Isle of Wight is supposed to have been the tin mart of the Greek traders mentioned under the name of *Ictis* by Diodorus Siculus. The Romans knew it as *Vecta* or *Vectis*, which is the Latinized form of the native name. It was conquered for the Romans by Vespasian in the reign of Claudius (43 A.D.). Cerdic, the founder of the Kingdom of Wessex, took the island in 530 A.D. In 661 A.D. it was reduced by Wulphere of Mercia, and given to Ethelwold, King of Sussex, from whom it was wrested (686 A.D.) by Ceadwalla of Wessex, to whom, under the influence of Wilfrid, Archbishop of York, the island owed the introduction of Christianity. During the three centuries preceding the Norman Conquest it was repeatedly devastated by the Danish pirates, who made it their stronghold to which they retired with their plunder. William the Conqueror gave it to his kinsman, Fitz-Osborne; Henry I transferred it to the family of De Redvers, in whose hands it remained till the reign of Edward I, when it passed by sale to the crown. During the French wars of Edward III and his successors the island was repeatedly invaded and pillaged by the French. At the close of the reign of Henry VIII the Armada dispatched by Francis I, under the command of D'Annebault, made several landings on the coast, and inflicted some damage, but was ultimately driven back by the prowess of the islanders. The most interesting event in the history of the island is the imprisonment of Charles I in Carisbrooke Castle, after his flight from Hampton Court. The island, though included in Hampshire, enjoys a form of quasi self-government under a governor, who for many years has been some member of the royal family of Great Britain. Consult Edward Thomas, *The Isle of Wight* (Boston, 1912).

WIGHT, ORLANDO WILLIAMS (1824–88). An American physician and translator, born in Centreville, N. Y. He was educated at the Rochester Collegiate Institute, was ordained as a Universalist clergyman and accepted a call to Newark, N. J. (1850). Three years afterward he left the Church to engage in literary work. In 1865 he graduated in medicine at the Long Island College Hospital; in 1874 was appointed State geologist and Surgeon General of Wisconsin, and afterward served as health commissioner of Milwaukee (1878–80) and of Detroit. His publications include: *History of Modern Philosophy* (trans. with F. W. Ricord from the French of Victor Cousin, 1852); *Life of Abélard and Héloïse* (1853 and 1861); *Standard French Classics* (14 vols., 1858–60); *Pascal's Thoughts* (1859); *The Household Library* (18 vols., 1859 et seq.); six volumes of translations from Balzac (1860); Henri Martin's *History of France* (with Mary L. Booth, 1863); and *A Winding Journey Around the World* (1888).

WIG'MORE, BARON OF. See MORTIMER, ROGER DE.

WIGMORE, JOHN HENRY (1863–). An American legal scholar and educator. He was born in San Francisco and was educated at Harvard (A.B., 1883; LL.B., 1887). He practiced law at Boston in 1887–89, served as professor of Anglo-American law at Fukuzawa University, Tokyo, Japan, in 1889–92, and was professor of law from 1893, and dean of the faculty of law from 1901, at Northwestern University. In 1909–10 he served as president of the American Institute of Criminal Law and Criminology. His publications include: *Digest of the Decisions of the Massachusetts Railroad Commission* (1888); *The Australian Ballot System* (1889); *Notes on Land Tenure and Local Institutions in Old Japan* (1890); *Materials for the Study of Private Law in Old Japan* (1892); *Treatise on Evidence* (4 vols., 1904–05; supplementary vol., 1908; 2d ed. of latter, 1915); *A Pocket Code of the Rules of Evidence* (1910; new ed., 1915); *The Principles of Judicial Proof* (1913).

WIG'WAG'GING. See SIGNALING AND TELEGRAPHING.

WIGWAM, wĭg'wŏm (Etchemin Algonquian *weckwahm*, house). In general, a native American house, especially one made of bark or matting. The typical wigwam consists of a framework of saplings set in the ground, connected by longitudinal poles, and bent inward and lashed together by means of withes or thongs in such a manner as to form a rounded roof; the whole covered with sheets of birch bark sewed together and attached to the frame by means of flexible rootlets. The better structures were provided with a smoke hole and wind guard in the centre of the roof, and a deerskin curtain to cover the doorway, which faced the east. South of the birch-tree zone mats made of rushes, etc., were sometimes substituted for the sheets of bark, although most of the mat-covered structures are elongated and dome-shaped in form. In some districts the walls were of slender saplings wattled together and the roof of bark or skin. Some of these forms grade into the *tipi*, or tent of poles and buffalo skins; the *wickiup*, or house of shrubbery usually wattled; the *ki*, or grass houses of the prairies and deserts; the earth lodge, of which the Navajo *hogan* may be taken as the type; and the *pueblo* of adobe or stone. The native houses were all invested with a certain sacred character, and each type was constructed with care according to fixed standards, and often in conformity with ritualistic observances, extending from the gathering of material to the ceremonial installation of household deities. See INDIANS.

WIJNANTS, vī'nänts, JAN. A Dutch painter. See WYNANTS.

WIKCHAMNI, wĭk-chăm'nĭ. See YOKUTS.

WIKING. See NORMANS.

WILAMOWITZ-MÖLLENDORF, vē'lä-mō'vĭts-mēl'en-dôrf, ULRICH VON (1848–). A German classical scholar. He was born at Markowitz, Posen, and was educated at the universities of Bonn and Berlin. In 1874 he became privatdocent in Berlin, and in 1876 professor of classical philology in Greifswald. In 1883 he was called to a similar position at Göttingen, and in 1897 to Berlin, where he was also made a member of the Academy of Sciences and a director of the German Archæological Institute. His works include: *Analecta Euripidea* (1875); Haupt's *Opuscula* (1876); *Callimachus* (1882; 3d ed., 1907); translations of Æschylus' *Agamemnon* (1885) and *Orestea* (1896); Euripides' *Hippolytus* (1891) and *Heracles* (3d ed., 1909), noteworthy for its introduction; *Aristoteles und Athen* (1893); *Bakchylides* (1898); the *Persians* of Timotheus

(1903); *Einleitung in die Attische Tragödie* (2d ed., 1907); "Die Griechische Literatur des Altertums," in *Die Griechische und Lateinische Literatur und Sprache*, vol. i, part 8 of *Die Kultur der Gegenwart* (3d ed., 1912); *Sappho und Simonides* (1912); *Reden und Vorträge* (3d ed., 1912); *Reden aus der Kriegszeit* (1915).

WILARS DE HONECOURT, vē'lär' de ôn'-kōōr', written also VILLARD DE HONNECOURT (13th century). A French architect, born at Honnecourt in French Flanders. He was active in the middle of the thirteenth century, when he built the choir of the cathedral of Cambrai (demolished 1790); he also probably built churches at Meaux and Vaucelles. He traveled in Hungary and through parts of France, making numerous sketches, by which he is chiefly known. These invaluable drawings in silverpoint, lead, and pen-and-ink, are preserved in the Bibliothèque Nationale at Paris, whither they were transferred from Saint-Germain des Prés. Only 33 of the 41 leaves existing in the fifteenth century are now extant, representing the towers of Laon Cathedral, various rose windows, architectural details, and studies of figures and mechanical contrivances, accompanied by notes. The *Album de Villard de Honnecourt* has been published in Paris in facsimile.

WILBERFORCE (ALBERT) BASIL (ORME) (1841–1916). An English clergyman, son of Samuel Wilberforce (q.v.). He was born in Winchester and after studying at Eton and at Oxford was chaplain to his father, then Bishop of Oxford. Subsequently for some years he was a curate and rector. From 1894 to 1900 he served as canon of Westminster, being also rector of St. John's (Westminster), and, from 1896, chaplain of the House of Commons. From 1900 till his death he was archdeacon of Westminster. One of the most noted preachers of his time, he published *Sermons Preached in Westminster Abbey* (1898), a second series being entitled *Feeling after Him* (1902), and a third series *Sanctification by the Truth* (1906). Other writings include: *Following on to Know* (1904); *Speaking Good of his Name* (1905); *The New Theology* (1908); *The Hope that is in Me* (1909); *The Power that Worketh in Us* (1910).

WILBERFORCE, SAMUEL (1805–73). A distinguished English bishop. He was born at Clapham, and privately educated until his matriculation at Oriel College, Oxford. He was ordained deacon in 1828 and priest a year later, after which he became rector of Brightstone in the Isle of Wight and remained there for 10 years. He became archdeacon of Surrey in 1839 and canon of Winchester in 1840, in which year he also took the living of Alverstoke in Hampshire. In 1845 he was made dean of Westminster. Here he remained only a few months, however, becoming Bishop of Oxford in October. His position here was unusually difficult, owing to the excitement caused by the ferment of the Oxford movement. He was a moderate high churchman, but opposed the extremes of some of the ritualists. Among other activities, he founded a theological college at Cuddesdon and a training college for school masters at Culham. He soon became recognized as a power in the House of Lords and in the national life generally. He was the prime mover in the revival of Convocation (q.v.), and took a leading part in the controversies over *Essays and Reviews*, the Hampden election, and the Colenso case. In 1869, on the resignation of Bishop Sumner of Winchester, he was translated to the vacant see, which gave him opportunities for more extended work. Only four years later, however, he was killed by a fall from his horse, July 19, 1873. Consult: his *Life*, by A. R. Ashwell and his son R. G. Wilberforce (London, 1879; revised edition by R. G. Wilberforce, ib., 1888); id., in *Leaders of the Church, 1800–1900* (ib., 1907); G. W. Daniell, *Bishop Wilberforce* (Boston, 1891); J. W. Burgon, in *Lives of Twelve Good Men* (2 vols., London, 1888); and references in most of the works cited under OXFORD MOVEMENT.

WILBERFORCE, WILLIAM (1759–1833). An English statesman and philanthropist, born at Hull, in Yorkshire, Aug. 24, 1759. While at school he addressed a letter to a York paper "in condemnation of the odious traffic in human flesh," a subject he seems never afterward to have lost sight of. At 17 he entered St. John's College, Cambridge, and in due time he passed his examinations with credit. On attaining his majority he came into possession of a large fortune, and determined to enter Parliament. In 1780 he was returned for Hull. He had known Pitt when at Cambridge, and in London they became inseparable friends. In Parliament, however, Wilberforce remained independent of party, and when the elevation of Pitt to the Premiership gave him an opportunity of taking office he declined to do so, but rendered efficient service to his friend. In 1784, in spite of opposition from the great Whig families, he was returned to Parliament without a contest as a representative from Yorkshire. In 1786 he carried through the Commons a bill for mitigating the criminal law, but the Lords rejected it. Next year he founded a society for the discouragement of vice, and about the same time he entered on his great struggle for the abolition of the slave trade, to which he thenceforward dedicated his whole energy. He was powerfully supported by the Quakers, and by Thomas Clarkson (q.v.), who collected evidence and kept the general public interested while Wilberforce represented the cause in Parliament. In 1789, after a critical illness, he brought before the House of Commons a series of resolutions condemning the slave trade. Supported by Pitt, Burke, and Fox, he carried them, but the planters caused their postponement. In 1792 a motion for the gradual abolition of the slave trade passed the House of Commons by a great majority. Again in 1804 his bill was carried through the Commons, to be rejected by the Lords, and in the following year it was lost in the Commons. In 1806, however, a resolution was moved by Fox, pledging the Commons to a total abolition of the slave trade in the following session. Meantime a work published by Wilberforce against the traffic had a remarkable influence on public opinion and on the subsequent debates. True to its pledge, the House of Commons accepted the bill, the Lords finally approved it, and it received the royal sanction in 1807. Wilberforce now sought to secure the abolition of the slave trade abroad, and at the same time entered on an agitation for the total abolition of slavery itself. Declining health, however, compelled him, in 1825, to retire from Parliament, in which since 1812 he had sat for the borough of Bramber. The movement against slavery was then intrusted to Sir T. Fowell Buxton. Three days before Wilberforce's

death news was brought him that the abolition bill had passed a second reading. He died July 29, 1833, and was buried as a national benefactor in Westminster Abbey. He was a man of great versatility of mind and character; sociable, witty, vivacious, and so kind and sincere that even his opponents loved him. He wrote *Practical View of the Prevailing Religious System of Professed Christians, in the Higher and Middle Classes, Contrasted with Real Christianity* (1st American ed., Philadelphia, 1798) and was the founder of the *Christian Observer*. Consult: R. I. and Samuel Wilberforce (his sons), *Life of William Wilberforce* (5 vols., London, 1838); his *Correspondence* (ed. by his sons, 2 vols., ib., 1840); *Private Papers* (ed. by A. W. Wilberforce, ib., 1897); also: Thomas Clarkson, *History of the Rise, Progress, and Accomplishment of the Abolition of the African Slave Trade by the British Parliament* (New York, 1836), and Sir James Stephen, in *Essays in Ecclesiastical Biography* (ib., 1907).

WILBERFORCE UNIVERSITY. A coeducational institution for the higher education of colored students founded at Wilberforce, Ohio, in 1856, under the control of the African Methodist Episcopal church. In addition to regular courses the institution maintains a preparatory school. The total attendance in all departments in 1915–16 was about 450, and the faculty numbered 35. The total annual income of the university was about $85,000, of which the larger part was received from the State. The value of the grounds and buildings was about $420,000, and the endowment funds amounted to about $430,000. The library contains about 7000 volumes. The president in 1916 was William S. Scarborough.

WILBOUR, Charlotte Beebe (1833–1914). An American clubwoman, born at East Hartford, Conn. She was married to Charles E. Wilbour in 1858. An advocate of woman suffrage, she was a coworker with Susan B. Anthony, Elizabeth Cady Stanton (qq.v.), and others in advancing that cause. With Mrs. Jane C. Croly and Miss Kate Field (qq.v.) she founded the Sorosis Club, New York, of which she was president in 1870–75 and in 1903–07, and thereafter honorary president. At the time of her death she was president of Phalo, a woman's literary club. She lived abroad from 1875 to 1900. One of her daughters was married to E. H. Blashfield (q.v.).

WILBRANDT, vĭl'brănt, Adolf (1837–1911). A German novelist and dramatist, born in Rostock. He studied at Rostock, Berlin, and Munich, whither he was drawn by Geibel and Hayse, and where he began his journalistic work on the *Suddeutsche Zeitung*, which he followed also to Frankfort-on-Main. Then after some years in Italy spent in recovering his health and in studying art, he went to Vienna, where he managed the *Burgtheater* from 1881 to 1888, and married the actress Augusta Baudius. In 1889 he removed to Rostock, where he continued his literary work till his death in 1911. His novels of present-day problems, *Adams Söhne* (1890), *Hermann Ifinger* (1892), *Der Dornenweg* (1894), *Die Osterinsel* (Stuttgart, 1895; 5th ed., 1905), *Schleichendes Gift* (1897), *Feuerblumen* (1900), *Villa Maria* (1902), *Grosse Zeiten* (1904), and *Irma* (1905), and others, were hardly less successful than his dramas, among which *Kriemhild* (1877) is noteworthy as an effort to give new life to the heroic saga. *Der Graf von Hammerstein* (1870), *Die Maler* (1872), *Gracchus* (1872), *Arria und Messalina* (1872), *Giordano Bruno* (1874), and *Timandra* (1903) are also noteworthy. His best comedies are *Jugendliebe* (1872) and *Nathalie* (1878). But his only drama that succeeded in holding the stage for any length of time is *Der Meister von Palmyra* (1889). He wrote biographies of Heinrich von Kleist (1863), Hölderlin, and Fritz Reuter, the last two in the collection *Führende Geister* (2d ed., Berlin, 1896). Consult Viktor Klemperer, *A. Wilbrandt* (Stuttgart, 1907).

WILBROD, or **WILBRORD,** Saint. See Willibrord.

WIL'BUR, John (1774–1856). The founder of the Wilburite branch of Friends (q.v.). He was born at Hopkinton, R. I., and spent much of his life as a school teacher and surveyor. At the age of 28 he was appointed an elder in the orthodox Friends church. For opposing the innovations made in the church by Joseph J. Guerney and others he was denounced in the Rhode Island Yearly Meeting in 1838, and when he was sustained by his own monthly meeting of South Kensington, that meeting was dissolved, and its members were added to the Greenwich meeting, while in 1843 he was disowned. A considerable number of his supporters withdrew from the orthodox church and formed an independent yearly meeting, whose members became known as Wilburites. This branch, in 1915, numbered 3880. Wilbur published *A Narrative and Exposition* (1845). His *Journal and Correspondence* were published by his friends in 1859. Consult A. C. and H. R. Thomas, *History of the Society of Friends in America* (New York, 1894).

WILBUR, Ray Lyman (1875–). An American physician and university president. He was born at Boonesboro, Iowa, graduated in 1896 from Leland Stanford University and in 1899 from Cooper Medical College, San Francisco, and at various times did postgraduate work in Frankfort-on-the-Main, London, and Munich. At Stanford he had risen to be professor of medicine by 1909, and in 1911 added to his other duties those of dean of the medical school; in 1915 he was chosen president of the university. Wilbur held the presidency of the American Academy of Medicine in 1912–13.

WIL'COX, Cadmus Marcellus (1826–90). An American soldier, born in Wayne Co., N. C. He studied at Cumberland College, Nashville, graduated in 1846 at West Point, and served through the Mexican War. Upon the outbreak of the Civil War he resigned his commission of captain and was appointed a colonel in the provisional Confederate service. He reënforced General Beauregard at the first battle of Bull Run, and served with the Army of Northern Virginia until its surrender. In 1861 he was promoted brigadier general, and in 1863 major general. He fought in the second battle of Bull Run and at Fredericksburg, Chancellorsville, and Gettysburg, and after the war declined an appointment as brigadier general in the Egyptian army. From 1886 to 1889 he was chief of the railroad division of the Washington general land office. He published *Rifles and Rifle Practice* (1859), *Evolutions of the Line, as practiced by the Austrian Infantry and Adopted in 1853* (1860), and a *History of the Mexican War*.

WILCOX, Delos Franklin (1873–).

An American municipal expert. Born at Ida, Mich., he graduated from the University of Michigan in 1894, and later studied at Columbia (Ph.D., 1896). He was editor of the *Civic News* at Detroit, Mich., in 1905–07, and served as chief of the bureau of franchises of the Public Service Commission (first district) of New York in 1907–13. One of the foremost experts on American municipal government, he wrote: *The Study of City Government* (1897); *Ethical Marriage* (1900); *The American City* (1904); *The Government of Great American Cities* (1908); *Municipal Franchises* (2 vols., 1910–11); *Great Cities in America* (1910); *Government by All the People* (1912).

WILCOX, ELLA WHEELER (1855–). An American journalist and writer of popular verse, born at Johnstown Centre, Wis. She was educated at the University of Wisconsin and married (1884) Robert M. Wilcox, of Meriden, Conn. Soon afterward she moved to New York. She was at an early age a frequent contributor to journals. Among her collections of verse are: *Drops of Water: Temperance Poems* (1872); *Maurine* (1876); *Shells* (1873); *Poems of Passion* (1883), her best-known performance; *Poems of Pleasure* (1888); *Picked Poems* (1912). Other books of hers are: *Mal Moulée* (1886), a novel; *Men, Women, and Emotions* (1896); *Sweet Danger* (1902); *Story of a Literary Career* (1905); *Sailing Sunny Seas* (1910); *A Woman of the World* (1912); *The Art of Being Alive* (1914). She also wrote many short essays for the New York *Journal* and Chicago *American*. Though critics refused to take her work seriously, she found a large public for her writings in both verse and prose.

WILD, vilt, HEINRICH VON (1833–1902). A Swiss meteorologist and physicist. He was born Dec. 17, 1833, at Uster (Canton Zurich), and was educated at Zurich, Königsberg, and Heidelberg. In 1858 he was appointed professor of physics and director of the observatory at Bern. That institution he enlarged into a central meteorological bureau and laid the foundation of the extensive meteorological system of Switzerland. Appointed inspector of weights and measures in 1861, he brought about reforms, and was made head of the commission to maintain the standards (1867). In 1868 he was called to St. Petersburg, where he completely reorganized the observatory and established a meteorological system throughout the Empire and founded the meteorological observatories at Pavlovsk and Irkutsk. Until his retirement in 1895 he remained in the service of the Russian government. Wild died at Zurich Sept. 5, 1902. He invented the polaristrobometer—a form of saccharimeter—a polarization photometer, a magnetic theodolite, and various new optical methods for comparing measures of length. Many of his papers were published in the *Annalen des physikalischen Observatoriums für Russland* and the *Neues Repertorium für Meteorologie*, founded by himself in 1865 and 1869 respectively; as also in the *Mitteilungen* of the International Polar Commission, of which he was president (1882–83). He published, furthermore, the great work *Temperaturverhältnisse des russischen Reichs* (tables, atlas, etc., 1876; Ger. and Russ.).

WILD, JONATHAN (c.1682–1725). An English thief and receiver of stolen goods. He was born at Wolverhampton, was apprentice to a Birmingham buckle maker, and about 1706 went to London. Having been four years imprisoned for debt, he became a receiver of stolen goods, and, when he chose, an informer. He concluded his career at Tyburn. He is interesting chiefly as being in rather remote fashion the subject of Fielding's satire, *History of the Life of the Late Mr. Jonathan Wild the Great* (1743).

WILD'AIR, SIR HARRY. A gay man-about-town, in Farquhar's *Constant Couple*, and the title character of the same author's *Sir Harry Wildair*. The character was successively personated by Wilks, Garrick, and Peg Woffington.

WILD AMMONOOSUC. See AMMONOOSUC.

WILD CARROT. See CARROT.

WILDCAT. In general, a wild cat as distinguished from a domesticated one; specifically, the European wildcat (*Felis catus*), primitively numerous all over Europe, except Scandinavia, and much of northern Asia, and still to be found in the wilder districts. It is much larger than the domestic cats and differs from them in the proportionately longer body and limbs and the shorter and thicker tail. Its body is yellowish gray, with a dark mark along the back, and numerous darkish stripes down the sides and across the limbs; its tail is ringed with black; and in the male the soles of the feet are deep black. Although it may have contributed by an occasional cross to the varieties of domestic cat (q.v., under CAT), it is not believed that any domestic race sprang directly from it. Consult for this species Hamilton, *The Wildcat of Europe* (London, 1896).

In the United States the name "wildcat" is applied to the lynx; in Egypt, to the Caffre cat or the gloved cat; in India, usually to the jungle cat; and in Mexico, to the chati or margay (two forms of *Felis tigrina*). In fact, omitting the lion, tiger, leopard, puma, jaguar, and a few others, the term applies to all the feline race, of which some 40 species might be mentioned, most of which are elsewhere described under their distinctive names, as OCELOT, EYRA, ETC. See FELIDÆ; CAT; and authorities there cited. See Plate of WILDCATS, under CAT.

WILD CELERY. See VALLISNERIA.

WILD CHERRY (*Prunus*). Several North American trees and shrubs belonging to the

WILD RED CHERRY (*Prunus pennsylvanica*).

family Rosaceæ. *Prunus pennsylvanica*, or wild red cherry, is a tree from 20 to 30 feet high, common in rocky woods, particularly in the

northern States, with oblong-lanceolated, pointed, finely and sharply serrate leaves, green, and smooth on both sides; flowers in a cluster on long pedicels in May; fruit round, light-red, very small, with thin pulp; stone globular. *Prunus serotina*, the wild black cherry, is a fine tree with gray or black, sometimes rather shaggy bark on the trunk, and reddish limbs, often growing in the western States to 100 feet in height and 4 feet or more in diameter, but smaller in the Atlantic States, leaves lanceolate-oblong, taper-pointed, serrate, with incurved, short, and callous teeth, thick, shining above; flowers, which appear in June, in long racemes; fruit purplish-black, about the size of a common pea, but often larger on rich alluvial soils. When very ripe it is agreeable to the taste. In some of the older sections of New York the tree occurs in the fields and along the fences. Its light brown or red timber is highly valued as a cabinet wood. *Prunus virginiana*, the common choke cherry, is a tall, rather slender shrub (sometimes it may be called a tree), from 8 to 15 feet high, with grayish bark, leaves oval, oblong, or obovate, blunt-pointed, sharply serrate; racemes short and close; petals roundish; fruit red, turning to dark crimson, and very astringent until perfectly ripe, when it is not unpleasant to the taste. The tree grows along fences and river banks, especially northward. The popular name is sometimes wrongly applied to the preceding species. The name wild cherry is often given to other species than the above, as to the bitter cherry (*Prunus emarginata*) and the holly-leaf cherry (*Prunus ilicifolia*), varieties of the cultivated cherries that are said to have escaped from cultivation in some places in the eastern United States. The sand cherry common from New Brunswick to Virginia and westward to Wisconsin is *Prunus pumila*, a low shrub. The same name is given to *Prunus besseyi* in Nebraska and the Dakotas. See CHOKE CHERRY.

WILD COFFEE. See FEVERWORT.

WILD COMFREY. See HOUND'S TONGUE.

WILDE, wīld, HENRY (1833–). An English electrical engineer, born at Manchester. He was educated at private schools, and from an early age engaged in scientific pursuits, particularly the study of electromagnetism, which enabled him to make certain improvements in lightning conductors and the telegraph (1858–64). In 1864 he discovered that currents of electricity of considerable intensity could be derived when electromagnets were substituted for permanent magnets in the magneto machine, and in this way was thus led to develop a dynamo-electric machine. Four years later in investigating alternating currents he discovered that by their synchronizing property it was possible to control the rotations of the armatures of a number of generators. In 1878 he discovered certain remarkable multiple relations among the atomic weights. He developed a powerful electric light, used in 1865 and later developed into a searchlight employed in the Royal Navy. He also carried on important investigations in electrolysis and magnetism, devising many important methods used in electroplating, and inventing a magnetarium for reproducing and studying the phenomena of the earth's magnetism.

WILDE, LADY JANE FRANCISCA ELGEE (1826–96). An Irish writer, wife of Sir William Robert Wilde, and mother of Oscar Wilde (qq.v.). She was born at Wexford, Ireland, and after her marriage began to contribute both in prose and in verse to the nationalist newspaper, *The Nation*. An article from her pen, signed Speranza, was the ostensible reason for the suppression of the journal in 1848. After 1876, she took up her residence in London. Her publications include: *Poems by Speranza* (1871); *Driftwood from Scandinavia* (1884); *Ancient Legends, Mystic Charms, and Superstitions of Ireland* (1887); *Ancient Cures, Charms, and Usages of Ireland* (1890); *Notes on Men, Women, and Books* (1891); and *Social Studies* (1893).

WILDE, OSCAR (O'FLAHERTIE WILLS) (1856–1900). A British author and wit. He was born Oct. 15, 1856, in Dublin. His father was Sir William Wilde (q.v.) and his mother Lady Jane Francisca Elgee Wilde (q.v.). The son studied at Trinity College, Dublin, in 1873–74, and graduated B.A. from Magdalen College, Oxford, in 1878. In both institutions he was noted as a classical student; in the latter he won the Newdigate prize with his poem "Ravenna." While an undergraduate at Oxford Oscar Wilde formulated the æsthetic philosophy of which he became a kind of apostle. His long hair and velvet knee breeches, his enthusiasm for *objets d'art*, sunflowers, blue china, and peacock feathers, and his other æsthetic eccentricities brought him his desired notoriety; made him a target for the satire and ridicule of *Punch;* and resulted in the creation of the character of Bunthorne in Gilbert and Sullivan's *Patience*.

A collection of his poems appeared in 1881, and during a lecture tour he made in the United States in 1882, his drama *Vera* was produced in New York. Returning to England he settled in London, and married Constance Lloyd in 1884, devoting himself to literature. In 1888 appeared the delightful fairy stories *The Happy Prince and Other Tales*, a vein further worked in *A House of Pomegranates* (1892). In 1891 appeared two volumes from Wilde's pen—*The Picture of Dorian Gray*, perhaps his most widely read book and one which makes no effort to conceal the unwholesome taint that frequently discovers itself in his work, but which is, for all that, a fine performance on the score of brilliant, epigrammatic writing; and the short stories in *Lord Arthur Savile's Crime*. His American dramatic venture of 1882, Wilde followed up with *The Duchess of Padua* (1891), which was produced in New York, but it was not until the appearance of *Lady Windermere's Fan* (produced in London, 1892, and published there in 1893) that he found himself dramatically. That light comedy, with the clever insolence of its dialogue and its sparkling wit, was followed by similar plays—*A Woman of No Importance* (produced in London in 1893, and published in 1894), *The Ideal Husband* and *The Importance of Being Earnest* (both produced in London in 1895; published 1899). In 1891, in the *Fortnightly Review*, Wilde made himself a defender of Socialism in "The Soul of Man under Socialism," which was apparently serious under its paradoxical play of wit and irony, and took his public by surprise. In the same year was published a volume of essays entitled *Intentions*. In 1892 appeared his *Collected Poems*.

Continued dramatic activity was evidenced by *Salomé*, a morbid drama, but the best of his serious plays, the performance of which was forbidden by the licenser of plays in 1893.

Originally written in French, an English rendering of it, illustrated by Aubrey Beardsley, appeared in 1894, which latter year saw also the production of the French version by Sarah Bernhardt in Paris. In 1905 Strauss made an opera from the play.

Convicted in 1895 of a grave offense against morality, Wilde was imprisoned for two years. A literary result of this imprisonment was the most powerful of his poems, the *Ballad of Reading Gaol* (1898), and *De Profundis* (1905), an account of certain of his prison experiences and a kind of *Apologia*, the sincerity of which critics have not found above suspicion. Essayist, minor poet, and novelist, Wilde's chief distinction derives from his light, elegant, dexterous comedies, unsurpassed in wit and epigrammatic brilliance since Sheridan. His last years were passed under a cloud on the Continent, and mainly in Paris, where he used the name "Sebastian Melmoth" and where he died Nov. 30, 1900. The Ravenna edition of his works is in 13 volumes (New York, 1915). Consult: R. H. Sherard, *Life of Oscar Wilde* (New York, 1906); Arthur Ransome, *Oscar Wilde: a Critical Study* (London, 1912); Lord Alfred Douglas, *Oscar Wilde and Myself* (New York, 1914); Stuart Mason, *Bibliography of Oscar Wilde* (London, 1914).

WILDE, Richard Henry (1789–1847). An American poet, born in Dublin, Ireland. He came to America with his parents in 1797, settling finally at Augusta, Ga. He studied law, was admitted to the bar in 1809, rose rapidly in his profession, became Attorney-General of the State, and was three times a member of Congress, 1815–17, 1824–25, and 1827–35. He was a lyric poet of merit, and during a stay in Europe from 1835 to 1840 did considerable study in Dante and Tasso, and helped to discover Giotto's portrait of the first-named poet. He translated several of Dante's sonnets and wrote a *Life and Times of Dante* that remained in manuscript. On his return from Europe he attained success at the bar of New Orleans, and was made professor of constitutional law in the University of Louisiana. He is best known as the author of the lyric, "My Life is Like the Summer Rose." A long posthumous poem, *Hesperia*, was published in 1867, and during his life he issued *The Love, Madness, and Imprisonment of Torquato Tasso* (1842).

WILDE, Thomas. See Truro, Baron.

WILDE, Sir William Robert Wills (1815–76). An Irish surgeon and antiquarian, born at Castlerea, County Roscommon. Beginning his studies at Dublin in 1832, he received his diploma as a surgeon five years later. He spent three years in study at London, Berlin, and Vienna, and after 1841 practiced at Dublin. In 1851 he married Jane Francisca Elgee (see Wilde, Lady Jane F. E.), and was the father of Oscar Wilde (q.v.). He was knighted in 1864. His publications include: *The Narrative of a Voyage to Madeira, Teneriffe, and along the Shores of the Mediterranean* (2 vols., 1840; 2d ed., 1844); *The Closing Years of Dean Swift's Life* (1st and 2d ed., 1849); *Epidemic Ophthalmia* (1851); *Aural Surgery* (1853); *Catalogue of the Contents of the Museum of the Royal Irish Academy* (3 vols., 1858–63).

WILDEBEEST, wĭld'bēst *or* vĭl'de-bāst. See Antelope; Gnu.

WILDENBRUCH, vĭl'den-brŭk, Ernst von (1845–1909). A German dramatist and novelist, born in Beirut, Syria, where his father was Prussian Consul. He belonged to a side branch of the Hohenzollern. He served for two years in the army, then studied law, and entered the government service. He became Privy Councilor of Legation in 1897. Of his earlier dramas the more successful were: *Väter und Söhne* (1882), *Harold* (1882), *Der Menonit* (1882), all in a somewhat radical spirit. More significant are the series of national dramas: *Die Karolinger* (1882), *Die Quitzows* (1888), *Der neue Herr* (1891), *Heinrich und Heinrichs Geschlecht* (1895), *Willehalm* (1897), and *Die Tochter des Erasmus* (1900), all remarkable literary expressions of the new Prussia. He was awarded the Schiller prize in 1884 and 1896. In his short stories and novels, e.g., *Der Meister von Tonagra* (1880), *Der Astronom* (1887), *Das edle Blut* (1893), *Franzeska von Rimini* (1893), *Eifernde Liebe* (1893), *Schwester-Seele* (1894), *Der Zauberer Cyprianus* (1896), *Tiefe Wasser* (1898), and *Semiramis* (1904), as well as in social drama, Wildenbruch showed great originality. Among his *Lieder und Gesänge* (1877) and *Dichtungen und Balladen* (1884) are pieces, notably "The Witches' Song," that have become widely popular. Consult Röhr, *Wildenbruch als Dramatiker* (Berlin, 1908), and A. Stern, article in *Studien zur Litteratur der Gegenwart* (3d ed., Dresden, 1905).

WILDER, Burt Green (1841–). An American comparative anatomist, born in Boston. He graduated at Harvard (Lawrence Scientific School, 1862; medical department, 1866). During part of the Civil War he served as surgeon of the Fifty-fifth (Negro) Massachusetts Infantry. From 1867 to his retirement in 1910 he was professor of neurology and vertibrate zoölogy at Cornell. He also lectured at various other institutions. In 1885 he was president of the American Neurological Association and in 1898 of the Association of American Anatomists. In 1892, 15 of his former students presented to him a *Festschrift*, called *The Wilder Quarter-Century Book*. Among his writings are: *What Young People Should Know* (1874); *Anatomical Technology* (1882), with Gage; *Physiology Practicums* (2d ed., 1895). He also wrote music for songs.

WILDER, Marshall Pinckney (1798–1886). An American merchant and agriculturist, born at Rindge, N. H. He received a common school education, worked on a farm for some time, and in 1825 became a merchant in Boston in the West India trade. He was a member at different times of both Houses of the Massachusetts Legislature, being chosen President of the Senate in 1850, and was also a member of the Executive Council. He was one of the organizers of the Constitutional Union party, which nominated Bell and Everett in 1860. Having acquired a large fortune, he turned his attention to the development of agriculture. He founded the United States Agricultural Society and the Massachusetts Agricultural College, was an officer of various agricultural and genealogical societies, and was one of the earliest promoters of the Massachusetts Institute of Technology. Among his publications are a number of addresses and *The Hybridization of the Camellia and Its Varieties* (1847) and other lectures on floriculture, pomology, and agriculture.

WILDER, Marshall Pinckney (1859–1915). An American humorist, born at Geneva, N. Y.

He was crippled by a fall when a child, so that he was handicapped all his life. His gifts as a mimic and elocutionist eventually led to his becoming a public entertainer in 1879. In 1883 he went to London, where he appeared before the Prince of Wales (later Edward VII), whose patronage started him on the road to success. Thereafter he appeared annually in London until 1899, when he entered vaudeville. In 1904–05 he toured the world. He always managed his own appearances, and his shrewdness and popularity combined to earn him a fortune. His writings include: *The People I've Smiled with* (1890); *The Sunny Side of the Street* (1905); *Smiling 'round the World* (1908). He edited *The Ten Books of the Merrymakers* (1909).

WILDERMUTH, vĭl'dĕr-mo͝ot, OTTILIE (1817–77). A German novelist. She was born at Rottenburg-on-the-Neckar, was married in 1843 to Professor Wildermuth, of Tübingen, and in that city passed the remainder of her life. Her novels had a wide popularity especially with women and children. She pictured with much grace the life of the region to which she confined her work—Swabia. The best of her works are: *Bilder und Geschichten aus Schwaben* (1852–54); *Auguste* (1857); *Bilder aus der Wirklichkeit* (1861); and *Zur Dämmerstunde* (1871). Her collected works were issued in 10 vols. (1892–94) and her autobiography was edited by her daughters (Stuttgart, 1888).

WILDERNESS, BATTLE OF THE. A battle of the Civil War in America, fought on May 5–6, 1864, between the Army of the Potomac under General Meade, with General Grant in supreme command, and the Army of Northern Virginia under General Lee. The Wilderness is a region lying immediately south of the Rapidan River, extending for about 15 miles from east to west and 10 miles from north to south, and so thickly covered with second-growth scrub and underbrush as to make not only cavalry operations and the use of artillery, but even ordered infantry operation, extremely difficult. The battle of the Wilderness was the opening engagement of the campaign of 1864 in Virginia. The Confederate army, consisting of three corps, lay in a strong position south of the Rapidan, with its right under Ewell on the river, the centre under A. P. Hill at Orange Court House, and the left under Longstreet at Mechanicsburg. Its strength was about 62,000 men, with 224 guns. The Union army was encamped north of the Rapidan from Hazel's River through Culpeper to Stevensburg. It comprised the corps of Warren (Fifth), Sedgwick (Sixth), and Hancock (Second). With Burnside's corps a day's march to the north, the Union strength amounted to about 120,000 men, with 356 guns. Grant's plan was to cross the Rapidan, turn Lee's right flank, and then force that general either to come out of his entrenchments, or to be taken in reverse. The movement of troops was begun at midnight of May 3, Warren's corps, preceded by cavalry and followed by the corps of Sedgwick, crossing at Germanna Ford, while Hancock crossed at Ely's Ford, farther down the river. The right column was ordered to proceed to Wilderness Tavern, at the junction of the Germanna Plank Road and the Orange County Turnpike; Hancock's objective was Chancellorsville. Lee had anticipated this movement; informed that it had begun, he audaciously sent Ewell and Hill along the Orange County Turnpike and the Orange Plank Road to take Grant's army in flank. Early in the morning of May 5, Warren reported the hostile infantry in some force on the pike, about 2 miles from Wilderness Tavern. Believing at first that the enemy's forces were but a strong rear guard, Grant made no attempt to support Warren, but some time before noon it became evident that the main strength of the Confederates was in front. Sedgwick's corps was thereupon directed to support Warren on the right, while orders were sent by Meade to Hancock, who was now some distance beyond Chancellorsville, to return by the Brock Road and take up his position at its junction with the Orange Plank Road and to Getty to move up to the same point. Owing to the nature of the ground, Sedgwick was delayed in bringing support to Warren on his left, and though Griffin's and Wadsworth's divisions drove Ewell's vanguard before them, they were compelled to give way before the attack of the latter's main force. The Sixth Corps as it was working into position was also struck by Ewell, but after a fierce struggle the Confederates were repulsed. Getty, meanwhile, hard pressed by Hill, was relieved by the arrival of Hancock at about three in the afternoon, and a desperate conflict ensued, at a close distance, in which neither side gained any distinct advantage. Wadsworth, sent to the support of Hancock's right, did not arrive until night put an end to the combat. Owing to the impossibility of manœuvring in the tangled underbrush, the conflict became a struggle between lines of men closely in touch, but for the most part invisible. It was almost exclusively a musketry battle. The combat between Warren and Ewell and that between Hancock and Hill were practically distinct conflicts.

During the night of the 5th and 6th Burnside's corps was brought to the front and placed between Warren and Hancock but did not go into action till 2 P.M. of the 6th. The gap in the meantime had been filled on the Confederate side by Heth and Wilcox, who succeeded in repelling the attack of Burnside's troops. Longstreet had been summoned by Lee from Gordonsville and ordered to reënforce Hill on his right. At 5 A.M. of the 6th, the attack was renewed on the right and left of the Union line. Sedgwick could make no impression on Ewell, but Hancock succeeded in driving back Hill, by attacks on his flank, for more than a mile, when the Union advance ceased, owing to the confusion in the lines and to the fact that Hancock had left part of his corps behind, in anticipation of a flanking movement by Longstreet. The latter now came on the field of battle, driving Hancock back to his original position. At 10 A.M. he sent Mahone against Hancock's left. The movement was successful, driving back the Union line to its trenches on the Brock Road. Here General Wadsworth was killed. But at this critical moment for the Union army Longstreet was wounded by some of Mahone's men; General Jenkins was killed by this fire, and the violence of the attack subsided until about four o'clock, when Lee threw Hill's and Longstreet's corps against Hancock. Aided by a fire which broke out in the underbrush and seized on the logs of the Union breastworks, while the wind blew the smoke into the faces of the Federals, the Confederates broke through the Union line and a Confederate flag was planted upon the intrenchments. Almost

immediately, however, the Confederate line was driven back. The battle ended with an assault by Ewell (suggested by Gen. J. B. Gordon early in the day but rejected by Ewell, and finally ordered by Lee in person at about 6 P.M.) on the Union right, in which two brigades were captured and the Union line was for a time endangered. Night, however, came to the Federal rescue. The battle was a drawn one.

The best authority places the Union casualties at 2265 killed, 10,220 wounded, and 2902 missing, a total of 15,387. The woods took fire in many places, and at least 200 wounded perished in the flames. The Confederate records show 2000 killed, 6000 wounded, and 3400 missing, a total of 11,400. Among the general officers killed were Wadsworth and Baxter of the Union army, and Jenkins of the Confederates, while Getty of the one and Longstreet of the other side were wounded.

Meserve, *Grant in the Wilderness* (ib., 1915).

WILD FOWL. A general term for wild birds, especially such as interest sportsmen, in distinction from domesticated fowls. The term has been restricted to game birds, especially to ducks, geese, or waterfowl, etc., and to shore birds; one who made a practice of shooting this class of birds for sport was formerly known as a wild-fowler. The indefiniteness of the term has gradually caused its disuse and the term "wild fowl" is now chiefly poetic.

WILD GINGER. See ASARABACCA.

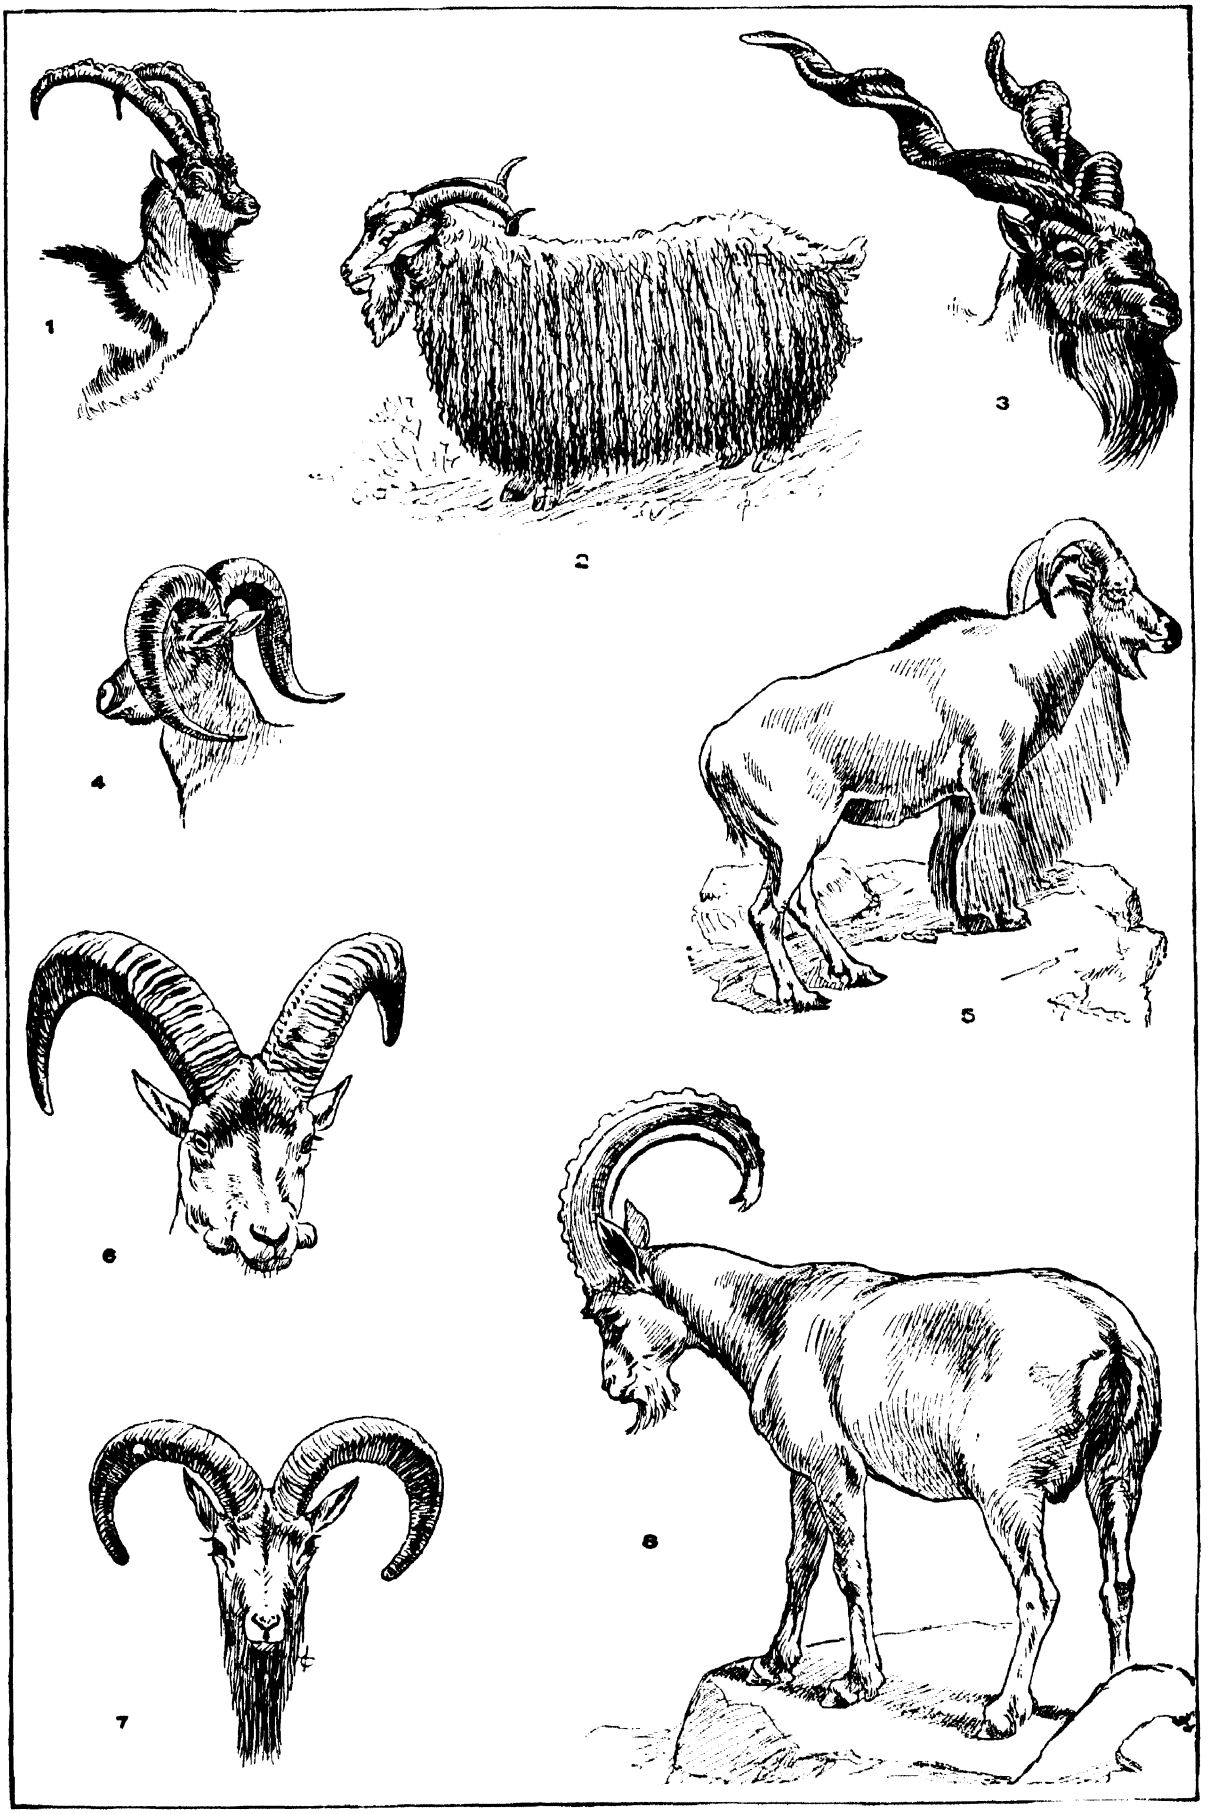
WILD GOATS, SHEEP, AND IBEXES. A group of small ruminants not easily divisible technically even into the two apparently easily distinguishable genera *Ovis* (sheep) and *Capra* (goats and ibexes); and characterized by the massive, angulated horns borne by the male (rams), which in the sheep tend to form a coil beside the head, and in the goats sweep backward from the forehead and show a strongly cross-ridged front. The wild sheep and goats are mountain-dwelling animals, and are limited, with one exception, to the central elevated regions of the Old World, stretching from the Pyrenees, Atlas, and Abyssinian mountains through the Sinaitic Carpathian, Armenian, and Persian chains, to the Himalayan and Mongolian ranges, which are continued northeastward to Bering Strait. Each separate section of the line of uplift has one or more peculiar species. There is also an American species or group of species (see BIGHORN) native to the northern cordillera, as far south as the borders of Mexico. The species are not many, most of them have a comparatively limited and local range, and several are extinct as wild animals. The genus *Ovis* has given to civilized man the domestic sheep, but their specific source (or sources) is uncertain. The domestic goat seems to have been derived with little admixture from the wild goat still extant in southwestern Asia. See GOAT; IBEX; SHEEP.

WILD-GOOSE CHASE, THE. A comedy by John Fletcher, produced in 1621, printed in 1652. Four acts of Farquhar's *The Inconstant* were taken from it.

WILDING, wild'ing. 1. The principal character in Shirley's *The Gamester*. In his adaptation of this play, *The Gamesters*, Dec. 22, 1757, Garrick himself assumed the rôle. 2. The principal character in Foote's play, *The Liar*. The author himself created the rôle of Young Wilding in this play.

WILD LEMON. See PODOPHYLLUM.

WILD LIFE, CONSERVATION OF. In its current meaning this phrase refers especially to governmental and private efforts to preserve, in their natural state or in established sanctuaries, the species of wild mammals, birds, and fishes which are more beneficial than harmful to mankind.



In 1913 Dr. William T. Hornaday (q.v.), director of the New York Zoölogical Park, and a careful student of this subject, stated that, between 1840 and 1910, 11 species of American avifaunal life were exterminated, and that 23 others were then threatened with early extinction. As to American mammals Dr. Hornaday directed attention to the extermination, in a wild state, of the great herds of bison which, within the memory of middle-aged men, roamed the American plains west of the Mississippi; and the similar fate of the Arizona elk, the California grizzly bear, and the prong-horn antelope—now practically extinct. Various African and Asiatic species have also disappeared within recent times.

The champions of the movement point to the fact that more or less serious results always follow the disturbance of nature's balance: that, e.g., if at the behest of gunners animals or birds which prey partly on game birds and partly on noxious insects and vermin are exterminated in any locality, the insects and vermin will increase often to the point of becoming serious pests. Similar results follow the destruction of insectivorous birds; and that this is a serious matter may be inferred from the estimate of the United States Board of Agriculture that in 1904 (when this subject was carefully investigated by the Board) crops of all kinds to the value of $420,100,000 were destroyed by insect pests, most if not all of which are the natural food of such birds.

Governmental protection of wild life in America may be said to have begun in 1739 with the appointment in Massachusetts of local officers for the preservation of deer. For further discussion of the governmental and private protection of wild life the reader is referred to the articles GAME LAWS and GAME PRESERVE, but it may be added here that, in 1915, 45 States and Territories of the United States intrusted the enforcement of game laws to game commissioners, game wardens, or other State officials.

By far the most sweeping measure for the national protection of wild life enacted by the United States government is the so-called "Federal Migratory Bird Bill," included as an amendment of the Agricultural Appropriation Bill, signed by President Taft on March 4, 1913. This measure extends Federal protection to all migratory game and insectivorous birds (including about 600 species), i.e., to all birds (quot-

ing the text of the law) "which in their northern and southern migrations pass through and do not remain permanently the entire year within the borders of any State or Territory." The origin of this law was a bill introduced in the House of Representatives by the Hon. George Shiras, 3d, of Pennsylvania, in 1904. This measure was followed by others having a similar purpose, but the final success of the movement seems clearly to have been due to the inclusion of the nongame insectivorous birds, whose incalculable economic value was made the subject of a nation-wide campaign of education conducted (1913) in a most aggressive manner by Dr. Hornaday, T. Gilbert Pearson, secretary of the National Association of Audubon Societies, and many other organizations and individuals. The only serious opposition to the measure, once it had become a law, was aroused by its prohibition of the spring shooting of wild fowl. This opposition came mainly from the gunners of the Middle West (especially Missouri and Arkansas), and found definite expression in several suits (still pending in 1916) to test the constitutionality of the principle that the migratory habits of the birds included made them proper subjects for Federal legislation. At the same time there was also pending a treaty between the United States and Canada for the protection of migratory birds.

Another Federal law of great importance in the conservation of wild life was the clause included in Schedule N of the Tariff Bill of 1913, which forbids the importation of all foreign wild birds' plumage except for educational or scientific uses, and thereby practically put an end to the employment in the United States of such birds' plumage for millinery purposes. It is worth noting that this bill had the hearty support of many of the influential women's organizations in America. Still another Federal law designed to protect American birds and mammals is the "Lacey Act," passed in 1900, which makes unlawful the delivery to any common carrier for shipment between any States or Territories of dead birds or animals (or parts of them), which have been unlawfully killed. A third important measure was the Chamberlain-Hayden Bill (introduced in Congress in January, 1916) for the establishment of game preserves in national forests.

National organizations for the conservation of wild life include the following: New York Zoölogical Society (1895), New York; National Association of Audubon Societies (1902), New York (which conducts invaluable educational work especially by means of the Junior Audubon Classes, which in 1915 included 7723 clubs with a total paid membership of 152,179); American Bison Society (1905), New York; the American Ornithologists' Union (1884), Washington, D. C.; Boone and Crockett Club (1887), New York; Camp Fire Club of America (1903), New York; National Association of Game Commissioners and Wardens (1902), East Orange, N. J.; American Game Protective Association (1911), New York; National Educators' Conservation Society (1916), New York; and the Permanent Wild Life Protection Fund, amounting (in May, 1916) to $102,000, secured by the efforts of Dr. Hornaday, and of which he is the trustee.

WILES, IRVING RAMSAY (1861–). An American figure and portrait painter, born in Utica, N. Y. He was a pupil of his father, Lemuel M. Wiles, who was for many years director of the college of fine arts at Ingham University, Le Roy, N. Y., and was also known as a painter. Irving Wiles later studied at the Art Students' League, New York, under Chase and Beckwith, and from 1882 to 1884 with Carolus Duran in Paris. Returning to the United States, he settled in New York and devoted himself principally to portraits and figure subjects. Among his paintings, which are characterized by breadth and sureness of handling, careful composition, and agreeable color, are "Sonata"; "Memoirs" (1891, Carnegie collection); the "Girl in Black"; "Golden Dreams"; "Lady Betty" (St. Louis Museum); "Shelter Island, Summer" (Metropolitan Museum, New York); "The Student" (Corcoran Gallery, Washington); "The Brown Kimona"; and "Russian Tea" (National Gallery, Washington). Representative portraits are "My Father and Mother" (1902); Julia Marlowe (1903); Mrs. Gilbert (1904); Lemuel Maynard Wiles (1904, Metropolitan Museum); Henry Wolfe (1906); St. Clair McKelway (1914); Ex-Mayor Schieren (City Hall, Brooklyn); Gen. Eugene V. Henry (West Point); George A. Hearn (1914, Metropolitan Museum). Wiles was elected a member of the National Academy in 1897 and received numerous prizes and medals, including gold medals at Buffalo (1901), St. Louis (1904), Buenos Ayres (1910), San Francisco (1915), and the Proctor Portrait Prize at the National Academy of Design (1913).

WILEY, wī'lī, HARVEY WASHINGTON (1844–). An American food chemist, born at Kent, Ind. He graduated at Hanover (Ind.) College in 1867, at the Indiana Medical College in 1871, and at Harvard in 1873; was professor of chemistry at Purdue University from 1874 to 1883; and was State chemist of Indiana in 1881–83. From 1883 to 1912 he was chief of the Division of Chemistry in the United States Department of Agriculture, where by his energetic enforcement of the pure food and drug laws he aroused much antagonism among manufacturers, who made charges against him. In 1911 an investigation was made by Congress and he was fully exonerated. In addition to his government work he was professor of agricultural chemistry in George Washington University from 1899 to 1912. Thereafter he devoted himself to pure food propaganda by public lectures and by his contributions to *Good Housekeeping*, of which magazine he became editor. In 1893–94 he served as president of the American Chemi-

cal Society and in 1911 of the American Therapeutic Society. His publications include: *Songs of Agricultural Chemists* (1892); *Principles and Practice of Agricultural Analysis* (3 vols., 1894–97; 2d ed., 1906–14); *Foods and Their Adulterations* (1907; 2d ed., 1911); *1001 Tests of Food, Beverages, and Toilet Accessories* (1914); *The Lure of the Land* (1915); *Not by Bread Alone: The Principles of Human Nutrition* (1915), and a large number of government bulletins and reports.

WILFLEY (wĭl'flĭ) **TABLE.** See OBE DRESSING.

WIL'FRID, or **WILFRITH,** SAINT (c.634–709). An English churchman. He was the son of a Northumbrian thane. At 14 he was sent to the court of King Oswin, and from there to the Monastery of Lindisfarne. At the age of 19 he went on a pilgrimage to Rome. After an absence of five years he returned to England and warmly advocated the Roman custom of celebrating the Easter Festival on the 14th day of the moon, which had never been followed in the British Isles. From Alchfrith, King of Deira, he received a grant of land for a monastery at Ripon, and there, probably in 663, he was ordained a priest. The Synod of Whitby, which met in 664 to discuss the disputed question regarding Easter Time was attended by the most distinguished members of both parties, and among others by Colman, Bishop of Lindisfarne, and Wilfrid. The council and audience were carried away by Wilfrid's argument, and the King decided in favor of the Roman party. Wilfrid was afterward named Bishop of York, but he did not enter into possession of his see until 668 or 669. He then surrounded himself with great pomp, built churches, one of which, at Hexham, was said to be the finest north of the Alps, but soon found himself at strife with the royal power. A quarrel with the King of Northumbria, named Ecgfrith, resulted in Wilfrid's deposition. He started on a journey to Rome to make a personal appeal to the Pope and on the way landed on the coast of Frisia, the inhabitants of which were still pagan. There, however, he was hospitably received by the ruler, and he baptized many of the people. Wilfrid was afterward recalled to his see; but he was still active as the leader of the Roman party, and ultimately he was deprived of his bishopric. He again went to Rome, where he was in 703–704, returned to England in 705, and received the see of Hexham. He died at Oundle, in Northamptonshire. The best contemporary authority is Eddi's *Vita Wilfridi*, published in *Historians of York*, vol. i, "Rolls Series." Consult also William Bright, *Early English Church History* (3d ed., Oxford, 1897); William Hunt, *The English Church from Its Foundation to the Norman Conquest* (London, 1899).

WILGUS, WILLIAM JOHN (1865–). An American railway engineer, born in Buffalo, N. Y. He entered railroad service as a rodman in 1885, and by 1890 had become division engineer of construction with the Minnesota and Northwestern Railroad. For the next three years he had charge of the construction of the Chicago Union Transfer Railroad. Between 1893 and 1907 he was connected in various capacities with the New York Central, being chief engineer of construction in 1899–1903 and then vice president in general charge of construction, including the important electrification of the approach to the Grand Central terminal and of suburban lines within a specified zone. Wilgus was also chairman of the advisory board of engineers for the construction of a tunnel under the Detroit River. In 1908 he established himself in private practice as a consulting engineer. He received the Rowland prize of the American Society of Civil Engineers in 1909 and the Telford medal of the Institution of Civil Engineers, London, in 1911. He published *Physical Valuation of Railroads* (1913).

WILHELM. See WILLIAM.

WILHELM, KARL. See WACHT AM RHEIN, DIE.

WILHELMINA, vĭl'hĕl-mē'nȧ, Queen of the Netherlands (1880–). The only daughter of William III of the Netherlands and his second wife, Emma, daughter of Prince George Victor of Waldeck, she was born at The Hague on Aug. 31, 1880. Upon the death of her father in 1890 she became Queen; but the country remained under the regency of Queen Emma until Aug. 31, 1898, when Wilhelmina completed her eighteenth year and became Queen regnant. Her coronation took place on Sept. 6, 1898, in the New Church at Amsterdam, amid great rejoicing. The influence of the popular Queen Emma was not lessened by this event, however, and she remained the constant companion and adviser of her daughter till the latter's marriage on Feb. 7, 1901, at The Hague, to Duke Henry Frederick of Mecklenburg-Schwerin. Wilhelmina came to be greatly beloved by her people. Consult Helen Vacaresco, *Kings and Queens I Have Known* (New York, 1904). Her daughter and heir presumptive, Juliana, was born at The Hague on April 30, 1909, and received the titles of Princess of Orange-Nassau and Duchess of Mecklenburg.

WILHELMJ, vĕl-hĕl'mĕ, AUGUST (1845–1908). A German-English violinist and conductor. He was born at Usingen, in Nassau, and received his first lessons on the violin from Conrad Fischer, court conductor to the Duke of Nassau at Wiesbaden. At the age of eight he played in quartets, and on Jan. 8, 1854, made his first public appearance at a concert given at Limburg-on-the-Lahn, and two years later caused a great sensation with his skillful playing at the Court Theatre of Wiesbaden. From 1861 to 1864 he studied under Richter and Hauptmann, at the Leipzig Conservatory, and subsequently under Raff at Wiesbaden. Throughout his entire career as a student, however, Ferdinand David, to whom he had been taken by Liszt, superintended his studies. In 1865 he made a tour of Switzerland, and the following year visited Holland and England, in 1877 France and Italy, and in 1878 Russia, in which latter country he became acquainted with Berlioz. In 1874 he toured Norway, Sweden, Denmark, Germany, and Austria, and made a long stay in England. In 1876 he was concertmeister of the Bayreuth orchestra during the production of *Der Ring des Nibelungen*. Probably his most successful and enthusiastic tour was that of the United States from 1878 to 1882. Other tours in European countries followed up to 1892, when he permanently settled in London as professor of violin at the Guildhall School of Music. He has been an important factor in the development of orchestral music and concerts in England, and notably in the great Wagner Festival held in the Royal Albert Hall in May, 1877, for which event he was able to

secure the personal attendance and conductorship of Wagner himself, and at the same time introduced Hans Richter to the British public. He died in London. His only published works are: *Hochzeits-Cantate*, for soli, chorus, and orchestra, a violin concerto, a few instrumental pieces, and a number of transcriptions from Bach, Chopin, and Wagner. Together with James Brown he wrote a *Modern Violin School* (six parts).

WILHELM MEISTER'S LEHRJAHRE, vĭl'hĕlm mī'stĕrz lâr'yä-re (Ger., Wilhelm Meister's apprenticeship). A romance by Goethe, published in 1795–96, but planned some 20 years previously, and three-fourths drafted by 1785. In it appear several of Goethe's finest lyrical compositions, including Mignon's "Kennst du das Land?"

WILHELMSHAVEN, vĭl'hĕlms-hä'fen, or **WILHELMSHAFEN**. The chief naval station of Germany, on the west side of the entrance of the Bay of Jade, an inlet of the North Sea, 40 miles northwest of Bremen (Map: Germany, B 2). The town, projected in 1856, is regularly laid out on a strip of land bought in 1853 by Prussia from Oldenburg. There is an inner and an outer harbor, divided by locks, the former containing a shipbuilding basin, 1237 feet long, from which three immense dry docks open out, and a fitting-out basin, 3832 feet long. The workshops of the Imperial shipyards are inclosed by a lofty wall, pierced by 14 portals. There is a torpedo-boat station, connecting with the Jade by a lock. The town is strongly fortified. It is the station of the North Sea fleet and possesses artillery and naval mine depots. Pop., 1900, 22,571; 1910, 35,044.

WILHELMSHÖHE, vĭl'hĕlms-hē'*e*. See CASSEL.

WILHELM TELL, vĭl'hĕlm tĕl. See SCHILLER.

WILHEM, GUILLAUME LOUIS BOCQUILLON. See BOCQUILLON-WILHEM.

WILKES, CHARLES (1798–1877). An American naval officer and explorer, born in New York City. He received a common school education, entered the United States navy as a midshipman in 1818, served in the Mediterranean and the Pacific, became a lieutenant in 1826, and in 1830 was placed in charge of the United States department of charts and instruments. In 1838 he was placed in command of an expedition authorized by act of Congress of May 18, 1836, for the purpose of exploring and surveying the Southern Ocean. This was the first expedition fitted out by the National government for scientific purposes. Between the years 1838 and 1842 the expedition visited the Madeira Islands and Rio de Janeiro in 1838; Tierra del Fuego, Chile, Peru, the Paumotou group, Tahiti, Tutuila and the Samoan group, and New South Wales in 1839; the Antarctic regions, New Zealand, the Fiji group, and the Hawaiian Islands in 1840; the Columbia River, of which a survey was made, Willamette valley, and part of the California coast in 1841; and the Philippine Islands, Sulu Archipelago, St. Helena, Singapore, and the Polynesian Islands in 1842. A great mass of valuable scientific information was collected during the voyage and afterward published in 19 large volumes. A very valuable part of the report was that of J. D. Dana (q.v.). Wilkes wrote the volumes on *Meteorology* and *Hydrography*, and also the *Narrative of the United States Exploring Expedition* (6 vols., 1845; abridged ed., 1850). The claim of Wilkes to the discovery of an Antarctic continent has not always been conceded although Sir Ernest Shackleton and Sir Douglas Mawson (qq.v.) later confirmed Wilkes's discoveries. Wilkes became a commander in 1843 and a captain in 1855, and in 1861, upon the outbreak of the Civil War, was placed in command of the frigate *San Jacinto* and sent to the West Indies in search of the Confederate cruiser *Sumter*. On Nov. 8, 1861, he stopped at sea the English mail steamer *Trent*, and removed therefrom Mason and Slidell, the Confederate commissioners to England and France respectively. (See TRENT AFFAIR.) Wilkes commanded the Potomac flotilla in 1862, and later commanded the flying squadron ordered to prevent blockade running between the West Indies and the Confederacy. He became a commodore in July, 1862, was placed on the retired list in June, 1864, and became a rear admiral on the retired list in July, 1866. Besides the reports mentioned above, he published: *Western America, Including California and Oregon* (1849); and *The Theory of the Wind* (1855).

WILKES, JOHN (1727–97). An English politician, born in London, Oct. 17, 1727. He received an excellent education, spending four years at the University of Leyden. In 1754 he entered national politics by standing for Berwick-upon-Tweed, but he was not successful. Three years later, however, he became member for Aylesbury. In 1761 he was again returned for the same seat. When Lord Bute forced Pitt out of office in 1762, Wilkes began a bitter fight against the new government. To assist him in this attack he established a paper called the *North Briton*. Number 45 of this paper, which was issued after the appearance of the King's message on the Peace of Hubertsburg (1763), contained an article that maligned the government for its desertion of Frederick the Great and its peace policy in general. Then followed what was popularly known as the Seven Years' War against Wilkes. A general warrant was issued for the apprehension of the author of the article, and Wilkes was among the number of those arrested, but after a week in the Tower he was released on the ground of his privilege as a member of Parliament. With this incident the practice of issuing general warrants came to an end, for Wilkes and others brought suit against Lord Halifax and other officials of the government who were concerned in the matter, with the result that the court declared general warrants illegal, and granted heavy damages, Wilkes receiving £4000. When Wilkes, however, reprinted the obnoxious issue, his enemies renewed their attack upon him and succeeded in getting the House of Commons to declare the article "a false, scandalous, and seditious libel." In January, 1764, he was expelled from Parliament on this ground, and in February the Court of King's Bench found him guilty of republishing the article and also of printing an *Essay on Woman*, an obscene parody on Pope's *Essay on Man*. In the meantime Wilkes, who had been wounded in a duel, had repaired to Paris to recuperate, and, as he did not appear to receive his sentence, the court declared him an outlaw. Wilkes remained abroad until, in 1768, his penurious condition forced him to face matters in England. He first sued for pardon from the King, but in so undiplomatic a way that it was denied him. He then stood for Parliament from

London, but was defeated. A second contest, this time for Middlesex, brought him victory. Wilkes then surrendered himself to the Court of King's Bench to answer to the charge of outlawry. A technical point brought about the reversal of this sentence, but the original condemnation for reprinting Number 45 of the *North Briton* and the *Essay on Woman* still stood, and for these he was sentenced to 22 months in prison and a fine of £1000. He was expelled from the House. Though still in prison, Wilkes was again returned for the district, only to be expelled a second time. Again the same process was repeated, and when the district returned him a fourth time by a vote of 1143 to 296 for his opponent, Colonel Luttrell, the House seated the latter, declaring that as Wilkes was an outlaw all votes for him were void. This persecution gained for Wilkes great personal popularity and money. Before he left prison he was elected alderman of London. In 1771 he served also as sheriff for Middlesex and London and in the same year played a prominent part in the contest between the House of Commons and the printers, by which the latter gained the freedom to publish Parliamentary debates. In 1774, after a previous unsuccessful contest, he became Lord Mayor of London. In the same year he was returned to Parliament from his old Middlesex district, which he now represented continuously until 1790. This time the House permitted him to sit, on the ground that the disability resulting from outlawry did not last over the Parliament in which it occurred. In 1779 Wilkes was elected to the position of Chamberlain of the City of London. He spent the last years of his life in his Parliamentary work and in various literary undertakings, but none of the latter are of especial merit. Wilkes's contest with the Ministry is of primary importance in English history as vindicating the absolute rights of the Parliamentary constituencies. Consult: W. F. Rae, *Wilkes, Sheridan, and Fox* (London, 1874); P. H. Fitzgerald, *The Life and Times of John Wilkes, M. P.* (ib., 1888); J. B. Daly, *The Dawn of Radicalism* (ib., 1892).

WILKES-BARRE, wĭlks'bär-rē. A city and the county seat of Luzerne Co., Pa., 145 miles by rail north by west of Philadelphia, on the Susquehanna River, here spanned by four iron bridges, and on the Pennsylvania, the Lehigh Valley, the Central of New Jersey, the Delaware and Hudson, the Lackawanna and Wyoming Valley, the New York, Susquehanna, and Western, and the Wilkes-Barre and Hazleton railroads (Map: Pennsylvania, K 4). It is attractively situated in a region abounding in beautiful scenery, and is rich in reminiscences of the Colonial and Revolutionary periods. The Wyoming Monument in the vicinity marks the site of the conflict of July 3, 1778, between the Americans and the Loyalists and Indians (see WYOMING VALLEY). The Forty Fort Church and Queen Esther's Rock are points of interest. Among the prominent institutions of Wilkes-Barre are the Harry Hillman Academy, the Wyoming Seminary, Wilkes-Barre Institute, Y. M. C. A., the Mallinckrodt Convent, St. Mary's Convent, Home for Friendless Children, Home for Homeless Women, and the City, Homeopathic, Nesbitt, and Mercy hospitals. The Osterhout Free Library has more than 40,000 volumes. Other collections include those of the Law and Library Association, the Wyoming Historical and Geological Society, the Luzerne County Medical Society, and the Young Men's Christian Association. The Wyoming Historical Museum has 20,000 volumes, and a collection of 30,000 relics of the early wars. Of the buildings the most notable are the post office, the Irem Temple, a splendid example of Moorish architecture, the Y. W. C. A., county courthouse, city hall, jail, armory, and coal exchange. Wilkes-Barre is known as the centre of the most productive anthracite coal region in the United States, the total shipment of the trade region in 1914 amounting to more than 41,000,000 tons. The manufacturing interests are extensive. According to the 1914 census the various industries had an invested capital of $18,987,000 and a production value of $16,669,000. Among the largest concerns of their kind in the country, are its lace manufactory, wire-rope works, axle works, iron works, and adding-machine plant. Other important establishments include foundries and machine shops, and manufactures of silk, underwear, flour, clothing, shirts, munitions, tobacco, etc. The commission form of government has been adopted, providing for a mayor, chosen every four years, and four councilmen, elected for a period of two years. All subordinate officials except the city controller are appointed by the commission. In 1914 the net bonded debt of the city was $1,374,000, and the assessed valuation of real and personal property was $60,000,000. Pop., 1900, 51,721; 1910, 67,105; 1915 (U. S. est.), 75,218. The first settlers came to Wilkes-Barre in 1769 and laid out the village. In 1784, during the Pennamite-Yankee War, 23 of the 26 buildings were destroyed by the Pennamites, but the village was slowly rebuilt and in 1806 was incorporated as a borough. In 1850 its population was only 2723, but after the Civil War it grew rapidly, and in 1871 was chartered as a city. It takes its names from John Wilkes and Col. Isaac Barré, advocates of the colonists in the British Parliament, during and preceding the Revolution. Consult O. J. Harvey, *History of Wilkes-Barré and Wyoming Valley* (3 vols., Wilkes-Barre, 1909).

WIL'KIE, SIR DAVID (1785–1841). The principal genre painter of the Scottish school. He was born at Cults, a small village in Fifeshire, where his father was a clergyman. At 14 he entered the Trustees' Academy, Edinburgh, where he studied under the historical painter John Graham until his return in 1804 to Cults. Here he painted "Pitlessie Fair," his first important work and in 1805 he went to London, enrolling at the Royal Academy schools. In 1806 he exhibited "Village Politicians," which received much favorable comment. Among the best of his popular works that followed are: "Blind Fiddler" (1806), and "Village Festival" (1812), "The Bagpiper" (1813), all in the National Gallery; "Card Player" (1808), "Rent Day," "The Cut Finger," "The Penny Wedding" (1818, Buckingham Palace); and "Reading of the Will" (Pinakothek, Munich); "The Parish Beadle" (Tate Gallery). Wilkie's work is characterized by unfailing invention and good humor, careful, detailed technique, and considerable charm of color. He was elected a Royal Academician in 1811. In 1825–28, because of enfeebled health, Wilkie traveled extensively abroad, and was especially influenced by the works of Velazquez, Titian, and Rembrandt. He changed his theme from genre to historical and portrait subjects, in which, however, he did not succeed so well. His

best-known works of this character, which are executed with breadth of handling, include: "Wellington Writing a Dispatch," "Napoleon and the Pope at Fontainebleau," and "John Knox Preaching" (1832, Tate Gallery). In 1830 he was appointed painter to the King, in 1836 he was knighted, and in 1840 he started upon a tour abroad, but died and was buried at sea. Consult: Allan Cunningham, *Life of Sir David Wilkie, with his Journals, Tours, and Critical Remarks on Works of Art . . .* (3 vols., London, 1843); Lord Ronald Gower, *Sir David Wilkie* (New York, 1902); J. C. Van Dyke, in *Old English Masters* (ib., 1902); William Bayne, *Sir David Wilkie* (ib., 1903); *Masters in Art*, vol. vii (Boston, 1906).

WIL'KINS, JOHN (1614–72). An English prelate and scientist. He was born at Fawsley, Northamptonshire. He graduated at Oxford in 1632; took orders in 1635; during the Civil War adhered to the Parliament; was made warden of Wadham College (1648); and was appointed by Richard Cromwell master of Trinity College, Cambridge, in 1659. He was ejected at the Restoration (1660); but being greatly esteemed for his toleration and attainments, obtained favor with Charles II, was made prebendary of York in 1660; rector of St. Lawrence, London, in 1662; and Bishop of Chester in 1668. At an early age he became known for his scientific writings, invented and described the perambulator or measuring wheel, and in 1645 was one of the promoters of a philosophical club which in 1662 developed into the Royal Society, of which he became first secretary. His principal writings are: *The Discovery of a World in the Moone* (1638), to which was added a *Discourse Concerning the Possibility of a Passage Thither* (1640); *A Discourse Concerning a New Planet* (1640), an argument that the earth is one of the planets; *Mercury, or the Secret and Swift Messenger* (1641), an ingenious treatise on rapid means of correspondence; *Mathematical Magick* (1648); *An Essay Towards a Real Character and a Philosophical Language* (1668); and *On the Principles and Duties of Natural Religion* (1678). Consult P. A. Wright-Henderson, *The Life and Times of John Wilkins* (London, 1910).

WIL'KINS, MARY ELEANOR (MRS. MARY E. WILKINS FREEMAN) (1862–). An American novelist, born in Randolph, Mass., of Puritan descent. She received her education at Mount Holyoke Seminary, South Hadley, Mass., and passed the greater part of her life in Massachusetts and in Vermont. For many years she was secretary to Dr. O. W. Holmes (q.v.). In 1902 she married Dr. Charles M. Freeman of Metuchen, N. J. Occasionally she contributed verse, as well as prose, to magazines. Her stories, dealing mostly with New England life, and among the best of their class, include: *The Adventures of Ann* (1886); *A Humble Romance* (1887), which made her widely known; *A New England Nun* (1891); *Young Lucretia* (1892); *Jane Field* (1892); *Giles Corey* (1893); *Pembroke* (1894); *Madelon* (1896); *Jerome, a Poor Man* (1897); *Silence, and Other Stories* (1898), containing some of her best work; *The Love of Parson Lord* (1900); *The Portion of Labor* (1901); *The Wind in the Rose Bush* (1903); *The Givers* (1904); *The Debtor* (1905); *The Fair Lavinia, and Others* (1907); *The Winning Lady, and Others* (1909); *Butterfly House* (1912); *The Copy-Cat, and Other Stories* (1914).

WILKINSBURG. A borough in Allegheny Co., Pa., adjoining Pittsburgh, of which it is a residential suburb (Map: Pittsburgh, and vicinity). It has the Home for Aged Protestant Women and the United Presbyterian Home for the Aged. Wilkinsburg was named in honor of William Wilkins, Secretary of War under President Tyler. Pop., 1900, 11,886; 1910, 18,924; 1915 (U. S. est.), 22,361.

WIL'KINSON, JAMES (1757–1825). An American soldier and adventurer, born in Benedict, Md., of English ancestry. He was privately tutored and studied medicine in Philadelphia (1773–75). In September, 1775, he enlisted in the American army, joining the army before Boston; the following year, he was made captain and led a company northward, joining Arnold at La Chine in the invasion of Canada. He became a colonel, served on the staff of General Gates, and was promoted by the latter to be deputy adjutant general of the Army of the Northern Department. He served with some distinction through the Saratoga campaign, and was delegated to bear to Congress the news of the surrender of Burgoyne. He was brevetted brigadier general in November, 1777; was implicated in the Conway Cabal (q.v.); acted as secretary to the Board of War from January to March, 1778; and in July, 1779, was made clothier general of the Continental Army. He resigned in 1781, and in 1784 removed to Kentucky, where he soon came to exert considerable influence. He played a conspicuous part in the early politics of that State; and even went so far as to intrigue with the Spaniards in Louisiana for the absorption of the western country by Spain. For the rôle he played he received valuable trade concessions with Louisiana—he had come to be the largest tobacco dealer in the West—and a pension from the Spanish government. His treasonable conduct being unknown, he was appointed lieutenant colonel in 1791, and served with ability in the Indian wars of the West, notably in Anthony Wayne's campaign. In March, 1792, he was appointed brigadier general, and in 1796 succeeded Wayne as commander in chief of the army. He continued to receive his Spanish pension. In 1805, after the acquisition of Louisiana and its division into two Territories, he was appointed by Jefferson Governor of upper Louisiana with his capital at St. Louis. At this time he was already engaged with Aaron Burr in a scheme for the conquest of Mexico, and in the following year sent Z. M. Pike (q.v.) upon his exploration to the Southwest. During 1806, under cover of the Spanish War excitement, this scheme took shape, but Wilkinson, seeing the opportunity of driving a double bargain, turned traitor, denouncing the expedition to the President, and applying to the Viceroy of Mexico for money to compensate him for having saved that kingdom to Spain. His treachery and guilty conduct, however, were clearly exposed to some people and he narrowly escaped indictment along with Burr at Richmond in 1807. On Dec. 31, 1807, John Randolph introduced a resolution in Congress to inquire into the conduct of Brigadier General James Wilkinson "in relation to his having, at any time, while in the service of the United States, corruptly received money from Spain or its agents." He was exonerated, but of his guilt Randolph was certain, and early in 1810 two committees in Congress took up charges against the general. On Dec. 25, 1811, he was again acquitted, and in 1812 resumed command

of the army at New Orleans. In March, 1813, during the second war with Great Britain, he was raised to the rank of major general and placed in command of the Canada Expedition, but, proving incapable, he was superseded in 1814, and in November a court-martial was ordered for his trial on charges of neglect of duty, drunkenness, conduct unbecoming an officer, and of countenancing and encouraging disobedience of orders. In 1815 he was again acquitted, and was honorably discharged from the service. He removed to Mexico City and took a small part in some of the revolutionary movements then afflicting that country. His last years were spent in trying to collect from Mexico a large sum of money due himself and some of his friends for munitions and arms. He was a brave officer, a fluent speaker, and a ready but rather grandiose writer. Since his death materials have been brought to light which show him to have been a consummate intriguer, barren of honor and shamelessly corrupt. He published: *The Aaron Burr Conspiracy Exposed* (1808); and a partially reliable work, *Memoirs of My Own Times* (1816), which was left incomplete. For accounts of his Western intrigues, consult: Gayarré, *Spanish Dominion in Louisiana* (New York, 1854); Roosevelt, *Winning of the West*, vol. iii (ib., 1894); Daniel Clark, *Proofs of the Corruption of Gen. James Wilkinson* (1809); McCaleb, *The Aaron Burr Conspiracy* (New York, 1903); Shepherd, "Wilkinson and the Beginning of the Spanish Conspiracy," in *American Historical Review*, vol. ix (New York, 1904); and Cox, "The Later Intrigue of Wilkinson with the Spaniards," in *American Historical Review*, vol. xix (ib., 1914).

WILKINSON, JEMIMA (1753–1819). An American religious enthusiast. She was born at Cumberland, R. I., and educated among the Society of Friends. When 20 years old she suffered from a severe fever, and, after an apparent suspension of life, asserted that she had been raised from the dead, and professed to work miracles. She had a few followers who with her built in Yates Co., N. Y., a village named Jerusalem (1789). She enjoined celibacy, and the religious exercises which she instituted had some resemblance to those of the Shakers. At her death the sect was broken up.

WILKINSON, JOHN (1728–1808). An English ironmaster, born at Clifton, Cumberland. He established the first blast furnace at Bilston, Staffordshire, about 1748, and about 1756 founded a plant at Bersham for boring cylinders, of which he became owner and manager in 1761–62. He then set up a large forge at Brosely, where he manufactured wrought iron. In 1786 he was filling large government orders for artillery material, and in the following year constructed the first iron barge. In 1790 he patented an important process for making lead pipe. Wilkinson also proposed and cast the first iron bridge.

WILKINSON, SIR JOHN GARDNER (1797–1875). A distinguished English traveler and Egyptologist, born Oct. 5, 1797. Wilkinson was educated at Harrow and at Exeter College, Oxford, but left the university without taking a degree and went to Italy for his health in 1820. Becoming interested in Egyptological studies, he went to Egypt in 1821 and took up his abode at Cairo, where he soon became proficient in Arabic and in Coptic. In the course of the next 12 years he explored nearly every part of Egypt and lower Nubia, twice ascending the Nile as far as the second cataract and several times as far as Thebes. To the exploration of the latter site he devoted more than a year, and he also visited the deserts on either side of the Nile and the Egyptian oases. As a result of his first visit to Egypt, he transmitted to the British Museum more than 300 antiquarian objects, besides numerous specimens of natural history. His first work on Egyptian antiquities, *Materia Hieroglyphica*, was published at Malta in 1828. It was followed, two years later, by *Extracts from Several Hieroglyphical Subjects*, and in the same year (1830) he published his *Topographical Survey of Thebes* in six sheets. In 1833 he was compelled by ill health to return to England, and at the close of the following year he was elected fellow of the Royal Society. His *Topography of Thebes and General View of Egypt* was published at London in 1835, and two years later appeared his great work, *Manners and Customs of the Ancient Egyptians* (3 vols., best ed. by Birch, 1878), a work remarkable both for the extensive and accurate information it contains and for the agreeable style in which it is written. It immediately attained great popularity and gained for its author in 1839 the honor of knighthood. In 1841 he revisited Egypt, traveled extensively in northern Africa, Syria, and Turkey, and returned to England in 1843. In the year of his return he published his *Modern Egypt and Thebes*, of which a new and condensed edition was issued among Murray's *Hand-books* in 1847. A journey through Montenegro, Herzegovina, and Bosnia, in 1844 furnished the material for his *Dalmatia and Montenegro* (2 vols., 1848). He visited Egypt for the third time in 1848–49 and again in 1855–56. He presented his collection of Egyptian, Greek, and other antiquities to Harrow School and in 1874 gave to the same institution his valuable collection of coins and medals. He died at Llandovery, in Wales, Oct. 29, 1875. Among Wilkinson's other works may be mentioned: *The Architecture of Ancient Egypt* (1850); *The Fragments of the Hieratic Papyrus at Turin* (1851); *A Popular Account of the Ancient Egyptians* (1853); *The Egyptians in the Time of the Pharaohs* (1857); *On Color, and on the Necessity for a General Diffusion of Taste among All Classes* (1858).

WILKINSON, (HENRY) SPENSER (1853–). An English writer on military subjects. He was born in Manchester; was educated at Owens College, Manchester, and at Merton College, Oxford, and was called to the bar at Lincoln's Inn in 1880. From 1882 to 1892 he was on the staff of the Manchester *Guardian*, and from 1895 to 1914 on the staff of the London *Morning Post*. Convinced as early as 1874 that Great Britain was inadequately armed, he began to devote his attention to the subject of the national defense. During the early months of the Boer War (1899–1900) Wilkinson made remarkably accurate forecasts of military movements. He was made Chichele professor of military history at Oxford in 1909. He wrote: *Essays toward the Improvement of the Volunteer Forces* (1886); *The Brain of an Army* (1890), an account of the German general staff; *Imperial Defense* (1892), with Sir Charles Dilke; *The Command of the Sea* (1894); *The Nation's Awakening* (1896); *British Policy in South Africa* (1899); *War and Policy* (1900); *Britain at Bay* (1909); *Hannibal's March through the Alps* (1911); *First Lessons in War*

(1914); *The French Army before Napoleon* (1915); *The Nation's Servants* (1916). Consult William Archer, *Real Conversations* (London, 1904).

WILKINSON, TATE (1739–1803). An English actor and theatrical manager, especially celebrated for his powers of mimicry. At first he did not meet with much success as an actor, and in fact his own regular acting never advanced him very far; but he showed such a popular gift for mimicking the peculiarities of other performers that he was throughout his early career alternately the delight and the detestation of the theatrical people with whom he had to do. He was especially successful in mimicking Peg Woffington, Foote, and Garrick, to all of whom he gave considerable offense. In the provinces Wilkinson successfully took leading parts in serious drama. About 1768 he married and settled down in York as the manager of what was called the Yorkshire Circuit, which he directed with excellent judgment and prosperity for over 30 years. Among his actors were Mrs. Siddons and the other Kembles, Miss Farren, and a number of others who afterward became famous. His oddities were notorious, but he was a generous manager. Of his writings the most important are the *Memoirs of his Own Life, by Tate Wilkinson, Patentee of the Theatres-Royal, York and Hull* (1790), and *The Wandering Patentee; or a History of the Yorkshire Theatres from 1770 to the Present Time, etc.* (1785). Consult William Archer, in *Actors and Actresses of Great Britain and the United States*, edited by Matthews and Hutton (New York, 1886), and H. B. Baker, *Our Old Actors* (London, 1881).

WILKINSON, WILLIAM CLEAVER (1833–). An American scholar and writer. He was a graduate of the University of Rochester (1857) and the Rochester Theological Seminary (1859), pastor of Baptist churches in New Haven and Cincinnati, and then head of a school at Tarrytown, N. Y. From 1872 till 1881 he was professor of homiletics in Rochester Seminary, and after 1892 professor of poetry and criticism in the University of Chicago. He devoted much time to literary work. For the Chautauqua Literary and Scientific Circle he prepared many textbooks on languages. He published also: *The Dance of Modern Society* (1868); *A Free Lance in the Field of Life and Letters* (1874); *The Baptist Principle* (1881); *Webster*, an ode (1882); *Poems* (1883); *Edwin Arnold as Poetizer and Paganizer* (1885); *Poetical Works* (5 vols., 1905); *Daniel Webster, with Other Historical Essays* (1911); *Paul and the Revolt against him* (1914).

WILL. In psychology, a term which formerly signified a power or activity of the mind coördinate with thought and feeling, but which has now come to be the "general name for the sum total of tendencies, inherited and acquired, that determine our actions." (See DETERMINING TENDENCY.) Under the general heading of Will experimental psychology is concerned (1) with the psychology of action, particularly in its selective and volitional stages, and (2) with the psychological description of the will-consciousness.

The first of these problems has been considered under Action (q.v.). There it is shown that the essential thing in every action-consciousness is its predetermination in the sense of an idea of end. The typical impulsive action is singly determined, i.e., the determination drives straight through to its goal; there is no indecision, no questioning, no halting, until the idea of end is realized in perception. On the conscious side the tendency is actualized in three successive steps: (*a*) the intention of movement (usually given in kinæsthetic terms) and the idea of result; (*b*) the perception of an object, which is apprehended in relation to the idea of result; and (*c*) the perception of movement and the realizing perception of result. This is the typical action-consciousness; and so far there need be no specific will-consciousness. In selective and volitional action we find a conflict of tendencies, two or more struggling for control of the nervous paths; and when one eventually wins, the typical action-consciousness is repeated. There are, of course, many possibilities as regards the outcome of the struggle; two tendencies may completely inhibit each other, or under other circumstances may facilitate each other. The point is that the action is still determined, and that as yet there need be no pattern of consciousness other than the determined succession of ideas which is typical of the action-consciousness at large.

There is, however, a will-consciousness, and it is sometimes reported even in the simplest forms of action. Under analysis it appears to be a conscious attitude of acceptance or of resolution. The attitude sometimes reduces to an organic set, which carries the meaning "I agree," or "I will." The same meaning may also be expressed in verbal and bodily kinæsthesis; the "I" of the meaning "I agree" is then emphatic, the individual feels himself into the situation; and there is often a feeling of exertion, as if the action were already being carried out. Finally, the attitude is incorporated, as it were, in the total reaction-consciousness; the organic sensations are blended with the other conscious contents, and the ideas of object and of end seem to be necessary parts of the will-consciousness. The will-consciousness is thus always complex, and is as difficult of analysis as are the conscious attitudes in general (see THOUGHT); but the key is to be found in the actor's consciousness of self, a variable group of processes set on a background of determining tendencies.

Attempts have been made to distinguish types of will, according as the sum total of tendencies to action shows itself characteristically in different ways. The energetic will, e.g., is a will of strong and persistent tendencies; the weak will is one of instable, the healthy will of nicely balanced tendencies. The explosive will is one that functions too rapidly for inhibitions to arise.

Some psychologists posit a mental element, called conation, which is described as a mental unrest, and which is said to be common to desire, yearning, longing, craving, wishing, willing, and like experiences. Such an element, however, is merely an assumption made in the interest of description, and experimental investigation shows no warrant for it. See CONATION.

WILL. A legal act to take effect at death,

by which a person disposes of his property. In civil law such an act is called a testament. Power to testate has not been discovered in any primitive system of law; the primitive method of modifying succession is the adoption (q.v.) of the intended heir, who thereby receives the right to succeed as a son. The modern will is a Roman invention. Its general diffusion was effected, in the ancient world, through the expansion of the Roman Empire; in the modern world, through the influence of the Roman church.

Roman Law. The Roman testament grew out of mancipation. This was originally a sale, in which the price was paid in a certain weight of copper. When the payment of price became symbolic, the transaction became a conveyance. A mancipation involved the presence of the conveyor and conveyee, a scale holder, and five witnesses. The evolution of testament out of mancipation was accomplished as follows. Originally, the estate (*familia*) was conveyed to the intended heir (*emptor familiæ*), on the understanding that he was not to assert his right until the conveyor's death. Later, a fiduciary conveyee was substituted, who took title to the estate not in his own interest, but in commission (*mandatela*), to dispose of it according to the instructions of the conveyor. These instructions (*nuncupatio*) were at first given publicly and orally; later, the conveyor produced written and sealed tablets, and declared that these contained his instructions. To the tablets were then attached, for identification, the seals of the conveyee, the scale holder, and the five witnesses. It is probable that the conveyee discharged, at this stage in the evolution of testament, the duties of an executor; later, he became, like the scale holder, a purely ceremonial person. At the close of the Republican period the prætors accepted testamentary tablets bearing the seals of seven witnesses, and gave effect to the dispositions contained in such tablets, without inquiring whether the forms of mancipation had been observed; and in the second century of the Empire Marcus Aurelius enacted that an allegation that there had been no mancipation should not be heard. At this point the substitution of the written, secret, and revocable testament for the oral, public, and irrevocable conveyance was complete; but the ceremony "with copper and the scales" was long retained "in imitation of the old law."

The rules governing the Roman testament at the close of the Republican period were very technical. It must create one or more lines, or universal successors, who were to take the whole estate, pay debts and special bequests (*legata*), and retain the residue. The heir or heirs, accordingly, were at once executors and residuary legatees. If the heir was under age, or insane, his guardian acted as executor. If a testator had natural heirs under his household authority (*sui*, see PATRIA POTESTAS) he could indeed give the inheritance to others, but he must first expressly disinherit the *sui*.

At the older civil law, again, only a Roman citizen of the age of puberty and not under *patria potestas* (q.v.) could make a testament; and only a person in existence at the time of the testator's death could take as heir. Uncertain persons (like the poor) could not be instituted as heirs, nor could juristic persons (corporations).

Informal dispositions of property in contemplation of death were made possible by the enactment of Augustus that trust bequests (*fidei commissa*, q.v.) should be enforced whenever the intention of the decedent could be proved. By such trusts nearly all the technical limitations upon testation were ended. Such trusts were usually (but not necessarily) made in documents termed "codicils," and they might apply to the whole estate (universal *fidei commissa*). In the later Empire there was a reaction towards stricter forms. Except in the case of soldiers in the field, who might testate informally, every declaration of last will must assume the form either of a regular testament with seven witnesses, or of a codicil with five witnesses. Codicils might be added to a testament, but they could be established independently (*codicilli ab intestato*). Justinian introduced several alternative forms of testation for the benefit of persons who, by reason of their infirmities or their situation at the moment of testation, could not observe the usual forms.

Canon Law accepted the Roman law of testation with few modifications. It accepted a testament made in the presence of the parish priest and two witnesses, and it introduced testamentary executors.

Modern Civil Codes recognize various forms of testation. That most favored is the testament certified by a judge or by notaries and by at least two witnesses. Less formal testaments may be made at sea, in time of pestilence (especially in quarantine), by soldiers in the field, etc., but such testaments usually become invalid soon after the emergency has passed and the testator is able to observe the usual forms.

In French, Italian, and Spanish law a testament wholly written by the testator himself and also dated and signed by him (holographic testament) is valid without witnesses or formalities of any sort. This rule has been much criticized, on the ground that it facilitates forgeries and bases the succession essentially on expert testimony as to handwriting.

Inheritance Contract. In Roman law and in all modern legislation successions to the property of a husband or wife may be granted, in part at least, by the term of an antenuptial contract. In the late mediæval customs of Germany reciprocal rights of inheritance might be established between any persons by contract (*Erbverbrüderung, Erbvertrag*), and the same result was attainable in northern France by the establishments of reciprocal testaments, which, unlike other testaments, were not revocable. In France reciprocal testaments were abolished by an ordinance of 1735; but the inheritance contract was recognized in nearly all the State codes of Germany and is recognized in the German Imperial code. The inheritance contract must be in writing and must be certified by a judge or a notary.

Limitations on the Power of Testation. At Rome in the later Republican period efforts were made to limit the amount of legacies or special bequests. This end was attained, 40 B.C., by the Lex Falcidia, which provided that legacies should not exceed three-fourths of the net value of the entire estate. This did not affect the power of the testator to make a stranger heir, to the total exclusion of his nearest kin. It was, however, possible for children or parents disinherited without cause, or for a brother or sister to whom a disgraceful person was preferred, to attack as undutiful a testament under which such natural heirs received less than one-

fourth of their intestacy share; and such an attack was quite likely to be successful if mental weakness could be shown on the part of the testator or undue influence on the part of the stranger heir. Justinian gave descendants and ascendants an absolute right to one-third, or, in some cases, to one-half of their intestacy shares, unless there was good ground for their disherison. All the modern civil codes give statutory shares to descendants and to parents, and nearly all give a share (or at least usufruct in a share) to a surviving spouse. See HEIR; INHERITANCE; SUCCESSION AB INTESTATO; TESTAMENT.

Wills at Common Law. At early common law a gift by will of personal property was valid without writing or other formality. As knowledge of the art of writing became more general, the courts came to look askance at verbal or nuncupative wills, holding that they were valid when executed in that manner only by force of necessity. An early statute (29 Charles II, ch. 3) placed various restrictions upon the power of disposing of personal property of less than 30 pounds in value by nuncupative wills. It required such wills to be executed by the testator in the presence of three witnesses in his own house and during his last sickness. This statute with unimportant modification was generally enacted into the statute law of this country. In all of the States wills of personal property may now be executed with the same formalities as wills of real estate, and in a number of States, as in New York, all wills of personal property are now required to be executed in that manner, with the exception that nuncupative wills of soldiers in actual service and of sailors while at sea are still deemed valid.

It seems probable that by the Anglo-Saxon law land held by grant from the King, sometimes known as book land, was to a limited extent devisable. Disposition of land by will, however, was inconsistent with feudal tenure, as it deprived the overlord of his feudal rights and privileges, and, following the Norman Conquest, the practice of making gifts of lands by will ceased with the gradual establishment of the feudal system. There were exceptions in some of the ancient cities as to lands held in burgage (q.v.) and in the County of Kent as to lands held by gavelkind (q.v.), where the power of disposition of land by will was preserved by local custom.

The development of the system of uses by the English Court of Chancery admitted of gifts of land by will by means of a conveyance of the land to such uses as the grantor might appoint by his will. (See TRUST.) This method of making devises was temporarily destroyed by the Statute of Uses (27 Hen. VIII), but the power of devising was completely restored as to all socage estates and as to two-thirds of the testator's lands held by knight service by the Statute of Wills (32 Hen. VIII) enacted in 1540. By the abolition of feudal tenures (12 Charles II, ch. 14) in 1656, the Statute of Wills was indirectly extended in its application to all lands.

No particular formality was required by the Statute of Wills for the execution of a valid will except that it was required to be in writing. By the Statute of Frauds (29 Charles II, ch. 3) a will was required to be signed by the testator and to be subscribed by three or more witnesses. Other statutory changes have been made in the English Law of Wills which are substantially embodied in the Wills Act (7 Wm. IV and in 1 Vict., ch. 26).

Statutes based on the Statute of Wills and the Statute of Frauds have been enacted in most of the United States, in all of which there are statutes authorizing gifts of land by will. While varying in numerous particulars, these statutes are alike in requiring generally that the will shall be in writing and signed by the testator at the end of the will. Generally two and in some States three witnesses are required, who must subscribe the will as witnesses in the presence of the testator and in the presence of each other. In some States a smaller number of witnesses is required for a will of personal property than for a will of real property. In some States, also, as in New York, the testator is required to publish his will, that is, announce at the time of executing it that the document is his last will and testament, although in these States the witnesses are not required to subscribe the will in each other's presence, nor need the testator sign the will in the presence of the witnesses, provided he acknowledges the signature to be his. In Louisiana holographic wills without witnesses are valid; also nuncupative wills, provided the will is transcribed by a notary in the presence of witnesses numbering three or five according to circumstances. There are also in that State other rules as to the execution and proof of wills which are not generally in force in the other States of the United States.

The person executing a will must have testamentary capacity, i.e., he must be 21 years of age in case of wills of real estate, and in most States 18 years of age in case of wills of personal property. In New York in case of personal property the rule is 18 for males and 16 for females. He must be of sound mind and act without undue influence on the part of others. See INSANITY; INFANT; HUSBAND AND WIFE; MARRIAGE.

In general, any property may be disposed of by will. Such limitations as there now are upon such dispositions are properly limitations on the powers of beneficiaries to take, and only indirectly affect the power of giving property by will. (See CHARITABLE TRUSTS, OR CHARITIES.) As a will only takes effect at the death of the testator, it may affect all property acquired by him after its execution as well as before, provided the property falls within the description of the will. Formerly wills were held to affect only the property owned by the testator at the time of execution.

The rules governing the construction of wills, particularly of wills of real estate, are too numerous and complex for discussion here. The most important rule of interpretation is that the intention of the testator as it appears from the will shall be carried out wherever legally possible, and when the will is ambiguous the circumstances surrounding its execution may be examined for the purpose of ascertaining the testator's intention.

A codicil, which is in effect a supplementary will, is to be construed with the will which it supplements. See DEVISE; BEQUEATH; INTERPRETATION; LEGACY.

A will remains revocable until the time of the testator's death. The method of revocation is usually provided for by the statute giving authority to make wills. A will may be revoked by the express language of a subsequent will

or by gifts made by it inconsistent with the earlier will, and generally a will may be revoked by cancellation, tearing, or burning by the testator with intention to revoke it, although a part of a will may not generally be so revoked. The accidental destruction of a will does not affect its validity or efficacy if its contents can be proved. Disposition of his property by the testator before his death in effect works a revocation of his will, and under the earlier statutes marriage of the testator or the birth of a child revoked his will. There are now various statutory rules on this subject. Consult: Jarman on *Wills* (6th Am. ed., Boston, 1893); James Schouler, *The Law of Wills* (5th ed., Albany, 1915); W. P. Borland, *Law of Wills and the Administration of Estates* (Kansas City, 1915). See CONVEYANCE; EXECUTOR; PERSONAL PROPERTY; REAL PROPERTY.

WILLAERT, vĭl'lärt, ADRIAN (c.1480–1562). A Flemish composer, founder of the older Venetian school of composition. He was born at Bruges or at Roulers, West Flanders, studied with Jean Mouton and Josquin Deprés, and in 1516 went to Rome. In 1527 he received the appointment of maestro di cappella at St. Mark's, Venice, where he established a music school. He is known as the originator of the style of writing for two choirs, the idea of which was suggested to him from the two opposed organs at St. Mark's. Among his works are two masses for from four to seven voices; books of motets (1539–45); *Canzone villanesche* (1545); madrigals; vesper psalms; hymns; *Musica nova* (1559); and psalms for vespers and compline (1571).

WILLAMETTE, wĭ-lă'mĕt. A river of western Oregon. It rises in the Cascade Mountains, and flows northward through a fertile and well-settled valley, emptying into the Columbia River after a course of 250 miles (Map: Oregon, B 3). It is always navigable to Portland, about 15 miles, and by means of a canal and lock around the Willamette Falls small steamers can for the greater part of the year ascend it about 150 miles to Eugene.

WILLAMETTE UNIVERSITY. An institution for higher education founded in Salem, Oregon, in 1843, under Methodist Episcopal auspices. The university includes a college of liberal arts, an academy, school of music, and school of law. The total attendance in 1916 was about 312, and the instructors numbered 19. The endowment of the university amounted to about $560,000, the grounds were valued at $200,000, and buildings at $104,500. The library contained about 11,500 volumes. The annual income was about $35,000. The president in 1916 was Carl G. Doney, B.S., Ph.D.

WILLARD, ASHTON ROLLINS (1858–). An American art critic. He was born at Montpelier, Vt., and graduated at Dartmouth College in 1879. He at first practiced law, but subsequently directed his attention to literature and the criticism of art. He published: *The Life and Work of the Painter Domenico Morelli* (1895); *The History of Modern Italian Art* (1898); *The Land of the Latins* (1902). He spent much time in Italy, and in 1902 was created a Chevalier of the Crown of Italy by King Victor Emmanuel III.

WILLARD, EDWARD SMITH (1853–1915). An English actor. He was born at Brighton and made his début upon the stage at Weymouth in 1869. In 1881 he went to London, and with Wilson Barrett at the Princess Theatre played in *The Lights of London*, *The Silver King*, and other well-known pieces. In 1886 he made a hit as *Jim the Penman* at the Haymarket. One of his greatest successes was his production of *The Middleman*, by H. A. Jones, at the Shaftesbury in 1889, he himself creating the part of Cyrus Blenkarn. He came to the United States in 1890 and again in 1896, remaining till 1903, when he had made 13 American tours. In 1906 he retired from the stage, but returned on special occasions, as in 1911 for the gala performance at His Majesty's Theatre, London, to play the part of Brutus in the forum scene from *Julius Cæsar*. Consult W. Winter, *Shadows of the Stage* (New York, 1892).

WILLARD, EMMA C. (HART) (1787–1870). A pioneer in the field of higher education for women, born at Berlin, Conn. In 1803 she became a teacher in the village school; three years later she received a position in an academy at Westfield, Conn., but after a few weeks became principal of an academy for girls at Middlebury, Vt. In 1809 she married Dr. John Willard. In the same year she established at Middlebury a girls' boarding school with improved methods of teaching. Five years later she submitted to Governor Clinton of New York a manuscript entitled *A Plan for Improving Female Education*. The ideas she advanced met with favor, and in 1821 she was able to establish at Waterford, N. Y., a girls' seminary, partly supported by the State. Two years later she removed the school to Troy, where it acquired a wide reputation as the Troy Female Seminary. Afterward, as the Emma Willard School, it was notably prosperous and successful. Mrs. Willard's husband died in 1825, but she continued to manage the institution until 1838, when she placed it in the hands of her son. In 1830 she made a tour in Europe, and three years later published *Journal and Letters from France and Great Britain*. The proceeds from the sale of the book she gave to a school for women that she had helped to found in Athens, Greece. In 1838 she married Dr. Christopher C. Yates, but was divorced from him in 1843. Among her other works are: *The Woodbridge and Willard Geographies and Atlases* (1823); *History of the United States* (1828); *Universal History in Perspective* (1837); *Treatise on the Circulation of the Blood* (1846); and *Last Leaves of American History* (1849). In 1830 she also published a book of poems, of which the best known is *Rocked in the Cradle of the Deep*. Her *Life* was written by John Lord (New York, 1873). In recognition of her services to the cause of higher education for women a statue was unveiled in her honor at Troy in 1895.

WILLARD, FRANCES ELIZABETH (1839–98). An American educator and reformer, born at Churchville, N. Y. She graduated at the Northwestern Female College at Evanston, Ill., in 1859; taught in various Western towns, and in 1866–67 was principal of the Genesee Wesleyan Seminary at Lima, N. Y. After two years of travel in Europe and the East, she became professor of æsthetics at Northwestern University, and dean of the Woman's College there. In 1874 she became corresponding secretary of the Woman's Christian Temperance Union, and from 1879 till her death was its president. Under her guidance the organization of the Union was perfected and its sphere of activity greatly enlarged. In 1882 she became a member of the

executive committee of the Prohibition party; in 1883 she founded the World's Woman's Christian Temperance Union and in 1888 became its president. Besides contributing frequently to the magazines, she wrote a number of books and pamphlets, including: *Nineteen Beautiful Years* (1868); *Woman and Temperance* (1883); and *Glimpses of Fifty Years* (1889). She edited for a time the Chicago *Post and Mail*, and in 1892–98 *The Union Signal* (Chicago), the official organ of the Union. Consult Gordon, *The Beautiful Life of Frances E. Willard* (Chicago, 1898).

WILLARD, JOSEPH (1738–1804). An American clergyman and educator, born in Biddeford, Me., a great-grandson of Samuel Willard (q.v.), who was acting president of Harvard (1701–07). He graduated at Harvard in 1765, and was tutor till 1772, when he became colleague pastor of the Congregational Church at Beverly, Mass. He was president of Harvard from 1781 to 1804. Among his published writings are papers in the *Memoirs of the American Academy* and the *Philosophical Transactions*.

WILLARD, JOSEPH EDWARD (1865–). An American diplomat, born in Washington, D. C. He graduated from the Virginia Military Institute in 1886, studied law at the University of Virginia, and was a captain in the United States Volunteers during the Spanish-American War. He served as a Democratic member of the Virginia House of Representatives (1894–1902), as Lieutenant Governor of Virginia (1902–06), and as State corporation commissioner (1906–10). Appointed Minister to Spain by President Wilson in 1913, he was raised to the rank of Ambassador in the same year.

WILLARD, JOSIAH FLYNT. See FLYNT, JOSIAH.

WILLARD, SAMUEL (1640–1707). A Colonial clergyman. He was born in Concord, Mass.; graduated at Harvard in 1659; was minister at Groton from 1663 to 1676, whence he was driven by the Indians during King Philip's War; was pastor of the Old South Church, Boston, from 1678 until his death; strenuously opposed the witchcraft persecutions in 1692; and was acting president of Harvard from 1701 until his death. He published many sermons, including: *The Duty of a People that Have Renewed Their Covenant with God* (1680); *Brief Animadversions upon the New England Anabaptists' Late Fallacious Narrative* (1681); and *Mourner's Cordial against Excessive Sorrow* (1691). A folio volume entitled *A Compleat Body of Divinity* was published posthumously in 1726.

WILLCOCKS, MARY PATRICIA (1869–). An English novelist. Her publications include: *Widdicombe* (1905); *The Wingless Victory* (1907), which made her widely known; *A Man of Genius* (1908); *The Way Up* (1910); *Wings of Desire* (1912); *The Wind among the Barley* (1912); *The Power Behind* (1912); *The Will to Live* (1913); *Change* (1915).

WILLCOCKS, SIR WILLIAM (1852–). A British engineer. He was educated at Roorkee College at Roorkee, India, was connected with the Indian Public Works in 1872–83 and with the Egyptian Public Works in 1883–97, and projected and designed the Assuan Dam in 1898. In 1911 he was connected with the irrigation works of Mesopotamia. His publications include: *Egypt Fifty Years Hence* (1902); *The Drainage of Lower Egypt* (1912); *The Assuan Reservoir and Lake Mœris* (1914).

WILLCOX, CORNÉLIS DEWITT (1861–). An American army officer and scholar, born at Geneva, Switzerland. He graduated from the University of Georgia in 1880, from the United States Military Academy (1885) and Artillery School (1892), and in 1913 studied at the University of Grenoble. As captain and A. A. G. of volunteers he served in the Santiago campaign in 1898. A member of the general staff corps in 1906–10, he witnessed the German fall army manœuvres in 1907, and was chief of the military information division at Manila, P. I., in 1908–10. In the latter year he became professor of modern languages, with the rank of lieutenant colonel, at West Point, and was promoted colonel in 1914. Besides translating from the Spanish *Letters of Montiano during the Siege of St. Augustine* (1909), and *Spanish Official Account of Attack on Colony of Georgia* (1913), and contributing to the NEW INTERNATIONAL ENCYCLOPÆDIA, he published *A French-English Military Technical Dictionary* (1900; new ed., 1910); *The Head Hunters of Northern Luzon* (1912); *A Reader of Scientific and Technical Spanish* (1913). He helped to found the *Journal of the United States Artillery* (1892), and in 1915 became an editor of the *International Military Digest*.

WILL'COX, ORLANDO BOLIVAR (1823–1907). An American soldier, born in Detroit, Mich. He graduated at West Point in 1847; served under General Scott in the latter part of the Mexican War; became a first lieutenant in the Fourth Artillery in 1850; resigned from the army in 1857; and then began the practice of law in Detroit. He reëntered the service in May, 1861, after the outbreak of the Civil War, as colonel of the First Michigan. In the first battle of Bull Run he was wounded and captured, and was exchanged in February, 1862. He fought at South Mountain, Antietam, and Fredericksburg; commanded the District of Indiana and Michigan for a short time; took part in the operations in East Tennessee in the fall and winter of 1863–64; led a division of the Ninth Corps in the Wilderness and Richmond campaigns; was brevetted major general of volunteers on Aug. 1, 1864; and was the first to break into Petersburg, receiving the surrender of that place. In January, 1866, he was mustered out of the service, but reentered it in the following July as colonel of the Twenty-ninth Infantry. In March, 1867, he was brevetted brigadier general and major general in the regular army for services at Spottsylvania and Petersburg respectively. He reached the regular rank of brigadier general in 1886, and retired in the following year. He published *Shoepack Recollections* (1856) and *Faca: An Army Memoir, by Major March* (1857).

WILLCOX, WALTER FRANCIS (1861–). An American statistician, born at Reading, Mass. He graduated at Amherst in 1884 and at the Columbia Law School in 1887, and studied further at Yale, Berlin, and Columbia (Ph.D., 1891). Thereafter a member of the faculty at Cornell, he became professor of economics and statistics in 1901, and in 1902–07 was also dean of the faculty of arts and sciences. From 1899 to 1901, on leave of absence, he served as one of the five chief statisticians of the twelfth census. He held the presidency of the American Statistical Association in 1911–12 and of the American Economic Association in 1915. Besides essays and magazine articles, and contributions to the NEW INTERNATIONAL ENCYCLOPÆDIA, he published *The Divorce Problem, A Study in*

Statistics (1891; 2d ed., 1897), and *Supplementary Analysis and Derivative Tables*, twelfth census (1906).

WILLCOX, WILLIAM RUSSELL (1863–). An American lawyer and publicist, born at Smyrna, N. Y. He studied at the University of Rochester in 1888, graduated from Columbia Law School in 1889, and after 1890 practiced law in New York City. He was president of the New York Park Board in 1902–03 and postmaster of New York City in 1905–07, and became known for important services as chairman of the New York Public Service Commission (first district) in 1907–15. In 1916 he was appointed chairman of the Republican National Committee, being the personal choice of the presidential candidate, Charles E. Hughes, and also acceptable to Colonel Roosevelt.

WILLE, vĭl'le, JOHAN NORDAL FISCHER (1858–). A Norwegian botanist, born in Haaböl, Smaalenene. After studying in Christiania (Ph.D., 1885), Upsala, Copenhagen, and Berlin, he was professor successively at Stockholm University, at Aas Agricultural College, Norway, and at Christiania, where he was also director of the Botanical Garden and of the Botanical Museum. He reformed the botanical instruction at the university, founded the botanical laboratory, and helped establish the biological station at Dröbak. In the interest of his science he traveled widely in Europe, Asia, the United States, and Central America. Wille contributed to scientific periodicals on algæ, plant morphology, plant physiology, plant anatomy, and plant geography. He lectured at the quarter century of the Missouri Botanical Garden at St. Louis in 1914, and in other large American cities, including New York. By the New York Botanical Garden and Museum he was sent to Porto Rico to study algæ (1914–15).

WILLEMITE, wĭl'ĕm-īt (named in honor of William I, Dutch *Willem I*, King of Holland). A mineral zinc silicate crystallized in the hexagonal system. It has a resinous lustre, and is of various shades of light yellow, green, red, and brown in color. It is found in Prussia, in Greenland, and with the zinc deposits in Sussex Co., N. J., where it occurs massive and also intimately mixed with franklinite and zincite. The transparent specimens from New Jersey have been cut as cabinet gems. The reddish-colored crystals found in New Jersey are known as *troostite*.

WILLEMS, vĭl'ĕms, FLORENT (1823–1905). A Belgian genre painter, born in Liége. He was a pupil of the Mechlin Academy, but formed his art chiefly after Terborg and the old Dutch masters, famous for their minute execution. In 1844 he removed to Paris, where he received many medals and other honors. He is well known in the United States, good examples of his works being in the Metropolitan Museum (New York), the Art Institute of Chicago, and other public and private collections. His favorite subjects are taken from the seventeenth century. They show proficiency in line, but are hard and dry in color.

WILLEMS, JAN FRANS (1793–1846). A Flemish philologist, historian, and poet. He was born at the village of Boechout, near Antwerp, and at the age of 12 was sent to the town of Lierre, to learn singing and music. His talents attracted the notice of several influential persons there, through whose agency he was sent to Antwerp, to study in the office of a notary; and in 1812 he won the prize awarded for the best poem on the battle of Friedland and the Peace of Tilsit. From this period his poetical and dramatic compositions followed each other in rapid succession. His ode *Aen de Belgen*, which appeared in 1818, in which he exhorted his countrymen to resume the use of their native Flemish, and his treatise *Over de nederduitsche taal en letterkunde* (1819–24), in which he traced the history of the Flemish and Dutch tongues from their common origin through their gradual but slight divergences, mark an epoch in the literary history of Belgium. The Dutch government gave him the post of keeper of the archives at Antwerp, but the Catholic party in Belgium, resenting the attempt made by Willems to attribute the decline of Belgian national renown to the abandonment of the Flemish vernacular, looked upon his writings with mistrust; and in 1830, when Belgium was definitely separated from Holland, the dominant Belgian party deprived Willems of his office. In 1835 he was, however, promoted to the place of keeper of the archives at Ghent, where he continued to reside until his death. Among the numerous Flemish works published by Willems, special notice is due to his version of the mediæval poem of *Reinaert de Vos*, while among the more important of his strictly national works were his editions of the rhymed chronicles of Jan Van Helu (1836) and Jan de Klerk (1840), *De brabantsche Yeesten* (1839–43), and his *Mengelingen van vaderlandschen Inhoud*, and his posthumous *Oude Vlœmsche liederen* (1848); *Brieven* (1874); and *Keus van dicht- en prozawerken* (1875). He founded and edited the quarterly *Belgisch Museum voor de Nederlandsche taal- en letterkunde* (10 vols., 1837–46). Biographies of Willems have been written by Snellaert (Ghent, 1847) and Rooses (Antwerp, 1874). Consult also Rooses, Buylsteke, and Bergmann, *Jan Frans Willems* (Ghent, 1893).

WILLEMSTAD, vĭl'ĕm-städ. The capital of the island of Curaçao (q.v.).

WIL'LENHALL. A manufacturing town in Staffordshire, England, 3 miles east of Wolverhampton. It has iron foundries, and metal works of all kinds. The town's industrial importance dates from the reign of Elizabeth. Pop., 1901, 18,513; 1911, 18,884.

WILLESDEN, wĭlz'den. A town in Middlesex, England, a suburb of London, 7 miles west-northwest of St. Paul's (Map: London, D 5). Dollis Hill House was the occasional residence of William E. Gladstone. Public libraries, several parks and recreation grounds, and an isolation hospital are maintained. Pop., 1901, 114,815; 1911, 154,214.

WIL'LET (so called in imitation of its cry) A large North American snipe or tatler (*Symphemia semipalmata* or *Catoptrophorus semipalmatus*), with long wings and long strong legs, making the bird tall and a fast flyer; it measures about 15 inches in length. It is dark ash color above, spotted with brown, and white on the rump and under surface. It resides in the Southern States, breeding as far north as New Jersey or occasionally farther; and in the fall is seen in flocks along the seacoast, where it is a favorite object of sport. Cf. YELLOWLEGS.

WIL'LETT, MARINUS (1740–1830). An American soldier, born at Jamaica, N. Y. During the French and Indian War he served as a lieutenant in the Ticonderoga and Fort Frontenac expeditions, and subsequently became promi-

nent as a leader of the Sons of Liberty (q.v.) in New York City. He entered the Continental army in 1775, accompanied Montgomery to Canada, served in the vicinity of New York in 1776, and, as second in command (under Ganse-voort) at Fort Stanwix (then Fort Schuyler), distinguished himself and earned the thanks of Congress by making a brilliant sortie (Aug. 7, 1777) against the besieging enemy. He then penetrated the British lines and procured re-enforcements, under Arnold, from General Schuyler, then facing Burgoyne near Stillwater. By successive promotions he attained the rank of colonel in December, 1779. In 1779 he accompanied Sullivan's expedition against the Iroquois, and in 1780–83 commanded the New York militia in the Mohawk valley, making the last attack of the war on the British at Oswego, in February, 1783. After the war he was a member of the New York Assembly in 1783–84, was sheriff of New York from 1784 to 1792, and was Mayor of New York City in 1807–08. Consult *A Narrative of the Military Actions of Col. Marinus Willett* (1831), by his son William M. Willett.

WILLETTE, vē'yĕt', ADOLPHE (1857–). A French lithographer and painter. Born at Chalons, he studied painting with Cabanel, and was somewhat influenced by the lithographer Jules Chéret, with whom he worked. He is most important as a lithographer. His very original art is fantastic, delicate, youthful, dreamy; he is thoroughly Gallic, an artistic descendant of Watteau, Boucher, and Fragonard. His subjects are in a light vein, Pierrots and Pierrettes, impudent little Parisiennes, and quaint allegorical creatures. He figured in most lithographic productions of his day, especially in *Le Chat Noir* and *Le Courrier Français*, and designed many posters and book covers, notably the cover for Arsène Alexandre's *L'Art du Rire*, besides many political cartoons, intended to aid his own political aspirations. He exhibited a number of paintings in the academic style, but is more important for decorations in various private houses and in the Hôtel de Ville, Paris. He exhibited in the old Salon, and became an officer of the Academy.

WILLETTS POINT. See FORT TOTTEN.

WILLEY, ARTHUR (1867–). A British zoölogist, born at Scarborough and educated at University College, London, and at Cambridge, where he was Balfour student (1894–99). Afterward he was successively lecturer in biology at Guy's Hospital, director of the Colombo Museum, Ceylon (being also marine biologist to the Ceylon government in 1907), and, from 1910, Strathcona professor of zoölogy at McGill University, Montreal, Canada. He published *Amphioxus and the Ancestry of the Vertebrates* (1894); *Convergence in Evolution* (1911); and edited *Zoological Results* (1898–1902).

WILLIAM I, THE CONQUEROR (c.1027–87). King of England from 1066 to 1087. He was an illegitimate son of Robert II, Duke of Normandy, by Herleva, or Arlette, a tanner's daughter, and in early life was known as William the Bastard. When Duke Robert set out on his pilgrimage to the Holy Land in 1034 he caused William to be chosen by the nobles as his successor, and on Robert's death in 1035 William became Duke of Normandy. Rebellions broke out almost immediately, and attempts were made to seize the person of the young Duke. These rebellions continued during the whole time of his minority, the most serious taking place in 1047. In that year, in alliance with the French King, Henry I (q.v.), William won a brilliant victory over the rebels at Val-ès-dunes. In 1051 William visited Edward the Confessor (q.v.) in England, and probably was promised the English crown after Edward's death. During the succeeding years until 1060 William was engaged in very frequent warfare with the King of France, the Count of Anjou, and some of his own subjects, but he succeeded in establishing his authority firmly, and by 1063 gained full possession of Maine. In 1061 he had established the curfew (q.v.) in Normandy, whence later it was carried over into England.

About 1064 Harold, Earl of Wessex, appears to have spent some time in Normandy, perhaps after a shipwreck which placed him as a prisoner in the hands of the Normans. According to the Norman chroniclers, whose story is discredited by Freeman, Harold took an oath to aid William in securing the English crown on the death of Edward the Confessor. On Edward's death Harold was chosen King of England and was crowned by the Archbishop of York (1066). William had determined that the crown of England should be his, and at once proceeded to claim it, although he had no valid claim whatever. He pretended to be the rightful heir by Edward's bequest and through the failure of Harold to abide by his sworn engagements. Through the agency of Hildebrand, later Gregory VII, he obtained the sanction of the Pope for the conquest of England, on the ground that Harold was guilty of perjury. He collected an army made up in part of volunteers from France and Flanders, and landed in England on Sept. 28, 1066. The size of his army is not known, the most reliable estimates varying from 25,000 to 60,000. At the same time the English had to face an onslaught by the Norwegians. On October 14 William won the battle of Hastings (q.v.), or Senlac, in which Harold was slain. After wasting the whole country about London he finally secured his admission into the city, and on December 25 was crowned King at Westminster, after having been duly elected by the Witan. Five more years of ravaging and fighting completed the conquest of England, the revolt under Hereward (q.v.) being put down only in 1071. In 1070, in order to make all further resistance impossible, he laid waste the whole Vale of York. Many thousand people were killed or perished from starvation. In 1072 he invaded Scotland and received the homage of Malcolm Canmore. See MALCOLM.

During the next 10 years William divided his time between Normandy and England. He was compelled to carry on war against the Count of Anjou, the French King, and his own son Robert. In 1075 a serious revolt occurred in England, where the two most powerful earls had plotted treason. After subduing them, William put to death Waltheof, the last earl of purely English stock. About 1076 William created the New Forest in the southwest of Hampshire. In 1082 he imprisoned his brother, Odo, Bishop of Bayeux, whom he had made Earl of Kent and had left as his regent in England during his absences. He retained him in captivity almost until the time of his own death. In 1085 he prevented an invasion by Canute the Saint (q.v.), and in the same year ordered a survey of England. (See DOMESDAY BOOK.) In 1086 he required all vassals of mesne lords, as well as direct vassals, to do fealty to him, thus introduc-

ing into England the Norman custom by which the Duke had direct authority over all his subjects. This was the most important feudal innovation that William made in England. In 1087, while waging war against Philip I of France, he received an internal injury, and died September 9.

William was a man of remarkable ability, and owed his success almost entirely to his own exertions. He ruled strictly and kept excellent order, but he was unscrupulous and merciless in punishing any opposition to his own will. He confiscated all of the land held by his opponents under the pretext of law, as he considered them traitors, and he extorted very heavy fines on all possible occasions. The taxation also bore very heavily upon his subjects. He was religious and blameless in his private life. Although very liberal to the Church, he ruled absolutely over its officials, and refused to give up to the papacy anything which he regarded as a royal prerogative. In 1076, when Gregory VII demanded of him fealty and the payment of Peter's pence, he sent the latter, but refused to hold his kingdom as a fief from the papacy. In his later years he became tyrannical and avaricious. His tyranny was all the more oppressive because it was cloaked with a pretense of law, and he accomplished his purposes by legal subtleties, maintaining as far as possible the old English customs, which he shaped to suit his own wishes. In his later years he was often called William the Great. His wife was Matilda, heiress of the Count of Flanders. Their marriage was long delayed because forbidden by Leo IX (q.v.) on account of consanguinity; but it took place in 1053 in spite of the opposition of the Pope. Finally, in 1059 William secured a papal dispensation sanctioning his marriage. He had four sons and five daughters. The eldest of the sons died before his father; of the others, Robert inherited the Duchy of Normandy, William the Kingdom of England, and Henry, who was later King of England, a considerable sum of money.

Vinogradoff, *English Society in the Eleventh Century* (Oxford, 1908); F. M. Stenton, *William the Conqueror* (New York, 1908).

WILLIAM II RUFUS (c.1056–1100). King of England from 1087 to 1100. He was the third son of William the Conqueror, and was educated by Lanfranc (q.v.), Archbishop of Canterbury. William was the favorite son of his father, who, after having recommended him to the barons and prelates as successor to the crown, sent him to England the day before he himself died. Landing at Dover, William presented himself to Lanfranc, who brought him before the nobles and prelates as their King. No opposition was offered, and William was crowned on Sept. 26, 1087. But in less than three months his uncle, Odo, headed a rebellion in favor of the King's brother, Robert (q.v.), Duke of Normandy, who was considered less stern. William put down the rebellion by the aid of his English subjects, and in revenge he invaded Normandy in 1090. Peace was made in 1091 and Robert and William then turned their united arms against their brother Henry, later Henry I (q.v.), who had purchased from Robert the district of Cotentin. The fortune of war went against Henry, who was driven into exile. Returning to England, William's next enterprise was an invasion of Scotland, whose King did homage to him. In 1094 he again invaded Normandy, but accomplished little. William was recalled to England by disturbances in Wales and in the North. In the year 1096 Robert, who had resolved to go to Palestine, pledged his Duchy of Normandy to William for 10,000 marks. In 1098 William attempted to conquer Maine, but was only partially successful. He was shot while hunting in the New Forest, Aug. 2, 1100. It is not known by whom the arrow was shot, or whether it was done accidentally. William was a stern ruler and was feared by his subjects. His justiciar was the notorious Ranulf Flambard (q.v.). His private life was extremely immoral. After Lanfranc's death in 1089 he oppressed the Church. In February, 1093, he was ill, and, fearing death, became repentant. Then he consented to the appointment of Anselm (q.v.) to the see of Canterbury, left vacant by Lanfranc's death, but, soon recovering, he fell back into his evil ways. From this time he was in constant strife with Anselm, and in 1099 was threatened by the Pope with excommunication. When he was buried at Winchester no religious services were held. The English chronicle says "he was loathsome to well-nigh all his people, and abominable to God." Consult: E. A. Freeman, *History of the Norman Conquest*, vol. v (Oxford, 1876); id., *William Rufus* (2 vols., ib., 1882); J. H. Round, *Feudal England* (London, 1895).

WILLIAM III (1650–1702). King of England, Scotland, and Ireland from 1689 to 1702. He was the posthumous and only son of William II of Orange, Stadtholder of the United Netherlands. His mother was Mary, eldest daughter of Charles I of England. He was born at The Hague on November 14 (old style, Nov. 4), 1650. The ambitions of the elder William to increase the power of the Stadtholder had aroused an aristocratic reaction under Jan De Witt (q.v.) which created much trouble for the young prince. The alliance of his family with the Stuarts excited the jealousy of Oliver Cromwell, by whose influence William and his descendants were excluded, in 1654, from the Stadtholdership. The restoration of the Stuarts to the English throne, however, caused the revocation of this act, and on the invasion of Holland by Louis XIV of France in 1672 William was elected Stadtholder, Captain-General, and Admiral. By the wisdom and determination of the young Stadtholder the contest with France was brought to a close by the Treaty of Nimeguen (q.v.) in 1678. Before the close of the war he had married his cousin, the Princess Mary, eldest daughter of the Duke of York, who became King James II (q.v.) of England in 1685. As the tyranny of James soon began to estrange the affections of every class of his subjects, the eyes of all were turned towards the Stadtholder as their only hope. Accepting an invitation signed by seven representative leaders of the two English parties, William with an army of 15,000 English and Dutch landed at Torbay, Nov. 5, 1688. His success was rapid and bloodless, and on December 18 he entered London as a national deliverer. On Feb.

13, 1689, William and Mary, after accepting the Declaration of Rights, were proclaimed King and Queen of England. The adherents of James held out for some time in Scotland and Ireland. The death of Dundee (see GRAHAM, JOHN) in 1689 ended their resistance in the former country, but in the latter they kept up a vigorous contest until the battle of the Boyne (July, 1690) broke the power of the Jacobites. William was now able to combat Louis XIV with the united forces of England and Holland. He himself took the field in the Belgian Netherlands, but was unable to cope with Marshal Luxembourg, who defeated him at Steenkerke in 1692 and at Neerwinden in 1693. Reluctantly he signed the Peace of Ryswick (1697), which, however, proved highly popular. In spite of his sterling qualities, and of the debt which they owed him, the English never really liked William III. The death in 1694 of his wife, on whom the crown had been conferred jointly with himself, materially injured his position. His schemes were thwarted by Parliament and continual plots for his assassination were hatched by the adherents of James. The succession of Philip of Anjou to the throne of Spain on the death of Charles II in 1700, tending to the aggrandizement of France, was a blow to William's policy. He persevered with unflagging vigor in his determination to unite Europe against France, and he left England at the head of the Grand Alliance. (See SUCCESSION WARS.) He died on March 19 (old style, March 8), 1702, in consequence of a fall from his horse. The massacre of the Macdonalds of Glencoe (q.v.) is a blot on William's reputation which his most thoroughgoing apologists have been unable to efface. His services, however, both to England and to his native country can hardly be overrated. In his reign the Bank of England was founded, the modern system of finance introduced, ministerial responsibility recognized, and the liberty of the press secured. William's manner was wholly Dutch, and even his countrymen thought him blunt. "In his intercourse with the world in general," says Macaulay, "he appeared ignorant or negligent of those arts which double the value of a favor, and take away the sting of a refusal."

See FRANCE; NETHERLANDS.

WILLIAM IV (1765–1837). King of Great Britain and Ireland from 1830 to 1837. He was the third son of George III, and was born at Buckingham Palace on Aug. 21, 1765. At the age of 14, after receiving an elementary education, he entered the navy as an able seaman and was made lieutenant in 1785. In 1786 he received his commission as captain. In 1780 he was created Duke of Clarence and of St. Andrews, and Earl of Munster. At this time he abandoned active naval service, but was formally promoted through the successive ranks until he was made admiral of the fleet in 1811. For many years he lived with Mrs. Jordan (q.v.), a celebrated actress, by whom he had a family of five sons and five daughters, who became known by the surname FitzClarence, and were raised to titular dignities. In 1818 he married Adelaide, eldest daughter of the Duke of Saxe-Meiningen. The issue of this marriage was two daughters, both of whom died in infancy. By the death of his brother, the Duke of York, in 1827, the Duke of Clarence became heir presumptive to the throne, to which he succeeded on the death of George IV, on June 26, 1830. He was mentally incapacitated for the kingly office, but government by the Ministry was now well developed, so that his eccentricities could do no mischief. His utter inability to understand the fitness of things and his incoherence of thought gained for him the name of Silly Billy. So far as William had political sentiments, he probably sympathized with the efforts of his ministers to bring about the reform of Parliament. Although he at first refused to create a new batch of peers to overcome the majority opposed to the Reform Bill (see REFORM BILLS) he finally consented to apply this extreme remedy in case of necessity. Overawed by the threat, the lords passed the bill on June 4, 1832, and three days afterward it received the royal assent. This was the great event of his reign. The first reformed Parliament met on Jan. 29, 1833. The abolition of colonial slavery, and the reform of the poor laws and of the Irish church, were the immediate results of the great constitutional change. King William died after a short illness on June 20, 1837, and was succeeded by his niece, Victoria.

Consult: P. H. Fitzgerald, *Life and Times of William IV* (2 vols., London, 1884); Walpole, *History of England from the Conclusion of the Great War in 1815* (5 vols., London, 1878–86); J. F. Molloy, *The Sailor King, William, the Fourth* (2 vols., London, 1903).

WILLIAM I (Ger. WILHELM) (1797–1888). King of Prussia and German Emperor. He was the second son of Frederick William III of Prussia and Queen Luise, and was born March 22, 1797. He took part in the campaigns of 1814 and 1815 against Napoleon. On the accession of his elder brother, Frederick William IV (q.v.), to the Prussian throne in 1840, William received the title of Prince of Prussia and became Governor of Pomerania. His Absolutist attitude provoked such popular enmity that on the outbreak of the revolution of 1848 he had to flee to England. He returned some months later, and was elected to the Prussian National Assembly, where in a brief address he placed himself on record as favoring a constitution, but took no further part in the discussion. In 1849 he commanded the Prussian forces sent to put down the revolutionists in the Palatinate and Baden. In October, 1857, the King having become mentally incapacitated, William assumed charge of the government temporarily, and in October, 1858, became Regent. While Regent he contended steadily, against the opposition of the Diet, for the reorganization of the Prussian army. On the death of his brother, Jan. 2, 1861, William became King of Prussia, and at his coronation, at Königsberg, October 18, he declared that he "ruled by the favor of God, and of no one else." The result of the elections to the Prussian Diet being in favor of the Liberal party, William declared in his address at the opening of the chambers that he "never could permit the progressive development of our inner, political life to ques-

tion or to endanger the rights of the crown and the power of Prussia." This principle he maintained and the contest over the army continued. At last, in 1862, he found Bismarck a Minister who was able to govern without a parliamentary majority. The struggle between the King and the Liberal majority in the chambers was thrown into the background at the close of 1863, by the strategy of Bismarck, who made Prussia champion the cause of Schleswig-Holstein against Denmark—an intervention in which Austria was forced to participate—and, contriving to make the Schleswig-Holstein question one of German interest, silenced, for the time being, the Liberal opposition in Prussia. In 1866 came the war between Prussia and Austria, in which the King took the field as commander in chief of the Prussian forces. William became the head of the North German Confederation in 1867. At Ems, in July, 1870, took place the memorable interviews between William and the French ambassador, Benedetti, which resulted in the sending of the famous Ems Dispatch to Bismarck. Bismarck's tinkering with this telegram precipitated the outbreak of the Franco-German War (q.v.). William was at the head of the united German army, and commanded personally at the decisive battles of Gravelotte and of Sedan. On Jan. 18, 1871, he was proclaimed German Emperor in the palace of the French kings at Versailles. On March 21 he opened in Berlin the first Reichstag of the new German Empire. (For the events of his reign as German Emperor, see GERMANY, BISMARCK, KULTURKAMPF, SOCIALISM, and POLITICAL PARTIES, section on *Germany*.) In 1878 two attempts were made on the life of the Emperor. The second time he was seriously wounded. These attempts were attributed, directly or indirectly, to Socialist influence. William married, June 11, 1829, the Princess Augusta of Saxe-Weimar, by whom he had two children. The son, Frederick William, succeeded his father as Frederick III (q.v.).

WILLIAM II (FRIEDRICH WILHELM VICTOR ALBERT) (1859–). German Emperor and King of Prussia, son of Emperor Frederick III and Victoria, Princess Royal of Great Britain. He was born in Berlin, Jan. 27, 1859. At the age of 14 he entered the Gymnasium at Cassel, and three years later he began to take courses at the University of Bonn, where he specialized in law and political science. In 1881 Prince William married Princess Auguste Victoria of Schleswig-Holstein-Sonderburg-Augustenburg. Of their children the Crown Prince Friedrich Wilhelm (see WILLIAM, CROWN PRINCE OF GERMANY) was born in 1882, Eitel Friedrich in 1883, Adalbert in 1884, August Wilhelm in 1887, Oscar in 1888, Joachim in 1890, and Princess Victoria Luise in 1892. The future Emperor never displayed great affection for either of his parents, but he showed unbounded admiration for his grandfather, Emperor William I. On the death of his father he succeeded to the throne of Prussia and became German Emperor, June 15, 1888, at the age of 29. He soon gave evidence of a restless and active mind, a versatility, and a self confidence that were in strong contrast with the character of his father and grandfather. The motto which he adopted while still a school boy, "*Rast' ich so rost' ich*" (If I rest, I rust) gives the keynote to his restless energy.

At the outset of his reign he asserted unmistakably his divine right to rule in fact as well as in name. He sincerely believed in the divine mission of the house of Hohenzollern. "It is a tradition of our House" he said on one occasion, "to consider ourselves as designed by God to govern the peoples over which it is given us to reign." It was evident that a man of such a character would not be willing long to remain a mere passive tool in the hands of the great Chancellor Bismarck, who had completely dominated the reign of his grandfather, William I. From the beginning friction developed between the Iron Chancellor and the Emperor. The break finally came in March, 1890, when Bismarck disputed the right of the Emperor to act directly through any of his ministers except the Chancellor. This statement resulted in a demand for Bismarck's resignation. In the letter accepting the resignation, the Emperor referred to the event as "ordained by God; so I have to bear it even though I sink under the load." There was no successor to Bismarck. The four men, Caprivi (1890–94), Hohenlohe (1894–1900), Von Bülow (1900–09), and Bethmann-Hollweg (from 1909), who have occupied the office of Chancellor have been simply the Emperor's servants. The Imperial will has been the decisive factor in both foreign and domestic policies.

In foreign affairs, William II continued the policy of Bismarck in maintaining the Triple Alliance (q.v.) with Austria and Italy. He abandoned, however, Bismarck's efforts to maintain a close understanding with Russia. He entered energetically the sphere of "Weltpolitik" and determined to obtain for Germany a "place in the sun." With this end in view he encouraged German colonial expansion, cultivated friendly relations with Turkey, and pushed German commercial and financial interests in Asia Minor. To defend these new interests the Kaiser felt that it would be necessary to build a great navy. With the declaration that "Germany's future is upon the waters," he turned with characteristic energy to the development of the German fleet, which soon took rank with that of the first naval powers.

In the internal development of Germany the Emperor pursued a policy which shows strange contradiction in his obstinate adherence to much of the past and his quick sensitiveness to many aspects of modern life. On the one hand he encouraged schools and universities, and a modern industrial régime, and on the other hand vigorously upheld the antiquated Prussian electoral system and the Divine Right Kingship. The rapid transformation of Germany from an agricultural into an industrial state brought with it the many serious problems of the relations of capital and labor. Discontent among the laboring classes led to the rapid development of the Socialist party in Germany. At the beginning of his reign the Kaiser hoped to be able to check this movement by continuing the policy of state Socialism which had been inaugurated by Bismarck (q.v.). By adopting measures to ameliorate the condition of the working classes,

he hoped to eliminate the discontent of the workers. At his suggestion an international labor conference was held at Berlin and he attended its sessions. It soon became apparent that this attempt to stop the growth of the Socialist movement by paternalistic interest in the working classes was a failure. The Socialist party grew steadily until it became the largest political group in the Empire, constituting more than one-third of the electorate. This failure to appreciate his well-meant efforts was bitterly resented by the Emperor. He referred to the Socialists as "a horde of men unworthy to bear the name of Germans." On another occasion he said "if the schools did what we have the right to expect from them they would have undertaken the struggle against Socialism." He refused to allow any modification of the grossly unjust representation in the Reichstag, because such a change would increase the representation of the Social Democratic party (see SOCIALISM).

His impetuous spirit and natural gift of eloquence frequently betrayed him into difficult situations. One of these occasions arose in 1908 when the London *Daily Telegraph* published an interview with the Kaiser in which he commented with great freedom upon the relations of Great Britain and Germany. A violent popular protest was made in Germany against such irresponsible utterances of the Emperor, which might involve Germany in serious trouble with foreign countries. In the newspapers and in the Reichstag, persons of all shades of party affiliation censured the Kaiser's action. Demands were made that thereafter all statements of the Emperor on public questions should be approved by the Chancellor. With the consent of the Emperor, the Chancellor stated that "His Majesty would observe thenceforth in his private relations that reserve which is as indispensable for a continuous policy as for the authority of the crown."

Emperor William from the beginning of his reign emphasized his dependence upon the army. In his first proclamation after his accession he said of the army, "We are made for one another and we shall remain closely bound together whether God gives us peace or war"; and on another occasion, "It is the soldier and the army and not the majorities and Parliamentary decisions, that have forged the unity of the German Empire. It is on the army that my confidence rests."

His public speeches display much rhetorical impulsiveness but frequently lack depth of thought and consistency. For many years he interested himself in art and literature. He was personally responsible for the *Sieges-Allee*, or Avenue of Victory in Berlin, with its marble statues of the Hohenzollerns, and he suggested the designs of many of the other statues in Berlin. He opposed strenuously the realistic movement in German literature represented by Hauptmann and Sudermann and the newer tendencies in art represented by Böcklin, Liebermann, and others.

An accomplished pianist, he took an active interest in musical productions, and for many years he devoted attention to the theatre, showing a special liking for brilliant historical pageants. He spoke freely and at length on the subject of education, with especial regard to the advancement of technical and scientific education. While of a deeply religious nature and head of the Lutheran church, he never displayed religious bigotry, but frankly admired Pope Leo XIII and deplored the anti-Catholic policy of Bismarck.

Those who came into close personal contact with the Emperor have agreed as to his magnetic personality. His keen curiosity, his unbounded enthusiasm and energy impressed every one, and despite his somewhat irritable nature he often gave evidences of a kindly and generous spirit. On the death of Marshal McMahon he sent a sympathetic letter to the widow and a similar message went to Madame Carnot at the time of her husband's assassination.

Whatever may be the verdict of history in regard to the influence of this remarkable personality upon the destinies of his country and Europe, there is little question that he will be considered the ablest, most energetic, and most interesting sovereign of his time. For Emperor William's relation to the great European War see WAR IN EUROPE.

WILLIAM (FRIEDERICH WILHELM VICTOR AUGUST), CROWN PRINCE OF PRUSSIA AND OF GERMANY (1882–). The son of William II, German Emperor, and King of Prussia, and of the Empress Auguste Victoria, he was born at Potsdam and was educated at the University of Bonn. In 1903, with his brother Eitel Friedrich, he traveled in the Orient and in Italy, and in 1910–11 visited India with the Crown Princess, Cecilie Auguste Marie (born 1886)—he had married in 1905 a daughter of the Grand Duke Friedrich Franz III of Mecklenburg Schwerin. The eldest of their sons, Wilhelm Friedrich, was born in 1906. The Crown Prince frequently seemed to be at swords' points with his father the Kaiser. Late in 1913 he was removed from the command of the Death's Head Hussars, and he was bitterly attacked by Radicals and Socialists in the Reichstag and in the press for siding with Colonel Von Reuter, who was on trial for firing on an Alsatian crowd. In the great war which began in 1914 the Crown Prince played a prominent part in the campaigns around Verdun. He commanded the unsuccessful attempt to break through that fortress in 1914 and again commanded the titanic offensive waged against it in the early months of 1916. (See WAR IN EUROPE.) He wrote *Aus meinem Jagdtagebuch* (1912). Consult Paul Liman, *Der Kronprinz* (Minden, 1914), and A. G. Gardiner, *The War Lords* (New York, 1915).

WILLIAM I. Landgrave (as such William IX) and later Elector (William I) of Hesse-Cassel. See HESSE-CASSEL.

WILLIAM II. Elector of Hesse-Cassel. See HESSE-CASSEL.

WILLIAM I (1772–1843). The first King of the Netherlands. He was the son of William,

the last Stadtholder of the Dutch Republic, and was born at The Hague, Aug. 24, 1772. He commanded the Dutch army in 1793–95 in the war with France, and after the conquest of his country he went to Berlin. His father in 1802 bestowed upon him the Principality of Fulda, with other districts, but they were taken from him in 1806 because of his refusal to join the Rhenish Confederation. In the same year he succeeded to the hereditary possession of the House of Nassau-Dietz through the death of his father. He held a high commission in the Prussian army, was captured at Jena, and upon his release entered the Austrian service. After the battle of Wagram (1809) he went to Berlin, and in 1813 he returned to Holland, where he was received as legitimate ruler by the people. In accordance with the Act of the Congress of Vienna constituting Belgium and Holland the Kingdom of the Netherlands, he was proclaimed ruler of the new kingdom March 16, 1815. His hereditary possessions in Germany were transferred to Prussia, and he received in lieu thereof the Grand Duchy of Luxemburg. Belgium revolted in 1830 and achieved its independence in 1832. King William protested ineffectually and obstinately refused to recognize the settlement, which was recognized by the Powers, provoking much bitter feeling. Finally he abdicated, Oct. 7, 1840, took the title of Count of Nassau, went to Berlin, where he married the Countess d'Oultremont in 1841, and died Dec. 12, 1843. His first wife, whom he married in 1791, was Frederike Luise Wilhelmine, daughter of Frederick William II of Prussia.

WILLIAM II (1792–1849). King of the Netherlands from 1840 to 1849. He was the son of King William I and was born at The Hague, Dec. 6, 1792. He studied at Berlin and Oxford, and in 1811 joined the English army in the Peninsular War. He served as adjutant and colonel on Wellington's staff, distinguishing himself at Fuentes de Onoro, Ciudad Rodrigo, and Badajoz, Salamanca, and Vitoria, and in the battles of the Pyrenees. On the return of the Orange family to the Netherlands William I made him commander of the army. The last campaign of Napoleon brought the Prince again into active service, and he was wounded at Quatre-Bras and Waterloo. He married, Feb. 26, 1816, Anna Pavlovna, youngest sister of the Emperor Alexander I of Russia. When the Belgian Revolution broke out in 1830 he was called again into public life, and, as governor of the loyal districts, tried by concessions to allay the storm. On the abdication of William I (1840) the Prince of Orange assumed the reins of government as William II. The political movements of 1848 were felt in the Netherlands, as in other countries, and the ministerial plans of reform not having satisfied the party of progress, the King announced his willingness to sanction whatever changes in the constitution were thought necessary, and the storm was averted. The new constitution was proclaimed Nov. 3, 1848. William II died March 17, 1849.

WILLIAM III (1817–90). King of the Netherlands from 1849 to 1890. He was born at The Hague, Feb. 19, 1817, and succeeded to the throne on the death of his father, William II, in 1849. He married, June 18, 1839, Princess Sophie of Württemberg. The kingdom enjoyed uninterrupted peace during his reign; material prosperity increased, and the public debt was considerably reduced. By his first wife William had two sons, neither of whom survived him; his second wife, Princess Emma of Waldeck, gave birth to a daughter, Wilhelmina, who succeeded him as Queen. He died Nov. 23, 1890. Consult Ling, *William III, König der Niederlande* (Luxemburg, 1889).

WILLIAM I (the SILENT). Prince of Orange, Count of Nassau (1533–84). Leader of the revolt of the Netherlands against Spain. He was the eldest son of William, Count of Nassau-Dillenburg, and was born at Dillenburg, April 16, 1533. In 1544 he inherited from his cousin, René of Nassau, the Principality of Orange. On his succession to the family estates in the Low Countries, he was sent to the Queen Regent's court at Brussels and brought up in the Catholic faith. At the age of 15 he became page to the Emperor Charles V, who in 1555 promoted him to the command of the Imperial army on the French frontier. Charles V on his abdication recommended William to his son, Philip II, who employed him in the negotiation of the Treaty of Cateau-Cambrésis with France (1559). On returning to the Low Countries he became the leader of the party which devoted itself to the assertion of the liberties of the country, agitated for the recall of the Spanish troops, and finally entered into open opposition to Cardinal Granvella (q.v.), the president of the council and the willing agent of Philip's tyranny. The King, nevertheless, proceeded to more extreme measures, the edicts against heretics being made still more stringent. William steadily refused to allow these enactments to take effect in his provinces of Holland, Zealand, and Utrecht, of which he had been made Stadtholder. Up to Alva's arrival as Governor (1567) William had labored conjointly with Hoorn and Egmont, but, failing to convince his two associates of the duplicity of the King, of which he himself was assured by means of the spies in his pay at the Spanish Court, he was compelled to leave them to their fate, and retired to his German estates. Cited as a rebel, he refused to appear, on the ground of being a Knight of the Golden Fleece and a sovereign prince, and was outlawed.

William now became convinced that the only means of resisting the Spanish tyranny was by force. An army under his brother Louis of Nassau gained some success, but was finally driven from the country. William in person invaded Brabant, but failed to effect anything of importance, for lack of means. In 1569 he went to France to aid the Huguenots, and later (1572) made an unsuccessful attempt to relieve his brother Louis, who was besieged by Alva in Mons. In the same year the provinces of Holland, Zealand, Gelderland, Overyssel, and Utrecht proclaimed him as their Stadtholder for the King, whose authority he and they still acknowledged. The fortune of the Spaniards on land, however, was in the ascendant, fortress after fortress fell into their hands despite William's utmost efforts to relieve them, and though Holland and Zealand still remained faithful he found it impossible to raise an army which could fairly cope with the enemy. In April, 1574, Louis and Henry of Nassau were defeated and slain in the battle of Mooker-Heide. William succeeded, however, in rescuing Leyden from the terrible fate which had befallen Haarlem. It was at this period that William openly professed himself a Calvinist, though he disclaimed the fanaticism which characterized his coreligionists and continually urged Calvinists and Lutherans

to harmonize their differences. In October, 1575, the provinces of Holland and Zealand pronounced Philip's deposition, and gave power to William to choose the country under whose protectorate they were to be placed. Meantime, the rapacity of the Spanish soldiery had roused the 15 provinces which still remained loyal to Philip, and the league known as the Pacification of Ghent (October, 1576), the object of which was to drive out the Spanish troops, and establish, at least for a time, toleration in religion, was the consequence. This was a brilliant success for William, and Don John of Austria, the new Governor, was compelled to ratify the Pacification by the Perpetual Edict (Feb. 12, 1577). Owing, however, to the Spanish monarch's lack of faith war was resumed, and the patriots suffered a great defeat. At Gembloux (Jan. 31, 1578) John of Austria's successor, Alexander Farnese, succeeded in detaching the Walloon provinces from the league. On the other hand William brought about the formation of the Union of Utrecht (1579), which comprised the provinces of Holland, Zealand, Utrecht, Gelderland, Groningen, Friesland, and Overyssel, and marked the birth of the Dutch Republic. In 1581 the United Provinces declared Philip deposed and, in accordance with William's desire, chose as their ruler the Duke of Anjou, brother of Henry III of France. The Duke, however, abandoned the country in 1582. In 1580 Philip had, by Granvella's advice, put a price of 25,000 gold crowns on William's head, and on July 10, 1584, he was assassinated at Delft by Balthasar Gerard. In personal relations William was frank and generous. His piety and integrity were unquestioned, and his sagacity, courage, and determined will made him a leader of men.

L. Motley, *Rise of the Dutch Republic* (ib., 1856; new ed. in "Everyman's Library," 3 vols., ib., 1909).

WILLIAM (commonly called the Lion) (1143–1214). King of Scotland from 1165 to 1214. He succeeded his brother, Malcolm IV. He attended Henry II of England in his Continental wars, and is supposed, while doing so, to have pressed for a portion at least of the long disputed districts of Northumberland, and other territories of what is now the north of England. In 1168 he made an alliance with France. This is the first recorded alliance between Scotland and that kingdom. In 1173 he conspired with the sons of Henry II against their father, and invaded Northumberland. On July 13, 1174, he fell almost by accident into the hands of an English party. For security, he was conveyed to Normandy, and there he consented, as the price of his liberation, to perform that homage for his Kingdom, which the English kings had so long in vain attempted to extract from the government of Scotland. The treaty of Falaise, as the transaction was termed, from the place where it was adjusted, was revoked in the year 1189 by Richard I of England, in consideration of a payment of 10,000 marks, which he wanted for his expedition to Palestine. William secured the freedom of the Scottish church, was one of the early benefactors of the regular ecclesiastics, and founded in 1178 the great Abbey of Arbroath, which he dedicated to St. Thomas à Becket. He founded many burghs, and extended the boundaries of the Kingdom, especially in the North. He died Dec. 4, 1214. Consult E. W. Robertson, *Scotland under the Early Kings* (2 vols., Edinburgh, 1862), and Andrew Lang, *History of Scotland*, vol. i (ib., 1900).

WILLIAM I, Friedrich Wilhelm Karl (1781–1864). King of Württemberg, born at Lüben, Silesia. His father became Frederick I, King of Württemberg, and his mother was the Princess Augusta of Brunswick-Wolfenbüttel. In 1800 he entered the Austrian army as a volunteer, and distinguished himself at the battle of Hohenlinden. Having returned to Württemberg in 1806, he lived at Stuttgart for six years, and then took command of the Württemberg contingent in Russia against the advance of Napoleon, but, on account of illness, was detained for some time at Vilna. After the battle of Leipzig (1813) his father joined the Allies, and the Prince commanded the Seventh Corps, which included Austrian and Russian regiments, in the early part of 1814, distinguishing himself at La Rothière, Bar-sur-Aube, Arcis-sur-Aube, and La Fère Champenoise. At Montereau (Feb. 18, 1814) he was defeated by Napoleon. In the campaign of 1815 he commanded the Third Corps in Alsace. Upon the death of his father, in 1816, he succeeded to the throne. William was a practical man of liberal tendencies, and soon succeeded in bringing order out of the confused conditions existing in Württemberg as a result of the Napoleonic wars. In 1819, by the promulgation of a constitution, he further advanced the prospects of his country, which passed through the troublous year 1848 undisturbed. William married in 1808 the Princess Charlotte of Bavaria (divorced 1814); in 1816, the Grand Duchess Catherine, widow of Prince George of Holstein-Oldenburg (died 1819); in 1820, his cousin Pauline of Württemberg (1800–73). His daughter Sophie (1818–77) became the consort of William III, King of the Netherlands, and his son Charles (1823–91) succeeded to the throne in 1864.

WILLIAM IX, Duke of Aquitaine and Count of Poitou (as such William VII) (1071–1127). The first Provençal poet whose songs have come down to us. He began his reign in 1087, and much of his life was spent in warfare with his neighbors. He twice conquered Toulouse, led a plundering expedition into Normandy, and engaged in other sanguinary conflicts. In 1100 he undertook a crusade with 60,000 men, but met with a disastrous defeat and fled almost alone. He succeeded, however, in reaching Jerusalem. On his way home he suffered shipwreck, but he reached his native land in 1103. His experience as a warrior of the cross did not amend his life, which was notoriously licentious and irreligious. In his conflicts with the Church he was twice excommunicated. Most of his poetry is as loose as was his life. It is, however, of special historical interest as marking the transition from popular to art forms. A romance dealing with a disreputable adventure is closest to the folk poetry, though some of his songs also are simple in structure. Some, on the other hand, are decidedly conventional and show him making use of the formulas of devoted lady serv-

ice, a fact which tends to demonstrate the existence of a previous lyric literature which has been lost. One song, probably composed just before his death, expresses repentance, renunciation of worldly pleasures, and the turning of his heart to God. An incomplete edition of his works was published by Holland and Kellar (Tübingen, 1850). Consult Sachse, *Ueber das Leben und die Lieder des Troubadours Wilhelm IX, Graf von Poitou* (Leipzig, 1882).

WILLIAM, ORDER OF. 1. A Hessian order with four classes, founded in 1851 by the Elector Frederick William and extinguished in 1866. The red cross of the order shows a golden lion with the inscription *Virtute et fidelitate*, with a crown and the initials W. K. on the reverse. 2. A military order of the Netherlands with four classes, founded by King William in 1815. The decoration is a white cross with Burgundian crosses of laurel between the arms, on which is the legend *Voor moed, beleid, trouw* (for valor, prudence, fidelity). The medallion shows the initial W with a laurel wreath. 3. A Prussian order with one class for men and women, founded in 1896 by King William II. It is designed to commemorate the Imperial proclamation at Versailles and is conferred as a distinction for services in elevating the people. The decoration is a medal surrounded by a wreath, bearing the bust of Emperor William I, and on the reverse the initials of William II with a crown and the legend, *Wirke im Andenken an Kaiser Wilhelm den Grossen.*

WILLIAM AND MARY COLLEGE. An institution of learning at Williamsburg, Va., founded in 1693, the second oldest college in the United States. Grants of land had already been obtained in 1619 for the establishment of a collegiate institution near Richmond, and a collegiate school was established at Charles City in 1621, but the plan was frustrated by the Indian massacres of 1622. In 1660 the plan was renewed and in 1693 a charter was secured from King William and Queen Mary by the Rev. James Blair, who became the first president of the college. The institution received a penny a pound on exports of tobacco and various other privileges, including the profits from the office of Surveyor-General of Virginia. The college attained rapid prosperity, but it suffered heavily in the Revolution through the loss of its endowments and the occupation of its buildings by the contending troops (1781), but with the exception of a short interval it was in session until the Civil War, when it was occupied by the Federal troops and much of its property was destroyed. It was reopened in 1869, but from 1881 to 1888 was so crippled financially that it was forced to suspend instruction. In the latter year an annual state appropriation of $10,000, later increased to $15,000, enabled it to resume work, and in 1893 Congress granted an indemnity of $64,000 for its losses during the Civil War. The college offers two courses—the collegiate, leading to the degrees of B.A., B.S., and M.A., and the normal. With the latter the Matthew Whaley Model and Practice School is connected. In 1916 it had a student attendance of 242, 21 instructors, a library of about 15,000 volumes, and an income of $54,000. Its endowment was $154,000, and the buildings and grounds were valued at $300,000. The college has a distinguished list of graduates, among them Presidents Jefferson, Monroe, and Tyler, Chief Justice John Marshall, and Gen. Winfield Scott. The Phi Beta Kappa Fraternity (q.v.) was established at William and Mary in 1776. The president in 1916 was Lyon G. Tyler, LL.D.

WILLIAM AUGUSTUS, DUKE OF CUMBERLAND (1721–65). An English commander. He was the third son of King George II, and was born in London, April 26 (15), 1721. He became Duke of Cumberland in 1726. He was intended by his father for the navy, and in 1740 saw some service in the Channel under Sir John Norris, but in the same year he became colonel of the Coldstream Guards and thenceforth devoted himself to a military career. He fought with distinction at Dettingen in 1743, and, made commander in chief of the British land forces in 1745, was defeated in that year by Marshal Saxe at Fontenoy (q.v.). The British troops were now recalled to meet the invasion of the Young Pretender, and in November, 1745, the Duke was placed at the head of an army of some 9000 men to operate against the Highland forces which were then in the north of England. These he drove across the border. After the defeat of General Hawley at Falkirk (January, 1746), the Duke once more assumed command, took Stirling and Perth, and on April 27 (16) crushed the Highlanders at Culloden (q.v.). He followed up his victory by sending detachments of soldiery throughout the country to hunt down the fugitives, and, though he does not seem to have been guilty of the relentless cruelty with which he was charged and which gained him the name of Butcher among the conquered inhabitants, he doubtless did pursue a course of extreme severity. In 1747 he commanded in Flanders and was defeated for a second time by Marshal Saxe at Laffeld, July 2, becoming in consequence extremely unpopular at home. Ten years later he was placed at the head of an army of 40,000 men, composed largely of Hanoverians and Hessians, intended to coöperate with Frederick II of Prussia against the French. On July 26, 1757, he was defeated by Marshal D'Estrées at Hastenbeck, and on September 8 he signed the convention of Kloster Zeven by which he agreed to disband his army, thus leaving Hanover to the French. The English government repudiated these terms, and the Duke thereupon retired to private life. He died Oct. 31, 1765. Consult Evan Charteris, *William Augustus, Duke of Cumberland* (London, 1913).

WILLIAM JEWELL COLLEGE. An educational institution founded by Baptists in 1849 at Liberty, Mo., a suburb of Kansas City. It has three departments—academic, collegiate, and theological, and confers the degrees of A.B. and Th.B. The attendance in 1916 was 460, and the faculty numbered 30. The library contained 28,000 volumes. The productive funds of the college amounted to $400,000, and its property in land, buildings, and equipment was estimated at $550,000. It is the oldest college for men west of the Mississippi River. The president in 1916 was John P. Greene, D.D., LL.D.

WILLIAM OF CHAMPEAUX. See GUILLAUME DE CHAMPEAUX.

WILLIAM (or WYLLYAM) OF CLOUDESLEY. A famous archer and outlaw in an old ballad edited by Bishop Percy. See CLIM.

WILLIAM OF HOLLAND (1227–56). Titular King of Germany. In 1234 he succeeded his father as Count of Holland. In 1247 he was chosen German King by the papal legate, and after he had besieged and taken Aachen he was crowned there in November, 1248. So strong,

however, was the opposition brought against him by the supporters of Frederick II that he returned to Holland. Upon the death of Frederick in 1250 William began to regain his influence, and when Conrad IV, who had gone to Italy, died there in 1254, he was generally recognized as King by the German princes. He was killed in a battle with the Frieslanders.

WILLIAM OF LORRIS. See GUILLAUME DE LORRIS.

WILLIAM OF MACHAULT. See GUILLAUME DE MACHAULT.

WILLIAM OF MALMESBURY, mämz'-bĕr-ĭ (c.1080–c.1143). An early English historian. He was born probably in Somersetshire, and was educated in the monastery whence he derived his name, and of which he became librarian. Malmesbury's principal works, which are written in Latin, are *De Gestis Regum Anglorum* (Rolls Series, 2 vols., London, 1887–89), a history of the kings of England from the Saxon invasion to 1127–28; *Historia Novella* (ibidem), a continuation of the first, to December, 1142; *De Gestis Pontificum Anglorum* (Rolls Series, London, 1870), containing an account of the bishops and principal monasteries of England from the conversion of Ethelbert of Kent by St. Augustine, to 1123. The first of these was translated into English by Sharpe (London, 1815), and has been reprinted in Bohn's Antiquarian Library, under the editorship of Giles (1847). In addition Malmesbury wrote a number of other works, including *Lives* of St. Dunstan and St. Wulfstan, and a work on the *Antiquities of Glastonbury.* Consult: W. de Gray Birch, *Life and Writings of William of Malmesbury* (London, 1874); Sir William Stubbs, in the *Rolls Series* (2 vols., ib., 1887–89); Kate Norgate, *England under the Angevin Kings,* vol. i (ib., 1887); Charles Gross, *The Sources and Literature of English History* (2d ed., ib., 1915).

WILLIAM OF NEW'BURGH (1136–c.1201). An English chronicler, who was brought up, lived, and died at the Augustinian Priory of Newburgh, near Coxwold, in Yorkshire. As far as we know, he never traveled farther from his priory than to the neighboring religious houses of Rievaux, Byland, and Finchale. His extant works show, nevertheless, a wide knowledge of ecclesiastical, political, and social affairs which must have come to him through the communication which his house kept up with the great foundations of the Cistercian world. His important work is the great *Historia Rerum Anglicarum,* which he undertook at the request of the abbot of Rievaux. The history covers the period from 1066 to 1198, and is a marvel of fair-minded and temperate writing. Though his statements were often inaccurate, he had such wide interests and such a well-balanced mind that his history is one of the most important records of mediæval England. The best edition is by Howlett, "Chronicles of Stephen, Henry II, and Richard I," in *Rolls Series* (London, 1884–85). See Charles Gross, *Sources and Literature of English History* (2d ed., London, 1915).

WILLIAM OF OCCAM. See OCCAM, WILLIAM OF.

WILLIAM OF ORANGE. See WILLIAM I, THE SILENT.

WILLIAM OF RUBRUQUIS, FRIAR. See RUBRUQUIS, FRIAR WILLIAM OF.

WILLIAM OF SAINT-AMOUR, săn'tà'-mo͝or' (?–1272). A mediæval theologian. He was born at Saint-Amour, Franche-Comté. By 1238 he was a master of arts and canon law at Paris; became professor in that university, and led the other nonmonastic teachers in their opposition to the Dominican and Franciscan orders. Pope Innocent IV interfered on the side of the friars, and eventually William was banished (1257). He went to Saint-Amour, and probably died there. His most famous treatise is *De Periculis Novissimorum Temporum* (1255), which describes the perils of the time as signs of the end of the world, and exhorts the prelates to arouse themselves. It was one of the earliest pieces printed, both in Latin and in a French translation, and on the basis of its contents the wits of the day built up their satirical verses against the mendicant orders. William's works, lacking, however, the important treatise on Antichrist, and containing at least one piece which was falsely attributed to him, appeared with a memoir in Paris (1632). Consult C. St. Marc, *Etude sur Guillaume de S. Amour* (Lons-le-Saunier, 1865).

WILLIAM OF TYRE, tīr (c.1130–c.1186). A mediæval historian and Archbishop of Tyre. He was born perhaps in Palestine, but of his family and early life nothing is known. In 1167 he was appointed archdeacon of Tyre, and about 1170 tutor to Baldwin, son of Amalric, King of Jerusalem. Upon the accession of his pupil as Baldwin IV (1174) he was made Chancellor of the Kingdom, and in the following year Archbishop of Tyre. In 1179 he represented the Latin church of the East at the Lateran Council. The date of his death is unknown. His *Historia Hierosolymitana,* from which most of the events of his career are gleaned, breaks off in 1184. This work, the only one of his now extant, is one of the best histories of the Middle Ages. It is our chief authority for the history of the Latin kingdom in the East between 1127 and 1184, and except for somewhat faulty chronology is remarkably accurate as well as painstaking and clear-sighted. William had the power of depicting the characteristics of men, countries, and events in a manner which few mediæval historians approached. Consult Auguste Molinier, *Les sources de l'histoire de France,* vol. ii (Paris, 1902).

WILLIAM OF WIED, PRINCE (WILHELM FRIEDRICH HEINRICH) (1876–). King of Albania in 1914. He was born March 26, 1876, at Neuwied, Prussia. A member of one of the historic mediatized houses of Germany, the son of the fifth Prince of Wied and of Princess Marie of the Netherlands, second cousin of both the German Emperor and the Czar of Russia, and nephew of Queen Elizabeth of Rumania ("Carmen Sylva"), Prince William early became familiar with Balkan conditions. His wife, Princess Sophie, whom he married in 1906, came from an ancient Rumanian family. He studied law and political science at Jena, and later graduated with distinction at the Kriegsakademie. Late in 1913, the great Powers of Europe, having decided to make Albania autonomous (see ALBANIA; BALKAN WAR), offered the throne to the Prince of Wied. On Feb. 21, 1914, he accepted it formally at Neuwied, and was saluted as King by the Albanian notables, although the Powers had expected him to take the title of Prince. He and his family landed the following March 8 at Durazzo, which he made his capital.

From the first his reign was troubled. He found the Epirotes in rebellion, but refused to

march against them, doubting the loyalty of the army. His chief opponent was Essad Pasha (see ESSAD TOPTANI), who had been Turkish commander at Scutari and who had wanted the throne for himself. He had become Minister of War under William, who, fearing treachery, had refused to allow him to repulse the Epirotes. Massacres of Mohammedans followed, and the populace were aroused. Essad resigned, and at the head of 5000 supporters attacked the royal palace. On May 19, 1914, Essad was arrested, placed aboard an Austrian warship which had been on guard in the harbor, and deported to Naples. Four days later the Prince and his suite took refuge on another Austrian vessel. He returned to find the country in anarchy. Ineffectual efforts had been made by outsiders, especially by George F. Williams, United States Minister to Greece, to promote a cantonal government for Albania. Williams resigned, since his activities, notably a bitter denunciation of the rule of Prince William, were inconsistent with his office. By September 3 the Prince, forced to leave the country, was on his way to Switzerland. The International Commission of Control, which had been in power after the Balkan War, resumed its duties. Before the end of September the Albanian Senate had elected as ruler the Turkish Prince Burhan Eddin, son of the former Sultan Abd-ul-Hamid.

WILLIAM OF WYKEHAM, wĭk'am (1324–1404). An English prelate, statesman, and architect, one of the most remarkable men of the Middle Ages. He was born at Wickham (or Wykeham), in Hampshire, and was educated at Winchester School. Having won the favor of Bishop Edington and of Sir John Scures, by whom he was recommended to the notice of King Edward III, he was appointed royal chaplain in 1349 and made surveyor and chief warden of Windsor, Leeds, Dover, and Hadleigh castles. Windsor Castle is largely his work, and he was also the builder or architect of Queensborough Castle. Turning from architecture again to divinity, he was promoted through a series of clerical posts and offices of State to be Bishop of Winchester and Lord Chancellor in 1367, being at that time the foremost subject in the Kingdom, "without whom they did nothing," as Froissart declares. He promoted education by founding New College at Oxford and St. Mary's College at Winchester. In 1376, by reason of his patriotic opposition to John of Gaunt and his party, he was deprived of his offices; but on the accession of Richard II (1377) he was pardoned. He was again Chancellor, 1389–91, after which he retired from public life, residing at his seat of South Waltham, Hampshire, until his death, Sept. 27, 1404. His last years were spent in remodeling the interior of Winchester Cathedral, though he did not live to witness its entire completion. He completed the transformation of the heavy Norman nave into one of Perpendicular style begun by his predecessor, Edington, who rebuilt the four bays next the transepts. But while Edington tore down the old work before rebuilding, Wykeham effected his transformation by a skillful recutting of the existing Norman masonry and the addition of a rich vault of stone in place of the earlier wooden ceiling. This achievement did much to fix the tendencies of the style which developed into the perfected Perpendicular of the fifteenth century. Consult G. H. Moberly, *Life of William of Wykeham* (London, 1893).

WILLIAM PENN CHARTER SCHOOL. A noted preparatory school for boys in Philadelphia, founded in 1689, incorporated in 1698, and chartered by William Penn in 1701, on the same day on which he chartered the city. The original corporate title was "The Overseers of the Public School founded in Philadelphia at the Request Cost and Charges of the People of God called Quakers." The subsequent charters from Penn in 1708 and 1711 broadened the scope of the school and rendered it undenominational. The school is organized in nine classes, each covering a year, and the senior school (highest four classes) provides for a classical and a modern side. The school has modern buildings in the heart of the city, and, well within the city limits, on the edge of the beautiful Wissahickon valley, playing fields of 22 acres. Its realty and equipment are valued at $500,000, and it has $50,000 available for scholarships. The school has about 350 students.

WIL'LIAMS, ALPHEUS STARKEY (1810–78). An American soldier, born at Saybrook, Conn. He graduated at Yale in 1831; studied law in the same institution, and in 1836 began practice in Detroit. During the Mexican War he served as colonel of the First Michigan Regiment. In May, 1861, after the outbreak of the Civil War, he was commissioned brigadier general of volunteers. He commanded a division at Cedar Mountain and a corps at South Mountain, Antietam, Fredericksburg, Chancellorsville, and Gettysburg. He then served under General Sherman in the Atlanta campaign and in the march to the sea, and after the capture of Savannah was brevetted major general of volunteers. From 1866 until 1869 he was United States Minister to Salvador; in 1870 was the Democratic candidate for the governorship of Michigan; and from 1874 until his death was a member of Congress.

WILLIAMS, ANEURIN (1859–). A British politician and economist, born at Dowlais, Glamorganshire. He graduated M.A. at St. John's College, Cambridge, in 1880, and was called to the bar at the Inner Temple in 1884. In 1886–90 he was one of the acting partners of the Linthorpe Ironworks, Middlesbrough. As a Liberal candidate he contested seats for Parliament in 1906 and 1910, and was elected for Northwest Durham in 1914. Williams served as chairman of the executive committees of both the Land Nationalisation Society and the International Coöperative Alliance. He published *Copartnership and Profit-sharing* (1913).

WILLIAMS, SIR CHARLES HANBURY (1708–59). An English diplomatist and satirical writer. He was born probably at Pontypool, Monmouthshire. His father was John Hanbury, whose friend, Charles Williams, left him an estate of £70,000 in 1720, with remainder to his son Charles, on condition that the latter should assume the name of Williams when he came of age. The boy was educated at Eton, where he was intimate with Henry Fox, Lyttelton, and Fielding. He was a member of Parliament from 1734 to 1747 and again from 1754 to 1759. In 1740 appeared his *Isabella, or the Morning;* in 1742, *The Country Girl;* and in 1743, several elegant satires, of which the *Letter to Mr. Dodsley, Solomon's Porch,* and *Peter and My Lord Quidam* were among the best. In 1746 Williams entered upon a successful diplomatic career, being successively envoy at Dresden, at Berlin (1750), at Dresden again (1751), and at Vienna (1753). He made a Latin distich

on Maria Theresa, that was repeated throughout Europe. Afterward he was appointed to St. Petersburg with the mission of helping form a triple alliance between Russia, Austria, and England, which did not come about. Williams's occasional verse is worthy to be regarded as a link between that of Prior and Cowper, and his conversation was exceedingly brilliant. His verses were collected in 1763, and were republished in 1775 and, in part, in 1822. Consult Coxe, *Historical Tour in Monmouthshire* (London, 1801).

WILLIAMS, EDWARD (bardic name, IOLO MORGANNWG) (1746–1826). A Welsh bard, born at Penon, Glamorganshire. He was self-taught. From the age of nine he worked for many years as a stonemason, and eventually took up land surveying. After much wandering he finally settled at Flemingston, in the vale of Glamorgan. His published verse comprises mainly *Poems, Lyric and Pastoral*, in English (2 vols., 1794), and *Psalms of the Church in the Desert*, in Welsh (vol. i, 1812; 2d ed., 1827; vol. ii, posthumous, 1834; 2d ed., 1857). With Owen Jones and William Owen Pughe he edited the collection of Welsh verse and prose called the *Myvyrian Archaiology* (3 vols., 1801–07; new ed., 1870). A continuation of the work, known as the *Iolo MSS.*, was issued by the Welsh Manuscripts Society in 1848 (reprint 1888). A treatise called *Cyfrinach y Beirdd* (*The Mystery of Bardism*), almost complete at his death, was prepared for the press in 1829 by his son Taliesin Williams (2d ed., 1874). Consult Elijah Waring, *Recollections and Anecdotes of Edward Williams* (London, 1850).

WILLIAMS, SIR EDWARD LEADER (1828–1910). An English engineer. He was born at Worcester, where he began his professional career. Until 1850 he was engaged in improving the waterway between Stourport and Gloucester, afterward he acted as engineer of the Great Northern Railway, and later was engaged on the Admiralty Pier at Dover. In 1856 he became engineer to the River Weaver Trust, and in that connection constructed a lift to raise vessels 52 feet from the Trent and Mersey Canal to the Weaver. When the Manchester Ship Canal was decided upon in 1882, Williams assisted in the preliminary survey. His scheme for the construction of the canal was accepted, and throughout the 12 years required for its accomplishment he served as chief engineer. He was knighted in 1894.

WILLIAMS, ELEAZAR (1787–1858). An American missionary, who claimed to be the lost dauphin (Louis XVII) of France. He was born probably in Caughnawaga, N. Y., and is supposed to have been the great-grandson of Eunice Williams, who was carried away from Deerfield, Mass., at the time of the massacre of February, 1704. Eleazar was educated at Longmeadow and Westhampton, Mass. He took orders in the Episcopal church and became a missionary among the New York Indians. In 1820 he accompanied the Oneidas, who were removed from New York State to a reservation near Green Bay, Wis., and remained there with them for 30 years. A rather striking likeness to the Bourbons, coupled with the fact that there were some discrepancies in the accounts of his early years, probably gave rise to the story that he was the lost dauphin, the son of Louis XVI and Marie Antoinette, whose fate was shrouded in mystery. His claim that, in 1841, he had an interview with the Prince de Joinville, then in America, who asked him to sign an abdication of the French throne was subsequently denied by the Prince. In 1850 he returned to New York and settled at Hogansburg, where he died. For a statement of his claim consult an article by Hanson in *Putnam's Magazine* for February, 1853, entitled "Have We a Bourbon Among Us?" also *The Lost Prince* (1854), by the same author. Williams was an authority on Indian language and history, and published *A Spelling Book in the Language of the Seven Iroquois Nations* (1813); *A Caution Against Our Common Enemy* (1813, in Iroquois; translated into English, 1815); *Life of Te-ho-ra-gwa-ne-gen* (Thomas Williams) (1859), a sketch of his reputed father, the grandson of Eunice Williams. He translated into Iroquois *The Book of Common Prayer* (1853).

WILLIAMS, EPHRAIM (1715–55). An American soldier and pioneer, founder of Williams College. He was born in Newton, Mass., and after following the sea for several years settled in western Massachusetts, where he distinguished himself in frontier warfare with the Indians. At the outbreak of the war with France in 1744 he commanded a company which took part in the Louisburg expedition, and later commanded the forts in the Connecticut River valley in western Massachusetts. In recognition of his services he received from Massachusetts in 1750 a grant of 200 acres of land near the present sites of Williamstown and Adams. At the beginning of the French and Indian War (1755) he was commissioned a colonel of one of the Massachusetts regiments raised to take part in Sir William Johnson's expedition against Crown Point. While in camp at Albany he made his will, leaving money and lands for the founding of a free academy at Williamstown, which eventually became Williams College (q.v.). He led the advance towards Crown Point and was killed at the head of his troops during a skirmish, known as the "Bloody Morning's Scout," that preceded the battle of Lake George, Sept. 8, 1755.

WILLIAMS, FREDERICK BALLARD (1871–). An American landscape and figure painter. He was born in Brooklyn, and studied in New York at the Cooper Union Art School and the National Academy of Design. His figure compositions are notable for rich, glowing color, highly decorative design, and romantic content. Good examples are: "Happy Valley" and "L'Allegro" (Metropolitan Museum, New York); "Chant d'Amour" and "Spring" (Brooklyn Institute Museum); "Vivacetto" (Albright Art Gallery, Buffalo); "A Glade by the Sea" and "Conway Hills" (National Gallery, Washington). Williams was elected a member of the National Academy in 1909, and received medals there and at the Panama-Pacific Exposition, San Francisco, in 1915.

WILLIAMS, SIR GEORGE (1821–1905). The founder of the Young Men's Christian Association (q.v.). He was born in the parish of Dulverton, Somersetshire, England. He was converted to Christianity at Bridgewater in 1837. In 1841 he became junior assistant in the dry goods firm of George Hitchcock & Co., in London. Two years afterward he induced some of the employees to hold a prayer meeting at regular intervals, and in June of the following year 12 persons, including Williams, formed themselves into a society under the name of the Young Men's Christian Association. There can be no doubt that to him belongs the chief credit

of originating the society. From 1863 to 1885 he was treasurer of the organization, and in 1885 became president. He also became head of the firm of Hitchcock, Williams & Co., and in 1894 was knighted. Consult Stevenson, *Historical Records of the Young Men's Christian Association from 1844 to 1884* (London, 1884).

WILLIAMS, GEORGE HENRY (1823–1910). An American lawyer, jurist, and legislator, born in New Lebanon, N. Y. He was admitted to the bar in 1844, and in 1847–52 was judge of the First Judicial District of Iowa. In 1853–57 he was Chief Justice of Oregon Territory, and in 1865–71, United States Senator from Oregon. He served on the joint high commission that adjusted the *Alabama* Claims. In 1872–75 he was Attorney-General in the cabinet of President Grant, by whom in 1873 he was nominated for Chief Justice of the United States Supreme Court, but the nomination was not confirmed. In 1902–05 he was mayor of Portland, Oreg.

WILLIAMS, GEORGE HUNTINGTON (1856–94). An American geologist, born at Utica, N. Y. He graduated at Amherst, studied at Göttingen and Heidelberg, and in 1885 was appointed an associate professor in the Johns Hopkins University. In 1892 he was appointed professor of inorganic geology there. He was a member of many American and foreign scientific societies, was vice president of the Geological Society of America, and published in all 72 geological papers, including one on the *Volcanic Rocks of Eastern North America.* He also published *Elements of Crystallography* (1890).

WILLIAMS, HELEN MARIA (1762–1827). An English writer. She was born in London, where, through the influence of Dr. Andrew Kippis, her legendary poem of *Edwin and Eltruda* was published in 1782 and was speedily followed by other works. In 1788, just before the Revolution, she visited a married sister in Paris; there she wrote in favor of the Girondists, and was imprisoned by Robespierre, but was released after his death. The rest of her life was passed in Amsterdam and in Paris. Among her published works relating to France and the Revolution are *Letters Written in France* (1790); *Letters Containing a Sketch of the Politics of France* (1795); *Sketches of Manners and Opinions in the French Republic* (1801). She translated Saint-Pierre's *Paul et Virginie* (1795), Von Humboldt's *Researches* (1814), and several other works; and wrote the favorite hymn, "While Thee I Seek, Protecting Power." Collections of her poems were published in 1786 and 1823. From her story *Perourou* (1801), Lord Lytton adapted his drama *The Lady of Lyons.*

WILLIAMS, HENRY SHALER (1847–). An American geologist and paleontologist, born at Ithaca, N. Y. He graduated at the Sheffield Scientific School of Yale in 1868. He was successively assistant professor of geology at Cornell University (1880–92), professor at Yale (1892–1904), and thenceforth professor, head of the geological department, and director of the museum at Cornell. He also had charge of the Devonian section of the United States Geological Survey. His publications include: *The Classification of the Upper Devonian* (1885); *The Cuboides Zone and Its Fauna* (1890); *Correlation Papers, Devonian and Carboniferous* (1891).

WILLIAMS, HENRY SMITH (1863–). An American physician and writer, born at Durand, Ill. Graduating from the Chicago Medical College in 1884, he entered practice as a specialist in nervous and mental diseases, and in New York State was connected with various State hospitals and asylums after 1887. From 1892 he was medical superintendent of Randall's Island Hospital (New York City). Among his publications are: *A History of Science* (10 vols., 1904–10); *The Story of Nineteenth Century Science* (1900); *Alcohol* (1909); *The Science of Happiness* (1910); *Miracles of Science* (1913); *Luther Burbank* (1915); *The Wonders of Science in Modern Life* (10 vols., 1912); and *Modern Warfare* (1915), all with his brother, Dr. E. H. Williams.

WILLIAMS, ISAAC (1802–65). A Welsh clergyman and author, born near Aberystwith, Wales, and educated at Harrow and Trinity College, Oxford. He took orders in the Church of England in 1829, and became a fellow of Trinity in 1831. Previously he made the acquaintance of Keble and of Richard Hurrell Froude, with whom he was associated in the Tractarian movement. As curate he had charge at Windrush, St. Mary the Virgin's at Oxford, and at Bisley. He was a successful imitator of Keble in sacred poetry, contributed to *Lyra Apostolica,* and published *The Cathedral, or the Catholic and Apostolic Church of England,* in verse (1838); *Hymns* (1839); *Harmony and Commentary on the Whole Gospel Narrative* (1842); *The Christian Scholar* (1849); *The Apocalypse* (1852); and *The Psalms Interpreted of Christ* (1864).

WILLIAMS, JAMES (1851–1911). An English lawyer and writer, born in Liverpool. He was educated at Liverpool College, and at Lincoln College, Oxford, and became a barrister in 1875. He received an LL.D. from Yale. His legal writings include: *The Schoolmaster and the Law* (1890); *Wills and Succession* (1890); *Law of Education* (1892); *Institutes of Justinian* (1893); *Dante as a Jurist* (1906); *The Law of the Universities* (1910). He was author also of *A Lawyer's Leisure* (1884); *Simple Stories of London* (1890); *Briefless Ballads* (1895); *Ventures in Verse* (1898).

WILLIAMS, JAMES DOUGLAS (1808–80). An American legislator and public official, born in Pickaway Co., Ohio. His parents moved to Indiana, when he was yet in his teens, and he was largely self-educated. He devoted himself to farming and in 1843 was elected to the State Legislature, where he remained, almost without interruption, until 1874, when he was chosen a member of Congress. In 1876, after an exciting campaign, in which the plainness of his dress and the blunt honesty of his speech won for him the sobriquet "Blue Jeans," he was elected Governor of Indiana. Throughout his entire life Williams was interested in the development of agriculture and served for 17 years in the State Board of Agriculture. He also was instrumental in securing valuable legislation, improving the educational system of the State.

WILLIAMS, JESSE LYNCH (1871–). An American journalist and author, born at Sterling, Ill. He graduated in 1892 at Princeton, where after some years in newspaper and magazine work in New York, he became (1900) editor of the *Alumni Princetonian.* Williams was elected to the National Institute of Arts and Letters. He published: *Princeton Stories* (1895); *The Stolen Story and Other Newspaper Stories* (1899); *The Adventures of a Freshman* (1899); *New York Sketches* (1902); *The Day Dreamer* (1906); *My Lost Duchess* (1908); *The Girl and the Game and Other College Stories*

(1908); *Mr. Cleveland, a Personal Impression* (1909); *The Married Life of the Frederic Carrolls* (1910); *And So They Were Married; a Comedy of the New Woman* (1914); *Remating Time* (1916). With John DeWitt, he wrote a *History of Princeton University* (1898).

WILLIAMS, JOHN (1582–1650). An English archbishop. He was born in Wales, was educated at Ruthin and at St. John's College, Cambridge, where he was distinguished in a wide range of studies and graduated in 1603. After being installed in various prebends, he became keeper of the great seal and Bishop of Lincoln in 1621. He offended Charles I, and after eight years' proceedings before the star chamber was condemned on the charge of betraying the King's secrets; suspended from his bishopric; fined £10,000; and imprisoned in the Tower, 1636–40. He was released by the Long Parliament and restored to his diocese; became Archbishop of Canterbury, 1641; was again imprisoned and released 1643, and was one of the King's adherents during the rebellion. He was the author of various theological treatises, of which the chief is *The Holy Table* (1637), directed against Archbishop Laud's ritualistic changes.

WILLIAMS, JOHN (1664–1729). A Colonial clergyman. He was born in Roxbury, Mass., and graduated at Harvard in 1683. In 1686 he became the first minister of Deerfield, then a struggling frontier settlement, and when that place was destroyed in 1704 (see DEERFIELD), the Indians killed two of his children, and started with him and the rest of his family (excepting one son, then absent), along with the other pioneers, towards Canada. On the second day his wife, unable to proceed, was killed. In Canada he was treated kindly and in 1706 was redeemed, with two of his children. Returning to Deerfield, he there remained as pastor, until his death. In 1707 he published a celebrated narrative of his captivity (since frequently reprinted), entitled *The Redeemed Captive Returning to Zion.* He also published a number of his sermons, and left in manuscript many papers on scientific subjects. Consult S. W. Williams, *Biographical Memoir of Rev. John Williams* (Greenfield, Mass., 1837).

WILLIAMS, JOHN (1792–1858). An English scholar and clergyman, born at Ystradmeurig, Wales. He was educated at Balliol College, Oxford, and from 1824 to 1847 was rector of the Academy, a day school at Edinburgh. He took the post at the wish of Sir Walter Scott and Lockhart, the latter a close personal friend; and he had in some respects an even more remarkable career there than did Arnold at Rugby. In 1848 he opened at Llandsbery a new school founded by Thomas Phillips, and in the course of five years made it one of the best known schools in Wales. His studies were largely in the classics and Celtic, and were valuable in their day. They include *Two Essays on the Geography of Ancient Asia* (1829); *The Life and Actions of Alexander the Great* (1829); *Homerus* (1842); *The Life of Julius Cæsar* (1854); *Gomer: or a Brief Analysis of the Language and Knowledge of the Ancient Cymry* (1854); and *Essays on Various Subjects* (1858).

WILLIAMS, JOHN (1796–1839). An English missionary. He was born at Tottenham, London, and at 14 was apprenticed to an ironmonger. In 1816 he offered himself to the London Missionary Society as a missionary to the South Seas, was ordained and sent to Eimeo, one of the Society Islands. After laboring with much success among the natives of the Society group, in 1823 he established missions on Raratonga and others of the Hervey Islands. He translated the New Testament into the Raratongan language, and prepared books for the schools which he established. In a vessel built by himself he visited many of the South Sea Islands, extending his missionary labors to the Samoa Islands. In 1834 he visited England, where he remained for nearly four years, during which he procured the publication of his Raratongan New Testament by the Bible Society, and raised £4000 for the purchase and outfit of a missionary ship for Polynesia. In 1838 he returned, visited many of the islands, and finally the New Hebrides, where he hoped to plant a mission, but was killed, Nov. 20, 1839, by the natives of Erromanga. He published *A Narrative of Missionary Enterprise in the South Sea Islands* (1837). Consult his *Life* by Campbell (London, 1842), and Prout (ib., 1843; 4th ed., 1847).

WILLIAMS, JOHN (1817–99). An American bishop of the Episcopal church. He was born at Deerfield, Mass., and educated at Harvard and at Trinity College, Hartford, where he graduated in 1835. He was ordained in 1841, and held the rectorship of St. George's Church, Schenectady, N. Y., from 1842 to 1848, after which he became president of Trinity College, and at the same time professor of history and literature. In 1851 he was elected Assistant Bishop of Connecticut, and on the death of Bishop Brownell, in 1865, succeeded him in the sole charge of the diocese. At the same time, from 1854 on, he held the office of dean of the Berkeley Divinity School, at Middletown, and was its principal instructor in Church history and theology. He succeeded Bishop Lee, of Delaware, in 1887, as presiding Bishop, and earned the reputation of a wise conservative leader in ecclesiastical affairs. Among his published works are: *Thoughts on the Gospel Miracles* (1848); *The English Reformation* (Paddock Lectures, 1881); *The World's Witness to Jesus Christ* (Bedell Lectures, 1882); and *Studies in the Book of the Acts* (1888).

WILLIAMS, JOHN JOSEPH (1822–1907). An American Roman Catholic prelate. He was born in Boston, and educated at the Sulpician College in Montreal and at the Seminary of St. Sulpice in Paris. After his ordination he became assistant at the Boston Cathedral in 1845, and rector in 1855. In 1857 he took charge of St. James's parish, and in 1866 became Bishop of Boston. His title was changed to Archbishop in 1875, when the see was raised to metropolitan dignity.

WILLIAMS, JOHN SHARP (1854–). An American political leader and legislator. He was born in Memphis, Tenn., of a distinguished and wealthy family. He studied at the Kentucky Military Institute, at the universities of the South and Virginia, and at Heidelberg. Law he studied privately and at the University of Virginia, and in 1877 was admitted to the Tennessee bar. He practiced his profession at Yazoo City, Miss., and was also a cotton planter. Entering Democratic politics, in 1893 he was elected Representative in Congress, where he served continuously until 1909. In the House he had a distinguished career, both as a parliamentarian and as minority leader of the Democrats from 1903 until 1909. He served as temporary chairman of the National Democratic

Convention of 1904. In 1907, as a conservative, he defeated the radical Vardaman (q.v.) in a bitterly contested primary election for United States Senator, and the choice was ratified by the Legislature in 1908. Upon taking his seat in 1911, he promptly became one of the leaders of the party, being regarded by many as the ablest political philosopher in the Senate. He was a consistent supporter of the Wilson administration and was a member of the committees on finance and foreign relations. In 1912 he gave a series of lectures at Columbia University, published as *Permanent Influence of Thomas Jefferson on American Institutions* (1913).

WILLIAMS, JOHN SKELTON (1865–). An American financier and railroad organizer, born in Powhatan Co., Va. He was educated at the University of Virginia and entered the firm of John L. Williams & Sons of Richmond. As banker and director of numerous corporations and industrial organizations, he accumulated a fortune. Believing that the South should have a trunk-line railroad under Southern control and ownership instead of under the control of Wall Street, to which he was bitterly opposed, he organized the Seaboard Air Line Railroad, and was, from 1894 to 1904, its president. When involved in much litigation and controversy with respect to the control of the road, he denounced Wall Street bankers and financial methods. He was also prominently known for his attempts to develop Southern resources. In 1913 he was made assistant secretary of the Treasury by President Wilson and in 1914 he was appointed Comptroller of the Treasury. In the latter capacity he was ex officio a member of the Federal Reserve Board.

WILLIAMS, JOHN STUART (1820–98). An American soldier and legislator, born in Montgomery Co., Ky. He graduated at Miami University in 1838, and was admitted to the bar in 1840. He served in the war with Mexico, distinguished himself at the battle of Cerro Gordo, and rose to the rank of colonel. A Whig in politics, he was a member of the Kentucky Legislature in 1851–52. Although he opposed secession, Williams accepted a commission as brigadier general in the Confederate army in 1862, and was serving with Gen. Joseph E. Johnston when the latter surrendered. He again served in the Kentucky Legislature in 1873–74, and as a Democrat was a member of the United States Senate in 1879–85.

WILLIAMS, JONATHAN (1750–1815). An American soldier. He was born in Boston, entered business life, made several voyages to England and the West Indies, and was secretary to Franklin, his grand-uncle, when the latter was Ambassador to France. Here he made a careful study of military science, and, after serving as judge of Common Pleas at Philadelphia, from 1785 to 1801, became a major in the artillery and engineer corps, and an inspector of fortifications. He was in command of the military post at West Point in 1801–02, and was superintendent of the United States Military Academy in 1802–03, giving instruction to the engineers and artillerists. In June, 1803, owing to a dispute over a question of rank, he resigned from the army, but in 1805 reëntered the service as lieutenant colonel and chief engineer, and was reappointed superintendent at West Point. He also had charge of the fortifications in New York harbor, planning and building Fort Columbus, Castle Clinton (Castle Garden), and Castle Williams, the last being, at the time of its erection, the only casemated battery in the United States. He was the first to introduce in the United States principles of scientific military engineering, and has therefore been called the "Father of the Corps of Engineers." In 1812 he claimed command of Castle Williams, and, on refusal, resigned. In 1814 he was elected to Congress, but never took his seat. He wrote *The Use of the Thermometer in Navigation* (1799), and translated *Elements of Fortification* (1801) and Kosciusko's *Manœuvers for Horse Artillery* (1808).

WILLIAMS, SIR MONIER MONIER-. See MONIER-WILLIAMS.

WILLIAMS, OTHO HOLLAND (1749–1800). An American soldier. He was born in Prince George Co., Md., and in 1775 entered the American army as lieutenant in a Maryland regiment, becoming a major in June, 1776, a colonel in December, 1776, and a brigadier general in May, 1782. At Fort Washington (Nov. 16, 1776) he was badly wounded and was captured, and for 15 months was a prisoner in New York being treated, for part of the time, with great severity. Subsequently he was deputy adjutant general under Gates, and adjutant general under Greene in the South, and served with gallantry at Guilford, Hobkirk's Hill, and Eutaw Springs, where he led a charge. After the war he was collector of the port of Baltimore, and held the position until his death. He wrote an excellent *Narrative of the Campaign of 1780*, printed in the *Appendix* of Johnson's *Life of Greene*. Consult Tiffany, *A Sketch of the Life and Services of Gen. Otho H. Williams* (Baltimore, 1851).

WILLIAMS, ROGER (c.1604–1683). The founder of the State of Rhode Island, born probably in London in either 1604 or 1605. In his youth he attracted the attention of Sir Edward Coke by his shorthand notes of sermons and speeches in the Star Chamber, and was sent by him to Sutton's Hospital, now the Charterhouse School, in 1621. He entered Pembroke College, Cambridge, in 1625, and took the degree of bachelor of arts in 1627. Williams probably took orders in the Church of England, but he soon became an extreme Puritan, and emigrated to New England, arriving at Boston Feb. 5, 1631. He refused to join the congregation at Boston because the people would not make public declaration of their repentance for having been in communion with the Church of England; he therefore went to Salem as assistant preacher, but was soon in trouble for denying the right of magistrates to punish Sabbath breaking and other religious offenses, as belonging to the first table of the law. Being thus in opposition to the Massachusetts Bay government, he went to Plymouth, where he assisted its minister, and studied Indian languages. In 1633 he returned to Salem, and was settled as pastor of the church, but was opposed by the government for denying the validity of the Massachusetts Bay charter and for denying its right to take the Indian's land without purchase, and the right to impose faith and worship. He held that it was not lawful to require a wicked person to swear or pray, which were both forms of worship; and that the power of the civil magistrate extends only to the bodies, goods, and the outward state of man, and not to their souls and consciences. Banished from the colony in 1635 by order of the General Court and threatened with being sent back to England in order to

prevent the spread of his new doctrines, he escaped in midwinter to the shores of Narragansett Bay, accompanied by a few adherents, and here purchased lands of the Indian chiefs, founded the city of Providence in 1636, and established a government founded on complete toleration. Having adopted the belief in baptism of believers by immersion, Williams was baptized by a layman, and then baptized him and 10 others, and founded the first Baptist church in America. Later he doubted the validity of his baptism, and withdrew from the Church he had founded. In 1643 he went to England to procure a charter for Providence and Rhode Island settlements, and while there published a *Key into the Language of America*, and *The Bloudy Tenent of Persecution for Cause of Conscience Discussed* (1644), his chief work on the nature and sphere of civil government (reprinted in the Narragansett Club Publications, 1st series, vol. iii). In 1645 he wrote a tract entitled *Christenings Make Not Christians* (reprinted 1881, as No. 14 of the Rhode Island Historical Tracts). After returning to Rhode Island he went a second time to England on business of the colony in 1651, when he published *Experiments of Spiritual Life and Health and Their Preservations*, also *The Hireling Ministry None of Christ's* and *The Bloudy Tenent Yet More Bloody by Mr. Cotton's Endeavor to Wash It White in the Blood of the Lambe*, a reply to a pamphlet by John Cotton. This last was reprinted in 1870 by the Narragansett Club, 1st series, vol. iv. At this period Williams engaged in an experiment of teaching languages by conversation, and made the acquaintance of Milton. He returned to Rhode Island in 1654, and was elected president of the colony. He refused to persecute Quakers, but engaged in a controversy with them, and published *George Fox Digg'd Out of His Burrowes* (reprinted, 1872, by the Narragansett Club, 1st series, vol. i). Through his influence over the Indians he was of great service to the other Colonies, but they refused to remove their ban, or to admit Rhode Island into the New England Confederation.

Bibliography. J. D. Knowles, *Memoir of Roger Williams* (Boston, 1834); William Gammell, *Life of Williams* (ib., 1845); O. S. Straus, *Roger Williams, the Pioneer of Religious Liberty* (New York, 1894); E. J. Carpenter, *Roger Williams* (ib., 1909); and Williams's letters and other works published by the Narragansett Club (Providence, 1866).

WILLIAMS, Rowland (1817–70). A clergyman of the Church of England. He was born at Halkyn, Wales, graduated B.A. at King's College, Cambridge, in 1841, and was fellow and tutor, 1839–50. He was vice principal and professor of Hebrew in the Welsh theological college of St. David's, Lampeter, 1850–62, and did much to improve the teaching and finances of the college. He was made select preacher at Cambridge in 1854, and vicar of Broad Chalke, Wiltshire, in 1858. His views on inspiration were unacceptable to many of the Welsh clergy; and in 1860 he published an appreciative review of Bunsen's *Biblical Researches* in *Essays and Reviews*, which led to his prosecution for heresy. He was condemned in the Court of Arches in 1862, but the judgment was reversed by the Privy Council in 1864. Among his works were *Rational Godliness* (1855); *Christianity and Hinduism* (1856); *Broad Chalke Sermon Essays* (1867); and *The Hebrew Prophets* (1866–71). Consult his *Life and Letters*, edited by his wife (London, 1874).

WILLIAMS, Samuel Wells (1812–84). An American missionary, Sinologist, and diplomat, born in Utica, N. Y. He studied at the high school there and at the Rensselaer Institute at Troy, and in 1833 went to Canton, China, where he took charge of the newly established mission press of the American Board of Commissioners for Foreign Missions. Unsettled conditions in Canton necessitated his removal to Macao in 1835. In 1845 he returned to the United States. In the fall of 1848 he resumed his labors at Canton. He was interpreter to Commodore Perry in his mission to Japan, 1853–54, severed his connection with the Mission Board in 1857, and was appointed secretary and interpreter to the United States Legation. In this capacity he assisted in negotiating the treaty of 1858, and accompanied Minister Ward to Peking in 1859 to exchange ratifications. In 1861 he again visited the United States, and when, in 1862, the first United States Legation was established at Peking under Burlingame, he took up his residence in that city and remained until 1876, when he resigned and returned to the United States. He settled at New Haven, Conn., and filled the chair of Chinese language and literature at Yale until his death. He edited the *Chinese Repository* during 19 years of its existence (1832–51), and was a voluminous contributor to it. He also carried through the press Medhurst's *Dictionary of the Hokkien Dialect* (1837), and (prepared with Bridgman) brought out *Chinese Chrestomathy* (1841). His independent works include *Easy Lessons in Chinese* (1842); *The Chinese Commercial Guide* (1844); *The Topography of China* (1844); *English Vocabulary in the Court Dialect* (1844); *The Middle Kingdom* (1848; rev. ed., 1901); *A Syllabic Dictionary of the Chinese Language* (1874), his greatest work; *Our Relations with the Chinese Empire* (1877); and *The Journal of S. Wells Williams* (Shanghai, 1911). Consult F. W. Williams, *Life and Letters* (New York, 1889).

WILLIAMS, Seth (1822–66). An American soldier, born at Augusta, Me. He graduated at West Point in 1842, entered the artillery, served on the frontier, and participated in the Mexican War. He was promoted to be first lieutenant in March, 1847, and was brevetted captain for gallantry at Cerro Gordo a month later. In 1861 he was commissioned brigadier general of volunteers, and from Nov. 14, 1862, to March 10, 1864, he served as inspector general in the adjutant general's department of the Army of the Potomac, taking part in the Peninsular, Maryland, Rappahannock, Pennsylvania, Rapidan, and Richmond campaigns. He received several brevets, including that of major general in the regular army for services in the field during the war. In February, 1866, he was appointed adjutant general of the Military Division of the Atlantic, but died less than a month later.

WILLIAMS, Talcott (1849–). An American journalist and educator, born at Abeih, Turkey, the son of Congregational missionaries. He graduated from Amherst in 1873. Entering newspaper work, he was on the staff of the New York *World* in 1873–77, and served as Washington correspondent of the New York *Sun* and the San Francisco *Chronicle* in 1877–79, and as editorial writer for the Springfield (Mass.) *Republican* in 1879–81. Thereafter he was an editor of the Philadelphia *Press* until in 1912

he became director of the new School of Journalism at Columbia University, built and endowed by Joseph Pulitzer (q.v.). With F. M. Colby (q.v.), he was associate editor of the second edition of the NEW INTERNATIONAL ENCYCLOPÆDIA. Dr. Williams became known as a speaker on subjects of public interest. He was elected vice president of the Pennsylvania Society for the Prevention of Tuberculosis and an honorary member of the Pennsylvania State Bar Association, and identified himself with various other organizations. In 1913 he served as president of the American Conference of Teachers of Journalism. Honorary degrees came to him from Amherst, Western Reserve, Rochester, Hobart, the University of Pennsylvania, Pennsylvania College, Pittsburgh, Franklin and Marshall, and Brown.

WILLIAMS, WALTER (1864–). An American journalist and educator, born at Boonville, Mo. He learned the printer's trade, was editor and part owner of the Boonville *Advertiser* (1884–89), and edited the Columbia (Mo.) *Herald* from 1890 to 1908, when he became dean of the School of Journalism and professor of the theory and practice of journalism at the University of Missouri. He established *The Country Editor* (monthly) in 1895, and edited also the St. Louis *Presbyterian* (1897–99), and the *Daily State Tribune* (Jefferson, Mo.) from 1898 to 1902. In 1904 he organized and was secretary of the World's Press Parliament at St. Louis, Mo. His writings include: *How the Cap'n Saved the Day* (1901); *Some Saints and Some Sinners in the Holy Land* (1902); *The State of Missouri* (1904); *History of Missouri* (1908); *Missouri since the Civil War* (1909); *Eloquent Sons of the South* (1909); *From Missouri to the Island of Mull* (1909); *The Practice of Journalism* (1911); *The World's Journalism* (1915).

WILLIAMS, WILLIAM (1717–91). A Welsh hymn writer. He was born at Cefn-y-Coed, Wales, became a deacon in the Church of England in 1740, but was never ordained priest, and served as an itinerant minister in the Methodist body all his life. He published his first volume of hymns in Welsh in 1744, and since then has been accorded first place among Welsh hymn writers. Many of his hymns are still sung by his countrymen, and one of them in its English translation, "Guide Me, O Thou Great Jehovah," is very familiar. The most recent collection of his works is by Cynhafa Jones (Newport, 1891). He himself published two volumes of hymns in English (1759 and 1771). His collected works were edited by J. R. Jones (Glasgow, 1867) and by C. N. Jones (Holywell and Newport, 1887–91).

WILLIAMS, WILLIAM (1731–1811). A signer of the Declaration of Independence, born at Lebanon, Conn. He graduated at Harvard in 1751; in 1755 was on the staff of his relative, Col. Ephraim Williams, in the battle of Lake George; and at the age of 25 became town clerk, a position he held for 45 years. About the same time he became a member of the Assembly, and was reëlected to that body until 1804. In October, 1775, and again in 1776, he was sent to the Continental Congress, and in the latter year was one of the signers of the Declaration of Independence. He also held numerous other positions; was for 40 years a judge of probate for the district of Wyndham; and was a member of the Connecticut convention that ratified the Federal Constitution.

WILLIAMS, SIR WILLIAM FENWICK (1799–1883). A British general, the hero of Kars. He was born at Annapolis, Nova Scotia, was educated at the Royal Military Academy, Woolwich, and entered the British army as second lieutenant in the Royal Artillery, 1825. After serving on various European stations, in 1841, then being a captain, he was employed in diplomatic work in Turkey, and was brevetted major and colonel. In 1848 he was appointed a commissioner for the settlement of the Turco-Persian boundary, and in 1854, during the Crimean War, British commissioner with the Turkish army in Asia, of which, with the brevet of a ferik or lieutenant general and the dignity of a pasha, he virtually took the command. In 1855 he heroically defended Kars against the Russians under Muravieff, who was repulsed in a great assault on September 29. After Williams was forced by famine to surrender (November 28) he was created Baronet of Kars, and received a pension of £1000. From 1856 to 1859 he was a member of Parliament and general commandant at Woolwich. He was subsequently in command of the forces in Canada, 1859–70, and at Gibraltar, 1870–76. In 1881 he received the appointment of constable of the Tower of London.

WILLIAMSBURG, wĭl'yamz-bûrg. A former city of King's Co., N. Y., united with Brooklyn in 1855 and now forming part of the borough of Brooklyn in the city of New York.

WILLIAMSBURG. A city and the county seat of James City Co., Va., 48 miles by rail east by south of Richmond, on the Chesapeake and Ohio Railroad (Map: Virginia, H 4). It is on a peninsula about midway between the James and York rivers, in a region of great historic interest. The chief feature of the city is William and Mary College (q.v.), the second oldest college in the United States, having been opened in 1693. There are also the Eastern State Hospital for the Insane, erected in 1769, and the Williamsburg Female Institute. Other features are Bruton Parish Church, dating from 1678 and rebuilt in 1715; the Powder Horn building (1714); the old court house (1769); and Fort Magruder. Williamsburg manufactures knit goods, brick, lumber, etc. There are also important fish and oyster interests. Pop., 1900, 2044; 1910, 2714. Williamsburg was settled in 1632, and was called Middle Plantations until 1699. In 1698 it supplanted Jamestown as the capital of Virginia, and in 1722 obtained a city charter, the oldest in the State. Here in 1765 Patrick Henry offered his resolution against the Stamp Act, and delivered his famous Cæsar-Charles I speech. In 1779 the capital was removed to Richmond. At Williamsburg, on May 5, 1862, during the Civil War, occurred the first serious engagement of the Peninsular campaign, a part of Johnston's Confederate troops under Longstreet, which had evacuated Yorktown on May 3, checking the pursuit of a part of the Army of the Potomac, under General Sumner. The fighting began at about 7:30 A.M. and continued during the greater part of the day, gallant though ill-organized attacks being made by Federal divisions under Hooker and Hancock; but neither side gained any decisive advantage, and during the night the Confederates continued their retreat towards Richmond. The Federal loss in killed, wounded, and missing was 2228; the Confederate, as reported by Longstreet, 1560. Consult L. G. Tyler, in L. P. Powell, editor, *Historic Towns of the Southern States* (New York,

1900); and for the battle, Webb, *The Peninsula*, in "Campaigns of the Civil War Series" (ib., 1881).

WILLIAMS COLLEGE. An institution of higher learning at Williamstown, Mass., chartered in 1793. It was developed from a free school established by the will of Col. Ephraim Williams (q.v.). The studies of the Freshman year are prescribed, with a moderate election of courses in the remaining years. The degrees of B.A. and M.A. are conferred in course. All examinations are conducted on the honor system. The astronomical department possesses two observatories, the Hopkins and the Field Memorial. In addition to prizes and honor scholarships, there is a large number of endowments, the income of which, amounting to about $11,000 annually, is available for distribution among needy students. In 1915–16 the college had an attendance of 515 students and 47 instructors. Its endowment in 1914–15 was $1,947,522, its income $231,161. The estimated value of the college property was $2,708,028, and of the grounds and buildings $1,747,525. The college library contained in 1916, 84,000 volumes and 20,000 pamphlets. The high rank of Williams is in large part due to the influence of Mark Hopkins (q.v.), who was its president from 1836 to 1872. The president in 1916 was Harry R. Garfield. Consult J. H. Hewitt, *Williams College and Foreign Missions* (Boston, 1914).

WILLIAM SMITH COLLEGE. See HOBART COLLEGE.

WILLIAMSON. A city and the county seat of Mingo Co., W. Va., 75 miles south by east of Huntington, on the Norfolk and Western Railroad (Map: West Virginia, B 4). The city hall, courthouse, and school buildings are noteworthy. Coal mining is the chief industry, the city being situated in the most productive coal region in the State. Williamson adopted the commission form of government in 1916. Pop., 1910, 3561.

WILLIAMSON, ALEXANDER WILLIAM (1824–1904). An English chemist, born at Wandsworth, near London. He was educated at Heidelberg, Giessen, and Paris. In 1849 he became professor of practical chemistry in University College, London, and in 1855 was chosen also to fill the chair of pure chemistry in the same institution. He retired in 1887. A memoir published in 1850 on *Etherification and the Constitution of Salts* attracted attention in the scientific world, and had a great influence on the theories of chemical action. In addition to *Chemistry for Students* (1865; 3d ed., 1873), he was the author of memoirs and papers on etherification, the atomic theory, and the composition of gases, in which he advanced new and original views, later generally accepted as distinct contributions to chemical knowledge. He was twice chosen president of the London Chemical Society, was president of the British Association in 1873, and was elected a corresponding member of the French Institute.

WILLIAMSON, ALICE MURIEL (LIVINGSTON). See WILLIAMSON, CHARLES NORRIS.

WILLIAMSON, BENJAMIN (1827–1916). An Irish mathematician. Born at Cork, he was educated at Kilkenny College, and at Trinity College, Dublin, of which he became a fellow in 1852 (senior fellow, 1897), and where he was professor of natural philosophy from 1884. He was elected a fellow of the Royal Society in 1879, and received the honorary degree of D.Sc. from Dublin in 1890, and that of D.C.L. from Oxford in 1892. His publications include: *An Elementary Treatise on the Differential Calculus* (1872; 9th ed., 1899); *An Elementary Treatise on the Integral Calculus* (1874; 7th ed., 1896); *Introduction to the Mathematical Theory of the Stress and Strain of Elastic Solids* (1894).

WILLIAMSON, CHARLES NORRIS (1859–). An English journalist and author, born at Exeter, and educated at University College, London. Until his 22d year his studies turned to science and engineering, but it was as journalist and author that he became known. He began work on the *Examiner* and afterward was for eight years on the *Graphic*. *Black and White* was founded by him in 1891. Alone he wrote many articles on travel, automobiling, and other subjects and also a *Life of Thomas Carlyle* (2 vols., London, 1881). But he became best known for stories written in collaboration with his wife, Alice Muriel (Livingston) Williamson, an American woman, born at Livingston Manor House, near Poughkeepsie, N. Y. She shared her husband's enthusiasm for motoring. Jointly (as "C. N. and A. M. Williamson") the two produced a group of lively, breezy, popular novels in several of which a motor car is conspicuous: *The Lightning Conductor* (1903); *The Princess Passes* (1905); *My Friend the Chauffeur* (1905); *The Car of Destiny* (1906); *Set in Silver* (1909); *The Motor Maid* (1910); *The Princess Virginia* (1907); *The Heather Moon* (1912); *It Happened in Egypt* (1914); *The Lightning Conductor Discovers America* (1916).

WILLIAMSON, GEORGE CHARLES (1858–). An English writer on art. He was born at Guildford, Surrey; commenced as a writer on local archæological matters; and traveled widely in his art studies. He is best known as an authority on portrait miniatures, especially the English. His principal works on this subject are: *Portrait Miniatures from the Time of Holbein* (1897); *Andrew and Nathaniel Plimer* (1903); *History of Miniature Painting* (2 vols., 1904). He wrote detailed catalogues of several private collections, including the miniatures of J. P. Morgan (4 vols., fol., 1906), which he was instrumental in assembling. He edited Bryan's *Dictionary of Painters and Engravers* (4 vols., 1903–05).

WILLIAMSON, HUGH (1735–1819). An American physician and legislator. He was born in West Nottingham, Pa., graduated at the College of Philadelphia (now the University of Pennsylvania) in 1757, studied theology and preached for two years (1759–61), was professor of mathematics in the College of Philadelphia from 1760 to 1763, studied medicine at Edinburgh and Utrecht, and subsequently attained eminence as a physician in Philadelphia. He visited the West Indies (1772) and England (1773) in behalf of the Newark (Del.) Academy and in February, 1774, was examined on colonial matters by the Privy Council. He served as surgeon in the North Carolina militia in 1780–82, was a member of the Continental Congress from 1782 to 1785 and in 1787–88, was a delegate to the Constitutional Convention of 1787 and to the State convention which ratified the Federal Constitution in 1789, and was a member of Congress from 1790 to 1793, when he removed to New York City. He published several essays on *Paper Currency* (1786); a *Discourse on the Benefits of Civil History* (1810); *Observa-*

tions on the Climate of America (1811); and a *History of North Carolina* (1812).

WILLIAMSON, WILLIAM CRAWFORD (1816–95). An English naturalist, born at Scarborough, Yorkshire. Having attracted attention in 1834 by a paper on Mesozoic fossils, he became curator of the Manchester Natural History Society Museum in 1835, and six years later graduated in medicine at University College, London. He practiced as a surgeon, was chief founder of the Manchester Institute for diseases of the ear in 1855 and was its consulting surgeon until 1870. From the founding of Owens College at Manchester in 1851 until 1892 he held the chair of botany. In zoölogy he made valuable investigations of the development of the teeth and bones of fishes; in geology he studied the zones of distribution of Mesozoic fossils and the part played by microscopic organisms in the formation of marine deposits; and by his work on the structure of fossil plants established British paleobotany on a scientific basis. His *Reminiscences of a Yorkshire Naturalist* (1896) contains a nearly complete bibliography of his writings.

WILLIAMSON FREE SCHOOL OF MECHANICAL TRADES. An educational institution at Williamson School Station, Pa., 16 miles from Philadelphia, founded in 1888 by Isaiah V. Williamson for the education of poor and deserving boys. Candidates for admission must be between 16 and 18 years of age, preference being given in the following order: to natives of Philadelphia; of Bucks, Montgomery, and Delaware counties; of other parts of Pennsylvania; of New Jersey; of other States. The school is only for pupils who intend to follow for a livelihood the trades there acquired. After a moderate preliminary trial all who prove satisfactory are bound as indentured apprentices to the trustees for the term of three years from their entrance. In addition to the academic training, the following trades are taught, the selection being made by the trustees, and each scholar taking but one trade: carpentering, bricklaying, machine trade, pattern making, steam and electrical engineering, and agriculture. The school and shops are in session eight hours a day for five days a week and three hours on Saturday, the proportion of shop work gradually increasing towards the close of the apprenticeship. The school term continues 11 months of the year. The pupils live in families of 24 in distinct cottages. In 1915 the school had 14 instructors, 6 assistant instructors, 245 students, a library of 3500 volumes, an endowment of $2,000,000, and an income of $108,000. The plant was valued at $650,000.

WIL'LIAMSPORT. A city and the county seat of Lycoming Co., Pa., 94 miles north by west of Harrisburg, on the West Branch of the Susquehanna River, and on the New York Central, the Philadelphia and Reading, and the Pennsylvania railroads (Map: Pennsylvania, G 4). It is in a region of attractive scenery, and is well laid out. Among the prominent features are Dickinson Seminary, the city hall, the United States government building, the Masonic Temple, the Scottish Rite Cathedral, public hospital, State Armory, Brown Library, and the Home for the Friendless. There are three parks—Brandon, Way's Gardens, and Vallamont. Williamsport was for a long time known for its extensive lumber interests, but is now a city of varied industries. In 1915 they were capitalized at $16,484,000, and had an output valued at $20,626,000. There are large clothing factories, foundries and machine shops, tanneries, furniture factories, dye works, silk mills, and manufactories of boilers and engines, lumber, steel, rubber goods, boots and shoes, mirrors, sandpaper, wire rope, building, paving, and fire brick, stacks, tanks, band instruments, nails, radiators, wood-working machinery, woolen goods, heaters, gas and gasoline engines, pumps, etc. The city adopted the commission form of government in 1912. Pop., 1900, 28,757; 1910, 31,860; 1915 (U. S. est.), 33,495.

WIL'LIAMSTOWN. A town in Victoria, Australia, 9 miles southwest of Melbourne, on Port Phillip Bay (Map: Victoria, D 5). It is interested in shipbuilding. Basalt and coal are mined in the vicinity. It is noted for its Prince Alfred Graving Dock, and its government railway workshops at Newport. Pop., 1901, 14,083; 1911, 15,642.

WILLIAMSTOWN. A town, including several villages, in Berkshire Co., Mass., 5 miles west of North Adams, on the Hoosac River, and on the Boston and Maine Railroad (Map: Massachusetts, A 2). It is the seat of Williams College (q.v.), opened in 1793. Mission Park is an attractive feature. Although primarily residential, Williamstown has a cotton mill, a corduroy factory, and freight yards. Williamstown was permanently settled in 1753 and was called West Hoosick until 1765, when it was incorporated under its present name, which was given in honor of Colonel Ephraim Williams. Pop., 1900, 5013; 1910, 3708. Consult Perry, *Origins in Williamstown* (New York, 1894); id., *Williamstown and Williams College* (Norwood, Mass., 1899).

WILLIAMSTOWN. A borough in Dauphin Co., Pa., 58 miles by rail northeast of Harrisburg, on the Pennsylvania and the Williams Valley railroads (Map: Pennsylvania, H 6). There are several anthracite coal mines and hosiery mills. Pop., 1900, 2904; 1910, 2934.

WILLIAM TELL. See GUILLAUME TELL.

WIL'LIBRORD, WIL'BRORD, or **WIL'BROD,** SAINT (c.658–739). The apostle of the Frisians. He was born in the Kingdom of Northumbria, and began his education at the monastery at Ripon, near York. At the age of 20 he was sent to the schools of Ireland. After a sojourn of 12 years in that country, he resolved to devote himself to the conversion of Friesland. In 690 he sailed with 11 companions, and arrived soon after the victory of Pepin of Herstal over the Frisians. They were warmly received by Pepin. Willibrord, having established the first beginnings of his mission, went to Rome in 692, whence he returned, with the sanction of the Pope, Sergius I, and continued his labor till 695, when he again visited Rome, and received Episcopal consecration, together with the pallium of an Archbishop. Fixing his see at Utrecht, he converted a large number of the inhabitants, and, although he received some check upon the death of Pepin in 714, yet the successes of Charles Martel enabled him soon afterward, under similar favorable auspices, to resume the work, which, after many alternations, ended in the successful establishment of Christianity. Willibrord died in 739 at the monastery which he had founded at Echternach, near Treves. His festival is November 7. His *Life* was written by Alcuin (Eng. trans., London, 1877).

WIL'LIMAN'TIC. A city and one of the

county seats of Windham Co., Conn., 16 miles northwest of Norwich, on the Natchaug River, and on the New York, New Haven, and Hartford, and the Central Vermont railroads (Map: Connecticut, G 3). It has a State normal school, a public library, the Dunham Hall Library, St. Joseph's Hospital, and fine post-office and high-school buildings. The city is favored with excellent water power, and is noted for the manufacture of cotton thread. Other important products are cotton and silk goods, velvet, plumbers' supplies, boxes, and fine machinery. Pop., 1900, 8937; 1910, 11,230; 1915 (U. S. est.), 12,438.

WILLING, THOMAS (1731–1821). An American merchant and financier. He was born in Philadelphia, was educated at Bath, England, and in the Temple, London, and, returning to Philadelphia, organized, with Robert Morris (q.v.), the famous mercantile firm of Willing and Morris, which, during the Revolutionary War, supplied naval and military stores to the government. He was elected mayor of Philadelphia in 1763, was an associate justice of the Pennsylvania Supreme Court from 1767 to 1774, was a member of the Pennsylvania Committee of Correspondence, was a delegate to the Assembly in 1775, and was a member of the Continental Congress in 1775–76. In 1780 he, with several associates, organized the Pennsylvania Bank as a means of procuring supplies for the Continental army, he himself subscribing £5000. He was president of the Bank of North America from 1781 to 1792, and was the first president of the Bank of the United States, organized in 1791.

WILLIS, BAILEY (1857–). An American geologist, born at Idlewild-on-Hudson, N. Y., son of Nathaniel P. Willis (q.v.). He graduated in 1878 at the Columbia School of Mines, and in 1879–81 was an expert on iron ores for the Tenth Census. In 1881–84 he was geologist of the Northern Transcontinental Survey, undertaken by the Northern Pacific Railway and other companies; and was then appointed geologist of the United States Geological Survey, in charge of the Appalachian division, and afterward of the Cascade Range and Puget Sound division. In 1903–04 he made geological explorations in China under the auspices of the Carnegie Institution. He lectured on geology at Johns Hopkins (1895–1902) and at the University of Chicago (1909), served as consulting geologist to the Minister of Public Works of Argentina in 1911–13, and became professor of geology in Leland Stanford Junior University in 1915. Willis edited the *Geologic Atlas of the United States*, and published *Northern Patagonia: Character and Resources* (1914).

WILLIS, H(ENRY) PARKER (1874–). An American financial expert, born at Weymouth, Mass. He attended Western Reserve University, in 1894 graduated from the University of Chicago (Ph.D., 1897), and studied also at Leipzig and Vienna. He taught economics and political science at Washington and Lee University (1898–1901; 1903–05), and was professor of finance (1905–06; 1907–12) at George Washington University, where he was also dean of the College of Political Sciences (1910–12). Willis was an assistant to the Monetary Commission in 1897–98, served as an expert to the Ways and Means and Banking and Currency committees of the United States House of Representatives between 1911 and 1913, became secretary to the Federal Reserve Board in 1914, and in 1916 was appointed by the Philippine Commission president of the Philippine Insular Bank at Manila. Besides contributions to the NEW INTERNATIONAL ENCYCLOPÆDIA, his writings include: *History of the Latin Monetary Union* (1901); *Reciprocity* (1903), with J. L. Laughlin; *Our Philippine Problem* (1905); *Principles and Problems of Modern Banking* (1910); *Principles of Accounting* (1910); *Life of Stephen A. Douglas* (1911); *The Federal Reserve* (1915); *American Banking* (1916).

WILLIS, NATHANIEL PARKER (1806–67). An American author, born in Portland, Me. He graduated in 1827 at Yale College, where, as an undergraduate, he became known as a writer of religious verse, some of it published as *Scripture Sketches* (1827). For S. G. Goodrich (q.v.), of Boston, he edited two annuals, *The Legendary* (1828) and *The Token* (1829). In the latter year Willis established at Boston *The American Monthly Magazine;* this in 1831 was merged with the New York *Mirror*, of which he became associate editor. From 1831 to 1836 he traveled in Europe and Asia Minor and contributed sketches to the *Mirror*, which were later published in *Pencillings by the Way* (3 vols., 1835). On his return to America he conducted a short-lived weekly journal, *The Corsair* (1839–40), and later two papers of brief existence, *The New Mirror* (1843–44) and *The Evening Mirror* (1844–45). In 1845 he went again to Europe, returning in 1846. The same year he established *The Home Journal*, which occupied him until his death at his estate, "Idlewild," at Cornwall-on-Hudson, N. Y. His works include: *Inklings of Adventure* (1836, 3 vols.); *Loiterings of Travel* (1839, 3 vols.); *Lady Jane, and Other Poems* (1844); *People I Have Met* (1850); *Life Here and There* (1850); *Hurry-graphs, or Sketches of Scenery, Celebrities, and Society* (1851); *A Summer Cruise in the Mediterranean on Board an American Frigate* (1853); *A Health Trip to the Tropics* (1854); *Famous Persons and Places* (1854); *Out-Doors at Idlewild* (1854); *The Rag-bag, a Collection of Ephemera* (1855); *Paul Fane* (1856), a novel; *The Convalescent* (1859); and others, chiefly prose. His complete poems appeared in 1868. His work was ready, fluent, light, graceful, and various, in the main that of a dilettante, and it was exceedingly popular during Willis's lifetime. His prose yields interesting sketches of contemporaries. Willis was generous to contemporary authors, but made many hostile critics by his indiscreetly personal tone of writing. Consult: his *Life* by H. A. Beers in the "American Men of Letters Series" (Boston, 1885); *Selections* from his prose writings (New York, 1885) edited by H. A. Beers; and M. A. de Wolfe Howe, in *American Bookmen* (ib., 1898).

WILLIS, ROBERT (1800–75). An English archæologist and professor of mechanism, born in London. He graduated at Caius College, Cambridge, in 1826, was soon afterward elected Frankland fellow and in 1829 foundation fellow. After his graduation he gave his attention chiefly to mechanism, and in 1837 he was chosen Jacksonian professor of applied mechanics at Cambridge. Meanwhile he devoted his spare time to the study of architecture and archæology, and his *Remarks on the Architecture of the Middle Ages* (1835) won a high place among works on the subject. In 1844 he became a member of the newly organized Archæological Institute, before which he delivered some of his most important lectures. Among his publications are: *Prin-*

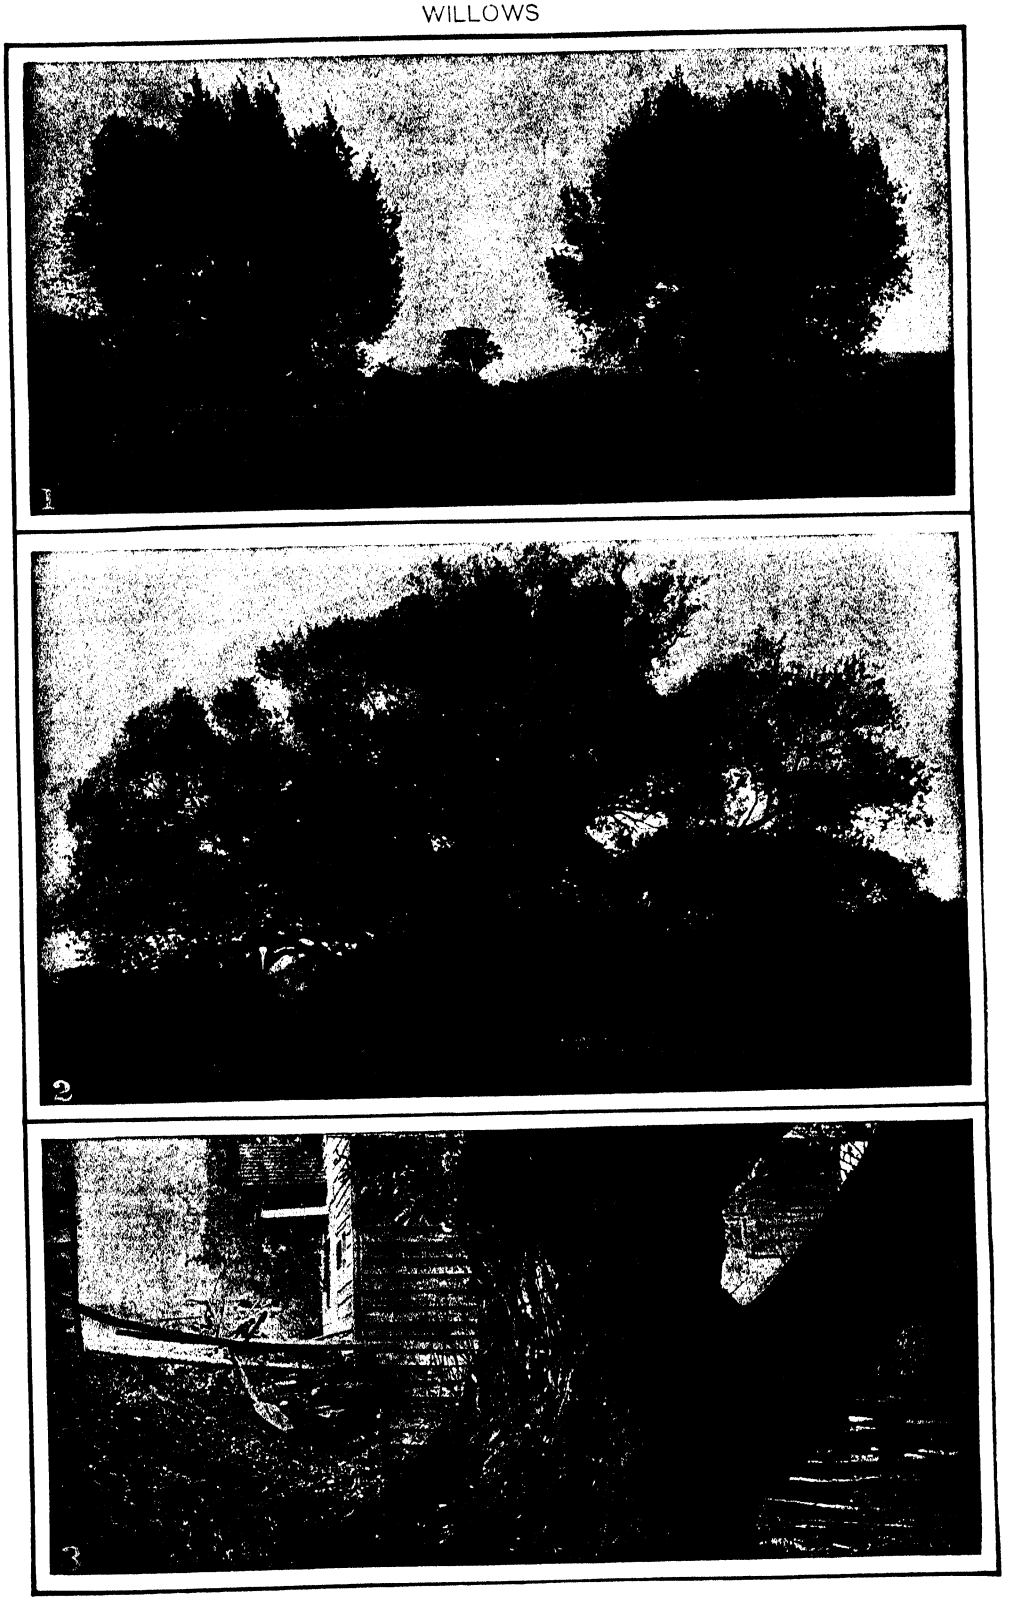
ciples of Mechanism (1841); *Architectural History of the Church of the Holy Sepulchre of Jerusalem* (1849); *The Architectural History of the Conventual Buildings of the Monastery of Christ Church, Canterbury* (1869); an epoch-making "Essay on Vaults" in the *Transactions of the Royal Institute of British Architects* (1842); and a series of lectures on the English cathedrals delivered between 1844 and 1865.

WILLIS, THOMAS (1621–75). An English anatomist and physician, born at Great Bedwin, Wiltshire. He graduated in 1639 at Oxford, where he began practice in 1646. He fought as a Royalist in the Revolution, studied medicine during the Protectorate, and at the Restoration was made Sedleian professor of natural philosophy at Oxford (1660). In 1666 he settled in London, where he became a founder of the Royal Society, and physician in ordinary to Charles II. Willis made important medical discoveries concerning the brain. A system of connecting arteries at the base of the brain is called the circle of Willis and the eleventh cranial nerve, which he described, is called the nerve of Willis. He was buried in Westminster Abbey. Besides many other works, he published *Cerebri Anatome, cui Accessit Nervorum Descriptio et Usus* (1664); *Pathologiæ Cerebri, etc.* (1668); *Affectionum quæ Dicuntur Hystericæ et Hypochondriacæ Pathologia Spasmodica Vindicata* (1671); and *De Anima Brutorum* (1672). His complete works, *Opera Omnia*, were published in Geneva (1676), and a translation into English in London (1684).

WILLISON, SIR JOHN STEPHEN (1856–). A Canadian journalist. He was born in Huron County, Ontario. For several sessions he was parliamentary correspondent of the Toronto *Globe* and in 1890 was appointed editor in chief. Under his management the editorial policy characteristic of the control and the posthumous influence of George Brown (q.v.) was altered. Willison made the *Globe* more responsive to the varieties of Liberal opinion and more urbane in its attitude towards opponents, an advantage afterward maintained. In 1902 he became editor in chief of the Toronto *News*, an Independent Conservative newspaper. He opposed the Taft-Fielding reciprocity agreement of 1911, and in the ensuing political campaign the *News* contributed more effectually than any other journal to the downfall of the Laurier administration. He was elected president of the Parliamentary Press Gallery, Ottawa, in 1890 and president of the Canadian Press Association in 1900; and was appointed Canadian correspondent of the London *Times* in 1910. In 1913 Willison was knighted. He published: *The Railway Question in Canada* (1897); *Lessons from the Old World* (1897); *Sir Wilfrid Laurier and the Liberal Party: A Political History* (2 vols., 1903), a work of great ability; *Anglo-Saxon Amity* (1906); *The United States and Canada* (1908); *The New Canada* (1910).

WILLISTON, SAMUEL (1861–). An American legal scholar. He was born in Cambridge, Mass., and, after attaining high honors as a student at Harvard College and Harvard Law School, he became in 1890 assistant professor of law at the latter institution. From 1895 he was professor, and from 1903 Weld professor of law. He contributed largely to legal periodicals and was prominently connected with the preparation of the Uniform Sales Act and similar codifications of the Law of Warehouse Receipts and the Law of Stock Transfer. Williston wrote: *The Law of Sales* (1909); *Commercial Law* (1915); *Negotiable Instruments* (1915); and he edited several important works, especially on contracts.

WILLISTON, SAMUEL WENDELL (1852–). An American paleontologist and anatomist, born in Boston. He graduated from the Kansas Agricultural College in 1872, and studied also at Yale (M.D., 1880; Ph.D., 1885), where he was professor of anatomy from 1886 to 1890. Afterward he served as professor of historical geology and anatomy and as dean of the Medical School at the University of Kansas until 1902, when he became professor of paleontology at the University of Chicago. At various times he was also connected with the United States Geological Survey, the journal *Science*, and the Kansas Board of Health and Board of Medical Examiners. In 1903 he served as president of the Society of Vertebrate Paleontology. Williston received the honorary degree of Sc.D. from Yale and was elected to the National Academy of Sciences in 1915. Besides about 250 scientific papers, and reports of the University Geological Survey of Kansas, he published *Manual of North American Diptera* (1896; 3d ed., 1908) and *Water Reptiles of the Past and Present* (1914).



WILL'MAR. A city and the county seat of Kandiyohi Co., Minn., 90 miles west of Minneapolis, on the Great Northern Railroad (Map: Minnesota, B 5). It has grain elevators, brick works, a creamery, and manufactories of gasoline farm tractors, lumber products, etc. Willmar Seminary and the State Hospital for Inebriates are here; and there are a handsome courthouse, Carnegie library, fine city hall and school buildings, and public parks.. Pop., 1900, 3409; 1910, 4135.

WILL-O'-THE-WISP. See IGNIS FATUUS; ROBIN GOODFELLOW.

WILLOUGHBY, wĭl'ô-bĭ, SIR HUGH (?1500–54). An English Arctic explorer. He was born at Risby, Derbyshire, and was knighted for his services in the expedition to Scotland in 1544. In 1553 he was made admiral of a fleet of three vessels sent out at the expense of the merchants of London with license from Edward VI "to discover strange countries and a northeastern passage to Cathay and India." The vessels took out 136 persons, of whom 18 were merchants having a share in the expenses of the expedition. In July, 1553, a storm on the coast of Norway dispersed the fleet. Two of the ships went into the harbor of Arzina, in Lapland, where the crews and passengers, 62 in number, perished of scurvy, the ships and bodies being found in 1554 together with Willoughby's journal and will. The third vessel, under Richard Chancellor (q.v.), reached the Dvina on the White Sea. Chancellor visited Moscow, and opened up a sea route to Russia. This was of vast importance to England, which through the Muscovy, or Russian Company (organized 1554), was the first western nation to establish trade relations with Russia.

WILLOUGHBY, WESTEL WOODBURY (1867–). An American political scientist, born at Alexandria, Va. He was educated at Johns Hopkins University (A.B., 1888; Ph.D., 1891), and was admitted to the bar in 1891. He practiced law in Washington, D. C., until 1897, also teaching at Johns Hopkins, where by 1906 he had become professor. His views on American

WILLOWS

1. POLLARDED WILLOWS. 2. WHITE WILLOW (Salix alba). 3. BARK OF WHITE WILLOW.

history and constitutional development are strongly federalistic in tone. In 1904 he became managing editor of the *American Political Science Review*, and in 1913 served as president of the American Political Science Association. He published: *An Examination of the Nature of the State—A Study in Political Philosophy* (1896; rev. ed., 1903); *The Political Theories of the Ancient World* (1903); *The American Constitutional System* (1904); *The Constitutional Law of the United States* (2 vols., 1910); *Principles of the Constitutional Law of the United States* (1912). He also edited the "American State Series," and became coeditor of the "Johns Hopkins Studies in Historical and Political Science."

WILLOW (AS. *welig*, of uncertain etymology), *Salix*. A genus of trees and shrubs of the family Salicaceæ. There are fully 160 species, but their precise number is not likely to be soon determined, as varieties are very numerous and many hybrids are known to exist. They are mostly natives of the colder temperate regions of the Northern Hemisphere, although some are found in warm countries, as *Salix tetrasperma* in the hottest parts of India. Most

SHINING-LEAVED WILLOW (*Salix lucida*).

of them are shrubs, and some are of very low growth, particularly those of arctic and alpine regions. Thus, *Salix herbacea*, which is common on the mountains of Scotland and farther north, also occurring in alpine and arctic portions of America, seldom rises more than an inch from the ground. *Salix arctica* and *Salix polaris* are the most northern woody plants. Other small species are also found at the limits of perpetual snow in various countries. Some of those which more generally receive the popular name willow are trees of considerable size and remarkably rapid growth. The wood of some of them, as the white willow or Huntingdon willow (*Salix alba*), and the crack willow (*Salix fragilis*), is used for many purposes, being remarkably light and soft, but tough and durable, especially in damp situations. It is used for making paddles of steamboats, because it wears better in water than any other kind of wood. The cricket bat willow is *Salix cærulea* which is believed to be a hybrid between the white and the crack willow. Willows are often planted as ornamental trees, especially near streams and in moist grounds. Many kinds are also planted on the banks of rivers to retain the soil in its place and restrain the encroachment of the water. They are peculiarly adapted for this purpose, as they grow readily from cuttings. Willow stakes driven into a moist soil strike root, and soon become luxuriant.

The twigs of most of the willows are very tough and flexible, and are used by coopers for making hoops, and by gardeners for tying large plants. They are much used for basket making and other kinds of wickerwork. (See OSIER.) Willow trees are often treated as pollards (q.v.) and grown in copses, because they stand cutting remarkably well, and the stems are useful for many purposes, such as hoops, poles, fuel, etc. The bark of most species contains tannin and salicin and is used in domestic medicine. A fragrant water is distilled in northern India from the catkins of the Egyptian or caliph willow (*Salix ægyptiaca*). The flowers of the willow, which in many species appear before the leaves, are much sought after by bees. The male catkins of many species are very beautiful, the prominent anthers being yellow, or in *Salix purpurea* of a rich purple. The weeping willow (*Salix babylonica*) is a very ornamental species, a native of the East, now much planted in America and on the continent of Europe, on account of its beautiful pendant twigs. (See WEEPING TREE.) The so-called Napoleon's willow is a variety of it. The white willow or Huntingdon willow (*Salix alba*) is one of the largest species known in America. It grows with great rapidity to a height of 80 feet, with a diameter of 5 to 8 feet. Its head is much branched and spreading, its leaves narrow, elliptical-lanceolate, silky beneath, and sometimes also above.

The popular name sallow is given to a number of species, among them the gray sallow (*Salix cinerea*), the round-leaved sallow (*Salix caprea*), the round-eared sallow (*Salix aurita*), and the long-leaved sallow (*Salix grandifolia*). These are common British species. They are not as pliable as the osier willows, but are used for hoops, implements, etc. At least half of the known species of willow occur in the United States. Among the best known are the black willow (*Salix nigra*), a tree 100 to 140 feet high, and *Salix cordata* and *Salix lucida*, shrubs or small trees along streams from New England to Virginia and westward to British Columbia and California. A considerable industry in willow lumbering has been developed along the lower Mississippi River and its tributaries, the black, white, and crack willows furnishing most of the lumber, more than 20,000,000 feet of black willow alone being used in 1913. It is used for furniture, interior finishing, boxes, cooperage, etc. See Plate of FLOWERS.

WILLOW GROUSE. See PTARMIGAN.

WILLOW INSECTS. In Europe 386 species of insects feed upon the various willows; in the United States Packard records 223, but this list has recently been largely increased. Many species which attack poplar, especially lepidopterous larvæ, attack the willows. The American cimbex (*Cimbex americana*), the largest of the native sawflies, lays its eggs in the leaves and the larvæ sometimes cause excessive defoliation. Among other sawflies dependent upon these trees, *Nematus ventralis*, whose yellow-spotted black larva is the yellow-spotted wil-

low slug, is especially injurious. There are at least five generations annually, and the insect frequently multiplies excessively, sometimes menacing the willowware industry through its destruction of the osier willow. The willow-shoot horntail (*Phyllœcus integer*) lays its eggs in the twigs and the larvæ burrow in the terminal shoots, causing them to wilt. The wilting is begun by the mother insect, which girdles the twigs below the place where the egg is laid. The cocoon is spun within the burrow and the larva remains in it through the winter, changing to pupa in the early spring. Several leaf beetles attack the foliage, and the larvæ of two longicorn beetles (*Xylotrechus annosus* and *Pogonocherus mixtus*) bore in the wood. A number of plant lice affect the leaves and twigs; several species of scale insects are found upon the bark; and two gall mites produce excrescences upon the leaves. Consult A. S. Packard, *Insects Injurious to Forest Trees* (Washington, 1890).

WILLOW WARBLER. See WARBLER.

WILLOW WREN. See CHIFFCHAFF.

WILLS, WILLIAM GORMAN (1828–91). A British playwright and painter. He was born in County Kilkenny, Ireland, and studied at Trinity College, Dublin. His early life was divided between painting and story writing. About 1868 he established himself as a portrait painter in London and attained a considerable reputation, while he was noted for the Bohemian eccentricities of his life. He began play writing about 1856, and among his dramatic works are: *The Man o' Airlie* (1867); *Charles I* (1872), in which Henry Irving secured one of his early triumphs; *Eugene Aram* (1873); *Marie Stuart* (1874); *Olivia* (1878), based on *The Vicar of Wakefield*, and a great success; *Nell Gwynne* (1878); *Faust*, as produced at the Lyceum (1885); and *A Royal Divorce* (1891). He died in London. Consult: Archer, *English Dramatists of To-Day* (London, 1882); Cook, *Nights at the Play* (ib., 1883); Freeman Wills, *W. G. Wills, Dramatist and Painter* (ib., 1898).

WILLS, WILLIAM JOHN (1834–61). An Australian explorer, born at Totnes, in Devonshire, England. He studied medicine in London, and in 1852 emigrated with his brother to Victoria, where for a time he was a shepherd. In 1855 he became a surveyor of crown lands, and in 1860 was appointed third in command of an expedition sent out under Robert O'Hara Burke (q.v.) to discover a route to the north across Australia. Soon after the expedition started Wills was made second in command, and in February, 1861, he and Burke succeeded in reaching tidal water on the Flinders River. They then turned back, but on the return journey both died of starvation near Cooper's Creek, and only one man, John King, succeeded in getting back to the settlements. The bodies of the two leaders were recovered and were given a public funeral in 1863. A national memorial to them was erected at Melbourne. Consult: *Wills's Successful Exploration Through the Interior of Australia*, consisting of Wills's recovered journal edited by his father (London, 1863); William Howitt, *History of Discovery in Australia* (ib., 1865); Ernest Favenc, *The History of Australian Exploration* (ib., 1888).

WILL'S COFFEE HOUSE. A famous resort of the wits during Queen Anne's reign, situated on the corner of Bow and Russell Streets, London. Dryden's corner in it is celebrated in literary history, and it was also the resort of Wycherley and Waller, who lived on Bow Street, near by. It was so called from the first name of its original proprietor and was succeeded by Button's.

WILLSON, HENRY BECKLES (1869–). A Canadian author. He was born in Montreal and graduated at the Boston Law School in 1886. He joined the staff of the Boston *Globe*, in 1889 went to Cuba as correspondent of the New York *Herald*, and later went to London, England, where he took an editorial position and contributed to leading periodicals, principally on Canadian topics. He returned to Canada in 1896 as special correspondent of the London *Daily Mail*, and traveled through Newfoundland and through the Canadian provinces to Vancouver. His writings include: *The Tenth Island* (1897), a description of Newfoundland; *The Great Company* (1899), a history of the Hudson's Bay Company; *The Story of Lost England* (1902); *Lord Strathcona* (1902; 2d ed., 1915); *Ledger and Sword* (1903); *The Romance of Canada* (1907); *The Life and Letters of James Wolfe* (1909); *Nova Scotia: the Province that has been Passed By* (1910); *Quebec: the Laurentian Province* (1913).

WILLSTÄTTER, RICHARD (1872–). A German chemist. He was born in Karlsruhe, Baden, and studied chemistry under Von Baeyer (q.v.) in the University of Munich, where he was docent and then assistant professor till 1905, when he was called to a chair in the Zurich Technical School. In 1912 he accepted an appointment as fellow in the Kaiser Wilhelm Institute in Berlin and an honorary professorship in the University of Berlin. Willstätter specialized in the investigation of complex organic compounds, notably on the coloring substances in plants, in which field he became probably the foremost authority of his time. His achievements brought him the Nobel prize in chemistry for 1915. Besides contributing numerous articles to chemical journals he published: *Untersuchungen über Chlorophyll; Methoden und Ergebnisse* (1913), with A. Stoll; *Ueber die Verwandtschaft der Anthocyane und Flavone* (1915), with H. Mallison.

WILLUGHBY, wĭl'lŭ-bĭ, FRANCIS (1635–72). An English naturalist, born at Middleton, Warwickshire. He studied at Trinity College, Cambridge, 1653–59, became much interested in natural history, and about 1662, with his former teacher, John Ray (q.v.), planned a work on natural history, the botany to be written by Ray and the zoölogy by Willughby. The two traveled on the Continent and in England collecting material, but before the work was completed Willughby died. Ray later published some of the results of Willughby's study, first in Latin in 1676, and then in English in 1678, under the title of *The Ornithology of Francis Willughby*. In the work there was for the first time a rational system of classifying birds, which has been asserted to be the basis of the Linnæan classification. In 1686 Ray published also the results of Willughby's study of ichthyology. Other results of his researches were collected by Ray in the *Methodus Insectorum* (1705), and by Derhorn, in his *Historia Insectorum* (1710).

WIL'MERDING. A borough in Allegheny Co., Pa., 12 miles southeast of Pittsburgh, on the Pennsylvania Railroad (Map: Pittsburgh

and vicinity). It has the extensive foundries and machine shops of the Westinghouse Air Brake Company. Pop., 1900, 4179; 1910, 6133.

WILMETTE'. A village in Cook Co., Ill., 14 miles north of Chicago, on the Chicago and Northwestern Railroad (Map: Illinois, J 1). It is essentially a residential suburb of Chicago, having many fine homes, a public library, and an attractive town hall. There are important floricultural interests. Pop., 1900, 2300; 1910, 4943.

WIL'MINGTON. The largest city in the State of Delaware, and the county seat of New Castle County, 27 miles southwest of Philadelphia and 69 miles northeast of Baltimore, at the junction of the Delaware River and Christiana and Brandywine creeks, and on the Pennsylvania, the Baltimore and Ohio, and the Philadelphia and Reading railroads (Map: Delaware, H 1). It is picturesquely situated on hilly ground, the abundant provision of shade trees adding to the beauty of the streets. Holy Trinity (Old Swedes') Church was built in 1698. Other notable edifices are the fine county and municipal building, the post office and United States government building, and the home of the Wilmington Trust Building Corporation. In or near the city are the Delaware, Physicians' and Surgeons', and Homœopathic hospitals, the State Hospital for the Insane, the Ferris Industrial School for Boys, the Delaware Industrial School for Girls, and the Home for Friendless and Destitute Children. The Friends' School is an old and prominent institution. The free library, begun in 1788 as the Library Company of Wilmington, and incorporated in 1857 as the Wilmington Institute, but now public, contains more than 85,000 volumes. Other collections are those of the Law Library Association of the county and the Historical Society. Wilmington is the leading industrial city in the State, its manufactures in the year 1914 having an aggregate capital of $46,400,000 and a product valued at $39,358,000. Important industries are the shipbuilding yards, car works, a paper-making plant, and morocco works. The paper-making plant is one of the largest in the country, while the morocco industry is centred in the city. About 2 miles from the city is one of the largest powder-manufacturing establishments in the world, that of E. I. Dupont de Nemours and Company, founded in 1801 by Pierre Samuel Dupont (see DUPONT DE NEMOURS) and his sons. Large quantities of foundry and machine-shop products and iron and steel are also manufactured. The Pennsylvania Railroad and the Pullman Company maintain extensive car shops at Wilmington. The city is a prominent distributing centre and a port of entry, its foreign trade in 1915 being valued at $24,000,000, including exports to the amount of $22,500,000. The government is vested in a mayor, elected every two years, and a unicameral council of 13 members. The mayor appoints the board of directors of the street and sewer departments and the board of water commissioners. Besides the mayor and council, the city treasurer, tax collectors, and board of education (a member from each ward) are chosen by direct popular vote. Wilmington spends annually in maintenance and operation about $1,200,000, the principal items of expenditure being: schools, $275,000; police department (including police courts, jails, etc.), $110,000; interest on debt, $182,000; water works, $152,000; fire department, $69,000. The water works, which are owned by the municipality, were constructed in 1827. Pop., 1900, 76,508; 1910, 87,411; 1915 (U S. est.), 93,161.

In 1638 Peter Minuet, with the first Swedish expedition to America, cast anchor in the Christiana, or Minquas, as the Indians called it, and erected a fort named Fort Christina in honor of the infant daughter of Gustavus Adolphus. He also founded a little village, Christinaham, where Wilmington now stands. Peter Stuyvesant, the Dutch Governor of New Netherland, stirred by the activity of Minuet's successor, Prinz, bought the region from the Indians, and in 1655 took Fort Christina and ended Swedish supremacy in Delaware. The Dutch rulers were in their turn succeeded nine years later by the English. Under William Penn's proprietorship the city acquired the sober Quaker character which it has never entirely lost. In 1737 Thomas Willing laid out a new town which bore his name, though Willingstown became Wilmington eight years later in honor of the English peer of that name. The battle of Brandywine (q.v.) was fought at Chadd's Ford, about 12 miles away. The first borough charter was issued in 1739. Consult Ferris, *History of the Original Settlements on the Delaware* (Wilmington, 1846), and L. P. Powell (editor), *Historic Towns of the Middle States* (New York, 1899).

WILMINGTON. A city, port of entry, and the county seat of New Hanover Co., N. C., 148 miles south by east of Raleigh, on the Cape Fear River and on the Seaboard Air and the Atlantic Coast lines (Map: North Carolina, E 3). It is situated 20 miles from the mouth of the Cape Fear River, and has steamship connection with New York and other Atlantic ports. Among the prominent structures are the United States government building, the city hall, the county court house, the Murchison Bank Building, and the Masonic Temple. There are also a public library, the City and County Hospital, and the United States Marine Hospital. Wilmington is primarily a commercial city. Cotton and lumber constitute the principal shipments. In manufacturing the city ranks fifth in the State, its various industries in 1914 having $3,699,000 capital and a production valued at $3,155,458. There are lumber mills, cotton presses, cotton mills, cottonseed-oil mills, dye works, wood-working plants, railroad shops, and manufactories of fertilizers, tea chests, wood distilling plants, metal goods, hosiery, etc. Wilmington has adopted the commission form of government providing for a mayor and six councilmen. Pop., 1890, 20,056; 1900, 20,976; 1910, 25,748; 1915 (U. S. est.), 29,384.

Settled as Newtown in 1730, Wilmington was incorporated in 1739 as a town under its present name. In 1743 it became the capital of the province. It was occupied by the British in 1781–82. During the Civil War it was the centre of communication between the Confederate States and foreign governments. Consult L. P. Powell (editor), *Historic Towns of the Southern States* (New York, 1900).

WILMINGTON. A village and the county seat of Clinton Co., Ohio, 55 miles by rail northeast of Cincinnati, on the Baltimore and Ohio Southwestern and the Pennsylvania railroads (Map: Ohio, C 7). It is the seat of Wilmington College (Friends), opened in 1870, and has a Carnegie library. The city manufactures auger bits, bridge work, bent-wood products, furnaces, and butter. Pop., 1900, 3613; 1910, 4491.

WIL'MOT, ALEXANDER (1836–). A British South African statesman and historian, born in Edinburgh, and educated at the universities of Glasgow and Edinburgh. For many years he served in various offices in Cape Colony, and in 1889 became a member of the Legislative Council. In politics he adhered to the Progressive (Rhodes) party. Among his published works are: *The History of the Cape Colony* (1869), with J. C. Chase; *The Geography of Cape Colony* (1882); *The Story of the Expansion of South Africa* (2d ed., 1895); *The History of Our Own Times in South Africa* (3 vols., 1897–99); *The History of South Africa* (1901).

WILMOT, DAVID (1814–68). An American political leader and jurist, born in Bethany, Pa. He was admitted to the bar at Wilkes-Barre in 1834, and practiced at Towanda. In time he became prominent as a Democratic politician, and from 1845 to 1851 was a member of the National House of Representatives. Although elected as a Democrat, he opposed the extension of slavery into the territory that it was expected the United States would acquire from Mexico, and in 1846 he moved his famous amendment, known as the Wilmot Proviso (q.v.). In 1848 he supported Van Buren for the presidency instead of the regular Democratic candidate, and afterward became a Republican. He was president-judge of the thirteenth district of Pennsylvania during 1853–61; was defeated as a candidate for Governor on the Republican ticket in 1857; served in the United States Senate, 1861–63; and then held the office of judge of the United States Court of Claims until his death.

WILMOT, HENRY. See ROCHESTER, EARL OF.

WILMOT, LEMUEL ALLAN (1809–78). A Canadian statesman. He was born in Sunbury County, New Brunswick, and was educated at the University of King's College, Fredericton. Called to the bar in 1832, he was two years later elected a Liberal member of the provincial Legislature. He supported the demand for responsible government, and in 1836 went to England as a delegate in behalf of popular control of the provincial crownlands. His mission was successful. In 1844 he became a member of the Executive Council, but resigned upon the appointment of a new member by the Lieutenant Governor without consulting his advisers. Four years later the Assembly passed a resolution favoring responsible government, and Wilmot became Premier, resigning three years later on his appointment as a judge of the Supreme Court of the province. He supported the movement for Canadian confederation, and was the first Lieutenant Governor of New Brunswick (1868–73) after it had become part of the Dominion of Canada.

WILMOT, ROBERT DUNCAN (1809–91). A Canadian statesman, born at Fredericton, New Brunswick, and educated at St. John. After engaging in shipping, and after a short period spent in England, he entered the Parliament of his province in 1846, holding his seat, except in 1861–65, down to confederation in 1867. He was mayor of St. John (1849); surveyor-general of New Brunswick (1851–54); provincial secretary (1856–57 and 1865–67); and in 1866–67 was a member of the conference of colonial delegates with the British government in London concerning the terms of Canadian confederation. Wilmot, who began his career as a Liberal, afterward joined the Conservatives of his province and opposed confederation; but after the latter was accomplished he was appointed to the Dominion Senate, of which he was Speaker in 1878–80. In 1880–85 he was Lieutenant Governor of New Brunswick.

WILMOT PROVISO. The name applied to an amendment proposed in the United States Congress in 1846 by David Wilmot (q.v.), a Democratic Representative from Pennsylvania, to a bill appropriating money for the purchase of territory from Mexico. On Aug. 8, 1846, President Polk sent to Congress a special message asking that body to appropriate money to be used in adjusting the boundary dispute between the United States and Mexico. In response a bill appropriating $2,000,000 was introduced in the House, and it was expected that the money would be used in buying the Mexican claims to the disputed territory. In the debate that followed, Wilmot moved an amendment which provided "that neither slavery nor involuntary servitude shall ever exist in any part of said territory, except for crime, whereof the party shall first be duly convicted." This amendment was adopted in the House by a vote of 83 to 64, and the entire bill was then passed. When it was taken up in the Senate, however, Lewis, of Alabama, moved to strike out the proviso; but Davis, of Massachusetts, spoke against the motion, and continued his opposition until Congress adjourned. In the following December the President again asked for the measure, and, as most of the Northern State Legislatures had declared in favor of it, bills were soon reported in both Houses. On Feb. 8, 1847, Wilmot again moved his proviso to one of these bills (appropriating $3,000,000 instead of the original $2,000,000), and it was again adopted, on February 15, by a vote of 115 to 106. Meanwhile, however, the Democratic Senate had passed a similar bill without the proviso, and this bill came up before the House. That body in committee of the whole voted to amend the Senate bill by adding the proviso, but the proviso was rejected by the Senate and the bill was finally passed without it.

In the contest the proslavery men had naturally fought the proviso, and in the effort to preserve harmony between the Northern and Southern wings of their party the Democrats were forced to evolve the doctrine of popular sovereignty (q.v.). Those who, like Wilmot, were unwilling to accept this doctrine split off from the party. The principle contained in the proviso continued to be a burning issue even after its temporary rejection. Attempts were made to apply the principle in organizing the territory that was acquired from Mexico, and it formed the basis, in part, of the Free-Soil party, and later of the Republican party. It was rejected in the Compromise of 1850, and its previous application in the Missouri Compromise (q.v.) of 1820 was wiped out by the Kansas-Nebraska Bill (q.v.) of 1854; and in the famous case of Dred Scott it was held to be out of harmony with the Constitution. Ultimately, however, it was established by the Act of June 19, 1862, which forbade slavery in "any of the Territories of the United States now existing, or which may at any time hereafter be acquired." Consult: Henry Wilson, *History of the Rise and Fall of the Slave Power in America* (3 vols., Boston, 1872–77); Schouler, *History of the United States of America under the Constitution* (New York, new ed., 1899);

Von Holst, *Constitutional and Political History of the United States* (Chicago, new ed., 1899); and G. P. Garrison, *Westward Extension, 1841–1850* (New York, 1906).

WILNA, vil'nà, RABBI ELIAS (1720–97). A name applied to Elijah or Elias ben Solomon, one of the greatest of Hebrew scholars, born at Wilna (Vilna), in Lithuania; also known as Elijah Gaon and The Gaon of Wilna. As a child he displayed remarkable gifts of memory and reasoning powers, and, beginning the study of the Talmud at the age of seven, he speedily mastered the subject. He was almost entirely self-taught, and to this was probably due the originality of method which he applied to Talmudic study. Unlike most Talmudists, whose efforts were directed to weaving about the text elaborate webs of the most subtle casuistry leading nowhere in particular, he made it his chief object always to arrive at the simple meaning of words. He even applied, in some degree, the methods of philology and higher criticism to the emendation of the Talmudic text, and at a time when the Talmud was practically the exclusive subject of study among the Jews, he laid great stress on the value of the biblical literature and the importance of Hebrew grammar. He went further still in advocating the cultivation of the profane sciences, a view at that time amounting almost to heresy, and himself did work of a very high order in the fields of mathematics and astronomy. He had also a great fondness for the Cabbala. With the exception of some travels in his youth he spent his entire life in semiseclusion at Wilna, declining numerous calls which his great reputation brought him, and content to impart instruction in grammar, the Bible, and the Mishna to a select number of pupils. The only event of moment in his life was his struggle with the Chasidim (q.v.), of whom he was one of the most inveterate persecutors; he repeatedly excommunicated them and forbade intermarriage with them. He wrote commentaries in every classic field of Hebrew literature, none of which, however, were published during his lifetime. These include commentaries on the Pentateuch, the Prophets and the Hagiographa, on portions of the Babylonian and Jerusalem Talmud, and on the Halacha, Haggada, and Cabbala (qq.v.), e.g., the Shulchan Aruch and the Zohar. He was also the author of a Hebrew grammar and treatises on geometry, algebra, trigonometry, and astronomy.

WIL'SON. A city and the county seat of Wilson Co., N. C., 49 miles east by south of Raleigh, on the Atlantic Coast Line and the Norfolk Southern railroads (Map: North Carolina, E 2). The district is engaged in farming and cotton growing, and especially in the cultivation of tobacco, in which it carries on an extensive trade. The industrial establishments of the town include cotton and oil mills, carriage and wagon factories, foundries and machine shops, lumber mills, tobacco factories, etc. Wilson has adopted the commission form of government. Pop., 1900, 3525; 1910, 6717.

WILSON, ALEXANDER (1766–1813). An American ornithologist, born at Paisley, in Scotland. He worked for some time as a weaver and then became a peddler. In 1790 he published a volume of poems, and in 1792 the anonymous narrative poem *Watty and Meg*, which was ascribed by some to Burns. Later, for writing satires on the Paisley master weavers in a trade dispute, he was imprisoned. In 1794 he emigrated to America, where for several years he worked as a weaver, peddler, and school teacher. William Bartram (q.v.) interested him in the drawing of birds, and he evolved a plan to illustrate the ornithology of the United States. In 1804, partly to collect material, he and two friends walked to Niagara from Philadelphia, a trip which he described in a long poem, "The Foresters." Two years afterward he became assistant editor of an American edition of Rees's *Cyclopædia*, the publisher of which, Thomas Bradford, undertook to issue Wilson's *American Ornithology*. The first volume of the latter appeared in 1808 and the second in 1810. To collect material and get subscriptions, the author traveled in various parts of the country, undergoing many hardships. After his return he completed five more volumes, but died before the work was finished, at the age of 47. Volumes eight and nine were edited by George Ord in 1814, and four supplementary volumes were prepared by Prince Charles Lucien Bonaparte (1825–33). Collected editions were published by Jameson (4 vols., 1831), Jardin (3 vols., 1832), and Brewer (1851). Wilson's *Miscellaneous Prose Works and Poems*, with a memoir, were published in two volumes at Paisley in 1876. His scientific work was not systematic, but his descriptions were good, his pictures were superior to most of those of his day, and he was a pioneer in his chosen field. Consult J. S. Wilson, *Alexander Wilson, Poet-Naturalist* (Washington, 1906); Witmer Stone, in D. S. Jordan, ed., *Leading American Men of Science* (New York, 1910).

WILSON, ALLEN B. (1824–88). An American inventor, born in New York. He learned the trade of a cabinetmaker. In 1849 he invented a sewing machine (q.v.), in which the material was carried forward by a feeding plate. By this means an endless seam could be formed at any curve. The feeding device he greatly improved in 1850 by giving the roughened feeding plate four motions. He also introduced the rotary hook and stationary bobbin. In 1850 he, with Nathaniel Wheeler, formed the Wheeler & Wilson Manufacturing Company for the manufacture of sewing machines, with works at Bridgeport, Conn.

WILSON, AUGUSTA JANE (EVANS) (1835–1909). An American novelist, born in Columbus, Ga. She lived as a child in Texas, and after 1841 in Mobile, Ala. She wrote her first novel, *Inez, A Tale of the Alamo* (pub. 1856), at the age of 17. During the Civil War she opened a private hospital for the Confederate wounded. She wrote several novels, of which the chief were: *Beulah* (1859); *Macaria* (1864); *Saint Elmo* (1866); *Vashti* (1869); *Infelice* (1875); *At the Mercy of Tiberius* (1887); *A Speckled Bird* (1902); *Devota* (1907).

WILSON, SIR CHARLES RIVERS (1831–1916). A British financier, born in London. He graduated at Balliol College, Oxford, in 1853; entered the Treasury as a clerk in 1856; was a private secretary to Disraeli in 1867–68, and was Comptroller General of the National Debt Office from 1874 till 1894. From 1876 to 1895 he served on the Council of the Suez Canal Company, and he was Finance Minister to the Khedive of Egypt in 1877–80. From 1895 until his death he was president of the Grand Trunk Railway, Canada. He was made G.C.M.G. in 1895.

WILSON, Sir Daniel (1816–92). A Scottish-Canadian archæologist and educational reformer, born at Edinburgh, Scotland. He graduated at Edinburgh University; worked in London in 1837–42 as a journalist; and then returned to Edinburgh, where five years afterward he published the archæological work *Edinburgh in the Olden Time*, illustrated with sketches made by himself. In 1851 he followed up this work with the highly praised *Archæology and Prehistoric Annals of Scotland.* Two years later he went to Canada to become professor of history and English literature in the University of Toronto, of which he was president from 1881 until his death. In 1854 he became editor of the *Journal of the Canadian Institute;* in 1859 and 1860 was president of that body; in 1885 was president of the Royal Society of Canada; and in 1888 was knighted. To Wilson's efforts are largely due the success of the undenominational as opposed to the sectarian idea in university education in Canada. His publications, other than those already mentioned, include: *Prehistoric Man: Researches into the Origin of Civilization in the Old and New Worlds* (1863; 3d ed., 1876); *Chatterton: A Biographical Study* (1869); *Caliban, the Missing Link* (1873); *Spring Wild Flowers,* a collection of poems (1875); *Reminiscences of Old Edinburgh* (1878); *Anthropology* (1885); and *The Right Hand: Lefthandedness* (1891). Consult J. C. Dent, *Canadian Portrait Gallery* (Toronto, 1880), and William Kingsford, "Sir Daniel Wilson" in *Transactions of the Royal Society of Canada* (Ottawa, 1893).

WILSON, Edmund Beecher (1856–). An American zoölogist, born at Geneva, Ill. He graduated from Yale in 1878 and obtained his doctorate at Johns Hopkins in 1881. He was lecturer at Williams College in 1883–84 and at the Massachusetts Institute of Technology in 1884–85; served as professor of biology at Bryn Mawr College from 1885 to 1891; and at Columbia was adjunct professor of biology (1891–94), professor of invertebrate zoölogy (1894–97), and professor of zoölogy after 1897. In 1900 he was president of the American Society of Naturalists and in 1913 president of the American Association for the Advancement of Science. His publications include, besides many special papers on embryology: *An Introduction to General Biology* (1887), with W. T. Sedgwick; *The Embryology of the Earthworm* (1889); *Amphioxus, and the Mosaic Theory of Development* (1893); *Atlas of Fertilization and Karyokinesis* (1895); *The Cell in Development and Inheritance* (1896; 2d ed., 1915).

WILSON, Edward A. (1872–1912). An English physician and explorer. He graduated at Cheltenham College and later at Caius College, Cambridge. He was appointed chief of the scientific staff of Captain Robert F. Scott's (q.v.) last antarctic expedition (1910–13), and was one of the party of five which reached the South Pole. With his commander and sledge comrades he perished of cold and starvation during the return sledge journey from the Pole. Consult *Scott's Last Expedition* (New York, 1913).

WILSON, Sir (William James) Erasmus (1809–84). A British surgeon, born at Marylebone. He studied at St. Bartholomew's Hospital, London, and was elected a fellow of the Royal College of Surgeons in 1843 and of the Royal Society in 1845. In 1869 he founded, and thereafter held until 1877, the chair of dermatology at the Royal College of Surgeons, of which institution he was president in 1881. He was especially noted for his work in behalf of the very poor who were afflicted with skin diseases. In 1877–78 he paid the expenses of the transportation of Cleopatra's Needle (q.v.) to London. Wilson was knighted in 1881. His publications include: *Practical and Surgical Anatomy* (1838; 2d ed., 1853); *The Anatomist's Vade Mecum* (1840; 11th ed., 1892); *Diseases of the Skin* (1842; 6th ed., 1867); *A Healthy Skin* (7th ed., 1866).

WILSON, Francis (1854–). An American actor, born in Philadelphia. He began his career in a minstrel show, but by 1878 was playing at the Chestnut Street Theatre, Philadelphia, and the next year appeared in *M'liss* with Annie Pixley. After several years in regular comedy, he took up comic opera. In 1889, leaving the New York Casino, he made his appearance as a star in *The Oolah.* Plays in which he starred subsequently include: *The Lion Tamer* (1891); *The Little Corporal* (1898); *The Bachelor's Baby* (1909–11), written by himself. He is the author of *Joseph Jefferson: Reminiscences of a Fellow Player* (1906), *The Eugene Field I Knew* (1898), and several plays of which *The Bachelor's Baby* was the most successful. Consult Clapp and Edgett, *Players of the Present* (New York, 1901).

WILSON, George Grafton (1863–). An American international law scholar, born at Plainfield, Conn. He was educated at Brown (A.B., 1886; Ph.D., 1889), where, after studying at Heidelberg, Berlin, Paris, and Oxford, he was associate professor (1891–94) and professor (1894–1910) of social and political science. Thereafter he held the chair of international law at Harvard. After 1900 he lectured also on international law at the United States Naval War College, after 1907 served on the board of editors of the *American Journal of International Law,* and in 1912–13 went to France as exchange professor. He wrote: *Town and City Government in Providence* (1889); *Insurgency* (1900); *Submarine Telegraph Cables in Their International Relations* (1901); *International Law* (1901; 6th ed., 1915), with G. F. Tucker: *International Law Situations* (11 vols., 1902–12); *International Law* (1910); *The Hague Arbitration Cases* (1915).

WILSON, Harry Leon (1867–). An American author. He was born at Oregon, Ill., and from 1896 to 1902 was editor of *Puck.* Wilson became a member of the National Institute of Arts and Letters. His writings include: *Zig Zag Tales* (1896); *The Spenders* (1902); *The Lions of the Lord* (1903); *The Seeker* (1904); *The Boss of Little Arcady* (1905); *Ewing's Lady* (1907); *The Man from Home* (1908; new ed., 1915), written with Booth Tarkington and dramatized with great success; *Bunker Bean* (1912); *Ruggles of Red Gap* (1915), also dramatized.

WILSON, Henry (1812–75). An American political leader, Vice President of the United States in 1873–75. He was born at Farmington, N. H., and his original name was Jeremiah Jones Colbath, but when he reached manhood he legally assumed the name of Henry Wilson. From the age of 10 till that of 21 he served an apprenticeship to a farmer. He then learned the shoemaking trade at Natick, Mass., where he later established a prosperous manufactory.

In 1840 he was elected to the Massachusetts House of Representatives as a Whig; was re-elected in the following year; and then served two terms in the State Senate. About this time he began to be an active opponent of slavery, and in 1848 he bought the Boston *Recorder* and edited it in the interests of the Free-Soil party. In 1850 he was again elected to the State Senate, and was chosen president of that body. In 1852 he presided over the Free-Soil Convention at Pittsburgh. In 1865 he was chosen by a combination of Free Soilers and Americans or Know Nothings to succeed Edward Everett in the United States Senate, and retained his seat until 1873. He denounced the assault of Preston R. Brooks upon Charles Sumner, and was challenged by Brooks, but declined, although he expressed his determination to defend himself if attacked. Before the Civil War he was considered one of the most effective speakers against slavery, and one of the foremost leaders of those who believed in fighting that institution through the machinery supplied by the Federal Constitution. In March, 1861, he was made chairman of the Committee on Military Affairs. After hostilities began he raised the Twenty-second Massachusetts Regiment and took it to the field, serving on the staff of General McClellan until Congress met. In 1872 he was nominated for the Vice Presidency by the Republicans on the ticket with Grant and was elected. In the following year he was stricken with paralysis, and died two years later. He was widely known during his political career as the "Natick Cobbler," a nickname given to him in allusion to his early life. Among his published works are: *History of the Anti-Slavery Measures of the Thirty-seventh and Thirty-eighth Congresses, 1861–64* (1864); *History of the Reconstruction Measures of the Thirty-ninth and Fortieth Congresses, 1865–68* (1868); and the almost completed *History of the Rise and Fall of the Slave Power in America* (3 vols., 1872–77), an exceedingly valuable work. Consult Russell and Nason, *Life and Public Services of Henry Wilson* (Boston, 1872), and Stowe, *Men of Our Times* (Hartford, 1868).

WILSON, Henry Lane (1857–). An American diplomat, born at Crawfordsville, Ind. He graduated from Wabash College in 1879. He was editor of the Lafayette (Ind.) *Journal* in 1882–85 and then removed to Spokane, Wash., where he was engaged in the practice of law and in banking until 1896. From 1897 to 1905 he was Minister to Chile, from 1905 to 1910 Minister to Belgium, and in 1910–13 Ambassador to Mexico. He had charge of American interests during the turbulent period marking the close of the Díaz régime and during the whole of the Madero administration; he advocated the recognition of Huerta by the United States. In 1913, recalled by President Wilson, he resigned. Later he criticized the administration's policy in Mexico.

WILSON, Horace Hayman (1786–1860). An English Orientalist, born in London, and educated for the medical profession. In 1808 he went to India as assistant surgeon on the Bengal Establishment, and a short time afterward obtained an appointment in the Calcutta mint as assistant to Leyden. He applied himself diligently to the study of Sanskrit, and in 1811 was appointed secretary of the Asiatic Society of Bengal. At Calcutta in 1813 Wilson published his first work, an edition of Kalidasa's *Mēghadūta* (new edition, 1901). His *Dictionary, Sanskrit and English* (1819–40) was followed by many other contributions. A complete edition of his works was published in 12 volumes (1862–71). Among them as written, edited, or translated by him are: *Select Specimens of the Theatre of the Hindus* (2 vols., 1826–27; 3d ed., 1871); *The Raghu Vansa, or Race of Raghu, a Historical Poem, by Kâlidâsa* (ib., 1832); *The Vishnupurāna* (1840; new ed., 1864–77); *Sanskrit Grammar* (1841); *Ariana Antiqua, a Descriptive Account of the Antiquities and Coins of Afghanistan* (1841); *History of British India from 1805 to 1835* (1844–48); *Rig-Veda-Sanhita* (6 vols., 1850–58); *Glossary of Judicial and Revenue Terms, from Arabic, Persian, Hindustani, etc.* (1855). He became professor of Sanskrit in Oxford in 1832, and librarian of the East India Company, London, in 1836, and held both of these positions till his death.

WILSON, Ida Lewis. See Lewis, Ida.

WILSON, Jack. See Wovoka.

WILSON, James (1742–98). An American jurist, and a signer of the Declaration of Independence. He was born near St. Andrews, Scotland, was educated at St. Andrews, Glasgow, and Edinburgh, and in 1763 emigrated to New York, whence he removed to Philadelphia in 1766. He taught Latin in the Philadelphia College (now University of Pennsylvania), studied law under John Dickinson (q.v.), and was admitted to the bar in 1767. He was a delegate to the Provincial Convention of 1775; was appointed Indian commissioner for the middle department in the same year; was a member of the Continental Congress in 1775–77 and in 1782–83, and of the Confederation Congress in 1785–87; was advocate-general for the French government from 1779 to 1783; was appointed brigadier general of militia in 1782; and, in the same year, was Pennsylvania's counsel in the suit with Connecticut over the possession of the Wyoming valley. He was a delegate to the Constitutional Convention of 1787 and took a foremost part in the debates, emphasizing the contention that sovereignty rests ultimately with the people rather than with the constituent States. Subsequently he was a member of the Pennsylvania Convention, and with Thomas McKean secured the ratification of the Constitution by that State. His opening speech is still regarded as one of the clearest expositions ever made of the general character of the Constitution. Of this and his other speeches in the two conventions James Bryce has said that "They display an amplitude and profundity of view in matters of constitutional theory which place him in the front ranks of political thinkers of his age." In 1789–90 he was a prominent member of the convention which remodeled the State constitution; in 1791 he became professor of law in the Philadelphia College; and from 1789 until his death he was an associate justice of the United States Supreme Court. He wrote several pamphlets, including *Considerations on the Nature and Extent of the Legislative Authority of the British Government* (1774) and *An Address to the Citizens of Philadelphia* (1784). His *Works* have been edited by his son, Bird Wilson (1803–04), and by James D. Andrews (Chicago, 1896). Consult an article by Justice J. M. Harlan, "James Wilson and the Formation of the Constitution," in the *American Law Review*, vol. xxxiv, and *James Wilson Memorial Volume* (1907).

WILSON, JAMES (1805–60). A British economist, born at Hawick, Roxburghshire, Scotland. His father was a member of the Society of Friends, and the son, after three years and a half in the Friends' schools, began a business career at Hawick, but removed in 1824 to London, where he was a merchant until 1844. He published in 1839 *Influences of the Corn Laws as Affecting All Classes of the Community* (3d ed., 1840), in which he showed that the duty on corn was really no more beneficial to the agricultural interest than it was to the manufacturing interest. In 1840 he published *Fluctuations of Currency, Commerce, and Manufactures*, in which he pointed out the evil effects of the artificial operation of the corn laws. In the following year appeared his *The Revenue, or What Shall the Chancellor Do?* Two years afterward he founded *The Economist*, in which he advocated the anticorn-law movement. In 1847 he published *Capital, Currency, and Banking* (2d ed., 1859), which was a collection of essays already printed in *The Economist*. In the same year he was returned to Parliament from Westbury, and from 1853 to 1858 held the position of Financial Secretary to the Treasury. In October, 1859, he became financial member of the Council of India, where he carried through a budget that provided for an income tax, and established a sound paper currency redeemable in silver. A memoir was written by his son-in-law, Walter Bagehot (London, 1861).

WILSON, JAMES (1835–). An American agriculturist. He was born in Ayrshire, Scotland, came with his parents to the United States in 1851, lived for a short time at Norwich, Conn., and in 1855 removed to Tama Co., Iowa, where for many years he was engaged in farming. He was a member of the State Assembly for three terms, during the last of which he was Speaker, and from 1873 to 1877 and again in 1883–85 was a member of Congress. In 1870–74 he was regent of the State University of Iowa and from 1890 to 1897 was director of the Agricultural Experiment Station and also professor of agriculture in the Iowa Agricultural College. In 1897 he became Secretary of Agriculture in the cabinet of President McKinley, being retained by Presidents Roosevelt and Taft, and serving continuously in that capacity for 16 years.

This was a period of remarkable development of the Federal Department of Agriculture, from a small and relatively unimportant institution to the greatest institution of its kind in any country, working in close contact with all branches of the industry. The interest and confidence Secretary Wilson aroused in agricultural investigation enabled him to secure rapidly increasing appropriation for expanding the department's work and influence. The appropriations grew from a little over $3,000,000 in 1897 to over $24,000,000 the year he retired, and the personnel from under 2500 to nearly 14,000 persons. In his administration a national forest policy was inaugurated and millions of acres set aside for forest reserves, a system of soil survey for the whole country was begun, Federal experiment stations were established in Alaska, Porto Rico, Hawaii, and Guam, farm management surveys were undertaken, and farm demonstration work started and developed upon a national scale. The regulatory work of the department was also very greatly extended. A review of the progress during his administration is given in the *Year Book of the Department of Agriculture* for 1912 (Washington, 1913).

WILSON, JAMES CORNELIUS (1847–). An American physician, born in Philadelphia. He graduated from Princeton in 1867, and in 1869 from Jefferson Medical College, where until his retirement he was professor of the practice of medicine and of clinical medicine. He was also identified with various Philadelphia hospitals. He served as president of the American Academy of Medicine (1897), of the American Association of Physicians (1902), and of other professional bodies. His publications include: *The Summer and its Diseases* (1879); *A Treatise on the Continued Fevers* (1881); *Fever Nursing* (1888; 8th ed., rev. and enl., 1915); *The Complete Medical Pocket Formulary and Physician's Vade-Mecum* (1892; 5th ed., rev., 1907); *A Handbook of Medical Diagnosis* (1909; 4th ed., rev., 1915).

WILSON, JAMES GRANT (1832–1914). An American soldier, editor, and author, born in New York City. He was educated chiefly by private tutors and through European travel, founded (1857) the Chicago *Record*, a journal of art and literature, and entered the Union army as major and left it as brigadier general (1865). He afterward lived in New York, was a popular speaker, a frequent contributor to periodicals, president of the Society of American Authors, and, after 1885, of the New York Genealogical and Biographical Society. He edited Fitz-Greene Halleck's *Poems* (1868); *A Memorial History of the City of New York* (4 vols., 1892–93); *Appleton's Cyclopædia of American Biography* (6 vols., 1887–89, with John Fiske; vol. vii, 1900), an excellent book of reference; *The Great Commanders Series* (18 vols., completed 1913); *The Presidents of the United States, 1789–1914* (4 vols., 1914), the work of many distinguished writers. His chief books include: *Biographical Sketches of Illinois Officers* (1862–63); *Life of Fitz-Greene Halleck* (1869); *Sketches of Illustrious Soldiers* (1874); *Poets and Poetry of Scotland* (1876); *Centennial History of the Diocese of New York, 1775–1885* (1886); *Bryant and his Friends* (1886); *Commodore Isaac Hull and the Frigate Constitution* (1889); *Love in Letters* (1896); *Life of General Grant* (1897); *Thackeray in the United States* (2 vols., 1904).

WILSON, JAMES HARRISON (1837–). An American soldier, born near Shawneetown, Ill. He graduated at West Point in 1860 and entered the topographical engineers. During the Civil War he acted as aid-de-camp to General McClellan in the Maryland campaign; was chief topographical engineer of the Army of the Tennessee from October, 1862, until March, 1863; was assistant engineer and inspector general of the Army of the Tennessee at Vicksburg and took part in the operations about Chattanooga. He was made brigadier general of volunteers in October, 1863. In February, 1864, he was put in charge of the cavalry bureau at Washington; then commanded the Third Cavalry Division under General Sheridan; was brevetted major general of volunteers on Oct. 5, 1864, for services during the war; and on Oct. 24, 1864, was put in command of the cavalry corps of the Military Division of the Mississippi. He participated in the battles of Franklin and Nashville, and in March, 1865, was sent on a cavalry expedition into Georgia and Alabama, and in 28 days captured Selma, Montgomery, Columbus,

Macon, and other places, with 288 guns and 6820 prisoners, including Jefferson Davis. For these services he was made a major general of volunteers in 1865. He resigned from the army in 1870 and engaged in large railroad and engineering operations at home and abroad. In May, 1898, he commanded the First Division of the First Army Corps in the campaign in Porto Rico. He took part in the China relief expedition of 1900, and retired in 1901 as a brigadier general in the regular army. From 1907 he was a trustee of the Mutual Life Insurance Company. He published among other things: *Life of General U. S. Grant* (1868), with Charles A. Dana; *China: Travels and Investigations in the Middle Kingdom* (1887; new ed., 1900); *Life of Charles A. Dana* (1907); *Under the Old Flag* (1912).

WILSON, JOHN (1588–1667). A New England clergyman. He was born at Windsor, England, graduated at Cambridge in 1606, obtained a fellowship and studied law three years. He was ordained in the Church of England; became chaplain to Lady Scudamore; preached at Mortlake, Henley, Bumsted, Stoke, Candish, and Sudbury, but was repeatedly suspended by the Bishop's court because of his Puritan sympathies. He embarked for America (1630) at the Isle of Wight, with Winthrop and others of the Massachusetts Colony, and landed at Salem, Mass. At Charlestown he organized a church, which afterward became the First Church of Boston; was ordained teacher in this church by the imposition of the hands of the members, and ordained as its pastor (1632). In 1634 he visited England, returning the next year with his wife, and Hugh Peters (q.v.), who was compelled to leave for nonconformity. With Governor Winthrop, Wilson opposed the Antinomian sentiments of John Wheelwright and Anne Hutchinson. He was chaplain to the troops sent against the Pequot Indians of Connecticut (1636), and was associated with John Eliot in his missionary labors among the Indians. He published in England *Some Helps to Faith* (1625) and a poem, *Famous Deliverances of the English Nation* (1626); in America, a Latin poem to the memory of John Harvard, and *The Day Breaking, if Not the Sun Rising, of the Gospel*, relative to the Indians in New England (1647; new ed., New York, 1865).

WILSON, JOHN, the CHRISTOPHER NORTH of *Blackwood's Magazine* (1785–1854). A Scottish writer, born May 18, 1785, at Paisley, and educated at Glasgow and Oxford. Inheriting from his father an estate of £50,000, he purchased the property of Elleray overlooking Lake Windermere, where he settled as gentleman and poet. There, in the Lake District, he associated intimately with Wordsworth and came to know well De Quincey, Southey, and Coleridge. To this period belong two volumes of graceful verse—*The Isle of Palms* (1812) and *The City of the Plague* (1816). Having lost his fortune through a dishonest uncle, he migrated to Edinburgh, where he took a memorable hand with J. G. Lockhart (q.v.) in the *Blackwood's Magazine* (q.v.) for October, 1817. Thereafter, till near his death, he was a leading writer for this famous Tory magazine, though he was never strictly its editor. In 1820 he was appointed professor of moral philosophy in the University of Edinburgh, defeating in the contest Sir William Hamilton. His only claim to the post was his rampant Toryism, then regarded as sufficient. Wilson nevertheless was an enthusiastic teacher and inspired his pupils, even if he had nothing very profound to impart to them. In 1822 he began in *Blackwood's* the symposium known as the *Noctes Ambrosianæ* (q.v.). Here Wilson is seen at his best—his wit, humor, and pathos. The "Ettrick Shepherd," of the *Noctes*, an idealized portrait of James Hogg (q.v.), is a masterly creation. The death of the Shepherd in 1835 necessarily put an end to these delightful banquets. In the earlier days Wilson also contributed to *Blackwood's* a good deal of prose fiction, afterward published separately: *Lights and Shadows of Scottish Life* (1822); *The Trials of Margaret Lyndsay* (1823); and *The Foresters* (1825). Later came the substantial essays on Homer, Spenser, and all manner of papers on contemporary writers and subjects. For 1834 the number reached fully 54 distinct contributions. In 1837 Wilson lost his wife and never recovered from his grief. On resigning his professorship in 1851 he was granted a pension of £300 a year. He died in Edinburgh, April 3, 1854. In 1865 a statue was erected to his memory in Princes Street Gardens. His brother, James Wilson (1795–1856), was known as a zoölogist. Consult: his *Works*, edited by P. J. Ferrier (12 vols., Edinburgh, 1855–58); the *Noctes Ambrosianæ*, edited by R. S. Mackenzie (5 vols., New York, 1854); *Memoir* by his daughter, M. W. Gordon (2 vols., Edinburgh, 1862); and for a good estimate, G. Saintsbury, in *Essays in English Literature* (London, 1890); C. T. Winchester, "John Wilson," in *Group of English Essayists of the Early Nineteenth Century* (New York, 1910).

WILSON, JOHN (1804–75). A British missionary and Orientalist, born at Lauder, Berwick, Scotland, and educated at the University of Edinburgh. In 1828 he went to Bombay as a missionary. His mastery of the languages of western India, his knowledge of the literature and the faiths of India, combined with his energy and sympathy with native feeling, enabled Wilson to exercise a wide influence. His linguistic labors, especially in Avestan, were valuable. He was twice president of the Bombay Branch of the Royal Asiatic Society, and was vice chancellor of the Bombay University. Among his writings other than those connected with his missionary work are: *The Parsi Religion* (1843); *The Lands of the Bible* (2 vols., 1847); *History of the Suppression of Infanticide in Western India* (1855); *India Three Thousand Years Ago* (1858); *Indian Caste*, edited by Peter Peterson (2 vols., 1877; new ed., 1878). Consult George Smith, *Life of Wilson* (London, 1878), and J. Marrat, *Two Standard Bearers in the East* (ib., 1882).

WILSON, JOHN (1837–1915). An English labor leader, born at Greatham. He began work at the age of 10 in the quarries of Durham, and later was employed in the mines of Durham and in the United States. Wilson was instrumental in organizing in 1869 the Miners' Association, and was its treasurer in 1882–90, financial secretary in 1890–96, and corresponding secretary thereafter. He was a member of Parliament in 1885–86, and after 1890 represented Mid Durham until his death. He was a leader of the Labor party, but coöperated with the Liberals, who assisted in his reëlection in 1906. He gained an international reputation. Consult his *Memories of a Labor Leader* (London, 1910).

WILSON, JOHN MOULDER (1837–). An American soldier and military engineer, born in the District of Columbia. He graduated at West Point in 1860. He served throughout the Civil War, first in the artillery, then in the topographical engineers, and finally in the corps of engineers; distinguishing himself at Gaines's Mill, Malvern Hill, and in the campaign against Mobile, and by the end of the war had been brevetted colonel in both the volunteer and the regular service. Afterward he was engaged on important engineering works for the United States government, was assistant to the Chief of Engineers at Washington from 1882 to 1886, was in charge of the public buildings and grounds in the District of Columbia in 1885–89, had charge of the completion of the Washington Monument and of the building of other memorials and monuments, and in 1889–93 was superintendent of the United States Military Academy at West Point. In 1897 he was made Chief of Engineers of the army, with the rank of brigadier general, and in 1901 he was retired.

WILSON, LUTHER BARTON (1856–). An American Methodist Episcopal bishop, born in Baltimore, Md. He graduated from Dickinson College in 1875 and from the Medical College of the University of Maryland in 1877. After entering the ministry in 1878, he served several pastorates, and was a presiding elder in the Baltimore Conference when elected Bishop in 1904. He became President of the Anti-Saloon League of America and President of the Board of Trustees of Drew Theological Seminary, and was connected with many important movements in his denomination.

WILSON, RICHARD (1713–82). An English landscape painter. He was born in Pinegas, Montgomeryshire, and after studying for six years with Thomas Wright in London began as a portrait painter. In this field he attained some success, and about 1748 executed a group picture of the Prince of Wales, the Duke of York, and their tutor (in the National Portrait Gallery). In 1749 he went to Italy, where he remained six years. Here, upon the advice of Zuccarelli and Joseph Vernet, he devoted himself entirely to landscape painting, achieving considerable success. Upon his return to England he painted for the Duke of Cumberland his famous "Niobe" (1760), of which there is a replica in the National Gallery. His landscapes were not appreciated, however, and he had a continual struggle with poverty. In 1776 he was appointed librarian to the Royal Academy, receiving a small pittance which kept him from starvation. In 1781 he fell heir to his brother's little estate at Llanberis, North Wales, where he spent the remainder of his life. Wilson was the founder of classic landscape painting in Great Britain and was one of the original members of the Royal Academy. Though he painted some of England's rivers and the mountains of Wales, the influence of his study under Italian skies is always present, as is also the classic manner of Claude Lorraine. His originality lay chiefly in his treatment of light, air, and color. His pictures usually contain distant hills and classic ruins beyond placid water, with a foreground of trees. In the National Gallery are 15 examples, including "The Ruins of the Villa of Mæcenas"; "Hadrian's Villa"; "The Castle of St. Angelo, Rome"; and "Lake Avernus." Others are in South Kensington Museum, and the Metropolitan Museum, New York, possesses three, including a fine Italian Landscape (Hearn collection).

WILSON, SIR ROBERT THOMAS (1777–1849). An English general and military writer, born in London and educated at Westminster and at Winchester. When scarcely 17 he served with distinction as a volunteer under the Duke of York in Belgium. He was appointed to command the small force of cavalry which served under Sir Ralph Abercromby in Egypt, and at the conquest of the Cape of Good Hope in 1806 he again commanded a small cavalry force. As a member of the staff of Lord Hutchinson, he was present at the battle of Eylau (q.v.), in 1807. Under Wellington he commanded a Spanish brigade at the battle of Talavera, in 1809. As British representative with the Russian army in the campaign of 1812, Wilson fought against the French in the battle of Smolensk, and participated in several engagements during the French retreat. At Lützen (1813) he took command of the Prussian reserve, and at a crisis of the battle succeeded in checking the enemy. At Bautzen he also distinguished himself, and a day or two after, the Emperor of Russia presented to him publicly the cross of the Order of St. George.

In 1841 he attained the rank of general; and from 1842 to 1849 he held the post of Governor of Gilbraltar. In 1818–31 he sat in Parliament as a Liberal for Southwark. His publications include: *An Inquiry into the Military Force of the British Empire* (1804); *Campaigns in Poland, with Remarks on the Russian Army* (1811); and a *Sketch of the Military Power of Russia* (1817). His nephew, the Rev. Herbert Randolph, edited his private diaries (1861), and a *Life* (1863), based on autobiographical materials.

WILSON, SIR ROLAND KNYVET (1840–). An English lawyer, born at Swaffham, Norfolk, and educated at Eton and at King's College, Cambridge. From 1878 to 1892 he was reader in Indian law at Cambridge University. He became well known for his important treatises on legal subjects, especially Anglo-Indian practice. Among his publications are: *A Short History of Modern English Law* (1874); *An Introduction to the Study of Anglo-Muhammadan Law* (1894); *A Digest of Anglo-Muhammadan Law* (1895; 4th ed., 1912); *The Province of the State* (1911); *The First and Last Fight for the Voluntary Principle in Education* (1915).

WILSON, THOMAS (1663–1755). An English bishop, born at Burton, in Cheshire, and educated at Trinity College, Dublin. He was appointed chaplain to William, ninth Earl of Derby, and tutor to his only son. In such esteem did Lord Derby hold him that the next year he offered him the rich living of Badsworth, which Wilson would not accept because of his disapproval of nonresident rectors. Toward the end of 1697 Lord Derby insisted upon his taking the bishopric of Sodor and Man, and he was consecrated early in 1698. He was strict in discipline and is perhaps best known for the unusual exercise of his rights as head of the ecclesiastical courts. Between 1713 and 1736 this led him into frequent collisions with the Governor of the Isle of Man. Wilson was fined and in 1722 was imprisoned in Castle Rushen for two months. To atone for this and to reimburse him for fines and other pecuniary losses the King offered him the bishopric of Exeter, which he refused. Among his writings were:

The Principles and Duties of Christianity (1699); *A Short and Plain Instruction for the Better Understanding of the Lord's Supper* (1736); *Essay Toward an Instruction for the Indians* (1740); and *Sacra Privata* (1781). Consult the *Life* by John Keble (Oxford, 1847–63), and J. W. Stubbs, *History of the University of Dublin* (London, 1889).

WILSON, WILLIAM BAUCHOP (1862–). An American cabinet officer and labor leader, born in Blantyre, Scotland. Brought as a child to the United States, he became a miner in Pennsylvania, and at 11 was a junior member of a labor union. He was reared in the midst of labor disputes. By 1888 he had become president of the District Miner's Union and a member of the executive board of the United Mine Workers, and by 1900 secretary and treasurer of the National Union of Miners. In 1907 he was elected Representative in Congress, and served until 1913 as a Democrat. While chairman of the committee on labor he drafted the bill to create a department of Labor, and in the year that it was adopted (1913) he was made a member of President Wilson's cabinet as Secretary of Labor. As such, he sought to better labor conditions, establishing a government bureau of employment and giving aid to similar agencies and bureaus in the States.

WILSON, WILLIAM LYNE (1843–1900). An American political leader and educator, born in Jefferson Co., Va. He graduated at Columbian College at Washington, D. C., in 1860; then studied for a year at the University of Virginia; served in the Confederate army; was professor of Latin in Columbian College in 1865–71; and then practiced law until 1882. In the following year he became president of the University of West Virginia, and from 1883 to 1895 was a Democratic member of Congress from West Virginia. In 1893-95 he was chairman of the Committee of Ways and Means, and he carried through the House the repeal of the Sherman Silver Purchase Law, and also framed the well-known Wilson Tariff Bill, which with some modifications became a law in August, 1894. (See TARIFF.) During his congressional career he won a high reputation as an eloquent and forceful speaker and as an authority on the tariff and other financial subjects. In 1892 he was chairman of the Democratic National Convention. In 1895 he became Postmaster General in the cabinet of President Cleveland, and held that office until 1897, when he became president of Washington and Lee University.

WILSON, (THOMAS) WOODROW (1856–). The twenty-eighth President of the United States, known also as a publicist, party leader, educator, speaker, and historian. He was born at Staunton, Va., Dec. 28, 1856, son of Rev. Joseph R. Wilson and Janet (Jessie) Woodrow, of Scotch-Irish ancestry. His paternal grandfather, James Wilson, came from Ireland in 1807 and became a publisher and the owner of a chain of newspapers. His father was a Southern Presbyterian minister. Woodrow Wilson studied for about a year at Davidson College (N. C.), and graduated from Princeton in 1879. He was known at Princeton for debating and literary ability and was editor of the *Princetonian*. While an undergraduate he published a widely noticed article in the *International Review* on cabinet government in the United States. In 1881 he graduated in law from the University of Virginia, for a year practiced in Atlanta, Ga., and then entered Johns Hopkins University, newly founded, for post-graduate courses in political science. There he published (1885) his thesis for the degree of Ph.D. (conferred 1886) as *Congressional Government*. This, the first attempt to describe the actual workings of the executive and legislative system of the United States, developed apart from the theory of the Constitution, was at once accepted as authoritative. Many of the changes urged in it, Wilson, as President, later brought about. He was associate professor of history and political economy at Bryn Mawr College (1885–88), serving also as lecturer at Johns Hopkins in 1887, and (1888–90) was professor of history and political economy at Wesleyan University, Middletown, Conn. At Wesleyan he completed *The State*, an analysis of various national governments, which established his reputation as a scholar and political philosopher and which is in use in many institutions.

Called to Princeton, Wilson was professor of jurisprudence and political economy (1890–95), of jurisprudence (1895–97), and of jurisprudence and politics (1897–1910), his courses being notably popular. In 1902, on the resignation of President Patton, Wilson was elected his successor, the first layman to hold the office. His presidency (1902–10) was a period of notable reforms (see PRINCETON UNIVERSITY). He was successful until he undertook to eliminate the exclusive senior-junior clubs and establish "colleges" or "quadrangles" in order to coördinate the social and intellectual life of the university. The plan met organized opposition from alumni members of the clubs, and the president was asked to withdraw it. Friction developed also, in 1909, over the plans and purpose of the proposed graduate school. In 1910 a popular demand was made that Wilson be nominated for Governor of New Jersey. He was a Democrat in politics, and though he was not known as a party man the leaders of the party favored him, and he was nominated. There followed a campaign remarkable for dignity, absence of acrimony, and clear, forceful statement of progressive democracy. Wilson was elected by a plurality of 49,056 in a State Republican for 16 years before. A movement was immediately begun to secure for him the Democratic nomination for President of the United States.

As Governor of New Jersey (1910–13), Wilson became known as a progressive statesman and a skillful politician. He held it the duty of his office to be the party leader, and to stand responsible for the legislative programme outlined in the platform. Despite a Republican majority in the Senate and opposition in his own party, he secured the enactment of various important laws designed to remedy political and economic conditions (see NEW JERSEY, *History, Government*). In his support of J. E. Martine for United States Senator in 1911, the Governor won a victory over James Smith, a party leader who wanted the nomination for himself. This contest focused public attention on New Jersey. In 1911 Wilson spoke throughout the West, and announced approval of the commission form of municipal government, and of the initiative, referendum, and recall (though opposing the recall of judges and judicial decisions). As an avowed candidate for the Democratic presidential nomination, his conservatism pleased the East and his progressive ideas and his record attracted

the West. During the campaign occurred a break between Wilson and George Harvey, editor of *Harper's Weekly*, whose support, since his journal was reported to be connected with certain interests, embarrassed the candidate. At the Baltimore Convention Wilson supported Bryan in the latter's opposition to the election of Alton B. Parker as temporary chairman, and in the balloting greatly profited by the contest between Clark and Bryan. On the forty-sixth ballot Wilson was nominated. In November, 1912, he was elected President. He received 435 electoral votes against 88 for Roosevelt (q.v.) and 8 for Taft (q.v.). During the campaign and in his inaugural address he set forth the principles of the New Freedom (q.v.). Thomas R. Marshall of Indiana was elected Vice President.

The Wilson administration was concerned with the enactment of important domestic legislation promised in the Democratic platform and with the conduct of foreign affairs that were particularly difficult and delicate. The President revived a custom long in disuse by presenting messages to Congress in person before both Houses in joint session. The extraordinary session summoned by him in April, 1913, was the longest in the history of that body. The most important bills passed were: The Underwood-Simmons Tariff Law (1913), The Glass-Owen Currency Act (1913), the trust legislation (1914), and the Panama Canal tolls legislation (1914). (For details, see UNITED STATES, *History.*) The success with which this programme was carried through enhanced the President's reputation and affected the congressional campaign of 1914. His attitude towards the national Legislature marked a departure from the custom of most presidents, for it was that of the party leader, demanding support from the Democratic members in Congress.

In diplomacy, Wilson's task was much more difficult. At the outset, the most perplexing question concerned Mexico. (See MEXICO, *History;* UNITED STATES, *History.*) His Mexican policy was based on a desire to allow Mexico to settle her own problems, but it was savagely criticized as unpractical and as an abandonment of American rights. In his efforts to foster friendly relations with South American countries and particularly to dispel uneasiness as to the attitude of the United States towards them he was more successful.

The great war had an important influence on legislation and on the President's policies. Marine insurance under government supervision, additional internal taxes, and the shipping bill (1914–15) were the immediate consequences. In advocating a merchant marine Wilson experienced his first important defeat in Congress (1915). At the beginning of the war he opposed the demand for greater military preparedness, but as the struggle continued he modified his attitude in view of the series of crises precipitated by submarine warfare. (See UNITED STATES, *History;* WAR IN EUROPE.) Despite scathing criticism of his foreign policy and of his consistency as to the preparedness programme, Wilson's personality deeply impressed itself on the American mind, and held the allegiance of his party.

In party politics a remarkable situation developed in 1916. On the eve of the assemblage of the Republican convention there was no outstanding candidate who seemed likely to secure the nomination. A strong movement had been started early in the year for Justice Charles E. Hughes, but he remained silent as to the issues and as to his willingness to accept the nomination. Another movement had been for conciliation between Republicans and Progressives and for the nomination of Roosevelt on the issue of Americanism and preparedness. Both conventions met at Chicago simultaneously, and, with no one having a majority of the Republican convention, unsuccessful negotiations were carried on between the two. Finally Hughes was nominated by the Republicans on the third ballot. Fairbanks was nominated for the position of Vice President. Wilson was nominated by acclamation for reëlection by the Democratic National Convention at St. Louis. Marshall was again chosen as candidate for Vice President.

Mr. Wilson's first wife, Ellen Louise Axson, died at the White House in 1914. He was married the next year to Mrs. Norman Galt of Washington. Two daughters, Jessie and Eleanor, were married in the White House, the former to Francis B. Sayre and the latter to William G. McAdoo, Secretary of the Treasury. Wilson's literary distinction was recognized by admission to the American Academy of Arts and Letters, and he was the seventh President to be a member of the American Philosophical Society before his election as chief executive. He published, besides the works already mentioned: *An Old Master, and Other Political Essays* (1893); *Division and Reunion, 1829–89* (1893; expanded, 26th ed., 1909); *Mere Literature, and Other Essays* (1893); *A History of the American People* (1902; reprinted 1903, 1910); *George Washington* (1896 and 1903); *Constitutional Government in the United States* (1908); *The New Freedom: A Call for the Emancipation of the Generous Energies of a People* (1913); and numerous periodical articles and addresses.

Gardiner, in *Pillars of Society* (London, 1913); Harry Clemons, *An Essay towards a Bibliography of the Published Writings and Addresses of Woodrow Wilson, 1875–1900* (Princeton, 1913); J. G. Wilson, ed., *Presidents of the United States, 1789–1914*, vol. iv (New York, 1914); Henry Jones Ford, *Woodrow Wilson: The Man and his Work* (1916).

WILSON'S CREEK, BATTLE OF. A battle fought near Wilson's Creek, about 10 miles south of Springfield, Mo., on Aug. 10, 1861, between a Federal force of about 6000 men under General Lyon and a Confederate force of about 10,000 under General McCulloch. McCulloch had advanced to Wilson's Creek, 10 miles from Springfield. Having resolved to attack him, Lyon on the evening of the 9th sent a column of 1200 men and six pieces of artillery under Col. Franz Sigel with orders to strike the Confederate right flank next morning; while he himself, with about 4200 men, including eight companies of regulars and 10 pieces of artillery, prepared to fall upon the Confederate left wing. The two attacks were delivered as planned, but Sigel's column was completely routed, and the Confederates were then able to concentrate superior numbers against Lyon. While leading a charge that general was killed; but his troops under Major Sturgis continued to fight with great determination, repulsed all the assaults

made against their position, and succeeded in effecting a retreat to Springfield and from there to Rolla. The Federal losses in the battle were about 1235; those of the Confederates about 1095. By the Southerners this victory was called "Oak Hills." As a result of the battle the Confederates were able to capture Lexington, Mo. Consult Johnson and Buel (eds.), *Battles and Leaders of the Civil War*, vol. i (New York, 1887).

WILTON, MARIE EFFIE. See BANCROFT, MARIE EFFIE WILTON, LADY.

WILT'SHIRE, or **WILTS.** An inland county of South England, bounded by Gloucester, Berkshire, Hampshire, Dorsetshire, and Somerset (Map: England, E 5). Area, 864,101 acres. The surface features are chiefly those of a rolling open country with some stretches of woodland, and the county is watered by the lower and southern Avon. The greater portion is in pasture land, though wheat, oats, turnips, and cabbage are raised. The mechanical industries are chiefly centred around the great railroad shops at Swindon, and there are iron mines and blast furnaces in several places. Wiltshire is very rich in archæological remains, among which is the famous Stonehenge (q.v.). Pop., 1901, 271,394; 1911, 286,822. County town, Salisbury.

WIM'BLEDON. A town in Surrey, England, 8 miles southwest of St. Paul's, London (Map: London, F 6). It is a favorite suburban residence of Londoners, and was formerly the meeting place of the British Rifle Association. It has remains of an early British earthwork, and is regarded as the scene of the defeat of King Ethelbert of Kent by King Ceawlin of Wessex in 586. Pop., 1901, 41,652; 1911, 58,003.

WIMBORNE, IVOR CHURCHILL GUEST, second BARON (1873–). A British administrator. He was educated at Eton, and at Trinity College, Cambridge; served in the South African War in 1900; and was a member of Parliament for Plymouth in 1900–06 and for Cardiff District in 1906–10. In 1910–12 he was Paymaster-General, and in January, 1915, became Lord Lieutenant of Ireland. He was created Baron Ashby St. Ledgers in 1910, and succeeded to his father's barony in 1914.

WIMMER, vĭm'mĕr, LUDVIG FRANDS ADALBERT (1839–). A Danish philologist, born at Ringkjöbing, in Jutland. He was educated at the University of Copenhagen, where he took his degree in 1868. In 1871 he became docent, and from 1886 to 1910 he was professor of Norse philology in the same institution. His contributions to the study of Scandinavian languages, and particularly to the study of runic writing, place him among the foremost scholars in Norse philology. His writings include *Oldnordisk Formlære* (1870; Ger. ed., 1871); *Runeskriftens Oprindelse og Udvikling i Norden* (1874; enlarged Ger. trans. as *Die Runenschrift*, 1887); *Döbefonten i Aakirkeby Kirke* (1887), and his great collection of Danish runes, *De danske Runemindesmærker* (4 vols., 1895–1908).

WIMPFFEN, vănp'fĕn'; *Ger. pron.* vĭmp'fen, EMMANUEL FÉLIX DE, BARON (1811–84). A French general. He was born at Laon, Department of Aisne. His first military service was in Algeria. In the Crimean War he displayed great bravery. He became brigadier general of the Imperial Guard in 1855, and a general of division four years later. Later he held the posts of commandant at Lyons, and of Governor of the provinces of Algiers and of Oran. In the Franco-German War he was at the head of the Twelfth and Fifth army corps, took the chief command at Sedan after MacMahon was wounded, and signed the capitulation September 2. After the war he resided in Algiers. He published two papers relating to the disaster in which he had so prominent a part: *Sedan* (1871) and *Réponse au Général Ducrot* (1871). He was engaged in a bitter controversy with Cassagnac's journal, *Le Pays*, and lost a libel suit against its editor. He also published *La situation de la France et les réformes nécessaires* (1873) and *La nation armée* (1876).

WIN'ANDERMERE. See WINDERMERE.

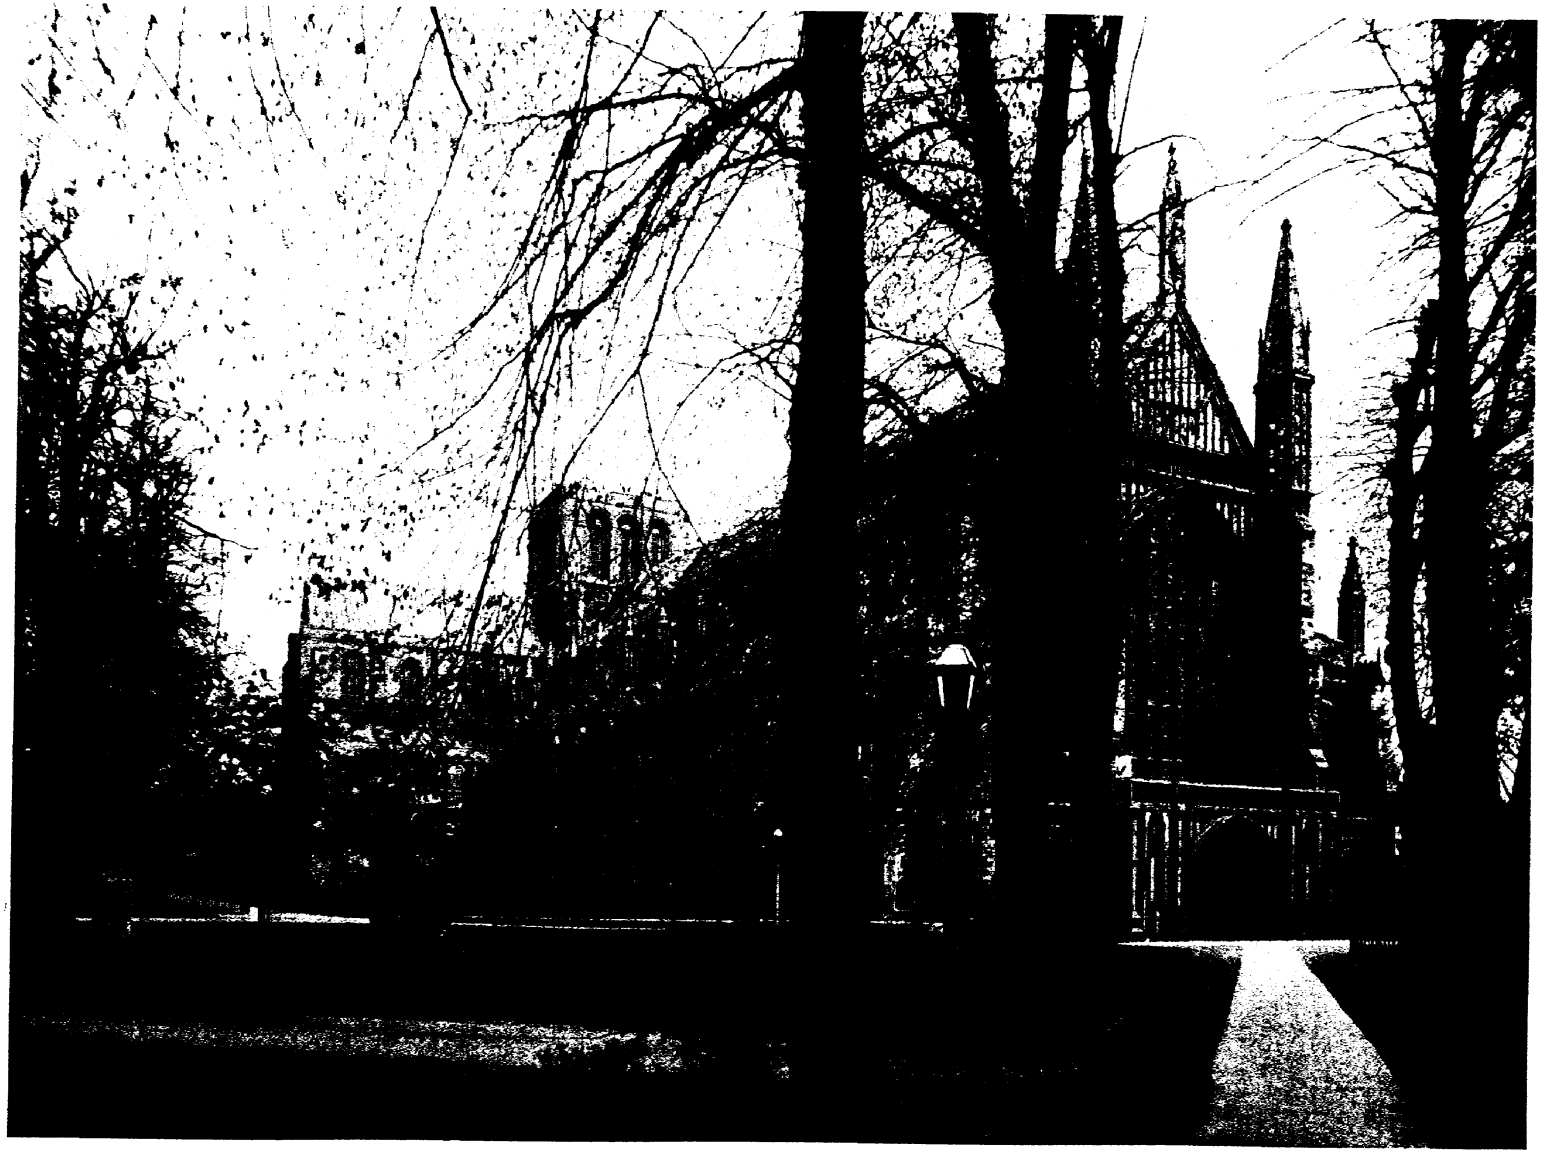
WINCH (AS. *wince*, winch). A form of hoisting machine in which an axle carrying a spool or drum is rotated by means of a crank handle and simple gears so as to wind and unwind a rope or cable to the free end of which is attached the article to be hoisted or hauled. Generally it is smaller than a windlass (q.v.), and frequently it is operated by steam or electricity.

WINCHELL, wĭn'chel, ALEXANDER (1824–91). An American geologist, born at North East, Dutchess Co., N. Y. He graduated at Wesleyan University in 1847 and was appointed professor of physics and civil engineering in the University of Michigan in 1853. Two years later he was transferred to the chair of geology, zoölogy, and botany. He was State Geologist and Naturalist of Michigan in 1859–62 and again in 1869–71. In 1873 he was chosen chancellor of Syracuse University, but resigned this post the following year and assumed the chair of geology, zoölogy, and botany. In 1875 he received a like appointment in Vanderbilt University and filled both positions till 1878, dividing his time between the two institutions. His advocacy of the theory of evolution met with the disapproval of the authorities of the Methodist church and led to his dismissal from Vanderbilt. In 1879 he was recalled to the University of Michigan as professor of geology and paleontology. He was one of the founders of the Geological Society of America (its president, 1891), and aided in the establishment of the *American Geologist*. He was best known as an entertaining lecturer and author of numerous books aiming to popularize science, especially geology. Among his works were: The *First Biennial Report of the Geological Survey of Michigan* (1861); *Geological Map of Michigan* (1865); *The Grand Traverse Region* (1866); *Genealogy of the Family of Winchell in America* (1869); *Geological Chart* (1870); *Sketches of Creation* (1870); *Geology of the Stars* (1872); *The Doctrine of Evolution* (1874); *Reconciliation of Science and Religion* (1877); *Preadamites* (1880); *Sparks from a Geologist's Hammer* (1881); *World-Life, or Comparative Geology* (1883); *Geological Excursions* (1884); *Geological Studies* (1886). For his brother, see WINCHELL, NEWTON HORACE.

WINCHELL, NEWTON HORACE (1839–1914). An American geologist, brother of Alexander Winchell, born at North East, Dutchess Co., N. Y. He graduated at the University of Michigan in 1866, was superintendent of public schools at Adrian, Mich., in 1866–69, and served as Assistant State Geologist of Michigan in 1869–70. In 1870–72 he was an assistant on the Ohio Geological Survey; from 1872 until 1900 was State Geologist of Minnesota; and

from 1873 to 1900 held the chair of geology and mineralogy at the University of Minnesota. After 1906 he served as archæologist of the Minnesota Historical Society. In 1902 he was president of the American Geological Society. He published a *Catalogue of the Plants of the State of Michigan* (1861); *Geology of Ohio and Minnesota* (1872–1900); *The Iron Ores of Minnesota* (1891), with his son, Horace V. Winchell, an economic geologist; *Elements of Optical Mineralogy* (1909), with another son, Alexander N. Winchell, professor of mineralogy and petrology at the University of Wisconsin; *The Aborigines of Minnesota* (1911); *Weathering of Aboriginal Stone Artifacts* (1913). He was also editor of the *American Geologist*.

WINCHELSEA, wĭn'chel-sē. A small English town, one of the Cinque Ports, 7 miles from Hastings, in Sussex (Map: England, G 6). It was formerly an important walled town. In the Roman and Saxon periods Old Winchelsea stood at the mouth of the Rother, 2 miles from the present town. It was frequently inundated by the sea and was submerged in 1250 and finally destroyed in 1287. New Winchelsea, built on a regular quadrangular plan, was founded by Edward I. This town was practically ruined by the gradual recession of the sea, amounting to a mile and a half since the sixteenth century. The salt marshes thus formed are now drained. Pop., 1911, 693.



WINCHELSEA, or **WINCHILSEA**, ANNE FINCH, COUNTESS OF (c.1660–1720). An English poet. She was a daughter of Sir William Kingsmill, of Sidmonton, Hampshire. She married Heneage Finch, who became, in 1712, fourth Earl of Winchelsea. Rowe composed in her honor an epistle, and Pope an impromptu, but Pope later ridiculed her as a bluestocking. After she had been long forgotten, Wordsworth praised her "Nocturnal Reverie" for its original images of external nature at a time when descriptive poetry was mostly artificial (essay appended to vol. i of *Poems*, 1815). Her verse consists of "The Spleen, a Pindaric Ode" (in Gildon's *Miscellany*, 1701; republished in 1709); *Miscellany Poems*, including the tragedy *Aristomenes* (1713); and scattered pieces. Consult: Myra Reynolds, *The Poems of Anne Countess of Winchilsea* (edited with introduction and notes, Chicago, 1903); also Edmund Gosse, in Ward's *English Poets* (New York, 1880) and in his own *Gossip in a Library* (ib., new ed., 1901); E. Dowden, *Essays, Modern and Elizabethan* (ib., 1910).

WINCHELSEA, DANIEL FINCH, sixth EARL OF. See FINCH.

WINCHENDON, wĭn'chen-don. A town, including several villages, in Worcester Co., Mass., 68 miles northwest of Boston, on the Boston and Maine and the Boston and Albany railroads (Map: Massachusetts, C 2). It has a public library, a fine high-school building, the gift of Capt. Ephraim Murdock, and Monument Park. Winchendon is chiefly an industrial town, the most important manufactures being cotton goods, woodenware, saws, toys, and wood-working machinery. Pop., 1900, 5001; 1910, 5678. Winchendon was first settled in 1752 and was known as Ipswich Canada until 1764, when it was incorporated as a township under its present name (from Winchendon, England). Consult Marvin, *History of the Town of Winchendon* (Winchendon, 1868).

WIN'CHESTER. The capital of Hampshire, England, on the Itchen, 66 miles by rail southwest of London (Map: England, E 5). In the fourteenth century it was the principal seat of England's woolen manufactures and had an extensive continental trade, but since the fifteenth century its prosperity has gradually declined. The city consists of one main thoroughfare, crossed by a number of streets running at right angles to it and was in early times surrounded by a wall, remains of which still exist. The castle hill is the site of the mediæval castle or royal palace, part of which survives in a magnificent hall, which is used for the county court; King Arthur's Round Table, a sixth-century relic, hangs on one of its walls. Charles II commenced a palace here, the completed part of which, used as a barracks, accommodated 2000 men until its destruction by fire in 1894; new barracks have since been built. The city cross in the High Street, dating from the fifteenth century, is very beautiful in design. A colossal bronze statue, erected in 1901 in connection with the King Alfred millennial celebration, typifies the great monarch, and stands in the Broadway. "Seinte Marie College of Wynchestre," now St. Mary's or Winchester College (q.v.), was founded by William of Wykeham, Bishop of Winchester, and completed in 1393. Winchester's chief glory is the cathedral. A church is said to have been built in the year 169, to have been destroyed in 266, restored in 293, and converted into a temple of Dagon or Wodin. In 635 the desecrated church was pulled down, and a new one commenced. From the year 674 the succession of bishops of Winchester, which includes the celebrated St. Swithin (q.v.), has continued unbroken. Of the ancient cathedral, in which most of the Saxon kings of Wessex (see HEPTARCHY) were interred, no portion remains. The present cathedral was built by Bishop Walkelin (1070–98). William of Wykeham greatly enlarged and beautified the building and began the remarkable transformation of the nave from the Norman to the Perpendicular. The cathedral is 560 feet long; its breadth at the transepts is 208 feet, length of nave 351 feet, and height 86 feet. There is a low central Norman tower 186 feet high. In 1905 extensive restorations were made, and a large part of the foundations were relaid. The interior is magnificent, and contains many objects of the highest interest—as the tomb of William Rufus; the golden shrine of St. Swithin, with some excellent specimens of sculpture, both ancient and modern; the tomb of Edmund, the son of King Alfred; and the tomb of Izaak Walton. There are other churches of interest and buildings of a religious and educational character, including the remains of Hyde Abbey, where King Alfred was buried. About a mile from the town is the famous Hospital of St. Cross, founded in 1136 by Henry de Blois, Bishop of Winchester. The city possesses a public library and a museum. Pop., 1901; 20,919; 1911, 24,146.

Winchester, the Roman *Venta Belgarum*, was the site of a British city before it became a Roman station, and a place of considerable importance. Taken by the Saxons in 495, the town was called Wintanceaster. As the capital of Wessex, Winchester became the capital of England, and even after the Norman Conquest was long a chief royal residence. In 1265, during the Barons' War, Winchester was sacked. It was taken by Cromwell in 1645; the castle was

WINCHESTER CATHEDRAL

dismantled and the cathedral pillaged and vandalized. Consult: G. W. Kitchin, *Winchester* (London, 1890); Telford Varley, *Winchester* (New York, 1910); S. H. Heath, *Winchester* (Boston, 1912).

WINCHESTER. A city and the county seat of Randolph Co., Ind., 24 miles north by west of Richmond, on the White River, and at the junction of the Cleveland, Cincinnati, Chicago, and St Louis and the Grand Rapids and Indiana railroads (Map: Indiana, G 4). It has the Randolph County Law Library, a Carnegie library, and attractive school and courthouse buildings. The principal manufactures include bricks, flint glass, flour, wagons, and lumber products. Pop., 1900, 3705; 1910, 4226.

WINCHESTER. A city and the county seat of Clark Co., Ky., 106 miles east by south of Louisville, on the Chesapeake and Ohio and the Louisville and Nashville railroads (Map: Kentucky, F 4). It is the seat of the Kentucky Wesleyan College (Methodist Episcopal, South), opened in 1866; and has a Carnegie library and a hospital. Farming is the leading industry of the surrounding country. The manufactures are planing-mill products, hemp, furniture, foundry products, spokes and rims, flour, gasoline engines, etc. Pop., 1900, 5964; 1910, 7156.

WINCHESTER. A town in Middlesex Co., Mass., 8 miles north by west of Boston, on the Boston and Maine Railroad (Map: Massachusetts, B 5, Insert). It is largely a residential place, and is the home of many business men of Boston. Middlesex Fells, a State park of more than 3000 acres, lies partly in the town. There are also a large public library, a hospital, and the Home for Aged People. The industrial interests of the town are confined chiefly to the manufacture of leather machinery, soda fountains, gelatine, felt goods, and watch hands. Pop., 1900, 7248; 1910, 9309; 1915 (State census), 10,005. The successive names of Winchester since the settlement of the country have been: 1638, Waterfield; 1640, Charlestown Village; 1642, Woburn; 1850, Winchester. Consult Hurd, *History of Middlesex County* (2 vols., Philadelphia, 1890).

WINCHESTER. A city and the county seat of Frederick Co., Va., 80 miles by rail west by north of Washington, D. C., on the Baltimore and Ohio and the Cumberland Valley railroads (Map: Virginia, F 2). It is the seat of Fort Loudoun Seminary (nonsectarian), and has the Shenandoah Valley Academy, the Handley Public Library, Memorial Hospital, and a fine city hall. The National and Confederate cemeteries are also of interest. Winchester is the commercial centre of a farming, stock-raising, and lumbering region. There are immense apple orchards here. Winchester is especially noted for its extensive glove and leather interests. Flour, woolen and knit goods, vinegar, and lumber products are also manufactured. The municipality adopted the city-manager form of government in 1915. Pop., 1900, 5161; 1910, 5864.

After Braddock's defeat (1755) Washington took command at Winchester of the British and Colonial troops. Fort Loudoun, built by him, still remains, and his headquarters can also be seen in one section of the town. During the Civil War several engagements were fought at and in the vicinity of Winchester, which by reason of its location was an important strategic point. On March 23, 1862, the Federal General Shields defeated General Jackson, with an inferior Confederate force, at Kernstown, 4 miles south of Winchester. On Aug. 17, 1864, General Early, with a Confederate force, drove a Federal force under General Torbert from Winchester. On Sept. 19, 1864, in the battle of Winchester or Opequon Creek General Sheridan, with a Federal force of about 38,000, defeated General Early, with a Confederate force of about 15,000, the Federals losing in killed, wounded, and missing about 5000, and the Confederates about 4000. This was followed by another engagement at Fisher's Hill, near this place, on September 22, in which Sheridan was again victorious. On Oct. 19, 1864, Sheridan started from Winchester on his famous ride to Cedar Creek (q.v.).

WINCHESTER, CALEB THOMAS (1847–). An American English scholar, born at Montville, Conn. He graduated in 1869 from Wesleyan University, where he was librarian till 1873 and thereafter professor of English literature. He also became known as a lecturer in his special field. The years 1880–81 he spent in study at Leipzig. Besides serving on the committee which revised *The Methodist Hymnal*, he published: *Five Short Courses of Reading in English Literature* (1892; 3d ed., rev., 1911); *Some Principles of Literary Criticism* (1899); *Life of John Wesley* (1906); *A Group of English Essayists* (1910); *Representative English Essays* (1914).

WINCHESTER, ELHANAN (1751–97). An American Universalist minister, born at Brookline, Mass. He joined the open communion Baptists, at Canterbury, Conn., in 1770, and was installed as pastor of a church at Rehoboth, Mass., in 1771; a year later he became a close communionist and was excommunicated. He resided in Charleston, S. C. (1774–80), became pastor of the First Baptist Church, Philadelphia, in 1780; and in 1781 became a preacher of universal restoration, and with a majority of his people formed a new church. He went to England in 1787, remaining till 1794, and preaching with great success. Among his numerous publications were: *New Book of Poems on Several Occasions* (1773); *Hymns* (1776); *The Face of Moses Unveiled* (1787); *The Universal Restoration, Exhibited in Four Dialogues* (1788); *The Restitution of All Things Defended* (1790); *Course of Lectures on the Prophecies that Remain to be Fulfilled* (1789–90); and *Five Letters on the Divinity of Christ* (1810). He was a forerunner of the present Universalist denomination. Consult his *Life* by Stone (Boston, 1836).

WINCHESTER, JAMES (1752–1826). An American soldier, born at White Level (now Westminster), Md. He became a second lieutenant in the Second Maryland in 1777, and first lieutenant in 1778, was captured at Charleston in 1780, but was exchanged the same year, and became a captain in the Third Maryland in 1781. In March, 1812, he was appointed a brigadier general, and in September superseded William Henry Harrison at Fort Wayne. In command of the left wing of the army, Winchester moved from Fort Defiance to Maumee Rapids, but on Jan. 22, 1813, was defeated at the river Raisin by a greatly superior force of British and Indians under Colonel Proctor. Winchester was himself taken prisoner, and was induced to send an order to those of his men who were still resisting to surrender. The sick and wounded Americans were massacred on

the 23d by the savages. (See FRENCHTOWN.) Winchester himself was taken as a prisoner to Quebec, and was not exchanged until the spring of 1814. In March, 1815, he resigned his commission in the army.

WINCHESTER, OLIVER FISHER (1810–80). An American manufacturer, born in Boston. He resided for a time in Baltimore, and in 1848 he removed to New Haven, where he opened one of the first shirt factories in the United States. When the Volcanic Arms Company was organized to manufacture the Henry magazine rifle, Winchester became a stockholder, and in 1860 bought it out and reorganized it as the New Haven Arms Company. Five years later he again reorganized it as the Winchester Repeating Arms Company, and gave the rifle his own name. In 1872 he began the manufacture of metallic cartridges. He was elected Lieutenant Governor of Connecticut in 1866. He gave large sums of money to Yale University and founded there an observatory which for some time bore his name.

WINCHESTER, WILLIAM PAULET (PAWLET, or POULET), first MARQUIS OF (c.1485–1572). An English nobleman, eldest son of Sir John Paulet of Basing, Hampshire. He held several positions in the royal household, was created Baron St. John in 1539, and was nominated by the will of Henry VIII one of the council of regency for the period of young Edward's minority. In 1550 he assisted Northumberland in overthrowing Somerset; was created Earl of Wiltshire five days later; and in the following year became Marquis of Winchester. He pretended to acquiesce in Northumberland's plan for setting aside the claims of Mary and giving the throne to Lady Jane Grey, but after Northumberland left London to put down the revolt, Paulet joined other noblemen in proclaiming Mary. She confirmed him in all his offices, and also made him Lord Privy Seal. Under Elizabeth he also continued to hold his offices, and was Speaker of the House of Lords in 1559 and in 1566. The head of this family is premier marquis of England.

WINCHESTER COLLEGE. One of the oldest public schools in England, situated at Winchester. It was founded by William of Wykeham in 1382, and opened in 1393, as a feeder for New College, Oxford. Originally the foundation consisted of a warden, 10 fellows, three chaplains, an usher, and 70 scholars; but in 1862 the number of fellowships was reduced to six. A certain number of outside pupils were admitted from the very beginning, and their number increased gradually. About 12 vacancies for foundationers occur every year, which are filled by competitive examination. Four exhibitions of the annual value of £50 each, tenable for four years at the universities of Oxford and Cambridge, are awarded every year. There are also six scholarships tenable at New College, Oxford. The original building with several additions is still extant. The attendance is about 450. Consult: A. F. Leach, *History of Winchester College* (London, 1899); L. L. Shawell, *Enactments in Parliament* (4 vols., Oxford, 1912); John Vaughan, *Winchester Cathedral Close* (New York, 1914).

WINCHILSEA. See WINCHELSEA.

WINCKELMANN, vĭn'kel-män, JOHANN JOACHIM (1717–68). A German classical archæologist and art historian. Born at Stendal, Brandenburg, on Dec. 9, 1717, the son of a poor cobbler, he was educated as a charity scholar in his native town, and then graduated from the Köllnisches Gymnasium in Berlin. From 1738 to 1740 he studied theology and the classics at Halle, then mathematics and medicine at Jena, and was tutor at Hadmersleben, and associate rector in the grammar school at Seehausen in 1743. In 1748 chance brought him employment in the library of the Saxon ex-minister and historian Count Bünau, at Nöthnitz, near Dresden, where he remained six years. His association with eminent artists and scholars at Dresden and the valuable instruction and advice which he received there, especially from Oeser, determined him to follow the career of a classical archæologist. His conversion to Roman Catholicism, the court religion at Dresden, through the papal nuncio at Dresden, Count Archinto, furnished the opportunity to prosecute this career. After a year in Dresden devoted solely to his studies, he published his first work, *Gedanken über die Nachahmung der griechischen Werke in der Malerei und Bildhauerkunst* (1755), well illustrated by Oeser, which brought him a royal stipend for two years in Rome. In November, 1755, he arrived at Rome, and immediately began the study of its treasures of classical antiquities, in which he was greatly aided by the friendship of Raphael Mengs. In 1757 he became librarian to Archinto, who in the meanwhile had been made a Cardinal and Secretary of State. In 1758 he visited Naples, Herculaneum, and Pompeii, and then spent nine months in Florence, cataloguing the unique collection of antique gems and intaglios of Baron Stosch.

After the death of Cardinal Archinto he became librarian to Cardinal Albani, the passionate art lover and most famous collector of his time, under whose roof he henceforth lived as a friend and confidant. Repeated visits to Naples resulted in several publications which greatly contributed to the elevation of taste in the decorative arts, but his greatest work is the *Geschichte der Kunst des Altertums* (1764; new ed., by Julius Lessing, with biography, 1882; Eng. trans. by G. H. Lodge, Boston, 1880). Through it, and in the field of archæology, through the *Monumenti antichi inediti* (1767–68; new ed., 1821), Winckelmann became the true expounder of classic art and the founder of scientific archæology. His views of the theory of the beautiful called forth Lessing's *Laokoon* and profoundly impressed Goethe, eliciting his famous *Winckelmann und sein Jahrhundert* (1805; Eng. trans., New York, 1914). In April, 1768, he left Rome in company with the sculptor Cavaceppi to revisit Germany, but in passing the Alps he evinced a strange reluctance to leave Italy, and was with difficulty persuaded to proceed to Munich. At Vienna he was received with honor by the Empress Maria Theresa. On his way back to Rome by way of Trieste, he was murdered there in a hotel June 8, 1768, by a robber named Arcangeli. In Winckelmann's honor a marble statue was erected in the vestibule of the Berlin Museum, a monument in his birthplace, and a colossal marble bust in the Villa Albani, Rome. The standard work on Winckelmann is by Carl Justi, *Winckelmann und seine Zeitgenossen* (3 vols., Leipzig, 1898). Consult also Walter Pater, *The Renaissance: Studies in Art and Poetry* (library ed., London, 1910), originally published as *Studies in the History of the Renaissance* (ib., 1873).

WINCKEL'S (vĭn'kelz) **DISEASE.** See CHILDREN, DISEASES OF.

WINCKLER, HUGO (1863–1913). A German Orientalist. He was educated at the University of Berlin, where, by 1904, he had risen to be professor of oriental languages and history. Besides doing much editorial work, he wrote: *Die Keilschrifttexte Sargons* (1889); *Untersuchungen zur altorientalischen Geschichte* (1889); *Geschichte Babyloniens und Assyriens* (1892; Eng. trans., 1907); *Alttestamentliche Untersuchungen* (1892); *Geschichte Israels* (1898); *Gesetze Hammurabis* (1904); *Die jüngsten Kämpfe wider der Panbabylonism* (1907); *Die babylonische Geisteskultur* (1908).

WIND (AS. *wind*, Goth. *winds*, OHG. *wint*, Ger. *Wind*, wind; connected with Lat. *ventus*, Skt. *vāta*, wind, from *vă*, to blow). Moving air. The direction of movement, if horizontal, is expressed by stating the point of the compass from which the wind comes. The force was formerly expressed on some arbitrary scale, such as zero for calm, and four for destructive to large trees. In 1806 Admiral Beaufort introduced into the British navy a scale of zero to 12, arranged according to the amount and kind of sail to be carried by the standard ship of the royal navy. (See BEAUFORT SCALE.) Instead of using the wind velocity, which is the datum specially appropriate to meteorology, many have attempted to measure the pressure against a normal unit of surface and thus obtain a scale of wind force. But as the pressure varies with the shape of the obstacle and the density of the air, it is generally conceded that velocities should be observed and pressures must be calculated therefrom as best we can.

From a general meteorological point of view, winds are classified as steady, periodical, and variable. The steady winds are best illustrated by the trade winds at the earth's surface, and the anti-trades above them, by the easterly wind that apparently prevails high above the equatorial region, and by the westerly wind that prevails above the north temperate zone. The periodical winds are represented by the diurnal land and sea breezes and the summer and winter monsoons, which are in fact sea breezes and land breezes on a large scale. The variable winds usually occur in connection with the areas of high and low pressure, or the storms that move over the earth. They represent ascending and descending movements due to the interaction of upper and lower strata or of cold arctic and warm tropical air, when seeking to obtain more stable equilibrium. The variable winds generally endure only a few days, or at the most a week, by which time the disturbance has passed by or perhaps altogether subsided, and a change of wind takes place. Sometimes the winds appear to blow with some regularity for a few days from the north and then for a few days from the south alternately, but this alternation is not often maintained for any length of time, as it is evidently due to the regularity with which areas of high and low pressure pass over the station. These irregular or variable winds give to ordinary local weather its characteristic variability, and they have therefore always been a prominent subject of observation and discussion. In the north temperate zone the westerly wind may be considered as the normal and most frequent; all other winds soon shift to the west.

The local names that have been given to various winds must not be considered as implying that the peculiarities of the winds are local. Thus the simoom, sirocco, and solano, which are the warm southerly winds of the northern Mediterranean coast, have their parallels in very similar southerly winds in Siam, India, and the Atlantic coast of the United States. The bora of the Adriatic and the gregale of Malta have their counterparts in the blizzards of the United States and the purga of Siberia. The dry puna winds of Peru have a very close parallel in the so-called hot winds of the region from Missouri to Nebraska and Iowa. The east winds of the British Islands prevail in New England as well as from Scotland eastward into Russia, where, however, they become drier than they are in Great Britain. The mistral, or northwest wind of southern France, is essentially the same as the northwest wind that follows a storm centre passing over the lake region eastward into New York and New England.

Several laws bearing on the winds have been enunciated. Dove maintained the existence of alternate currents, polar and equatorial, existing side by side and moving as a whole eastward. He also showed empirically that there was a certain law of sequence according to which the winds followed each other day after day, and which we now know is simply due to the fact that the majority of the storms pass on one side or the other of the station. Redfield, Reid, and other meteorologists showed that the winds circulate around a storm centre, a fact which, however, was also known to Dampier and other early voyagers. Hence all large storms have the character of whirlwinds. Redfield knew, but did not lay stress upon the fact, which Meldrum brought out most forcibly, that the winds are inclined at a considerable angle to the radius vector from the storm centre, or to the isobars surrounding the storm centre. J. Allan Broun and, many years later, Clement Ley and Cleveland Abbe independently announced that the upper winds are inclined to the lower winds in a regular sequence, so that as we ascend in the atmosphere the winds are deflected more and more to the right. Ferrel showed that the inclination of the wind to the isobar depends upon the distance from the storm centre, on the latitude of the place, and on the coefficient of resistance of the earth to wind, and he gave the formula connecting these together. Espy and, many years later, Koeppen, independently, showed that the interchange of air between the upper strata and those near the ground causes the decided diurnal increase in the velocity of the wind in the early morning hours up to a maximum at the hour when the interchange is most rapid; also that there must be a corresponding diminution of the wind in the upper strata, which diminution has been established by actual observations on mountain tops and other elevated points. The general circulation of the atmosphere is not a simple system of steady upper and lower winds. It has been shown that the dynamics of the air do not allow of the existence of any steady currents maintaining the dynamic equilibrium. Therefore the system of upper and lower winds devised by Ferrel as the simplest imaginable must be replaced by systems of whirls or eddies, so that the great whirlwinds or cyclones and anticyclones that observation shows on every daily weather map must be considered as an integral and essential

part of the general circulation, and would be so even if the globe were a uniform frictionless sphere.

Bartholomew, *Atlas of Meteorology* (London, 1900). For a comprehensive review of recent results, Julius Hann, *Lehrbuch der Meteorologie* (Leipzig, 1906); also C. J. P. Cave, *Structure of the Atmosphere in Clear Weather* (New York, 1912). See ÆOLIAN ACCUMULATIONS; ANEMOMETER; CLIMATE; METEOROLOGY.

WIND'AGE. In smooth bore artillery, the space between the projectile and the surface of the bore; in muzzle-loading rifle guns, the difference between the diameter of the piece and that of the projectile; in these relations the term is now obsolete. To-day it means the influence of the wind in deflecting the projectile from the point at which it is aimed; it is also applied to the allowance made on the wind gauge, which is a graduated attachment on the rear sight of the piece by which allowance may be made in aiming for the effect of the wind upon the projectile, as well as for drift. Consult *Small Arms Firing Manual*, United States Army (Washington, 1913). See DRIFT OF A PROJECTILE.

WIND AND WATER, BETWEEN. See BETWEEN WIND AND WATER.

WIND'BER. A borough in Somerset Co., Pa., 8 miles south of Johnstown, on the Pennsylvania Railroad (Map: Pennsylvania, D 7). Coal mining, lumbering and the manufacture of fire brick are the leading industries. Pop., 1910, 8013.

WINDBREAK, or SHELTER BELT. Any planting on the windward side of buildings, orchards, gardens, etc., with the object of overcoming the force of the wind. Windbreaks are of great advantage in prairie regions in protecting from the cold, lessening evaporation from soils and plants, retaining snow and leaves as protection, lessening liability to mechanical injury from winds, protecting trees at time of blossoming, and so on. Some disadvantages are that they cause snow to drift to the leeward; prevent the circulation of warm winds in spring, thus retarding the melting of snow and the drying of the soil and roads; and furnish harbors for plant pests, etc. The trees are usually planted upon the north and west sides of the object it is desired to protect. The drifting of snow may be prevented about buildings by planting a second line of trees at a short distance from the main shelter belt. The snow will then be caught in the space between the two. The number of rows of trees required for a good shelter belt will depend upon the kind of trees planted and the nature of the country. Among the best species for planting are the Norway spruce, Austrian and Scottish pines, maples, and box elder. In Minnesota and similar regions it is recommended first to plant white willows, followed by green ash and white elm, and after these become established to plant hardy evergreens, mountain ash, and birches or other ornamental trees and shrubs. A mixed plantation with hardy deciduous trees to the windward is by many considered the ideal windbreak. In planting windbreaks, as well as in all other tree planting on the prairies, the trees should be far enough apart for cultivation, but sufficiently thick to furnish forest conditions at the earliest time possible. A distance of 8 feet for the rows and 2 feet apart in the rows is believed to have given the most satisfactory results. In many tropical countries windbreaks have been found necessary to protect young plantings from the force of the trade winds. Temporary windbreaks of bananas, pigeon peas, etc., are provided until permanent ones of bamboos, or rapid growing trees may become established.

WIND CAVE NATIONAL PARK. See PARK, NATIONAL.

WINDELBAND, vĭn'dĕl-bänt, WILHELM (1848–1915). A German philosopher, born at Potsdam. He studied in the universities of Jena, Berlin, and Göttingen; in 1876 became a professor of philosophy at the University of Zurich, in 1877 at Freiburg, in 1882 at Strassburg, and in 1903 at Heidelberg. His work in the history of philosophy is of high value. Among his published works are: *Die Geschichte der neuern Philosophie in ihrem Zusammenhange mit der allgemeinen Kultur und den besondern Wissenschaften* (2 vols., 1878–80; 5th ed., 1911); *Praludien: Aufsatze und Reden zur Einleitung in die Philosophie* (1884; 5th ed., 1915); *Geschichte der antiken Philosophie* (3d ed., 1912; Eng. trans., 3d ed., 1910); *Geschichte der Philosophie* (1892; 4th ed. as *Lehrbuch der Geschichte der Philosophie*, 1907; 6th ed., 1912; Eng. trans., 1898); *Geschichte und Naturwissenschaft* (1894; 3d ed., 1904); *Platon* (1900; 4th ed., 1905); *Ueber Willensfreiheit* (1904; 2d ed., 1905); *Neure Philosophie in Kultur der Gegenwart* (1909); *Die Philosophie im deutsche Geistesleben des 19. Jahrhunderts* (1909; new ed., 1912); *Prinzipien der Logik* (1912).

WINDER, wīn'dĕr, WILLIAM HENRY (1775–1824). An American soldier, born in Somerset Co., Md. He graduated at the University of Pennsylvania, and from 1798 till 1812 practiced law in Baltimore. In 1812 he was appointed lieutenant colonel of the Fourteenth United States Infantry, was promoted to the rank of colonel, and in November of that year led a successful raid into Canada from Black Rock, N. Y. In the following March he was commissioned a brigadier general. He was captured at the battle of Stony Creek early in June, was held a prisoner until the spring of 1814, and in May of that year was put in command of the Tenth Military District, comprising Maryland, the District of Columbia, and a part of eastern Virginia. In the following August General Ross and several thousand British troops landed and advanced upon Washington. To oppose them Winder had only a few hundred regulars, and a mob of some thousands of militia. In consequence he was totally defeated at Bladensburg (q.v.), and the capital fell into the hands of the invaders. Winder was afterward court martialed, but was acquitted of all blame.

WINDERMERE, wĭn'dĕr-mēr, or **WINANDERMERE.** The largest lake in England, situated in a rock basin between Westmoreland and Lancashire, a few miles north of Morecambe

Bay, into which it discharges (Map: England, D 2). It is 11 miles long, 1 mile broad, and over 200 feet deep. It contains several islets, and the shores are high and wooded, becoming somewhat bold towards the north. The lake is celebrated for its quiet beauty. Near its northern extremity is Rydal, the home of Wordsworth.

WINDFLOWER. See ANEMONE.

WINDGALL (*wind* + *gall*, AS. *gealla*, probably from Lat. *galla*, gallnut). In horses a term for dilated bursæ at the posterior part of the fetlock joint. Windgalls have their origin in a dropsical condition of the bursæ of the joint itself and also of the tendon which slides behind it. They may be attributed to external causes such as severe labor or strains resulting from heavy pulling, fast driving or jumping or be among the sequelæ of internal disorders. Consult Leonard Pearson and others, *Special Report on Diseases of the Horse* published by the United States Bureau of Animal Industry (rev. ed., Washington, 1911).

WINDHAM, wĭn'dam, WILLIAM (1750–1810). An English statesman, born in London. He was educated at Eton, Glasgow University, and University College, Oxford. In the Portland Ministry, formed by the coalition of Fox and Lord North (1783), Windham became the principal secretary to Lord Northington, Lord Lieutenant of Ireland, but, dissatisfied with the policy pursued, he resigned, and returned to England. In 1784 he entered Parliament and held his seat till 1802. On the outbreak of the French Revolution he went with Burke into reaction, and favored the bills against seditious meetings and aliens. He entered the Ministry of Pitt (1794) as Secretary of War, and began a series of reforms in the army which mark his best work. Going out of office with Pitt in 1801 he opposed the Peace of Amiens, a policy which cost him his seat at Norwich. In 1803 he became the head of the Grenville party, and, gradually drifting away from Pitt, united once more with Fox, and in 1806 accepted the Colonial Office in the Grenville administration. Renewing his efforts for military reforms, he advocated and carried measures for pensions, higher pay, and shorter terms of service. Two years later life service was reintroduced against his protest, but in 1847 Windham's principle of short enlistment was reinaugurated. In the war against Napoleon Windham favored concentration and opposed the attack on Copenhagen and the disastrous Walcheren expedition. In general, he believed in protecting England by developing its navy, and not by fortifying its coasts. Consult: Thomas Amyot, *Speeches with Memoir* (London, 1812); Mrs. Henry Baring, *Windham's Diary* (ib., 1866); *Correspondence of Edmund Burke and William Windham*, edited by J. P. Gilson (Cambridge, 1910); *The Windham Papers* (2 vols., London, 1913).

WINDHOEK, vĭnt'hŭk'. Capital, since 1889, of German Southwest Africa, situated in the southern part of Damaraland on the northern slope of the Awas Mountains, at an altitude of 5331 feet (Map: Africa, F 7). It is often termed Great Windhoek, and officially, since 1903, Windhuk. In 1901 it was connected with Swakopmund, on the coast, by telegraph, and in 1902 by rail. The railway, taking a rather indirect course, is 237 miles in length; it was extended to Tsumeb (354 miles) in 1906. The white population in 1912 numbered 593. Just to the southwest is Little Windhoek, having, in 1912, 51 white inhabitants. Here are five hot springs, with temperatures from 104° F. to 122° F. The district of Windhoek had, in 1912, a population of 1312 whites, of whom 1105 were Germans, and about 23,000 natives. Windhoek was captured by the forces of the Union of South Africa in 1915. See WAR IN EUROPE.

WINDHOVER. See KESTREL.

WINDING UP OF COMPANY. Under the English law, a company which is incorporated under the Companies Act cannot go out of existence except through the process of winding up under the provisions of the Companies Winding Up Act (1890). This may be done by the court upon petition of the stockholders or the creditors, in which case the court appoints a receiver or liquidator, and the proceedings are quite similar to those in bankruptcy; or the shareholders themselves may wind up the company voluntarily. It is estimated that 90 per cent of the companies organized under the above Act are thus wound up by voluntary resolution of their shareholders, appointing liquidators and turning over the affairs of the company to them for settlement. Proceedings under this method resemble somewhat those under the insolvency acts in the United States. Consult: N. L. Lindley, *On Companies* (6th ed., 2 vols., London, 1902); Sir H. B. Buckley, *Law and Practice under Companies Acts* (9th ed., ib., 1909).

WIND INSTRUMENTS. A generic name for all those instruments in which the tone is produced by means of a vibrating column of air. With respect to the material employed in their construction wind instruments are divided into brass and woodwind. The organ is a combination of all the various kinds of wind instruments. See the separate articles on various instruments; also MUSICAL INSTRUMENTS; ORCHESTRA; ORGAN.

WINDISCH, vĭn'dĭsh, ERNST (1844–). A German Sanskrit and Celtic philologist, born at Dresden, and educated at the University of Leipzig (1863–67). In 1870–71 he catalogued the Sanskrit manuscripts in the India Office Library, London. From 1872 he was professor successively at Heidelberg, Strassburg, and Leipzig, being also rector of the latter university in 1895-96. In 1871 he became associate editor, with Berthold Delbrück, of the *Syntaktische Forschungen*, and in 1880 of the *Zeitschrift der deutschen morgenländischen Gesellschaft*. His publications include: *Der Heliand und seine Quellen* (1868); *Kurzgefasste irische Grammatik* (1879; Eng. trans. by Norman Moore, 1882); *Māra und Buddha* (1895); *Buddha's Geburt und die Lehre von der Seelenwanderung* (1908); *Keltische Brittanien* (1913). He also edited *Zwölf Hymnen des Rigveda* (1883); the *Pali Itivuttaka* (1890); *Georg Curtius, Kleine Schriften* (1886); *Irische Texte* (4 vols., 1880–1909), with Whitley Stokes; *Catalogue of Sanskrit MSS. in India Office Library* (1894); *Die altirische Heldensage Táin bó Cúalnge*, German translation (1905). His pupils and friends offered him a *Festschrift* on the occasion of his seventieth birthday, in 1914.

WINDISCHGRÄTZ, vĭn'dĭsh-grĕts. The name of a princely Austrian family, dating from the thirteenth century. Its most prominent member is ALFRED CANDIDUS FERDINAND, PRINCE WINDISCHGRÄTZ, who was born May 11, 1787, at Brussels, entered the Austrian army in 1804 and saw active service throughout the

Napoleonic wars. In 1833 he became a lieutenant field marshal and commander of division. From 1840 to 1848 he commanded the forces in Bohemia. In June, 1848, he suppressed the insurrection in Prague with bloody severity, but his wife and son were killed during the rioting. He was then placed in command of all the Austrian forces except those in Italy. After the insurrection of October 6 at Vienna Windischgrätz declared the city in a state of siege, and on October 23 began the attack on the capital. On October 31 he took the city by storm. With his brother-in-law, Prince Felix Schwarzenberg, he arranged the abdication of Ferdinand, and then led an army against the Hungarians. In January, 1849, he took Buda and Pest, but dissensions with the Vienna government led to his recall. In 1859 he was made Governor of Mainz, then under the control of the Diet of the Germanic Confederation. He died March 21, 1862. Under his auspices was published *Der Winterfeldzug 1848–49 in Ungarn* (Vienna, 1851).

WINDLASS (corruption of *windas, windass*, from MDutch *windacs*, Dutch *windas*, Icel. *vindlāss*, windlass, winding beam, from MDutch *windan*, Icel. *vinda*, to wind + MDutch *acs*, Dutch *as*, Icel. *āss*, Goth. *ans*, beam, pole; influenced by popular etymology with obsolete Eng. *windlass*, circuitous route, subtlety). A modification of the wheel and axle used for raising weights. It consists of a cylindrical drum, on which a rope or chain is wound, having its ends firmly supported in bearings, and an arrangement for applying a force with considerable leverage at one or both ends. It differs from the capstan (q.v.) chiefly from having a horizontal instead of a vertical axis. Some forms of windlass closely resemble the winch (q.v.) in construction. The advantage in power is secured by having the force applied on the wheel at considerable distance from the centre, according to the law of the wheel and axle (q.v.). See ANCHOR; CAPSTAN.

WINDLESTRAE, wĭn'd'l-strā'. See HAIR GRASS.

WINDMILL. A motor which utilizes the energy of the wind for pumping water, driving mills, or doing other work. The wind acts on a set of sails or slats attached to an axis so as to form a revolving wheel. A crank or gearing transmits the power from the axis to the pump or other mechanism to be driven. Most windmills are mounted on towers at an elevation above the ground, or else placed on the tops of buildings, in order to take advantage of the unobstructed action of the wind. A comparatively few wind wheels are set on a vertical axis, but as a rule the axis is either horizontal or slightly inclined therefrom. A deviation from the horizontal is sometimes essential to permit the sails to clear the base of the tower.

The typical Dutch windmill is composed of four long sails at right angles to each other, fixed on an axis inclining about 10° to the horizontal and mounted on an inclosed tower of masonry or wood. Modifications of this type include six or more sails. The web of the sails is generally of canvas, but wood may be substituted. In the best forms of European windmills each sail is composed of arms or whips 30 feet or more in length, attached at right angles to the sail axle. Transverse bars or rods are secured to the whip at intervals throughout its length, and on these the sails are stretched. By setting the bars at varying angles with the plane of revolution of the whips a warped surface is produced. This is essential, because, if the bars were all parallel to one another, the pitch of those at the extremity of the arms would be much greater than that of those near the axle. The result of this would be that the wind would tend to turn the outer end of the arms much more rapidly than the inner end, which would simply drag. The sails are generally wider at the tips than at the hub.

American windmills may be divided into two broad classes: (1) those that revolve in the same direction as the wind and resemble paddle wheels or certain types of water wheels, and (2) those revolving at right angles to the wind. The members of the second class in this one respect are similar to the Dutch and European mills already described, and may for convenience be called sail wheels. Most of the windmills in use fall in the second class. The paddle-wheel mills must have one-half of their fans guarded from the action of the wind, for otherwise they will not revolve, since the pressure on the two halves will balance. This protection may be afforded, in the case of wheels revolving on a horizontal axis, by casing in the lower half of the wheel; and for wheels on a vertical axis, by either casing in one-half or by using folding vanes that close on themselves when they come into the counter pressure. In either of these subclasses, it is evident that only a portion of the total wind area of the wheel is effective. The horizontally set paddle-wheel mills are generally placed near the ground and facing the prevailing wind. They are of no use except when the wind blows their way. Sometimes the vanes are made in the form of a warped or screw surface to obviate this defect, whereupon the mill assumes somewhat of the sail-wheel type. In the vertical paddle-wheel mills the wind guard may be made in the form of a semicylindrical revolving hood, self-adjusting by means of the changing direction of the wind itself, through the action of the wind on a rudder.

The American sail-wheel windmills vary in design from four or more arms attached to a horizontal axis, with a single plain board nailed to the arm at such an angle as to catch the wind, to an elaborate series of fans in one or more annular rings, the fans being composed of narrow slats of wood, also set at an angle with the wind. The majority of the windmills now on the market, however, are of a simple form, somewhat like the old European mills, except that in the place of a few curved sails of canvas and wood there are a number of metal sails with curved surfaces, all connected to make a compact, strong wheel.

Whatever the type of mill employed, its highest efficiency can be attained only by keeping it constantly in the wind; i.e., so that its plane of revolution will be at right angles to the wind in the sail-wheel mill, and parallel with it in the paddle-wheel type. In the early European mills the wheel and tower were mounted on a pivoted post and turned by hand. Later on the mills were so arranged that only the wheel, its accessories, and the dome or cap of the tower were turned. This was done either by hand or by wind power, an auxiliary windmill, with gearing, being employed in the latter case. In the American mill, also, only the upper part of the mill revolves. The turntable to

effect this movement is actuated by the direct pressure of the wind on either the wheel itself or a rudder attached to it; or else by means of a secondary wheel, which is used to turn the main wheel into the wind.

Besides devices to keep the wheel in the wind others must be employed to regulate the wheel under varying conditions of wind velocity. Such regulation is necessary to secure the maximum amount of power when the wind is low, a fairly constant speed, so far as is possible, under all conditions, a reduction of speed in high winds, and the complete stoppage of the windmill during gales. Regulation may be effected by applying a brake to check the speed, or, as is commonly the case, by diminishing the area of sail exposed to the wind. The latter may be effected by changing the angle of the groups of vanes of a sectional wheel by means of centrifugal action applied through lever rods and resisted by means of weights or springs. The greater the velocity of the wheel the more the vanes will be turned until, if the wind be high enough, they offer it no purchase whatever. A second method involves turning the wheel partially or wholly out of the wind, by revolving it about the axis of the tower. Counterweights may also be used here, as in the case of both the centrifugal governor and some of the devices used for holding the wheel in the wind. The object of the counterweights is to prevent too sudden action of the regulating devices, which might result in damage to some portion of the mechanism involved.

The chief use to which windmills are put in America is the pumping of water from wells, but they are also employed, often conjointly, for grinding grain and cutting fodder for stock, turning grindstones and other machinery for repairing and making farm tools, and numerous other purposes where a relatively small amount of irregular power is needed and where low first cost and a minimum of expense for maintenance and operation are essential. Experiments with windmills to drive dynamos to charge storage batteries have been carried on, but without marked success save in isolated instances.

The power of windmills increases a little faster than the square of the wind velocity and about 1.25 times the square of the diameter of the wind wheel. According to Murphy (see bibliography below) "a good 12-foot steel mill should furnish one horsepower in a 20-mile wind (indicated) and 1.4 horsepower in a 25-mile wind. This is the smallest amount of power that will do any considerable amount of useful work. A 16-foot mill will furnish 1.5 horsepower in a 20-mile wind (indicated) and 2.3 horsepower in a 25-mile wind.

"A 12-foot steel mill and a 50-foot steel tower as commonly made weigh about 2000 pounds. A 16-foot steel mill and a 50-foot steel tower weigh about 4250 pounds. The 16-foot outfit weighs more than twice that of the 12-foot, and its power is only 1.5 that of the latter. In addition, the 12-foot mill will govern more easily and is less likely to be injured in a storm than the 16-foot mill. In most cases, therefore, it is better to use two 12-foot mills than one 16-foot mill."

"Steel mills," he says, "with few large sails, have much more power than the wooden mills with their many small sails." Mills should be placed on towers 50 to 70 feet high, in order to get them at least 30 feet above the tallest trees and buildings. Mills should start in as light a wind as corresponds to a velocity of four or five miles per hour. For information as to velocity and other phases of the wind, see WIND.

Consult: A. R. Wolff, *The Windmill as a Prime Mover* (New York, 1885), a technical treatise; F. E. Powell, *Windmills and Wind Motors: How to Build and Run Them* (ib., 1910); E. H. Barbour, *Wells and Windmills in Nebraska*, (Washington, 1899), which contains a very interesting descriptive review of home-made windmills; and E. C. Murphy, "The Windmill: Its Efficiency and Economic Use," in United States Geological Survey, *Water Supply and Irrigation Papers*, Nos. 20, 29, 41, 42 (ib., 1899–1901); valuable data and other information are to be found in manufacturers' catalogues and in mechanical engineers' pocket books. R. M. Dyer in a paper published in *Machinery* (August, 1907) discusses Murphy's and other experiments presenting his own conclusions.

WIN'DOM, WILLIAM (1827–91). An American legislator and cabinet officer, born in Waterford, Ohio. He was educated at Mount Vernon (Ohio) Academy, was admitted to the bar in 1850, and in 1852 was elected prosecuting attorney of Knox County on the Whig ticket. In 1855 he removed to Winona, Minn., where he allied himself with the Republican party. He was a Republican member of Congress from 1859 to 1869, and was chairman of the important Committee on Indian Affairs. In July, 1870, he was appointed to the seat in the United States Senate made vacant by the death of Daniel S. Norton, and was regularly elected in 1871 and again in 1877, holding the position of chairman of the Committee on Appropriations. On March 4, 1881, he resigned his seat to enter President Garfield's cabinet as Secretary of the Treasury. He resigned his portfolio after Garfield's death, and was at once reëlected to the Senate to fill his own unexpired term. From 1889 until his death he was Secretary of the Treasury in President Harrison's cabinet. He was one of the early advocates of reciprocity and of the gold standard, and was a candidate for the presidential nomination in the Republican National Conventions of 1880, 1884, and 1888.

WINDOW (Icel. *vindauga*, window, wind eye, from *vindr*, AS. *wind*, wind + *auga*, Goth. *augō*, OHG. *ouga*, Ger. *Auge*, AS. *ēage*, Eng. *eye*). An opening in the wall of a building for the admission of light and air. Windows are generally closed with glass, set in a frame called the sash. This may be of wood or of metal, and may be fixed or arranged to be opened at will. Commonly the sash is in two halves, either hinged at the sides and meeting in the middle, as in French and casement windows, or sliding up and down in grooves, with cords and counterbalancing weights, as in double-hung windows. The former are the more common on the Continent of Europe; the latter in England and the United States. The sash is, however, sometimes pivoted so as to turn horizontally or vertically. When stained glass is used, it is set in small pieces held together by grooved strips of lead, and stiffened by iron bars. Large windows are often subdivided by fixed vertical bars or mullions of wood, metal, or stone, and one or more horizontal bars called transoms. A bay window or bow window is a window or group of windows set in a frame or structure projecting

outward from the face of the wall. A narrow bow window supported on a corbel or single shaft is called an oriel. A dormer is a vertical window lighting the interior of a steep roof. When the sash is made to lie in the slope of a roof it is called a skylight; it may be fixed or hinged, or partly fixed and partly hinged. Windows constitute one of the most important elements in the architectural design of buildings, especially of their exterior, and ever since the early Middle Ages their form, size, distribution, and decoration have in large measure determined the character of the various historic styles. The systematic arrangement and distribution of windows in the design of a building is called its fenestration.

Ancient. In Egypt unglazed windows were in common use in ordinary houses, piercing the wall on the second story front and on the inner court. In temple architecture they were rare, but occur at Karnak as clerestory openings in the hypostyle hall. In military architecture they were common, and in the palaces and villas of the new Empire were elaborately treated with heavy stone jambs and sills, and lintels crowned with the characteristic cavetto cornice. The openings were protected by wooden slats and shutters. In Babylonia and Assyria there was little use made of windows, though some reliefs show clerestories lighting the larger and loftier palace halls.

In Greece windows were in use from prehistoric times, but remained quite simple rectangular openings, sometimes slightly smaller at the top: the window frame was of stone or of wood, as occasion required. In some cases the windows are oblong and double, the lintel being supported in the centre by a pier. A decorative framework was often carved in the wall masonry, as in the beautiful Erechtheion windows discovered in 1907. The windows, when not left as mere openings, were fitted with gratings of wood or metal, or with shutters (usually of wood), or with both. The Romans made even more use of windows, with greater variety of form and increased richness of decoration. In private houses those on the streets were ordinarily small and simple (e.g. house of John and Paul on the Cœlian, Rome), but windows of temples were often highly elaborate, e.g., in the temple of Vesta at Tivoli; at Palestrina, surmounted by a cornice resting on consoles; and in the little temple of the Deus Rediculus near Rome, framed with rich ornamental carving. Under the late Empire round-headed windows became common, as at Telmessos in Asia Minor. Of extraordinary beauty are the windows of the Porta dei Borsari at Verona, which with their pilasters and gables undoubtedly served as models for the masters of the Renaissance. The great halls of the thermæ were lighted by huge semicircular clerestory windows, fitted with elaborate bronze gratings. The use of glass was far commoner than is imagined, beginning even in Republican times and probably derived from Alexandria and Antioch; several examples have been found in Pompeii. Even commoner was the use of transparent stones called specularia, the choicest of which came from Spain.

Mediæval and Mohammedan. The development of the basilican church involved the general use of windows. The normal window of Early Christian and Early Byzantine buildings was a single, plain and rather wide round-arched opening, without moldings or sculpture. Only in the East, where stone was commonly used, was the old Græco-Roman richness partly perpetuated, especially in the ruined cities of central Syria, where hundreds of windows remain in religious and secular structures built during the third, fourth, fifth, and sixth centuries A.D.

As the later Middle Ages approached, the Byzantine windows took on new forms, and were slenderer, often with two lights, separated by marble colonnettes and framed with moldings. The Roman custom of filling the aperture with glass, onyx, or alabaster was continued, and many examples remain of the perforated marble slabs; usually the perforations were small and circular, quite often square, sometimes in elaborate patterns. The perforations were at times filled with colored glass, thus combining the two varieties. The churches of Grado, Parenzo, Ravenna, Rome, etc., retain examples dating from the sixth to the eleventh century. In the Mohammedan East windows were early provided with musharabiyeh lattice work, or with stucco window sashes cut out in free and exquisite floral designs, filled with stained glass; this was practiced especially in Egypt (Cairo), but perhaps also in Syria, and many beautiful examples are to be seen in the mosques of Constantinople.

Romanesque windows are ordinarily single, round-headed apertures, splayed where the wall is thick; very seldom does a two-light window with central colonnette occur. Occasionally the arched opening was framed with carving or treated, like the superb doorways, with receding arches and carved moldings, especially in southern France and southern Italy. But the highest development of the window came with the Gothic style. Its perfect system of balanced construction permitted the opening of windows as vast as the entire space between the supporting piers of a vaulted interior. Thus arose the magnificent pointed and circular windows with tracery (q.v.), dividing them into several narrow lights. They were filled with stained glass, which developed into an important branch of painting. For the first time—except for a few late Romanesque examples in France and Germany—the pieces of stained glass framed in lead were so assembled as to form immense figured compositions rivaling wall paintings. France led the way, closely followed in this art by England and Germany. Italy was least important. See STAINED GLASS.

Renaissance. The discontinuance of the Gothic system of construction after the fifteenth century put an end to the use of tracery and removed the chief distinction between the windows of churches and secular buildings. The art of stained glass declined, although a few fine examples were produced in Florence and in northern France and Belgium during the early Renaissance. In general attention was now bestowed upon the architectural adornment and framing of the square or arched openings, which at first were single or coupled arches with little decoration, but later were enriched with most elaborate carved ornament, as in the superb windows of the Certosa at Pavia. In the later periods they were flanked by colonnettes and crowned with entablatures and often with curved or triangular pediments. Clear glass was almost exclusively used.

Modern. In modern work windows are either treated simply as openings for light and air,

and therefore filled with clear glass in movable sashes, usually of wood, or made internally decorative, as in the Middle Ages, by the use of stained glass. This art has been revived and extended by wholly new developments as to color and treatment, especially in England and the United States, and applied in both secular and religious architecture. In general the form and treatment of modern windows are made to conform to the historic style which predominates in the design, but the style is often handled with great freedom of detail. Nearly all types of Gothic and Renaissance windows may be seen in modern buildings, the Gothic being chiefly confined to ecclesiastical buildings. In windows of monumental size bronze is often employed for mullions, transoms, decorative framework, and even sashes. In the colonial houses of the United States windows over the doors (fan lights) and narrow windows on either side of the door (side lights) were often made with glass set in iron or lead framework forming charming decorative patterns. The use of plate glass has made possible the glazing of large windows without intermediate sash bars, with gain in light but frequent loss of architectural effect. Shop windows measuring 10 or 15 feet square are not uncommon, each of a single sheet of glass, but they detract greatly from the solid aspect of a building and are generally destitute of architectural character. The development of fireproof construction (q.v.) has brought about the use of wire glass, which may crack but will not disintegrate even in intense heat; and of sashes either wholly of metal or of wood cased in sheet copper or sheet brass, often called kalamine windows. The heavy glazed, round windows used in ships are called port holes. See GLASS.

WINDOWPANE. A small, thin, almost translucent, variously mottled flounder (*Lophosetta maculata*) common along the northeastern coast of the United States. It is a near ally of the English turbot, but is little used as food.

WINDOW SHELL. A Ceylonese oyster (*Placuna placenta*) of the family Anomiidæ, whose valves are round, nearly flat, almost transparent, and formerly were extensively used in China and elsewhere as a substitute for window glass. In the middle of the nineteenth century their export in shiploads was an important item of commerce in Ceylon. They abound in tiny pearls, which are saved for burning into a lime to be chewed with betel nut by those who can afford the luxury. Compare JINGLE SHELL.

WINDPIPE. See TRACHEA.

WINDS, TOWER OF THE. See TOWER OF THE WINDS.

WINDSOR, wĭn'zẽr. A municipal and Parliamentary borough in Berkshire, England, on the Thames, 21 miles by rail west by south of London (Map: England, F 5). Of great antiquity, its chief interest lies in its castle and parks. It has been a favorite residence of English monarchs. (See WINDSOR CASTLE.) Bridges connect the town with Eton and Datchet opposite on the left bank of the Thames. The town hall, built by Sir Christopher Wren in 1658, contains some royal portraits. Pop., 1901, 13,958; 1911, 15,370.

WINDSOR. A port and the capital of Hants County, Nova Scotia, on the Dominion Atlantic Railway, 45 miles northwest of Halifax (Map: Nova Scotia, F 7). It is the seat of the University of King's College, chartered in 1788 by George III. There are plaster, glue, and fertilizer works, a foundry, a builders' and a furniture factory, and gypsum is shipped in large quantities from the neighboring quarries. Pop., 1901, 3398; 1911, 3452.

WINDSOR. A city in Essex County, Ontario, Canada, on the Detroit River, opposite Detroit, and on the Canadian Pacific, the Michigan Central, the Grand Trunk, the Wabash, and the Pere Marquette railways (Map: Ontario, C 9). It has car and passenger ferryboats connecting with Detroit, electric lights and street railroads, important beds of rock salt, a large fruit and tobacco industry, and thriving manufactures. Pop., 1901, 12,153; 1911, 17,829.

WINDSOR. A town in Hartford Co., Conn., 6 miles by rail north of the city of Hartford, on the Connecticut and Farmington rivers, and on the New York, New Haven, and Hartford Railroad (Map: Connecticut, E 2). Manufacturing is the leading industry, the most important products being paper, knit goods, and electric motors. Tobacco culture is extensively carried on in the vicinity. Noteworthy features are the Loomis Institute, Campbell School, and the public library. Pop., 1900, 3614; 1910, 4178. In 1633 William Holmes and a few associates from Plymouth built here a fortified trading post, and two years later permanent settlers, headed by Roger Ludlow, came from Dorchester, Mass., the settlement being called Dorchester until 1637, when the present name was adopted. In 1639 Windsor united with Hartford and Wethersfield, under the "Fundamentall Orders," to form the Colony of Connecticut. Consult Stiles, *History of Ancient Windsor* (New York, 1859).

WINDSOR CASTLE. The chief residence of the British sovereigns, at Windsor (q.v.), on the Thames. The buildings, which crown a plateau west of the town, cover 12 acres of ground in the midst of the Little or Home Park, which is about four miles in circumference. A tree-lined avenue connects with the Great Park, which has a circuit of 18 miles, and west of this is Windsor Forest, occupying an area 56 miles in circumference. The castle may be grouped in three portions: The Middle Ward, conspicuous by the dominating Round Tower or Keep, 80 feet high, built on an eminence 42 feet high; the Lower Ward on the west, containing St. George's Chapel, the Albert Chapel, the houses of the military knights, cloisters, etc.; and the Upper Ward on the east, containing the royal private apartments. The Round Tower, which was built by Edward III to receive the round table of the knights of the newly founded Order of the Garter, was used as a prison until 1660. St. George's Chapel, begun in 1474 by Edward IV and completed by Henry VIII, is a fine specimen of flamboyant Gothic architecture. In the vault below the chapel Henry VI, Edward IV and his Queen, Henry VIII and Jane Seymour, Charles I, George III and his Queen, George IV, the Princess Charlotte, the Duke of Kent, the Duke of York, William IV and his Queen, and other members of the royal family are buried. Adjoining St. George's Chapel is the Albert Chapel, built by Henry VII, and lavishly restored by Queen Victoria as a memorial to the Prince Consort, Albert. The state apartments in the Upper Ward, including the celebrated St. George's Hall, 200 feet long by 34 feet wide, the Waterloo Chamber or Grand Dining Room, 98 feet long by 47 feet wide, the Throne Room, and the old Ball Room, now the

Vandyck Room, contain valuable collections of paintings, statuary, and other priceless objects of art. Frogmore (q.v.), the mausoleum of Queen Victoria and her husband, is in the park half a mile from the castle. Windsor was a residence of the Saxon kings before the Conquest, their palace being at Old Windsor, two miles distant. William the Conqueror chose the present site and built a castle which was extended by Henry I and Henry II, but under the orders of Edward II was taken down and a new one rebuilt by William of Wykeham, Bishop of Winchester. This castle was extended by successive monarchs, and under George IV it was completely renovated. Consult: W. H. Dixon, *Royal Windsor* (4 vols., London, 1879–80); W. J. Loftie, *Windsor: The Castle, Park, Town, and Neighborhood* (ib., 1886); G. F. Laking, *Furniture of Windsor Castle* (New York, 1905).

WINDSOR LOCKS. A town in Hartford Co., Conn., 12 miles north of Hartford, on the Connecticut River, and on the New York, New Haven, and Hartford Railroad (Map: Connecticut, E 2). The public library and Memorial Hall are noteworthy. There are manufactories of paper, underwear, cotton warp and yarns, trucks, rubber rolls, and machines. Pop., 1900, 3062; 1910, 3715.

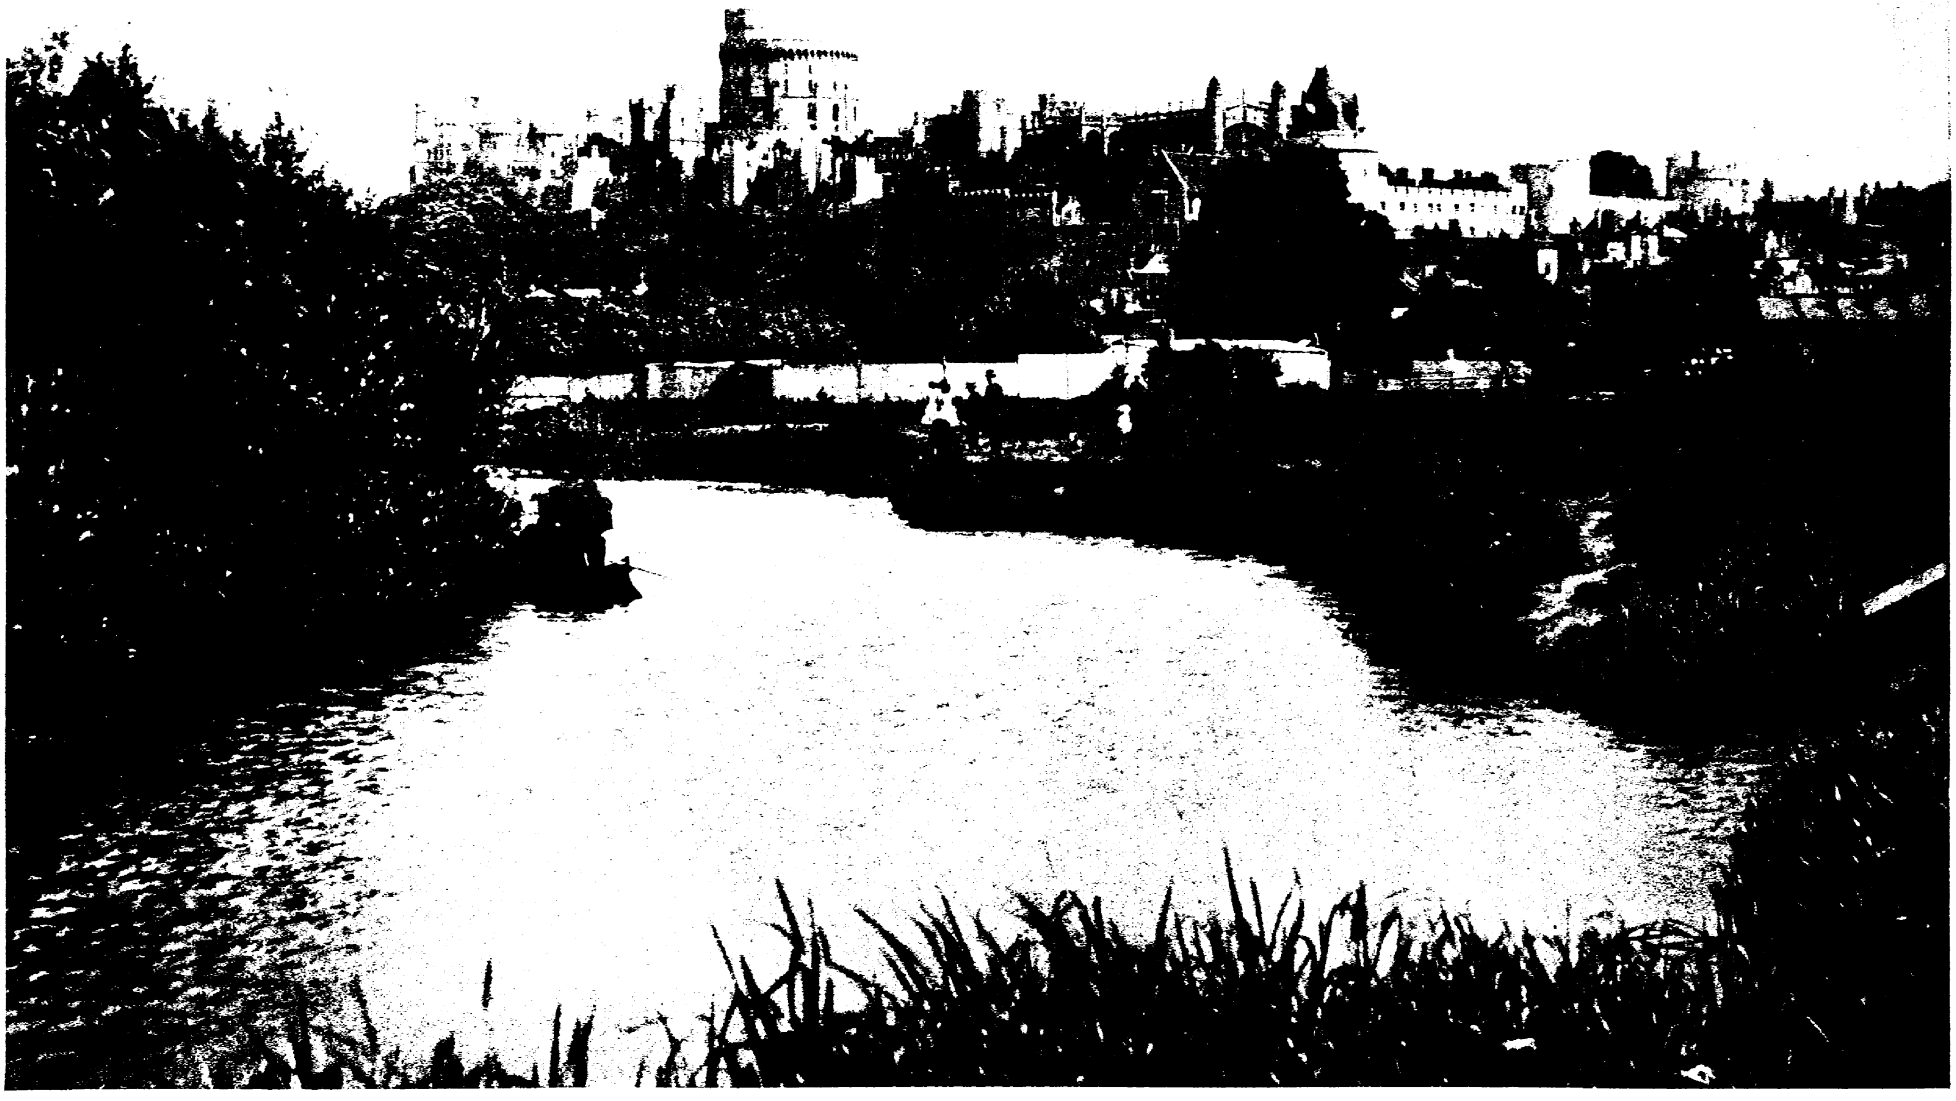
WINDSOR MILLS. A town in Richmond County, Quebec, Canada, on the St. Francis River and on the Grand Trunk and Canadian Pacific railways, 90 miles east (direct) of Montreal (Map: Quebec, J 6). It has a Protestant academy, a convent, and manufactories of powder, paper, and cheese. Pop., 1901, 2149; 1911, 2233.

WIND SUCKING. See CRIBBING.

WINDTHORST, vint'hôrst, LUDWIG (1812–91). A Prussian party leader. He was born at Kaldenhof, in Westphalia, studied jurisprudence at Göttingen and Heidelberg, became an advocate, and in 1849 was chosen a member of the Lower Chamber of Hanover. In this body he assumed the leadership of the party opposed to Prussian domination. He was made President of the Lower House, and from 1851 to 1853, and again from 1862 to 1865, was Minister of Justice. He was ultramontane in his views. When the collision between Austria and Prussia became imminent his influence was a considerable factor in bringing about the alliance of Hanover and Austria. After the North German Confederation had been formed and Hanover had been incorporated with Prussia Windthorst first led the Hanoverians in opposition, and when the Kulturkampf broke out he became the chief of the Catholic Centre party, whose policy he guided with great skill and persistence. While never completely reconciled to the Imperial Government, he succeeded, by supporting its economic policy, in gaining in return many a victory for his party and the Ultramontane cause generally. Consult Menzenbach, *Ludwig Windthorst in seinem Leben und Wirken, insbesondere in seiner politischen Thätigkeit* (Treves, 1892).

WIND VANE. An instrument for showing the direction of the wind, frequently also called anemoscope (q.v.).

WINDWARD ISLANDS. The southern portion of the Lesser Antilles, between St. Lucia and Trinidad, including the former and sometimes excluding Trinidad and Tobago (Map: West Indies, G 4). The northern portion of the Lesser Antilles—Martinique to the Virgin Islands inclusive—constitutes the Leeward Islands. Besides the islands already named, the principal members of the Windward group are St. Vincent, Barbados, and Grenada.



The name "Windward Islands" is also applied to a British possession consisting of the colonies of St. Lucia, St. Vincent, and Grenada (see these titles). The area is 524 square miles. Pop., 1901, 160,769; 1911, 157,264. The majority of the inhabitants are negroes, less than 5 per cent being whites. There are about 5000 East Indian coolies, and a few Caribs remain in St. Vincent. English is spoken, but among the peasantry of St. Lucia and Grenada a French patois persists. Imports and exports in 1913, £694,219 and £756,809. The three colonies are under the administration of one governor, resident at St. George's in Grenada.

The name "Windward Islands" was formerly applied to the whole of the main chain of the Lesser Antilles, the chain of islands extending east and west along the coast of South America having been known as the Leeward Islands.

WINE. Specifically, fermented grape juice; by extension, fermented juice of other fruits or plants, the name of the fruit always preceding the term, e.g., currant wine, rhubarb wine, elderflower wine, etc.; loosely, unfermented fruit juice used as a beverage. Wine manufacture antedates history. Sketches on Egyptian monuments indicate that it was practiced several years before our era; biblical records abound in references to wines and vineyards; history credits the dissemination of the vine throughout the Mediterranean region to the Phœnicians, and, to judge by the writings of Herodotus, Aristophanes, Democritus, Cato, Varro, Vergil, Columella, and Pliny, wine making in their days had reached a high degree of perfection among the Mediterranean nations. Many of the ancient wines, particularly of Western Asia, Greece, and Italy, owed their popularity to spices, the addition of which, except in the Mediterranean region and in the East, has been commercially abandoned. This practice and the present commercial demand for natural wines is partly accountable for the lower rating of formerly famous wines of the countries mentioned.

Commercial Importance. Wine is one of the most important agricultural products of the world, being made in every continent, and in almost every country except those of the extreme North. The world's supply, in 1912, was estimated at 3,454,941,336 gallons, which is equivalent to about 2.1 gallons per capita. During the fiscal year ending June 30, 1912, the United States exported 958,000 gallons of domestic wine and imported 4,035,746 gallons of foreign wine. In 1914 the value of wines imported into the United States was $10,117,000 and of wines exported $4,134,000. According to the *Moniteur Vinicole* the amount manufactured in the various countries, 1914, was as on page 693.

Classification. Wines are red or white according to the method of their manufacture. The former are prepared by fermenting or partially fermenting on the husks (skins), the latter after the expression of the juice. Often both kinds are prepared from the same grape, but of course a red wine cannot be made from a white grape, nor a white wine from a dark-colored must. Red wines are fuller (have more body), more astringent, and are usually more acid than white ones. Wines are classified as: Dry when completely fermented—only about 0.1 per cent of sugar remaining; sweet or fortified when the fermentation is checked at an early stage by the

WINDSOR CASTLE

FROM THE THAMES

addition of grape brandy or alcohol, evaporated must or sugar also being frequently added; still when the carbon dioxide produced by fermentation is allowed to escape before bottling or barreling; sparkling or effervescent when charged with carbon dioxide formed by the fermentation of a small amount of sugar solution added to the completely fermented wine; carbonated when charged artificially with carbon dioxide under pressure; rough and astringent or smooth, according to the amount of tannin derived from skins and stems during fermentation; heavy or light according as the alcoholic content is high

or low; full when rich in body (solids). According to flavor and aroma the self-explanatory terms "mild" and "delicate" are frequently employed. The variations in these characteristics are due to differences in climate, soil, culture, methods of manufacture, and varieties of grapes.

Wines are commonly classified also according to the country where manufactured, and within each country into special types. Among these types may be mentioned the following (see also the various manufacturing countries mentioned below): Bordeaux or claret—an astringent, dry, red wine manufactured in the valley of the Gironde in France; Burgundy—a smooth, dry, red wine made in Côte d'Or in France; Champagne—the most famous sparkling wine, made in the Province of Champagne, France; Madeira—a sweet Portuguese wine from the island of Madeira; Malmsey—a light, sweet Madeira; Moselle—an acid, dry, white wine made in the valley of the Moselle in Germany; Port—a famous sweet, red wine made near Oporto, Portugal; Rhine wine—a white, dry wine of fine aroma from the Rhine valley, Germany; Sauterne—a superior dry, or slightly sweet, white wine made in the upper valley of the Gironde, in France; Sherry—a dry, fortified Spanish wine; Tokay—a rich, soft, sweet Hungarian wine.

American Wines. About the middle of the sixteenth century wine was made in Florida from wild grapes, and unsuccessful attempts were made by the early settlers of Virginia to establish wine making as a permanent industry. In 1664 a man named Richards received permission from the first English Governor of New York to sell native wines without tax, and began the extensive cultivation of grapes in that Colony. During the latter part of the seventeenth century the manufacture of wine was begun in New Jersey and Delaware, and it was attempted, but without success, by William Penn in Pennsylvania. From the beginning of the industry in the United States the best grapes have been imported from wine-producing countries, but attempts to acclimate them have been largely unsuccessful except in the States lying west of the Rocky Mountains. See GRAPE.

There are five distinct wine-producing regions in the United States: (1) The Pacific district, including the territory lying west of the Rocky Mountains, New Mexico, Arizona, and a portion of the Rio Grande Valley in Texas; (2) New York; (3) Ohio and Virginia; (4) Missouri; and (5) the Southern States from North Carolina to Texas. These divisions are of the most general nature, and each would be subdivided into many districts if its wines were carefully and comprehensively studied. For instance, the soil and climatic conditions of California yield wines of widely varying characteristics. They are made almost exclusively from the European varieties of Vinifera. The wines of California have been carefully studied by Hilgard and his associates at the State Agricultural Experiment Station, and have been described in the station's publications. In general, California wines are higher in alcohol, solids, tannin, and coloring matter than European wines made from the same grapes. Thus California Bordeaux may be made more like the product of the Gironde by dilution. The successful wines of the Pacific district may be distributed among the following types: Bordeaux, Champagne, Jura, Sauterne, Southern French, Rhine, Port, Sherry, and the cultivated varieties of the North Italian. Burgundy, which resembles French Bordeaux more closely than it does French Burgundy, has been largely made, but is being discontinued. The Hungarian type, with the exception of the Zinfandel, is also rapidly losing favor.

East of the Rocky Mountains American varieties of grapes are used almost exclusively and the relative amount of grapes used for wine making and for the table depends largely upon the price of the latter; vines are most cultivated to supply table demands. But the number of vineyards for wine production is increasing, and there are some localities, especially in New York, Virginia, and Ohio, where wine making is an important industry. Large amounts of sparkling wine of fair quality are produced in this district, chiefly from Iona, Catawba, and Delaware varieties. In Virginia and Ohio a red wine of good color and body is made from Norton's Virginia and Ives's seedling grapes; the Cynthiana, Elvira, and Goethe grapes are employed for wine in Missouri; the Southern States from North Carolina to Texas employ the Herbemont, Lenoir, Goethe, and Elvira; in the Atlantic Coast States from North Carolina to Florida the Scuppernong is largely raised, and is highly prized both as a table and wine grape. The majority of the American varieties are said to have a foxy flavor, which is believed to be due to the short time that the American species have been cultivated. The wines of the Northern States are usually drier, less alcoholic, and more acid than more southerly kinds.

Austrian Wines. Austrian wines are little known in commerce; they are usually full, strong, and astringent. No distinct type can be described, since the various parts of Austria

RED WINES

NAME	Type	Country where made	Characteristics
Adelantadillo	Bordeaux	Spain	Still
Affenthaler	Rhine	Germany	Dry and still
Aleatico	Muscatel	Italy	Still, sweet, and delicate
Alicante (Alicant)	Southern French	Spain	Still and sweet
Assmannshäuser	Rhine	Germany	Still and sparkling, sweet and dry
Asti	Burgundy	Italy	Still or sparkling and strong
Auldana	Bordeaux	Australia	Full, still, and slightly astringent
Auvergnat	Bordeaux	France	Full, still, and slightly astringent
Auxerre	Burgundy	France	Still, smooth, and slightly astringent
Avallon	Burgundy	France	Still, smooth, and slightly astringent
Barbera	North Italian	Italy	Full, sparkling, and rough
Beaujolais	Burgundy	France	Smooth, slightly astringent, and still or sparkling
Beaune	Burgundy	France	Full, smooth, still or sparkling and astringent
Beclan	Jura	France	Still, full, and astringent
Beni Carlo	Burgundy	Spain	Deep red, still, smooth, and spirituous
Bergerac	Bordeaux	France	Still and astringent
Beziers	Burgundy	France	Still and sweet
Blanquefort	Bordeaux	France	Still and pungent
Blue Portuguese	Austrian	Austria	Still, deep colored, full, and neutral
Bonarda	North Italian	Italy	Still, deep colored, acid, and astringent
Bordeaux	Bordeaux	France	Still and astringent
Bourg	Bordeaux	France	Still and slightly astringent
Bual	Madeira	Madeira	Still, sweet and soft, ruddy brown
Burgundy	Burgundy	France	Still or sparkling, full, smooth, and dry
Cabernet	Bordeaux	France	Still and soft
Carignan	Southern French	France, United States	Still, full, and neutral
César	Jura	France	Still, full, deep colored, and rough
Chambertin	Burgundy	France	Dry, still or sparkling and soft
Champagne	Champagne	France	Dry or sweet and sparkling
Charbono	Bordeaux	France	Still, full, and astringent
Château Lafitte	Bordeaux	France	Still, full, and slightly astringent
Château la Rose Perganson (Château la Rose)	Bordeaux	France	Still, fruity, and soft
Château la Tour	Bordeaux	France	Still, full, and mellow
Château Margaux	Bordeaux	France	Still and generous
Chauché Noir	Southern French	France	Still, light, and neutral
Chianti	North Italian	Italy	Still, full, and spirituous
Cinsaut	Southern French	France	Still, full, and delicate
Claret	Bordeaux	France	Still and slightly astringent
Clos Vougeot	Burgundy	France	Still, full, and soft
Commanderia	Sherry	Cyprus	Still, heavy, and rich
Constantia	Sherry	Cape of Good Hope	Still, heavy, and sweet
Cosne	Bordeaux	France	Still, dry, and slightly astringent
Côte Rôtie	Southern French	France	Purple color, still or sparkling and slightly astringent
Dolcetto	North Italian	Italy	Still, deep colored, light, and soft
Epineuil (Epinal)	Burgundy	France	Full, dry, and sparkling
Etraire de l'Adhui	Jura	France	Still, full, and astringent
Falerno	Sherry	Italy	Still and sweet
Favorita	North Italian	Italy	Light, deep colored, and mild
Floirac	Bordeaux	France	Still and slightly astringent
Florence	Bordeaux	Italy	Still, full, and slightly astringent
Garnai Teinturier	Bordeaux	France	Deep colored, still, and full
Glenpara	Bordeaux	Australia	Still and spirituous
Gomera	Madeira	Canary Islands	Still and spirituous
Graves	Bordeaux	France	Still, full, and slightly astringent
Gros Mansenc	North Italian	Italy	Still, full, acid, and astringent
Grossblauer (Kölner)	Austrian	Austria	Still, light, and mild
Hermitage	Southern French	France	Still, full, soft, and aromatic
Highercombe	Australian	Australia	Still and dry
Hochheimer (Hock)	Rhine	Germany	Still or sparkling, dry or sweet, light, and acid
Kadarkas	Hungarian	Hungary	Dry, full, and rough
Karlowitzer	Port	Hungary	Still, spirituous, and astringent
Lacrimæ Christi	Southern Italian	Italy	Full, still or sparkling, and sweet
Lagrain	North Italian	Italy	Full, still, deep colored, and astringent
Lipari	Muscatel	Lipari Islands	Still, sweet, and raisiny
Mâcon	Burgundy	France	Still, light, and soft
Madeira	Madeira	Madeira	Still, dry, soft, delicate, and nutty
Malbec	Bordeaux	United States	Still and slightly astringent
Malmsey	Madeira	Madeira, Canaries, Greece, Spain, Italy	Still, sweet, full, and soft
Malvasia (Malvaise, Malvoisie)	Madeira	All wine-producing countries	Still, sweet, full, and soft
Marsala	Madeira	Sicily	Still, dry, and astringent
Marzemino	North Italian	Italy	Still, light, low acid, and rough
Mataro	Southern French	France	Still and slightly astringent
Médoc	Bordeaux	France	Dry, still, and delicate
Merlot	Bordeaux	France	Dry, still, and delicate
Meunier	Burgundy	France	Dry, still, full, and soft
Mission		United States	Light, neutral, and low acid
Mondeuse	Bordeaux	United States	Soft and slightly astringent
Montefiascone	Muscatel	Italy	Still and spirituous
Montepulciano	Muscatel	Italy	Still, spirituous, and sharp
Mourastel	Southern French	France	Dry, still, light, and neutral
Muscatel (Muscadel, Muscadine, Muscat)	Muscatel	All wine-producing countries	Still, sometimes sparkling, sweet, raisiny, and aromatic
Musigny	Burgundy	France	Dry, still, soft, and full

RED WINES—*Continued*

NAME	Type	Country where made	Characteristics
Nebbiolo	North Italian	Italy	Full, heavy, and acid

Volnay	Burgundy	France	Still or sparkling, full, delicate, and soft
Wälschriesling	Austrian	Austria, Germany, Switzerland	Dry, still, and neutral
Zeltinger	Moselle	Germany	Sparkling, sweet, soft, delicate, and aromatic
Zierfahndler	Austrian	Austria	Still, fiery, alcoholic, and somewhat sweet

produce widely different varieties. Many Austrian vineyards are fortunately located, and excellent wine is produced where the methods of manufacture are not too careless and inefficient. The grapes are usually those of the surrounding countries, especially Germany, Hungary, and Italy, and but few characteristic local varieties are known.

Australian Wines. The wines of Australia are very similar to those of California, and are popular in England. The industry is growing rapidly and is of considerable importance.

French Wines. The production of wine is one of the leading industries of France, 78 of the 86 departments producing it in large quantities. Until 1875 France easily led the world, but in the following years her vineyards were devastated by the phylloxera, which reduced the acre-

age between the years 1875 and 1887 from 5,550,000 acres to 3,722,000, and the output of wine from 1,840,000,000 gallons to 535,000,000. Since the latter date vineyards have been restored by grafting on resistant American varieties, and the industry is again flourishing. The best-known types of wine made in France are the Bordeaux, Burgundy, Champagne, and Sauterne. The wines of Saumer, of Jura, and the light wines of southern France are also worthy of mention. These in turn are divided and subdivided according to local geographical and climatic conditions and the varieties of grapes employed. The wines produced in the region of the Gironde, in and near the Province of Bordellais, are commonly called Bordeaux, a class including a large number of wines with somewhat widely varying characteristics. They are all full, astringent, acid, usually rich in coloring matter, and have a medium alcohol content; their average composition is: alcohol, 10.5 per cent; total acids, 0.60 per cent; tannin, 0.175 per cent; solids, 2.3 per cent. Among the grapes employed in the preparation of Bordeaux are the Cabernet, Verdot, Merlot, Malbeck, Teinturier, Gamai, and Charbono. Many light wines are made in this region, however, and these are usually blended with those having a higher percentage of alcohol before being placed on the market.

The wines of the Gironde naturally arrange themselves into the following classes: Médoc, Graves, Sauterne, Entre-deux-mers, Saint Emilionnais, Bourgeais, and Blayais: subdivisions which are, in a sense, geographical and vary in size from three cantons to the greater part of a department. They are also graded according to their supposed relative merits. The first classification of the Médoc wines was made in the eighteenth century, and has not been revised since 1855, when six groups were made, the first five called classified growths, and originally valued in the order of their number. This classification is rigorously retained, and it is difficult for a wine to be promoted into a higher grade even though it may make such a reputation as will demand a higher price than many in the grades above it.

Each of the Gironde districts makes wines distinctly different from those of the other districts, but this distinction is not commonly understood, and the great majority of the wines of the Gironde region are sold simply as Bordeaux.

The wines of Burgundy, which once ranked highest, are still held in high estimation by connoisseurs. Burgundy is rich in flavor, smooth, velvety, and when aged has a peculiar delicate aroma not present in the new wine. It has a medium content of alcohol, acid, and solids, is very low in tannin, and rather lacking in color. The vineyards, consisting of Pinots, Gamai Noir, and Meunier grapes, are located about half way up the hillsides (800–1000 feet high) in the Côte d'Or between Dijon and Châlons. Red and white varieties, which are made from the same grapes, are equally esteemed. Three classes or "growths" of red Burgundy and two of white are recognized. Similar to the wines of Burgundy, but inferior to them, are those of Chablis and Mâcon.

Champagne. Champagne is the name given to a famous sparkling wine of French production. It derives its name from the ancient Province of Champagne, where it was first produced. The discovery of the process of its production is attributed to Don Pérignon, a monk, about the close of the seventeenth century. However, the wine did not enjoy much popularity until the latter part of the eighteenth century. Its production has gained constantly and is to-day an industry of great importance. When champagne is poured into the glass the carbon dioxide gas escapes with a sparkle, the liberation of the gas continuing for some time if the wine is properly served. It is due to the sparkle that wines of this type owe their great popularity. The sparkle of true champagne is developed by bottle fermentation; i.e., the carbon dioxide is formed by the decomposition of sugar in the bottle. During bottle fermentation the pressure increases, and very often amounts to 5 or 6 atmospheres.

The time required for producing true champagnes and the care which is required in their preparation are the main reasons for the high price at which they are sold. To meet the demand for cheap articles the manufacturers carbonate wines artificially, i.e., force the carbon-dioxide gas into the finished wine, but the sparkle in these wines subsides sooner than in the true champagnes. Such wines, although of good quality, are not considered as champagnes in the true sense of the word.

The French government, by a decree issued by the Ministry of Agriculture, Dec. 17, 1906, delimited the territory for which the name of champagne is exclusively reserved to the Departments of La Marne and the Aisne. However, on the 9th of June, 1911, a supplementary decree to that of 1906 was issued delimiting a second zone, which includes the Aube, Haute Marne, and the Seine-et-Marne departments. No wine from other districts is permitted to be sold in France as champagne, but vintners in this district purchase the products of neighboring sections for blending, the result being that wines of this type may be purchased in Paris for very small sums.

Jura Type. The wines of the Department of Jura, made from such grapes as César, Mondeuse, Etraire de l'Adhui, Sirah, and Tinta Valdepeñas, are deep-colored and astringent, fuller, smoother, less aromatic than the Bordeaux, markedly different from the delicate, smooth Burgundies of the Côte d'Or, upon which the district borders, and also from the neutral wines of southern France. Their average composition is: alcohol, 11.50 per cent; solids, 3.00 per cent; acid, 0.55 per cent; tannin, 0.25 per cent.

Sauterne. The white wines made in the Sauterne district, in the Upper Gironde, are commonly divided into Haut and Grave Sauternes; the former, which contain about 14 per cent of alcohol, 3.5 per cent of solids, and 0.7 per cent of acid, being full, high in alcohol, smooth, somewhat aromatic, vinous, and slightly sweet, the latter, lighter, drier, and less aromatic. When fermentation has reached the desired stage, Haut Sauternes are racked into heavily sulphured casks, and consequently contain a relatively large amount of sulphurous acid, to the presence of which the persistent headaches that follow indulgence are attributed. The Grave Sauternes include many of the most highly prized of European white wines, their flavor being due to the care used in preparation rather than to soil and climate. A marked difference exists between the first growth and the second. In the preparation of the latter, only ordinary care is exercised; in that of the former, the berries are picked singly, and no possible precautions are omitted.

A number of the crus Bourgeois are of great merit, and often bring a higher price than some of the second growth.

A large amount of red and white, sweet and dry wine, unclassifiable into distinct types, but generally deficient in aroma, is made in southern France. The wines of the hill regions are somewhat full and smooth, and those of the plains low in alcohol, body, tannin, and acidity. The *vins de liqueur*, such as the sweet Muscats and Roussillon, are most prized. The average composition is: alcohol, 10 per cent; solids, 2.10 per cent; acid, 0.55 per cent; tannin, 0.15 per cent.

German Wines. The valleys of the Rhine and the Moselle in southern Germany, long famous for their wines, mark the northern limit of successful viticulture, but probably they suffer from unfavorable climatic conditions, especially cold and wet, more frequently than any other region. In favorable seasons the wines are of exceptionally fine flavor and delicate aroma. The Rhine valley is the most important wine district of Germany; north of Coblenz little wine is made; between Coblenz and Assmannshausen that produced is inferior. From the vicinity of Assmannshausen to that of Mainz on the north bank of the river are many of the most famous wine-producing localities, and in the neighborhood of Hochheim is produced the so-called Hock, under which name English usage often includes all Rhine wine.

The valleys of the Moselle and the Saar, especially in Lorraine, produce large quantities of high-grade wine. In Württemberg much low-grade wine is made. Characteristically German wine is white, but red wines are produced in some localities. In general, German wines are low in alcohol (generally below 9 per cent) and body, with very often as much as 1 per cent of acid; those of the higher grade approach French wines in composition, the average being: alcohol, 11 per cent; solids, 2.5 per cent; acids, 0.7 per cent.

The list of varieties of grapes employed is smaller than that of France, and includes Riesling (most widely grown), Traminer, Burger, Sylvaner, Ruländer, Blaver, Burgunder (a pinot), Affenthaler, Arbst, Kleinberber, Orléans, and Elbling.

Greek Wines. Since early historical times the hillsides and valleys of Greece have been famous for their wines, which, however, are commonly so crudely and imperfectly made, and so badly fermented, that they cannot be carried through the first summer. Rather than perfect their methods, the vintners use smoke and resin as preservatives. The wines of Santorin, which are shipped mainly to Russia, are acknowledged best. Other celebrated Greek wines are the Malvoisies or the Kephissia of Attica, a red wine of Zante, and the so-called Tokays, which are largely exported from Patras. Others in good repute are Thera, Caliste, and St. Elie. The annual vintage is about 45,000,000 gallons.

Hungarian Wines. Among the most prized Hungarian wines are the Furmint or Tokay and the Kadarkas, produced from Hungarian varieties of grapes. German and Italian varieties are also grown. Among the celebrated vineyards are those of Erlau, Tokay, Bakator, Erdöd, Somlyo, and Ménes; the Hegyalja Mountain and the valleys of Samos and Bodrog in the north; and Rust, Alsó-Fehér, the Banat, and the Wojwodina in the south.

Italian Wines. Most of the wine of northern Italy, being carelessly made from neglected vineyards, is light, neutral, coarse, and of bad keeping quality, but, owing to the natural advantages of the country, well-colored wines of high alcohol and tannin content can be produced with reasonable care. Though rough and astringent when new, they are fully equal to the Bordeaux type when properly aged, and are highly prized for their pleasant flavor and for blending with the neutral wines of southern France. The wines of Asti and Montferrat are among the most famous. The wines of southern Italy are rich in alcohol, but have less tannin and acid than the northern type. Those of Tuscany are highly prized, and a red wine made in Chianti finds a ready market. Among the grapes used are Refosco, Margemino, Barbera Fresa, Lagrain, Nebbiolo, and Moscatello Fino. The first two are remarkable for their adaptability, being among the most valuable wine grapes of Austria and California. The wines of Sardinia and Sicily are famous, the Marsala of Sicily especially.

Portuguese Wines. The soil and climate of Portugal are especially favorable to the grape, and some of the wines, which include red and white, sweet and dry, are among the world's most famous. Port, made in the mountains near Oporto, is said to have been first exported in 1678, and by 1750 to have reached a volume of 2,000,000 gallons. From 1757 to 1833 and from 1843 to 1867 it was controlled by a monopoly which raised the price, but lowered the quality to such an extent that the demand decreased. New port is ordinarily fortified with alcohol to hasten the ripening and prolong fermentation, and is made to appear aged by the addition of jeropiga, a solution of elderberries, raisins, molasses, and alcohol. Grapes were introduced into the island of Madeira early in the fifteenth century, since when Madeira vintages have been in great demand. An outbreak of oidium early in the nineteenth century reduced the output from 2,770,000 gallons in 1813 to 3780 gallons in 1855, and induced extensive immigration to the West Indies. Since the latter date production has increased, a successful remedy for oidium having been found. A light, sweet, aromatic Madeira wine called Malmsey from Napoli di Malvasia, an island in the Grecian Archipelago, the wines of which are widely known by this name, is made from fully ripe grapes partially dried on the vines and is produced in the Azores, the Canaries, Sardinia, Sicily, and Provence, as well as Madeira.

Spanish Wines. The favorable soil and climate have made viticulture the most important agricultural industry of Spain, an industry which has repeatedly received governmental encouragement. The wines are high in alcohol, color, and aroma, and have been extensively used for blending with French wines, especially of the Gironde district, the red wines of Tarragona Rioja being favorites for this purpose. Spain leads the world in the manufacture of fortified wines. The most famous, sherry, a dry wine, made in southern Spain between Port Saint-Mary (Puerto de Santa Maria) and Jerez, from which it is named, is so little fortified that it contains only 14 or 15 per cent of alcohol. The grapes, having been allowed to ripen fully and to become partially dry before picking, are sold to large wineries, and not, as in other regions, worked up in small establishments. After fortification the wine is matured (baked) in hot

rooms. Two classes of sherry deserve special mention, amontillado and manzanilla, the former, inland wines, subdivided into fino (the most delicate) and oloroso; the latter, lighter and drier wines, made on the coast. Mantilla, a wine resembling manzanilla, is made in the Province of Cordova. Other important Spanish wines are tinto, a sweet red wine from the Rota district; Valdepeñas (red), from Central Spain; and Tarragona or Spanish red, from Catalonia.

Wine Manufacture. In the successful manufacture of wine, great discretion, unremitting care, and large experience are essential. Climate, location, soil, vintage, and method of preparation profoundly influence the character and composition of wine, and it is exceedingly difficult to maintain the uniformity demanded by commerce. The manufacture of wine really begins with the growing of the grapes and ends only after the final racking of the finished product. The vine must be intensively cultivated to replace the often unpleasant natural odor of the fruit with an agreeable aroma. The grape obtained, the vintner must ascertain the variety of wine for which it is suited, and then study the method and details of fermentation which will give best results. Unless the fruit is ripe when harvested, it may need to be artificially ripened or fitted for pressing by exposure to sun or fire heat, by steaming, sweating, or freezing; unless ripe when pressed it will generally yield a small quantity of juice, which must be further manipulated to avoid the production of wine of excessive acidity; and unless free from dust it must be sprayed to prevent a taint of earth in the final product.

In many of the wine-producing sections of Europe, even in Médoc, Graves, and St. Emilion, the wine makers hesitate to adopt improved methods, because they fear that the quality of the product may be impaired. Here the cuvier or wine house is often a one-roomed, one-storied building which serves for both pressing and fermenting.

Stemming, Crushing, and Pressing. Grapes whose tannin content is low, and especially fully mature or over-ripe grapes, are often pressed without stemming. The kind and quality of wine to be made also helps to decide whether or not stemming shall be performed. For high-grade wines the berries are often picked by hand; for ordinary grades, and particularly in old-fashioned practice, they are removed by wicker-work or galvanized iron combs or screens against which the clusters are worked by hand; in modern practice, prevalent in California and somewhat used in the Gironde, steam-power stemmers are used, and some of these can stem more than 300 pounds of grapes a minute. For white wines the fruit is pressed (usually without stemming) and the juice fermented; for increasing the body and astringency it is crushed and allowed to ferment more or less before the must is removed for further fermentation; for red wines this is the usual practice, since it secures the required color from the skins in the solvent action of the alcohol formed during fermentation. According as a red or a white wine is desired the grapes in modern establishments are transferred by an endless chain from the storage rooms to a stemming machine or to an endless press. Sometimes a centrifugal machine is used for obtaining the juice from the crushed fruit. In some localities, however, the ancient method of treading the grapes with clogs or sandals or kneading with wooden pestles is still in operation, the claims being that it secures an amount of saccharine matter equal to that obtained by the recent process without crushing the stems or the unripe berries. Usually the first run, the juice that flows naturally from the crushed grapes, is treated separately from the second run, which is pressed out. The exhausted pomace may be treated with water, sugar, etc., for making inferior wines, brandy, or vinegar. In white-wine making the more perfect presses obtain from 60 to 80 per cent or even more of the juice of the fruit, depending largely upon the kind of grape, whether watery or pulpy; in red-wine making they often secure more than 85 per cent, the pulp and skins having been acted upon by fermentation prior to pressing.

Fermentation. Since wine fermentation is due to yeasts found in the air and upon the skins of the fruit, the addition of yeast to the must as in beer making is unnecessary. Action starts in from 12 to 24 hours, depending upon the temperature, and continues briskly for about a week. Selected yeasts (pure cultures), which have been carefully investigated, have been found of little value in cold climates, but in warm regions they are of assistance in controlling fermentation and improving the flavor of the finished product. It is not true, however, that they can convert cider into high-grade wine, as is popularly reported.

In making red wine the grapes may be fermented whole or after crushing according to the vintner's preference. The former practice insures a clearer, brighter wine than the latter, which yields a larger first run (*vin de goutte*) and a wine richer in body and coloring matter. In white-wine making the must becomes turbid from the growth of yeasts in it and from the flocculation of proteids and tartar. During the fermentation of red-wine must the floating mass (cap) of skins, stems, etc., brought to the surface by the gas evolved must be thoroughly mixed daily with the liquid to prevent souring and to insure uniform fermentation. To avoid this labor, perforated or loosely fitting covers are used, and in making red wine diverse inventions for excluding the air are gaining in favor.

With the appearance of requisite color in the must, the mass is pressed, an operation which, depending upon the color of the grapes and their content of tannin, may occur the day after crushing, usually before the fifth day, but sometimes not until the conclusion of fermentation. Since rapid fermentation at temperatures above 25° C. produces less aromatic and less stable wines than slower action at lower temperatures—a fact which largely accounts for the superior aroma of northern wines—cool cellars have long been used and artificial methods of cooling are sometimes employed. As soon as the wine becomes clear, usually in December, it is racked into clean casks and kept at a lower temperature in the subcellar. Here a slow fermentation continues and a second racking (drawing off) is made in March or April, when cheap wines may be bottled for sale. Higher grades are kept in casks and racked annually (in some cases for eight years) until the sediment (tartar, proteids, gummy matter, etc.) ceases to form, the casks being kept full to the bung by additions of wine every week during the first few months and fortnightly thereafter.

The fine bouquet so much desired is produced

by the gradual oxidation of the alcohols and the combination of the resultant products with acids; hence the necessity of keeping the wine in wood, through the pores of which the air enters. No bouquet is formed in air-tight vessels. Racking every alternate month permits the absorption of oxygen, thus hastening the formation of bouquet. But it exposes the wine to possible infection of so-called diseases which may impart stale, sour, or bitter flavors and thus ruin the product. To obviate this, scrupulous cleanliness is imperative. As an additional precaution, however, antiseptics and other means are used as preventives. Of these practices, burning sulphur in the casks is most general; filtering through unglazed porcelain, fining with gelatin and tannin are used in specific occasional cases; and pasteurizing has gained in favor since being demonstrated useful.

Sparkling Wines. Effervescent wines are prepared by adding a small quantity of sugar sirup and occasionally yeast-forming material to bottled (sometimes barreled) white or red still wines, after which they are kept closely corked to retain the carbon dioxide evolved by the ensuing fermentation. Champagne, which is the most noted of these wines, demands the highest degree of skill and care. The grapes are gathered with scissors, the defective berries are cut off, the fruit removed to the press room with as little bruising as feasible and pressed quickly to avoid the extraction of an excess of tannin and coloring matter. After vigorous fermentation subsides the wine is racked into barrels, blended for the desired flavor, and removed to the cold cellar, where it is again racked in December. In March or April it is removed to the fermenting room and sugar added. As soon as fermentation starts more sugar, as a sirup, is added and the wine decanted usually into tightly corked strong bottles, which are placed neck downward in an inclined position. When ripe the bottle is given a gentle rotary movement, the cork drawn, the sediment which collects in the neck dextrously removed, a small quantity of sweetened and flavored liquor added, and the bottle quickly corked. Barrels are sometimes used to cheapen the price. Champagne is never entirely dry, a trace of sugar being necessary to prevent a raw, unpleasant taste.

Sweet or Fortified Wines. To produce sweet wines, which may be red or white, still or sparkling, grapes of high sugar content are used, and before the sugar has all been acted upon fermentation is stopped by the addition of wine brandy, evaporated must being also often added to meet certain demands. The mixture is then ripened in warm rooms in partially filled casks. It must contain more than 18 per cent alcohol to prevent fermentation of the sugar, of which ingredient as much as 8 per cent may be found in the finished product.

Blending. Since the composition, flavor, etc., of wine obtained from any variety of grape varies with seasons and various other factors, and since commerce demands uniformity, the mixing of somewhat dissimilar wines is widely practiced. By this means excess or deficiency of acids, body, astringency, etc., are corrected. In the operation the known composition of the elementary wines is of assistance, but much more depends upon the manipulator. In no other branch of wine-making are skill, experience, and judgment more requisite.

Composition and Adulteration. The constituents of grape must vary considerably in percentage with season, variety, state of maturity, etc. The principal ones are water, sugar, and cream of tartar (bitartrate of potassium).

In cold climates, especially in unfavorable years, the sugars present (about equal parts grape and fruit sugar, and in few instances cane sugar) may be less than 12 per cent; in very warm localities, 30 per cent or even more; the usual range is from 15 to 25 per cent. Since they continue to form until the grapes are fully ripe, some is sacrificed when immature grapes are used; and since the mature fruit loses moisture rapidly, the relative proportion of sugars to water increases after maturity—a phenomenon utilized in making certain wines, notably Malmsey. In the preparation of dry wines, musts containing more than 25 per cent of sugar are commonly diluted thus to prevent the formation of a sweet wine by the non-conversion of the sugar into alcohol. Fermentation does not yield more than about 14 per cent of alcohol by volume and is slow and uncertain above 12.5 per cent. It converts the sugars largely into alcohol and carbon dioxide, theoretically thus:

$$\begin{matrix}\text{Glucose or}\\ \text{levulose}\end{matrix} = \text{Alcohol} + \begin{matrix}\text{Carbon}\\ \text{dioxide}\end{matrix}$$

$$C_6H_{12}O_6 = 2C_2H_6O + 2CO_2$$

the alcohol being 51.11 per cent of the sugar fermented. In practice, however, only about 48.5 per cent of alcohol is formed, the deficiency being represented mainly by glycerin (from 6 to 14 parts by weight to 100 of alcohol), higher alcohols, succinic and acetic acids and ethereal salts, upon the nature and quantity of which last the flavor of wine largely depends. Since the development of sugar is largely dependent upon temperature, the wines of northern climates are uniformly poorer in alcohol than those of the south. The alcohol content of unfortified wines known to be pure varies from 2½ to 15 per cent by volume; that of glycerol, from 0.2 to 1.4 grams per 100 cubic centimeters. A relatively high ratio of glycerol to alcohol is thought to indicate a superior wine, and in Europe a content of 7 to 14 parts glycerol to alcohol is desired, but, since many wines contain less than 7, the tendency is to lower the minimum to 6. Judging from the few complete analyses, American wines conform to the same standards.

The acidity of must may range from 0.5 to 1.5 per cent and is largely due to tartaric acid and its acid salts, cream of tartar and calcium and magnesium bitartrate. As grapes mature their relative acidity diminishes with an increase of sugar; as the young wine matures its absolute acidity decreases because of the deposition of cream of tartar, which is insoluble in alcohol. The acid of the young wine, which is rarely less than 0.4 gram, nor more than 1.5 grams per 100 cubic centimeters (calculated as tartaric acid) is diminished considerably during fermentation and storage, owing to precipitation of cream of tartar and the breaking up of malic acid into lactic acid and carbon dioxide. A small increase of acidity takes place during fermentation and storing through formation of succinic acid and volatile acids: however, these combined increases are practically negligible as compared with the very decided decrease caused through the first-mentioned sources. The acid content of a wine is usually in inverse ratio to the content of alcohol; thus dry, northern wines are less alcoholic but more

acid and aromatic than southern ones. While volatile acids are always formed during fermentation, excess indicates carelessness in management. In northern wines they are limited to 0.12 and 0.16 gram per 100 cubic centimeters respectively, in white and red wines.

Coloring matter is found in the skins, which, like the stems and seed coats, contain tannin. Hence, the closer the crushing, and, in red-wine making, the longer the immersion of these parts in the must, the higher the percentage of tannin in the expressed juice. Tannin is present only to a small extent in the first run, and, like coloring matter, is deficient in the juice of stemmed grapes quickly pressed.

Albuminoids, of which from 0.25 to 0.9 per cent is found in must, are somewhat decreased by fermentation. Their deficiency precludes complete fermentation; their excess is thought to interfere with the preservation of the wine; but their offices are not fully understood. Varying somewhat with the varieties, the sugar-free solids of white wine range from 1.6 to 2.5 grams per 100 cubic centimeters; those of red wine, 1.8 to 3.7; pure German reds reaching the minimum and Californian rarely less than 2.4 grams. Wines with an ash content of less than 0.14 gram per 100 cubic centimeters are suspicious, as are also those containing a high sodium chloride or potassium sulphate percentage and a minimum ash. The ratio of ash to solids is usually about 1 to 10, and the percentage of ash depends largely upon the composition of the wine in other respects; for instance, a plastered wine will necessarily contain a high ash, and a new wine more than an old. The separation of cream of tartar diminishes the ash content and the neutralization of excessive acidity increases it.

The Municipal Laboratory of Paris considers red and white wines to be fortified when their alcohol content exceeds 4.5 to 6.5 times, respectively, the weight of their solids. It also considers wine to be diluted with water when the percentage of alcohol by volume (natural alcohol in the case of fortified wines), plus the weight of total acids in grams (expressed as sulphuric acid—H_2SO_4), is less than 12.5 per liter.

The figure obtained by deducting the sum of the glycerol, ash, and fixed acids from the sugar-free solids is usually between 0.3 and 0.6 gram per 100 cubic centimeters, a figure of great importance in wines of low solid content, since it helps to determine whether addition has been made to increase the percentage of solids to the minimum limit. A high undetermined solid content should accompany a high percentage of alcohol and a low acid content.

The composition outlined above is possible only with wines made from grapes adapted to their climate and soil and grown in a favorable year. When the must of a particular vintage is not normal, as often happens, additions of sugar (chaptalizing), of acid, or water (gallizing) are permitted in many countries to make it normal; but such treatment is liable to abuse. When added so as to increase the output the practice is fraudulent.

A cheap winelike beverage (piquette) is made for home consumption by fermenting the pomace or marc of the grape with a sugar solution or of the liquids obtained by extracting pomace with sugar solution. Cheap wines are often made from raisins and other dried fruits, sugar, and glucose. The addition of preservatives to wine is not permissible. The use of sulphur for bleaching a dark-colored white wine or to check improper fermentation is fraudulent, though sulphur is widely used for cleansing the casks prior to their use in fermenting. Foreign coloring matters in red wine should not be employed; the skins should supply sufficient color. Misrepresentation as to variety of wine and place of production is the most common fraud practiced with supposed medium and high-grade wines.

Dietetic and Medicinal Value of Wines. Wines may be roughly divided according to their therapeutic and dietetic uses into the heavy sweet wines such as port, sherry, and Madeira; the lighter clarets, Burgundies, and acid white wines, Rhine and Moselle wines; and the sparkling wines or champagnes. Heavy wines are often used in disease instead of whisky or brandy when an alcoholic stimulant is needed. Port is a serviceable temporary tonic in cases of debility and exhaustion, especially in old people. It may be spiced, or mulled, and diluted. It is reputed to be unsuitable for dyspeptics, and those subject to gout, rheumatism, biliousness, or to the formation of gall stones or gravel.

The clarets or Bordeaux and the Burgundies and certain red Hungarian wines, which have a wider range of usefulness, if sound and well made, are among the most wholesome wines, and are serviceable tonics for invalids or convalescents. They contain little or no sugar and are of approved value in convalescence. The lighter varieties are best for daily consumption by brain-workers or those leading a sedentary life. Burgundy, being a much fuller wine than claret, is considered useful as a tonic and blood maker. All of these wines are best taken somewhat diluted with water.

Champagnes or sparkling wines are good for invalids and others with extremely irritable stomachs. Champagne will often remain in the stomach when that organ will retain nothing else. It is absorbed with great rapidity and acts promptly by invigorating the nervous system. It may often be substituted with advantage for spirits when an alcoholic stimulant is indicated. Sparkling wines impede the digestion less than still ones. The heavy wines retard digestion perceptibly.

WINE, IN MEDICINE. When used as a vehicle for medicinal substances wines closely resemble tinctures. In these preparations the official

white wine (*vinum album*), containing from 7 per cent to 12 per cent of alcohol is used, reenforced, however, by the addition of more alcohol. Besides *vinum album* and *vinum rubrum*, the United States *Pharmacopœia* recognizes eight medicated wines, viz., those of antimony, coca, ergot, colchicum seed, ipecac, opium, and two of iron. Only one of these, that of coca, is made of red wine. Their medicinal uses are the same as those of the drug which they hold in solution. See ALCOHOL.

WINE'BRENNER, JOHN (1797–1860). An American clergyman, founder of the Winebrennerians or Church of God. He was born in Glade Valley, Frederick Co., Maryland, was ordained as a minister of the German Reformed Church in 1820, and took charge of four small congregations at and near Harrisburg, Pennsylvania. In 1827, being out of harmony with this church, he withdrew, but continued to preach. In 1830, with several other preachers, he founded a new organization. (See CHURCH OF GOD.) For several years he edited the *Church Advocate*, and published a *Pronouncing Testament and Gazetteer* (1836); *Brief View of the Church of God* (1840); *Regeneration* (1844); *Practical and Doctrinal Sermons* (1860).

WINE'BRENNE'RIANS. See CHURCH OF GOD.

WINE'LAND. See VINLAND.

WINE PALM. See GOMUTI; JUPATI PALM.

WINER, vē'nĕr, GEORG BENEDIKT (1789–1858). A German biblical scholar. He was born in Leipzig, studied at the university there, and was made professor in 1819. In 1823 he was appointed to a chair at Erlangen, but returned to Leipzig in 1832. He devoted himself particularly to the philological side of Bible study, and is best known for his *Grammatik des neutestamentischen Sprachidioms* (1822; 8th ed., 1894; Eng. trans., Andover, 1825, Edinburgh, 1859, 1877). Besides this he published *Darstellung des Lehrbegriffs der verschiedenen christlichen Kirchenparteien* (1824; 4th ed., Eng. trans., Edinburgh, 1873); a Chaldee grammar (1824; Eng. trans., Andover, 1845) and reading book (1825); *Biblisches Realwörterbuch* (1820); *Handbuch der theologischen Litteratur* (3d ed., 1838–40; supplementary volume, 1842). He edited the *Neues kritisches Journal der theologischen Litteratur* (1824–30) and the *Zeitschrift für wissenschaftliche Theologie* (1826–32).

WINES, ENOCH COBB (1806–79). An American Congregational minister and penologist. He was born at Hanover, N. J., and graduated at Middlebury College in 1827. After teaching for some years he studied theology and began to preach in 1849. He was pastor at Cornwall, Vermont, and East Hampton, Long Island, became professor of languages in Washington College, Pennsylvania, in 1853, and president of St. Louis University in 1859. In 1862 he became secretary of the New York Prison Association, and of the National Prison Association in 1870. He was member of a commission appointed by the State of New York to investigate the relation of free labor and prison labor. In 1871–72 he organized in London the first international congress on prison discipline, and was an active member of many later meetings for similar purposes both in the United States and Europe. Of his published works mention may be made of *Two Years and a Half in the Navy* (1832); *Hints on Popular Education* (1838); *Commentaries on the Laws of the Ancient Hebrews* (1852); *The Prisons and Reformatories of the United States and Canada* (1867); *State of Prisons and Child-Saving Institutions* (1880).

WINES, FREDERICK HOWARD (1838–1912). An American sociologist, statistician, and penologist, born in Philadelphia, Pa. He graduated at Washington College (Pa.), in 1857; was chaplain in the United States army from 1862 to 1864; and after graduating at Princeton Theological Seminary in 1856 became pastor of the First Presbyterian Church of Springfield, Ill. From 1869 to 1893 and from 1897 to 1899 he was secretary of the Illinois State Board of Commissioners of Public Charities. Besides giving much time to the work of the National Conference of Charities and Correction, of which he was president in 1883, the International Prison Congress, and the National Prison Association, of which he was president in 1904, he lectured on these subjects at various universities. He served as assistant director of the census in 1899–1902. Besides the volumes on crime and pauperism of the tenth and eleventh censuses, his works include: *Punishment and Reformation* (1895; rev. ed., 1910); *The Liquor Problem in its Legislative Aspects* (1897; 2d ed., 1898). His father was Enoch Cobb Wines.

WINE STAIN. See NÆVUS.

WIN'FIELD. A city and the county seat of Cowley Co., Kan., 38 miles southeast of Wichita, on the Walnut River, and on the Atchison, Topeka, and Santa Fe, the St. Louis and San Francisco, and the Missouri Pacific railroads (Map: Kansas, F 8). It is the seat of the State Imbecile Asylum, of the Southwest Kansas College (Methodist Episcopal), opened in 1886, and St. John's Lutheran College, opened in 1893. Other features are the public library, high school, and courthouse. Winfield is the commercial centre of a region engaged in farming and stock raising, and containing a supply of natural gas. There are flouring mills, grain elevators, machine shops, and two large produce-packing establishments. Winfield has adopted the commission form of government. Pop., 1900, 5554; 1910, 6700.

WINFRID. See BONIFACE, SAINT.

WING. See BIRD.

WIN'GATE, GEORGE WOOD (1840–). An American lawyer and organizer of rifle practice. He was born in New York City. During the Civil War he served in a New York regiment, and subsequently he supervised the construction of elevated railways in Brooklyn. In 1867 Wingate drew up rules for systematic rifle practice by Company A, 22d regiment, New York National Guard, of which he was then captain. The publication of these rules (the first of the kind to be formulated in the United States) led to the organization (in 1871) of the National Rifle Association of America, of which he was first secretary and later president for 25 years. Besides special articles on military subjects he published: *Manual for Rifle Practice* (1872; 7th ed., 1880); *The Great Cholera Riots* (1880); *Through the Yellowstone Park on Horseback* (1886); *History of the 22d Regiment, N. G. N. Y.* (1896). See TARGET AND TARGET PRACTICE, *Civilian Rifle Practice*.

WINGATE, SIR (FRANCIS) REGINALD (1861–). A British soldier, born at Broadfield, Renfrewshire. Educated at the Royal Military Academy, Woolwich, he was appointed a lieutenant in the Royal Artillery in 1880. He

served in India and at Aden (1881–83), participated in the Nile Expedition (1884–85) under Sir Evelyn Wood, and then returned to England. Rejoining the Egyptian army in 1886, he took part in the battle of Toski (1889) and in the capture of Tokar (1891). After 1889 he was largely employed in the intelligence service, of which he became director in 1892, participated in the Sudanese campaigns of 1896–98, and commanded the operations which resulted in the death of the Khalifa, near Gedid, in 1899. He succeeded Kitchener as governor general of the Sudan in the latter year, and was promoted to major general (1903), lieutenant general (1908), and general (1913). Wingate was created K. C. M. G. in 1898, K. C. B. in 1899, and G. C. B. in 1914. He published *Mahdism and the Egyptian Sudan* (1891).

WINGED LION. See LION OF SAINT MARK.

WINGED PEA. See TREFOIL, BIRD'S FOOT.

WING'FIELD, EDWARD MARIA (c.1560–c.1613). An English merchant and colonist in America, born at Stoneley, Huntingdonshire. He served in the English army both in Ireland and in the Low Countries. Becoming interested in schemes for American colonization, he was one of those to whom the patent of Virginia was granted April 6, 1606. He was the only one of the patentees who sailed to America with the first colonists, and was named in the sealed instructions a member of the council, of which he was elected the first president. He quarreled with the other members of the council, and with Capt. John Smith in particular, his Catholicism threw suspicion upon his loyalty, and he was soon deposed both from the council and governorship in September, 1607. In 1608 he returned to England and was living on his family estates as late as 1613. He wrote *A Discourse of Virginia*, a journal of the colony from the first setting out to his departure from it, the manuscript of which is in Lambeth Library. It was edited and published by Charles Deane in 1860.

WINGHAM. A town in Huron Co., Ontario, Canada, on Maitland River, and on the Grand Trunk and Canadian Pacific railways, 129 miles west by north of Toronto (Map: Ontario, D 6). It possesses a business college, public library, hospital, and park, and has a variety of manufactures. Pop., 1901, 2392; 1911, 2238.

WINGLESS VICTORY. See NIKE APTEROS.

WING-SHELL. The name of various mollusk shells having a shape or expansions regarded as winglike, e.g., the great stromb (q.v.), or certain broad species of *Unio;* more especially the name of the irregular bivalves of the tropical family Aviculidæ, which includes the pearl oysters (q.v.) and other species of interest, existing and fossil. The family characteristic, typically displayed in the genus *Avicula* (see Plate of ABALONE, ETC.), is the straight hinge margin, produced on each side into winglike ears. This is carried to its extreme in the hammer oyster (see HAMMER SHELL). The outer surface of the shell is foliaceous, and the inner always highly macreous, yielding valuable mother of pearl.

WING'SPEED. See HOP TREE.

WINIFRED, wĭn'ĭ-frĕd, SAINT. A Welsh maiden of noble family, who lived in the seventh century. According to the legend Prince Caradoc cut off her head because she would not accept his addresses. Her head, so the legend says, rolled down the hill and into St. Bueno's Church, where immediately a spring appeared. The head was replaced by St. Bueno, after which she lived 15 years. This spring, called Holywell, is one of the most famous in England. The flow of water has never ceased. The spring was leased in 1876 to the corporation of Holywell by the Duke of Westminster for 1000 years at a sovereign a year. See HOLYWELL.

WINKELMANN, vĭŋ'kel-măn, EDUARD (1838–96). A German historian, born in Danzig and educated at Berlin and Göttingen. In 1859 he became a coeditor of the *Monumenta.* He was appointed head master of the knight and chapter school at Reval in 1860, and in 1865 professor at the University of Dorpat. He was called to the chair of history at Bern in 1869, and in 1873 to Heidelberg. He published *Geschichte Kaiser Friedrichs II. und seiner Reiche 1212–1235* (1863–65); *Forschungen zur deutschen Geschichte* (1872); *Bibliotheca Livoniæ Historica* (1870 and 1878); *Philipp von Schwaben und Otto IV. von Braunschweig* (1873–78); *Geschichte der Angelsachsen* (1883); *Urkundenbuch der Universität Heidelberg* (1886); *Kaiser Friedrich II.* (1889–97).

WINKELMANN, HERMANN (1849-1912). A German dramatic tenor, born in Brunswick. He adopted the profession of a singer after he had reached manhood. He made his début at Sondershausen, and then went to Darmstadt and Hamburg. He became identified with the Wagnerian drama in 1882, when he took the part of Parsifal at Bayreuth, with such success that he was engaged for the Imperial Opera at Vienna. Here he sang in Wagner's operas, with Madame Friedrich-Materna and Herr Scaria. The famous trio made a tour of the United States in 1884.

WINKELRIED, vĭŋ'kel-rēt, ARNOLD or ERNI. A Swiss peasant, who, according to tradition, is said to have brought about the victory of the Swiss over Duke Leopold of Austria at Sempach (q.v.) on July 9, 1386. The tradition relates that Winkelried broke the phalanx of the Austrians by gathering several spears of the enemy and pressing them into his breast, thus opening a way for his companions. A monument was erected in his honor on the battlefield in 1886. There has been considerable dispute as to whether Winkelried is a legendary character or not. There is no contemporary notice of him, but there are many modern works championing or assailing the legend. The evidence against is very well summarized by Moritz von Stürler in the *Anzeiger für Schweizerische Geschichte* (1881). Karl Dändliker in his *Geschichte der Schweiz,* vol. i (3d ed., Zurich, 1893), supports the story.

WINKING. See NICTITATION.

WINKLE. A name, shortened from periwinkle, applied among oystermen of the Northeastern coast of the United States to certain large mollusks destructive to oysters. See CONCH; OYSTER; PERIWINKLE.

WINNEBAGO, wĭn'ē-bā'gō. An important tribe of Siouan stock (q.v.) formerly residing in central Wisconsin, chiefly about the lake which bears their name, but now in part located on the Omaha reservation in northeastern Nebraska, while the majority continue scattered among the whites in their old country. They call themselves *Hochanka,* Winnebago being their Algonquian name, originally applied to the lake. They are first mentioned in 1640, and more than

a century afterward were prominent allies of the French against the English. Subsequently, in the Revolutionary War and down to the close of the War of 1812, they fought against the Americans, first under Little Turtle and afterward under Tecumseh. By treaties between 1825 and 1837 they sold all their lands east of the Mississippi and removed to Iowa. After several other removals, each disastrous in its effect upon the Indians, they were finally located in 1866 on the present reservation in Nebraska, although in various ways the major portion contrived to find their way back to their old homes, where they long remained forgotten and free from government supervision. In their original condition the Winnebago partook rather of the characteristics of the Algonquian tribes of the lakes than of the cognate tribes west of the Mississippi. Their alliances also were with the lake tribes as against those of the west. They lived in wigwams of wagon-top shape, covered with rush mats, which the women were very expert in weaving and dyeing. They practiced a limited agriculture, but, aside from hunting and fishing, depended chiefly upon wild rice. They also understood the art of making sugar from the juice of the maple. Those still in Wisconsin continue to follow their former habits of life to a great extent. The Winnebago in 1822—before the great smallpox epidemic of 1836, which carried off almost one-fourth of them—were estimated at 5800. In 1910 they numbered 1820, of whom 1007 were on the reservation, the rest in Wisconsin. Consult: Paul Radin, *Influence of the Whites on Winnebago Culture*, published by the Wisconsin State Historical Society (Madison, 1914); and id., *Social Organization of the Winnebago Indians*, published by the Canadian Geological Survey (Ottawa, 1915).

WINNEBAGO LAKE (Algonquian, dirty or cloudy water). A large lake in the eastern part of Wisconsin (Map: Wisconsin, E 4, 5). It is 30 miles long, from 3 to 11 miles wide, and discharges northeastward into Green Bay through the Fox River (q.v.). It is navigated by steamers, and there are a number of towns on its banks, the largest being Oshkosh and Fond du Lac.

WINNEPESAUKEE (wĭn'ē-pē-są'kē) **LAKE.** A lake in the east-central part of New Hampshire (Map: New Hampshire, G 6). It has an extreme length of about 20 miles and a width of from 1 to 8 miles, but is very irregular in outline, and studded with about 270 islands. The water is clear and deep, and the picturesque scenery attracts large numbers of visitors. The lake discharges through a small stream into the Merrimac River.

WINNETKA. A village in Cook Co., Ill., 16 miles north-northwest of Chicago, on the Chicago and Northwestern Railroad (Map: Illinois, J 1). It is a residential suburb of Chicago, having many fine homes, the North Shore Health Resort, the Henry D. Lloyd Public Library, and the Community House. Pop., 1900, 1833; 1910, 3168.

WINNFIELD. A city and the parish seat of Winn Parish, La., 46 miles by rail north of Alexandria, on the Chicago, Rock Island, and Pacific, the Tremont and Gulf, the Louisiana Railway and Navigation Company, and the Louisiana and Arkansas railroads (Map: Louisiana, D 3). There are saw and lumber mills, a creosoting plant, brick works, an ice factory, and a shoe and harness factory. Pop., 1910, 2925.

WINNINISH, wĭn'ĭ-nĭsh (Canadian French *ouananiche*, from the North American Indian name). A variety of the common salmon (*Salmo salar*, variety *ouananiche*), of the Saguenay River, Quebec, and neighboring waters.

WIN'NIPEG. A lake in the Province of Manitoba, Canada (Map: Manitoba, F, G 1, 2). It is 275 miles long and from 40 to 60 miles broad, has an area of 9000 square miles, and lies 710 feet above sea level. Its greatest depth is 70 feet. It is connected by navigable channels with lakes Winnipegoos and Manitoba, which lie to the west and extend almost parallel with it. Of its tributaries the largest is the Saskatchewan (q.v.). The Winnipeg River, 300 miles long, and flowing in a northwesterly direction, connects the Lake of the Woods and Rainy Lake with Lake Winnipeg. The Red River and its great branch, the Assiniboine, discharge their waters at the southern extremity of Lake Winnipeg. Nelson River, issuing at the north end of Lake Winnipeg, is its outlet, and connects it with Hudson Bay. A few Icelandic colonies to the southwest and some scattered posts of the Hudson's Bay Company are the only settlements on its banks.

WINNIPEG. The capital of the Province of Manitoba, Canada, situated at the confluence of the Red and Assiniboine rivers, the two principal streams of the province, and on the Canadian Pacific, Grand Trunk Pacific, Canadian Northern, and Great Northern railways, 1424 miles west of Montreal (Map: Manitoba, G 4). The area of the city in 1911 was 12,750 acres. Through the Red River there is access to Lake Winnipeg. The city is regularly laid out, except the old part contiguous to Fort Garry. Main Street, the chief business street, is the broadest thoroughfare in Canada. Other leading business streets are Portage Avenue and Princess Street, along which stretches the wholesale section. The principal residential portion of the city is south of Portage Avenue, but there are many handsome residences in Fort Rouge, the part of Winnipeg south of the Assiniboine. The city is the headquarters of the provincial government, and has the residence of the Lieutenant-Governor, the Parliament House, and the public departments of the province. The city hall is noteworthy, and is situated within a park, with a soldiers' monument. Other prominent buildings are the Courthouse, Union Bank, Merchants Bank, Post Office, Ideal Building, General Hospital, Women's Home, Children's Home, Masonic Temple, Royal Alexandra Hotel, Canadian Pacific and Union railway stations, Fort Garry Hotel, Hudson's Bay Company's and T. Eaton Company's stores, Young Men's Christian Association building, and the deaf and dumb institute. The principal parks are Assiniboine Park, River Park, containing a zoölogical garden, and Elm Park, a spoon-shaped peninsula formed by a loop of the Red River. There are several smaller parks. The University of Manitoba, situated here, includes Manitoba College (Presbyterian), St. John's College (Anglican), St. Boniface College (Roman Catholic), Wesley College (Methodist), and Manitoba Medical College. The provincial agricultural college is situated here. There is a fine system of public schools, housed in attractive buildings. The city has large machine and engine shops and car works belonging to the Canadian Pacific, Grand

Trunk Pacific, and the Canadian Northern railroads, lumber mills, abattoirs, meat-curing establishments, foundries and rolling mills, flour mills, tent, box, boiler, carriage, and other factories. In 1914 the value of the manufactured output was estimated at over $50,000,000. Electric power for manufacturing and lighting is obtained from Winnipeg River, 52 miles distant.

Winnipeg is the banking, financial, and wholesale centre for western Canada. The city is the centre of the Canadian grain trade. It owns its water works. It is governed by a mayor, four controllers, and 12 aldermen. As Fort Garry, Winnipeg was originally an old post of the Hudson's Bay Company, and was associated with the earliest days of trapping and fur trading. The fort was situated about 400 yards from the mouth of the Assiniboine, and in 1835 was replaced by a larger structure, now dismantled, which was the centre of the colony of Assiniboia. Only the gateway has been preserved. The fort figures prominently in the history of that colony and of Manitoba, and is noted as the seat of Louis Riel's short-lived government, 1869–70. Pop., 1871, 241; 1881, 7985; 1891, 25,639; 1901, 42,340; 1911, 136,035.

WINNIPEGOOS, wĭn'ĭ-pē-gōōs, or **WINNIPEGOOSIS,** wĭn'ĭ-pē-gōō'sĭs. A lake in Manitoba lying 20 to 60 miles west of Lake Winnipeg (Map: Manitoba, D 1, 2). It is about 130 miles long and 20 miles broad, but shallow and navigable only for vessels drawing 10 feet or under. It discharges through the Waterhen River southeastward into Lake Manitoba.

WINNIPISEOGEE, wĭn'ĭ-pĭ-sē'gē. See WINNEPESAUKEE.

WINONA, wĭ-nō'nȧ. A city and the county seat of Winona Co., Minn., 103 miles southeast of St. Paul, on the Mississippi River, here spanned by several bridges, and on the Chicago, Milwaukee, and St. Paul, the Chicago and Northwestern, the Chicago, Burlington, and Quincy, the Chicago Great Western, and the Green Bay and Western railroad (Map: Minnesota, F 6). It has a State normal school, College of St. Teresa, for girls, St. Mary's College, for boys, and a public library. Other features include the Winona General Hospital, Elks Home, Masonic Temple, courthouse, the Margaret Simpson Home, Levee and Bluffside parks, Y. M. C. A., Y. W. C. A., and the United States government building. Winona is favored with excellent transportation facilities and is especially known as the centre of extensive grain and lumber interests. It is prominent industrially, its various manufacturing establishments in 1914 having $12,013,000 invested capital and a production valued at $14,304,000. There are several large saw mills, railway shops, breweries, packing plants, an enormous flour mill, a malting plant, and manufactories of flax fibre, carriages and wagons, boots and shoes, farm implements, candy, patent medicines, machine shop products, etc. Pop., 1900, 19,714; 1910, 18,583.

WINONA. A city and the county seat of Montgomery Co., Miss., 89 miles northeast of Jackson, on the Illinois Central and the Southern railroads (Map: Mississippi, F 4). Winona has important cotton-shipping interests, and there are cotton and lumber mills. Pop., 1900, 2455; 1910, 2512.

WINOOSKI, wĭ-nōōs'kē. A village in the town of Colchester, Vt. See COLCHESTER.

WINOOSKI (or ONION) **RIVER.** A river of northern Vermont. It is formed at Marshfield, in the east-central part of the State, by several branches, and flows in a general southwesterly direction to Montpelier, whence its course is northwestward to Lake Champlain, which it enters near Burlington (Map: Vermont, C 3). It is about 60 miles long and its drainage area is about 995 square miles.

WINSFORD. A salt-mining town in Cheshire, England, 5½ miles south of Norwich. Pop., 1901, 10,382; 1911, 10,771.

WINSHIP, ALBERT EDWARD (1845–). An American educational journalist, born at West Bridgewater, Mass. After a teaching experience of several years, he became a student at Andover Theological Seminary in 1875 and was pastor of Prospect Hill Church, Somerville, from 1876 to 1883. In 1886 he became editor of the *Journal of Education*, Boston, which grew to be one of the leading popular educational magazines of the country. An active member of numerous educational associations, from 1903 to 1909 he was also a member of the Massachusetts State Board of Education. He published *Life of Horace Mann* (1896); *Great American Educators* (1900), and other works. For his son, see WINSHIP, GEORGE PARKER.

WINSHIP, GEORGE PARKER (1871–). An American librarian and author, son of Albert Edward Winship. He was born at Bridgewater, Mass., and graduated in 1893 at Harvard, where he was an assistant in history in 1893–95. Subsequently he was librarian of the John Carter Brown Library at Providence, R. I., until 1915, when he took charge of the collection of rare books made by Harry E. Widener and housed in the new Widener Memorial Library at Harvard. He contributed to the NEW INTERNATIONAL ENCYCLOPÆDIA, edited a number of historical works, and published: *The Coronado Expedition* (1896); *John Cabot* (1898); *Geoffrey Chaucer* (1900); *Cabot Bibliography* (1900); *William Caxton* (1909); *Printing in South America* (1912); *The John Carter Brown Library* (1914).

WINSLOW. A town in Kennebec Co., Me., on the Kennebec and Sebasticook rivers, and on the Maine Central Railroad. Interesting features are the public library, the high school, and the Block House, built in 1754, and now in good state of preservation. There are large paper mills and a power plant. Winslow was incorporated in 1771. Pop., 1900, 2277; 1910, 2709.

WINSLOW, EDWARD (1595–1655). An Anglo-American Colonial governor, born at Droitwich, Worcestershire, England. In 1620, with his wife and brother, he joined the *Mayflower* at Southampton and was one of the party that landed at Plymouth, Mass. His wife died in March, 1621, and his marriage two months later, with Mrs. Susannah White, was the first in New England. Susannah was the mother of Peregrine White, the first English child born in New England. The same year Winslow won the friendship of Massasoit, the Indian chief, with whom he negotiated a treaty. In 1623–24 he visited England as agent of the Plymouth Colony. He was elected Governor in 1633. While on a visit to England in 1635, he went before the council and prevented any attempt to destroy the self-government of the Plymouth Colony. The same year he was imprisoned for 17 weeks by Laud on the charge of giving instruction in the church and of celebrating marriages, while only a layman. He was Governor again in 1636

and 1644 and in 1643 he represented Plymouth on the Board of Commissioners of the New England Confederacy. He again visited England in 1646, and in 1649 went to England and stayed there. He was one of the founders of the Society for Propagating the Gospel in New England. In 1655 he was appointed by Cromwell one of three commissioners to accompany an expedition against the Spaniards in the West Indies, but he died on the voyage between Hispaniola and Jamaica. He wrote several works, the chief of which, *Good Newes from New England* (1624), *Hypocrisie Unmasked* (1646), and *The Glorious Progress of the Gospell Amongst the Indians* (1649), have been republished by the Massachusetts Historical Society.

WINSLOW, FORBES (BENIGNUS) (1810–74). An English alienist, of New England stock, born in London. He studied medicine in New York, at the Royal College of Surgeons, London, and at Aberdeen. He was superintendent of private asylums in London, was parliamentary reporter for the *Times*, and for many years served as an expert in court proceedings. He founded in 1848 the *Quarterly Journal of Psychological Medicine and Mental Pathology*, and conducted it till 1865. He also founded *The Medical Critic* (1861–63). He wrote many important books in his special field.

His son, L(ITTLETON) FORBES WINSLOW (1844–1913), was also a psychiatrist. He edited the *Psychological Journal* for eight years, founded the British Hospital for Mental Disorders (London), served as expert in notable cases, and published many articles and books. Consult his *Recollections of Forty Years* (London, 1910).

WINSLOW, vĭns'lō, JACQUES BÉNIGNE (JAKOB BENIGNUS) (1669–1760). A Danish naturalist, born at Odense. He studied in Holland and Paris, and in 1743 was made a professor of anatomy in the Jardin du Roi in Paris. He wrote a large number of works, of which the most important is *Exposition anatomique de la structure du corps humain* (5 vols., 1732; afterward translated into several languages), which remained a standard book for nearly a century. An opening in the gastrosplenic omentum is called after him the "foramen of Winslow."

WINS'LOW, JOHN (1702–74). An American soldier of the Colonial period. He was born at Marshfield, Mass., and was descended from the early Plymouth Colony Governor of his name. He led a company of his own raising in the luckless attack on Cartagena, and commanded the force which in 1754 was sent out to occupy the country about the Kennebec. In the following year he had charge of the seizure of the Acadians, but disliked the work exceedingly, and wrote of it, "The affair is more grievous to me than any service I was ever employed in." In 1756 he was given command of the New England troops; in the same year was placed in command of Fort William Henry on Lake George; and led a second expedition to the Kennebec in 1758–59. Afterward he was made presiding judge of Common Pleas for Plymouth County, and was a member of the Legislature and of the Council. The *Letter and Order Books of Winslow* are in the library of the Massachusetts Historical Society and form a valuable historical source upon the period of the French and Indian War.

WINSLOW, JOHN ANCRUM (1811–73). An American naval officer, born at Wilmington, N. C. He entered the United States navy as a midshipman in 1827; served on the *Cumberland* and in command of the prize *Morris* in the Mexican War; and in September, 1855, was commissioned commander. During the first year of the Civil War he was attached to the Mississippi flotilla under Foote, and in July, 1862, he was commissioned captain and received command of the *Kearsarge*. In that vessel he proceeded to the coast of Europe in search of Confederate cruisers. After blockading the *Florida* at Brest, and then the *Rappahannock* at Calais, he received word while at Flushing that the famous *Alabama*, under Captain Semmes (q.v.), was in the port of Cherbourg, France. He at once proceeded to that place, and upon his arrival Semmes, who was confident of a victory that would benefit the Confederate cause in Europe, challenged him to a combat. The meeting took place on June 19, 1864; and after a comparatively short engagement, in which Winslow managed his vessel with consummate ability, the *Alabama* was forced to surrender and soon afterward sank. For this brilliant service Winslow received the thanks of Congress and was promoted to the rank of commodore. He commanded the Gulf squadron in 1866–67; was made a rear admiral in March, 1870; and commanded the Pacific squadron in 1870–72. Consult Ellicott, *The Life of John Ancrum Winslow* (New York, 1902).

WINSLOW, JOSIAH (1628–80). A Governor of Plymouth Colony, born in Marshfield, Mass., was a member of the General Court in 1643, was Assistant Governor of Plymouth from 1657 until 1673, and was Governor from 1673 until his death, being the first Governor in any of the New England Colonies who was born in America. From 1658 until 1672 he was one of the commissioners of the United Colonies of New England, and in 1675, soon after the outbreak of King Philip's War, was chosen commander in chief of the intercolonial forces.

WINSLOW, MIRON (1789–1864). An American Congregational missionary. He was born at Williston, Vt., graduated at Middlebury College, 1815, and at Andover Theological Seminary, 1818. In 1819 he went to Ceylon, as a missionary of the American Board, and served there and (from 1836) in southern India for 44 years. He prepared a Tamil and English dictionary, completed in 1862. It was based in part on manuscript material of the Rev. Joseph Knight, of the London Missionary Society, and the Rev. Samuel Hutchings, of the American mission, and was the most complete dictionary of a modern Indian language published at that time.

WINSLOW, WILLIAM COPLEY (1840–). An American archæologist, born in Boston, the son of Hubbard Winslow. He graduated at Hamilton College in 1862, and, after doing newspaper work in New York, at the General Theological Seminary (1865). Afterward he was minister of various Protestant Episcopal churches near Boston. He founded the American branch of the Egyptian Exploration Fund in 1883 and served as vice president, honorary secretary, and official representative for America until 1903. His publications include: *Israel in Egypt* (1883); *A Greek City in Egypt* (1887); *The Store City of Pithom* (1885); *Tombs at Beni Hassan; Egypt at Home; Pilgrim Fathers in Holland* (1891).

WINSOR, wĭn'zẽr, JUSTIN (1831–97). An American librarian, born in Boston, Mass. He was educated at Harvard College and continued

his studies in Paris and Heidelberg. From 1868 to 1877 he was superintendent of the Boston Public Library, and from 1877 till his death librarian of Harvard University. Winsor served as president of the American Historical Association in 1886 and of the American Library Association in 1897. His historical work was chiefly of a bibliographical and cartographical kind. The first book was a *History of the Town of Duxbury* (1849). This was followed by several valuable bibliographies, as that of the literature of the battle of Bunker Hill (1876), of the original quartos and folios of Shakespeare (1876), of the earlier editions of Shakespeare's poems (1879), etc. His more original work included: *The Readers' Handbook of the American Revolution* (1880); the iconoclastic *Christopher Columbus* (1892); *Cartier to Frontenac: Geographical Discovery in the Interior of North America in its Historical Relations, 1534–1700* (1894); and the *Exploration of the Mississippi Basin* (1895). Winsor was also editor of a *Memorial History of Boston* (1880–81) and a *Narrative and Critical History of America* (1884–89)—a scholarly performance and his most useful work, no small part of its value being due to his own bibliographical and cartographical contributions.

WIN'STED. One of the county seats of Litchfield Co., Conn., 35 miles by rail northwest of Hartford, on the Mad and Still rivers, and on the New York, New Haven, and Hartford and the Central New England railroads (Map: Connecticut, C 2). It has the William L. Gilbert Home for Poor Children, the Litchfield County Hospital of Winchester, and the Memorial and Gilbert School libraries. Highland Lake and the Mad River furnish excellent water power, which is utilized by several manufacturing establishments. The most important products are clocks, pins, hosiery, coffin trimmings, brass goods, spool silk, edge tools, leather, hardware, machinery, underwear, and pocket cutlery. It adopted the commission form of government in 1915. Pop., 1900, 6804; 1910, 7754.

WIN'STON, JOHN ANTHONY (1812–71). An American administrator. He was born in Madison Co., Ala., and was educated at La Grange College and the University of Nashville. In 1840, and again in 1842, he was elected to the Lower House of the Legislature; from 1843 till 1852 was a member of the State Senate, and was several years its presiding officer. In 1853 he was elected Governor by the Democrats and in 1855 was reëlected. During his administrations he strongly opposed efforts made by the Legislature to extend State aid to railroads, and by vetoing 33 measures of this kind gained for himself the name of the "veto Governor." On the question of public schools, however, he and the Legislature were in better accord, and the session of 1853–54 marked the beginning of the public-school system of the State. When the Civil War came he was made colonel of an Alabama regiment, and fought at Yorktown and at Seven Pines, but was shortly afterward forced to resign because of bad health. By the Legislature chosen under the authorization of President Johnson he was elected United States Senator, but was not permitted to take his seat.

WIN'STON-SA'LEM. A city and the county seat of Forsyth Co., N. C., 110 miles west of Raleigh; on the Southern, the Norfolk and Western, and the Winston-Salem Southbound railroads (Map: North Carolina, B 1). In 1913 the adjacent municipalities Salem and Winston were consolidated to form the present city. Situated in a region famed for the production of tobacco, Winston-Salem is one of the leading cities of the United States in the manufacturing of tobacco products. Other important products include cotton goods, flour, fertilizers, furniture, carriages and wagons, knit and woolen goods, lumber products, tobacco boxes, etc. These represented, in 1914, an invested capital of $25,703,000, the products being valued at $37,288,000. Noteworthy features of the city are the Salem Academy and College (female) opened in 1802, Orphans' Home (Methodist), Slater Industrial College (colored), Carnegie library, Salem Museum, and the Federal building. Under the revised charter of 1899 the government is vested in a mayor, chosen biennially, and a unicameral council. The water works are owned and operated by the municipality. Pop., 1900, 10,008; 1910, 17,167; 1915 (U. S. est.), 23,566.

WINTCHEVSKY, wĭn-chĕf'skĭ, MORRIS (1856–). The pen name of the Yiddish poet L. Benedict. Born in the Government of Kovno, Russia, he received an orthodox Jewish education supplemented by intensive secular study. His first poems appeared in 1873 in the periodical *Ha-Magid*. In 1877 he founded a Socialistic monthly, *Assefat Chachamim*. Expelled from Prussia in 1879 because of his radicalism, he transferred his Socialist propaganda to London, where he founded a number of short-lived Yiddish periodicals. From 1906 to 1914 he edited *Die Zukunft*, a Yiddish Socialist monthly of New York. Despite the dominant propagandist note in his poetry, it is among the best in Yiddish, while his epigrams, satirical sketches, and philosophical reflections (ascribed to "The Insane Philosopher") are unique in that language. In English appeared a volume called *Stories of the Struggle* (1908).

WINTER, vĭn'tẽr, FRANZ (1861–). A German classical scholar, born at Brunswick. He studied at the universities of Zurich, Munich, and Bonn. In 1886–89 he traveled, for purposes of study, in Greece, Asia Minor, and Italy, and then for some years held positions in the Royal Museum in Berlin. From 1897 he was professor of archæology successively at Berlin, Innsbruck, Graz, Strassburg, and, after 1913, Bonn. His publications include: *Die jüngere attische Vasen* (1885); *Griechische Porträtkunst* (1894); *Kunstgeschichte in Bildern* (1900; rev. ed., 1912); *Die Typen der figürlichen Terrakotten* (2 vols., 1903); *Der Hildesheimer Silberschatz* (1901), with E. Pernice; *Die Alexandermosaik* (1909); *Der Alexandersarkophag* (1912); "Griechische Kunst," in vol. ii of Gercke-Norden, *Einleitung in die Altertumswissenschaft* (2d ed., 1912).

WIN'TER, SIR JAMES SPEARMAN (1845–1911). A Newfoundland statesman, born in Lamaline, Placentia Bay. He was admitted to the bar in 1867. He served as a Conservative member in the Newfoundland House of Assembly in 1874–89, in 1893, and in 1897–1900, and during that period was Speaker (1877–78), Solicitor-General (1882–85), and Attorney-General (1885–89). He was the Newfoundland agent at the Washington Fisheries Conference (1887–88); was a delegate at London in 1890 and 1898 in connection with the French West Shore fisheries question (see FISHING LAWS; NEWFOUNDLAND, *History*); and in 1898 was a mem-

ber of the Joint High Anglo-American Commission which met at Quebec and again in Washington in an unsuccessful attempt to settle outstanding questions between the United States and the British Empire. From 1893 to 1896 he was judge of the Supreme Court, and from 1897 to 1900 was Premier.

WINTER, JOHN STRANGE. See STANNARD, HENRIETTA ELIZA VAUGHAN.

WINTER, vĭn'tĕr, PETER VON (1754–1825). A German dramatic composer, born at Mannheim. He studied with Abbé Vogler, was appointed musical director at the Court Theatre of Mannheim in 1776, and two years later went with the court to Munich. He became court kapellmeister in 1788 and held the position until his death. He wrote a number of operas, oratorios, sacred cantatas, masses, several secular cantatas, and quantities of church music. His most celebrated opera, *Das unterbrochene Opferfest*, was produced at Vienna in 1796, and given in Italy as *Il sacrifizio interrotto*.

WIN'TER, WILLIAM (1836–). An American dramatic critic and author, born in Gloucester, Mass. He graduated from Harvard Law School in 1857, but turned promptly to literature as a career. In 1859 he removed to New York City, where he became literary critic of the *Saturday Press*, then (1861–65) of the New York *Albion*, and for more than 40 years (1865–1909) was dramatic critic of the New York *Tribune*. He became widely known for his critical notices, for biographies of actors and many volumes of reminiscence, for his verse, and for sketches of English scenery and historic localities. In 1916 a notable testimonial was tendered him by his many friends of the stage. His writings include: *Henry Irving* (1885); *The Stage Life of Mary Anderson* (1886); *Shakespeare's England* (1888); *Gray Days and Gold* (1889); *Old Shrines and Ivy* (1892); *Shadows of the Stage* (1892, 1893, and 1894); *The Life and Art of Edwin Booth* (1893); *The Life and Art of Joseph Jefferson* (1894); *Brown Heath and Blue Bells* (1896); *Ada Rehan* (1898); *Other Days of the Stage* (1908); *Old Friends* (1909); *Poems* (1909), definitive author's edition; *Life and Art of Richard Mansfield* (1910); *The Wallet of Time* (1913); a life of Tyrone Power (1913); *Shakespeare on the Stage* (2 series, 1911–15); *Vagrant Memories* (1915). He also edited, notably: the works of George Arnold (1866–67), John Brougham (1881), Fitz-James O'Brien (1881), and *The Shakespearean and Miscellaneous Plays of Edwin Booth* (1899). Consult the monograph on Winter, biographical and bibliographical, published in New York in 1916.

WIN'TERBERRY. A popular name for two species of Ilex, of the family Aquifoliaceæ. The common winterberry (*Ilex verticillata*), or black alder, grows from 6 to 12 feet high, on moist, preferably rich ground, bearing in November great quantities of brilliant crimson or scarlet-crimson berries, which are often gathered and used as vase ornaments or wreaths. If carefully dried they retain much of their brightness for several months. The smooth winterberry (*Ilex lævigata*) grows in wet grounds from Maine to the mountains of North Carolina. See INKBERRY; HOLLY.

WINTER CHERRY. See PHYSALIS.

WIN'TERGREEN (so called because the plant remains green throughout the winter). The popular name of plants of the genera *Pyrola* and *Chimaphila*, of the family Ericaceæ. About 30 species of *Pyrola* are known. They are native herbs or half shrubby plants in woods throughout the Northern Hemisphere. Several species, natives of America, are perennial herbs with flowers of some beauty. Two species of *Chimaphila*, half shrubby plants, with beautiful evergreen leaves, natives of North America, *Chimaphila umbellata*, known also as Prince's pine and pipsissewa, and *Chimaphila maculata*, spotted wintergreen, have been used to some extent medicinally. *Gaultheria procumbens*, a perennial half shrubby plant with bright red berries and spicy aromatic evergreen leaves, is known as wintergreen in parts of the United States. (See GAULTHERIA.) *Polygala paucifolia* is called flowering wintergreen.

WINTERGREEN, OIL OF. An essential oil yielded by the flowers of the *Gaultheria procumbens*, abundant in New Jersey, and consisting chiefly of methyl salicylate, $CH_3C_7H_5O_3$, mixed with a small quantity of a hydrocarbon, termed *gaultherilene*, which is isomeric with oil of turpentine, and which, being more volatile than the salicylate of methyl, is easily separated from it. This oil is not only yielded by the distillation of other plants (especially the bark of the sweet birch, *Betula lenta*), but may be artificially prepared by distilling a mixture of salicylic acid, wood alcohol, and strong sulphuric acid. Oil of wintergreen is a colorless or yellow oil, of a powerful, agreeable, and persistent odor; and hence it is largely used in perfumery. Both the natural and the artificial oil are used in medicine for the same purposes as salicylic acid. The artificial oil, however, is likely to contain harmful impurities. See SALICYLIC ACID.

WINTERHALTER, vĭn'tĕr-häl'tĕr, FRANZ XAVER (1806–73). A German portrait and historical painter. He was born at Menzenschwand, in the Black Forest, studied with Stieler in Munich, and first attracted attention by a portrait of Grand Duke Leopold of Baden (Karlsruhe Gallery). In 1834 he settled in Paris and became the most fashionable portrait painter of the age of the crinoline. His best known portraits are those of King Louis Philippe of France and of his Queen, of the royal family of England, the Empress Eugenie among her court ladies, William I of Prussia and his Queen, Emperor Maximilian of Mexico, Mme. Rimski-Korsakov (Louvre), and others. His works are elegant and idealized representations, rather poor in quality and lacking in color, but well drawn and arranged. Among his historical paintings are "Florinda" (Metropolitan Museum, New York) and "Susannah and the Elders" (Seattle Museum).

WINTER KING, THE. The popular title of Frederick V, Elector Palatine, who was King of Bohemia for a little more than a year, 1619–1620.

WINTER PALACE. A great building on the Neva in St. Petersburg, now used only for ceremonial purposes. It was the residence of the Empress Anne, and was built by her on the site of a house presented to Peter II. The palace was partially destroyed by fire in 1837, but was at once restored. Its dimensions are: length 455 feet, breadth 350 feet, and height 80 feet. The interior contains a great number of suites and richly ornamented halls with important paintings. The brilliant court balls are held in the Nicholas Hall and are the most

imposing royal functions of Europe. In the Romanov Portrait Gallery are preserved the likenesses of sovereigns since Michael Feodorovitch. The treasury contains the costly collection from the Russian crown jewels.

WINTER'S BARK. An aromatic bark, resembling cinnamon and similarly used. It derives its name from Captain Winter, who first brought it from the Strait of Magellan in 1579. It is the product of *Drimys winteri* of the family Magnoliaceæ, a native of some of the mountainous parts of South America and abundant in the lower grounds of Cape Horn. The bark of other species has similar properties. In Australia the fruit of *Drimys aromatica* is used as a substitute for allspice.

WIN'TERSET. A city and the county seat of Madison Co., Iowa, 42 miles by rail southwest of Des Moines, on the Chicago, Rock Island, and Pacific Railroad (Map: Iowa, C 3). There are valuable limestone deposits in the vicinity. The courthouse and the public library are among the chief features of the city. Pop., 1900, 3039; 1910, 2818.

WINTER'S TALE, A. A comedy by Shakespeare, produced, according to Forman's diary, in 1611, printed in the 1623 Folio, and probably one of Shakespeare's latest plays.

WINTERTHUR, vĭn'tĕr-tōōr. A town of the Canton of Zurich, Switzerland, in the Töss valley, on the Eulach, 16 miles by rail northeast of Zurich (Map: Switzerland, C 1). There are several handsome churches, a fine town hall in the Greek style from plans by Semper, a gallery of Swiss paintings, and a museum of antiquities and natural history. Winterthur is a rich manufacturing and commercial town. There are vine-growing, cambric-weaving, and cotton-printing industries, and the manufacture of machinery. Pop., 1910, 25,066, mostly German-speaking Protestants.

WINTER WHEAT. See FLOUR; WHEAT.

WINTHER, vĭn'tĕr, CHRISTIAN (1796–1876). A Danish poet, born in Fensmark, and educated at the University of Copenhagen. His first collection of poems (1828), a success, was followed by *Nogle digte* (1835), and by *Sang og sagn* (1841); *Lyriske digte* (1849); *Nye digtninger* (1852); and *Hjortens flugt* (1855), a romantic lyric which was his masterpiece. He also wrote several novels.

WINTHROP, wĭn'throp. A town, including several villages, in Suffolk Co., Mass., five miles northeast of Boston, on Massachusetts Bay, and on the Boston, Revere Beach and Lynn Railroad (Map: Massachusetts, F 3). It is the place of residence of many business men of Boston. The chief features include the Dean Winthrop house, dating from 1649, the Frost Public Library with a collection of pictures and interesting historical relics, Forts Banks and Heath, Ingall's Park, and the Winthrop Shore Reservation. Winthrop formed successively a part of Boston, Chelsea, and North Chelsea until 1852, when it was separately incorporated. Pop., 1900, 6058; 1910, 10,132; 1915 (State census), 12,758.

WINTHROP, BEEKMAN (1874–). An American public official, born at Orange, N. J. He graduated at Harvard in 1897, and at Harvard Law School in 1900, having been admitted to the New York bar in the preceding year. From 1900 to 1904 he was in the Philippine Islands, as private secretary to William H. Taft, then Governor, as assistant and acting executive secretary, and as judge of the Court of First Instance. He served as Governor of Porto Rico in 1904–07, as Assistant Secretary of the Treasury in 1907–09, and as Assistant Secretary of the Navy in 1909–13. Thereafter he was engaged in banking.

WINTHROP, FITZ JOHN (1638–1707). A Colonial Governor of Connecticut, the son of John Winthrop (1606–76). He was born in Ipswich, Mass., studied for a time at Harvard, went to England and served in the Parliamentary army until the Restoration, and returned to New England in 1663. He was a member of Governor Andros's council in 1686, and in 1690 commanded, as major general, the Connecticut and New York troops, together with the Iroquois who were to attack Montreal, but who never reached Canada. He was Governor of Connecticut from 1698 until his death.

WINTHROP, JOHN (1588–1649). An English colonist in America, first Governor of the Colony of Massachusetts Bay. He was born at Edwardston, Suffolk, England, and his early life was spent at Groton Manor, in Suffolk. He studied for two years (1602–04) at Trinity College, Cambridge. In 1626 he was appointed attorney in the Court of Wards and Liveries, presided over by Sir Robert Naunton. The drift of affairs in Parliament, the impending crisis in the political world, and his own sympathy with the Congregationalist movement, led him to take an interest in American emigration. The London proprietors of the Massachusetts Company, who had determined to transfer the seat of government to the New World, on Oct. 30, 1629, elected John Winthrop Governor. On June 22, 1630, with a fleet of 11 ships, Winthrop arrived at Salem. Soon afterward he removed to Charlestown, whence in the September following he and his fellow colonists again removed—this time to the site of Boston, which place they founded. In 1634 he was chosen Deputy Governor under Thomas Dudley (q.v.). Dudley was followed by John Haynes (1635) and Haynes by Sir Harry Vane (1636). During the latter's Governorship Winthrop as Deputy Governor led the opposition to the liberal policy adopted by Vane towards Anne Hutchinson (q.v.) and her followers. He had separated from the Church of England on leaving England, and was at this time thoroughly identified with the Puritan movement. He opposed strenuously the new Antinomianism and on the issue thus raised was chosen Governor over Vane in 1637. He retained the Governorship until 1640, was again Governor in 1642–44 and again from 1646 until his death. In 1643 the New England Confederation was formed under his auspices, and he became its first president. Winthrop's *Journal* was first published in a single volume (Hartford, 1790). This was republished with newly discovered manuscripts under the title *History of New England, 1630–49* (Boston, 1825–26), with notes by James Savage. Many of his papers have been published by the Massachusetts Historical Society. Consult also R. C. Winthrop's valuable *Life and Letters of John Winthrop* (2 vols., Boston, 1864–67); J. H. Twichell, *John Winthrop* (New York, 1891), in "Makers of America Series"; Andrew Macphail, *Essays in Puritanism* (Boston, 1905). For his wife, MARGARET TYNDAL WINTHROP (1591–1647), consult Alice Morse Earle, *Margaret Winthrop* (New York, 1895).

WINTHROP, JOHN (1606–76). A Colonial Governor of Connecticut. He was the son of

John Winthrop, the first Governor of Massachusetts Bay, and was born at Groton Manor, Suffolk, England. He was educated at Bury St. Edmunds Grammar School, at Trinity College, Dublin, and at the Inner Temple (1624). In 1627 he took part in the Duke of Buckingham's unsuccessful expedition to the Isle of Ré, near La Rochelle. He joined his father in New England in 1631, and two years later participated in the founding of the town of Ipswich. He was for some time titular Governor of a small settlement at Saybrook on the Connecticut River. In 1646 he laid out a plantation on the Thames River at what is now New London, where, after 1650, he made his home. He was elected a magistrate in 1651 and Governor in 1657. Then, after serving as Deputy Governor in 1658, he was again chosen Governor in 1660, holding office from that time continuously until his death. In 1662 he carried to England a loyal address from the Connecticut colonial government to Charles II, and was successful in securing from the King a very favorable charter. He was also influential in bringing about the union of the Connecticut and New Haven Colonies. In 1675 he was one of the commissioners of the United Colonies of New England. Consult T. F. Waters, *A Sketch of the Life of John Winthrop, the Younger* (Cambridge, 1899).

WINTHROP, JOHN (1714–79). An American physicist, born in Boston, Mass. He graduated in 1732 at Harvard, where, from 1738 until his death, he was professor of mathematics and natural philosophy. He was one of the foremost men of science in America in the eighteenth century, and his influence on the early advancement of science in New England in particular was very great. Both Benjamin Franklin and Benjamin Thompson (Count Rumford) probably owed to him much of their early interest in scientific research. In 1740 and 1761 he observed the transits of Mercury, in the latter year proceeding to Newfoundland in a ship provided by the Province of Massachusetts—probably the first scientific expedition sent out by an American State. His application of computations to earthquake phenomena after the famous earthquake of November, 1755, has formed the basis of the claim made for him as the actual founder of the science of seismology. In addition to his scientific work he was actively interested in public affairs, was a judge of probate in Middlesex County for several years, was a member of the Governor's council in 1773–74, and subsequently gave the weight of his influence to the patriotic cause in the Revolution. He published: *Lecture on Earthquakes* (1755); *Answer to Mr. Prince's Letter on Earthquakes* (1756); *Account of Some Fiery Meteors* (1755); and *Two Lectures on the Parallax* (1769).

WINTHROP, ROBERT CHARLES (1809–94). An American political leader and legislator, Speaker of the House of Representatives. He was born in Boston, graduated at Harvard in 1828, studied law in the office of Daniel Webster, and in 1831 was admitted to the bar. He was a Whig member of the Lower House of the Massachusetts Legislature from 1834 until 1840, serving during the last three years as Speaker. From 1840 almost continuously until 1850 he was a Representative in Congress. In the Thirtieth Congress (1847–49) he was Speaker of the House. He was appointed to the seat in the United States Senate left vacant by Daniel Webster's resignation in 1850, but was defeated in the regular election, held in the following year, by Charles Sumner. His legislative career was marked by strong conservatism throughout. He was an opponent of slavery, of the Mexican War, and of the Fugitive Slave Law, but followed Webster in his desire for compromise and in his support of the Fillmore Administration. On the break-up of the Whig party he refused to ally himself with the Republican party, and supported Fillmore in 1856, Bell in 1860, and McClellan in 1864. During the latter part of his life he devoted himself to the organization and development of the Peabody Education Fund. His services are also memorable as president of the Massachusetts Historical Society for 30 years. He published *Addresses and Speeches* (vol. i, 1852; vol. ii, 1886) and *Life and Letters of John Winthrop* (2 vols., 1864, 1867). Consult C. F. Adams, Jr., *Theodore Lyman and Robert Charles Winthrop, Jr.* (Boston, 1906).

WINTHROP, THEODORE (1828–61). An American novelist and soldier, a descendant of the second John Winthrop, born at New Haven, Conn. He graduated at Yale in 1848 and then spent some time in Europe. Returning, he was in steamship service at Panama and visited California and Oregon. In 1853 he accompanied Lieutenant Strain's canal surveying expedition to the Isthmus of Panama. He afterward practiced law and took part in the Frémont campaign, but later devoted himself mainly to writing novels. Just as *Cecil Dreeme* was to be published, the Civil War came on, and Winthrop at once went to Washington with the Seventh New York Regiment. He was soon made military secretary to General Butler, with the rank of major. He was killed at the battle of Big Bethel, while rallying his men. Shortly before his death he wrote for the *Atlantic Monthly* two articles descriptive of his marches. His novels and other books, which were rapidly published and sold, include: *Cecil Dreeme*, with memoir by G. W. Curtis (1861); *John Brent* (1862); *Edwin Brothertoft* (1862); *The Canoe and the Saddle* (1862); *Life in the Open Air, etc.* (1863); *Life and Poems* (edited by his sister, 1884); *Mr. Waddy's Return* (1904). Winthrop's novels are full of narrative talent, and indicate that their author might ultimately have taken an important position in American letters. They helped to bring the Far West into American literature.

WINTHROP NORMAL AND INDUSTRIAL COLLEGE. An institution for normal and industrial education, founded at Rockhill, S. C., in 1886, and supported by State appropriations. It includes a college and a training school. In the former in 1916 were enrolled 960, and in the latter 396 students. The teachers and officials numbered 100. A summer school is held each year. The value of the college grounds and buildings is about $900,000. The library contains about 18,000 volumes. The president in 1916 was D. B. Johnson, A.B., LL.B.

WINTON. A borough in Lackawanna Co., Pa., eight miles from Scranton, on the Delaware and Hudson, the Delaware, Lackawanna, and Western, and the New York, Ontario, and Western railroads. Coal mining is the chief industry. Pop., 1900, 3425; 1910, 5280.

WINTUN, wĭn-to͞on′ (People). A group of tribes of Copehan linguistic stock, formerly occupying the country of the upper Sacramento and Trinity rivers, northern California. Although of inferior type, their disposition enabled

them to maintain themselves in the face of civilization to better advantage than the more warlike tribes. Timid, gentle, and extremely sensual, they were also industrious, and were expert in diving for clams and spearing salmon. Their houses were conical lodges of bark over a frame of poles. Their weapons were the bow and the sling. Each harvest season of fish, nuts, or blossoms was the occasion of a tribal gathering and dance, many of the songs being sweet and melodious until repeated to monotony. They had also the scalp dance, the war dance, the gift dance, and the puberty dance for young girls. Polygamy was common. The dead were wrapped into bundles and buried with all their ornaments and smaller property, and the name never thereafter mentioned. In the case of a woman a quantity of acorns was sometimes poured upon the corpse in the grave. Like the other California tribes, they excelled in basketry. The surviving tribes are the Nomelaki, Patwin, and Wintun. They totaled 710 in 1910.

WIRE (AS. wīr, wire; connected with OHG. *wiara*, fine-drawn gold, Lat. *viriæ*, armlets, Lith. *vėlà*, wire, and ultimately with Skt. *vā*, weave). An extremely elongated, slender bar of metal produced by drawing a short thick bar through a succession of holes of regularly decreasing sizes until its diameter has been materially reduced and its length greatly increased. Wire is generally round, but flat wire, oval wire, and wire of other shapes are also made. The manufacture of wire has been traced by good authorities as far back as the period of early Egypt, and until the fourteenth century wire was manufactured by hammering out strips of metal. In the early history of the article, gold, silver, and bronze were practically the only metals used. It seems to be fairly well substantiated that the present method of producing wire by drawing was practiced in Germany during the fourteenth century. In 1865 machine-drawn wire was first produced in England.

Process of Manufacture. Wire is almost universally manufactured by drawing, and the facility with which any metal can be drawn into wire depends upon its ductility. Most metals have this property; but some, like antimony and bismuth, are so brittle that they can be drawn out only with difficulty, and wire made from such metals is useless from want of tenacity. All metals largely used for making wire, such as steel, brass, and copper, are drawn by essentially the same process. Steel billets first are rolled into round rods. The rods are cleaned of scale either by mechanical rubbing or more commonly by being immersed in an acid bath, and then deacidized by a bath of lime water. Each bar is then drawn into wire by pulling it through the holes of a draw plate. This is an oblong plate of hard steel pierced with conical holes, gradually diminishing in diameter and having the smaller ends of these tapering holes carefully prepared to the required size. Sometimes cubical-shaped dies, each with a single trumpet-shaped hole, are used. The workman begins by making a point on the rod, so as to permit it to pass through the hole and be grasped by a pair of pincers attached to a chain. This chain is pulled along by suitable mechanism until the length of wire which has been drawn through the hole is sufficient to pass around a revolving drum, which is then set in motion and draws the rod slowly through the draw plate, winding it upon itself as it revolves. From this drum the wire is passed through a smaller hole and wound on another drum, and so the process is repeated until the wire has been reduced to the proper size. Fine wire may require from 20 to 30 drawings. The drum revolves slowly with a thick wire and the speed is increased as the size diminishes. After being passed a few times through the draw plate the metal becomes brittle and has to have its ductility restored by annealing. (See ANNEALING.) From the annealing furnace the wire passes to the acid bath to remove the scale and then to the lime water to remove the acid. It is then ready to be further reduced by the draw plate until annealing is again required. Generally a lubricant, wax, grease, soap, or other similar material, is employed during the drawing, especially for fine wires. For some very accurate purposes, such as chronometer springs and for gold and silver lace, the wire is drawn through holes perforated in rubies and other hard gems.

Uses. The uses of various kinds of wire are practically innumerable, and involve numerous kinds of wire manufactured from various materials. The metals used are silver, platinum, copper, bronze, brass, iron, and steel, and from them are drawn wires varying in size from ¼ inch to $\frac{1}{7000}$ inch, and possessing a tensile strength of from 20 tons to 150 tons per square inch of sectional area. The manufacture of wire netting, gauze, and cloth is among the many ingenious and serviceable applications of wire. Many thousand tons of plain fencing wire, strands, and barbed wire are annually manufactured. Carding wire is a product of no less magnitude and importance.

Beautiful types of wire are to be found in the eyepieces of telescopes in the form of hair or spider lines for assisting in the observation of moving stars, planets, or bodies and their relative bearings and for measuring angles or determining evolutions and gradients. A platinum wire as fine as 0.00003 inch in diameter has been obtained, of which 1060 yards weighed 0.75 grain, or 1¼ grains per mile. This result was, however, obtained by covering the wire with silver, which, after being drawn down with the platinum to as fine a degree as possible, was dissolved off by a solution of nitric acid. Platinum and other wires are also used in galvanic cauteries, écraseurs, magnetic machines, probes, and other surgical instruments and appliances. Steel wire of high breaking strains has been employed for deep-sea soundings (see SOUND, SOUNDING), and also used in the construction of aëroplanes. One of the most important uses of wire in engineering is for making wire rope (q.v.). Wire netting is also made by machines which take the wire from bobbins and deliver the netting complete in rolls ready for shipping. Consult Smith, *Wire: Its Manufacture and Uses* (New York, 1891).

WIRE GAUGES. Wire is made in a number of sizes or diameters. To designate these sizes use is made of a series of numerals each of which indicates a certain diameter in fractions of an inch where English measure is used and in millimeters where metric measure is employed. Such a series of numerically designated sizes is called a wire gauge. In England the legal gauge is the Imperial wire gauge, which was established by law in 1884. Previous to this time a number of wire gauges had been employed in England, the best known of which are the Stubbs wire gauge and the Birmingham wire

gauge. France and Germany have standard wire gauges based upon the millimeter. In the United States there are a number of different wire gauges, but they are nearly all precisely similar to the Roebling and Washburn-Moen standard. A United States standard gauge for sheet and plate iron and steel was adopted in 1893, in which the ultimate purpose was to have the number of the wire size the same as its diameter in thousandths of an inch. The following table shows the two American wire gauges most used and the equivalents in the English legal standard:

Number of wire gauge U.S.A.	Roebling's and Washburn-Moen's gauge	Brown and Sharpe's gauge U.S.A.	Equivalents in the English legal standard. S. W. G.

For further comparison tables consult United States Bureau of Standards, *Circular No. 31*, and the engineering pocket books.

WIRE GLASS. See GLASS.

WIREKER, NIGEL. See NIGEL.

WIRELESS TELEGRAPHY AND TELEPHONY. The art of telegraphing or telephoning by electricity without the aid of interconnecting wires. The principal methods are based on:

1. Conduction or dispersion of electric currents through moist earth or water; (2) electromagnetic induction between metallic circuits; (3) electrostatic induction between metallic plates or conductors; (4) electromagnetic waves, now known as radiotelegraphy and radiotelephony. The first three methods never progressed beyond the experimental stage and are of historical interest only. The fourth method has become of great practical importance and is widely used throughout the world. Radiotelephony did not progress in its practical development as rapidly as radiotelegraphy, but great strides have been made towards the practical development of this method of communication.

Conduction or Dispersion Method. Probably the first successful attempt at electric telegraphy between stations not connected by wires, was that of Samuel F. B. Morse in 1842, when on December 16 signals were transmitted a distance of 80 feet across a canal in the city of Washington. Morse's apparatus consisted of wires, stretched along the banks of the canal, terminating in copper plates which were placed in the water as indicated in the diagram.

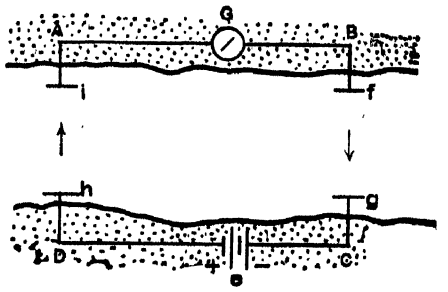

FIG. 1. MORSE'S EARLY EXPERIMENT.

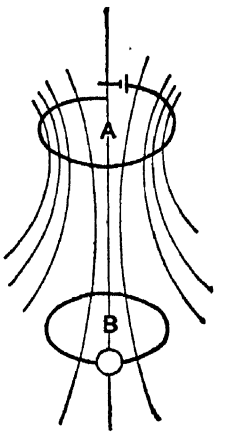
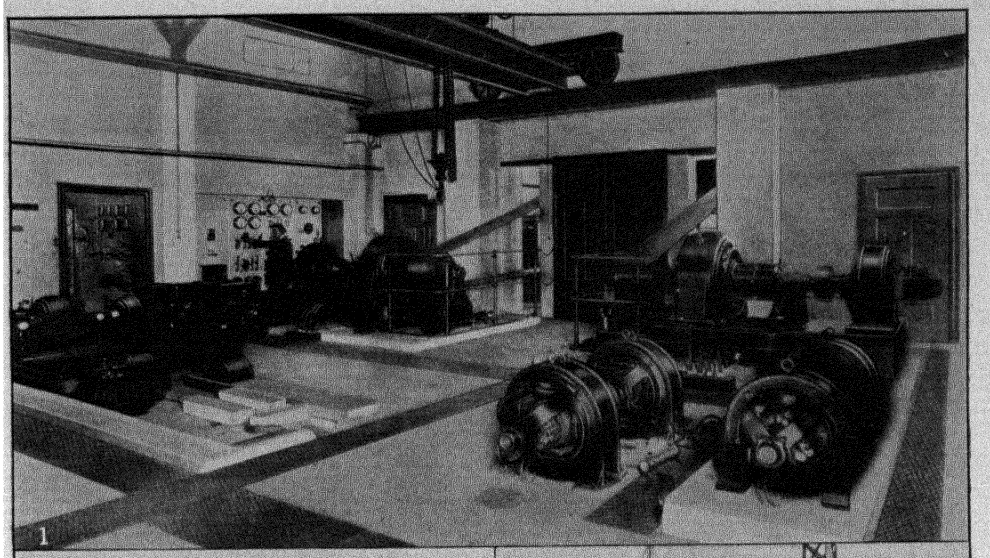
With this arrangement the current flows from the positive pole of battery *e* to the submerged copper plate *h*, thence across the canal through the water to the plate *i*, completing the circuit through the wire *AB* and galvanometer *G* to plate *f*, and from there returning through the water to the plate *g* and the battery *e*.

Prior to Morse's work, Sömmerring of Munich in 1811 demonstrated that an electrical connection could be established between a transmitting and receiving instrument with only water as a connecting medium, and Steinheil in 1838 quite accidentally discovered that the ground could act as the return circuit in ordinary wire telegraphy. Other names connected with conduction or dispersion telegraphy are those of Lindsay, Trowbridge, Vail, Bell and Preece.

Electromagnetic Induction Method. Wireless telegraphy by electromagnetic induction is based on the fact that when a current flows through a coil, as, e.g., coil *A* in Fig. 2, a magnetic field will be established. This field taking the form of curved lines of force will extend to a considerable distance, and will thread through the receiving coil *B*, inducing currents therein in accordance with the laws of magnetic induction. However, since the magnetic energy decreases as the square of the distance, the current in *B* will be less than in *A*. In this method the distance to which signals may be transmitted depends upon several factors, including the number of turns of wire on the coils *A* and *B*, the size of the coils and their distance apart.





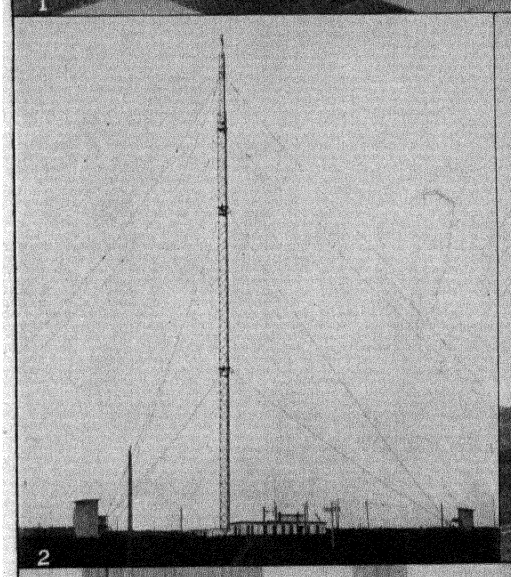


FIG. 2. INDUCTION METHOD.

Electrostatic Induction Method. In 1882 Professor Dolbear of Tufts College, Massachusetts, was awarded a United States patent on a system of wireless telegraphy which operated upon the principle of electrostatic induction.

5. BASE OF TOWER AT EILVESE, SHOWING CONSTRUCTION AND INSULATION.

Dolbear's transmitter (*A*, Fig. 3) consisted of an elevated condenser or capacity area 6, connected in series with the secondary 5 of the induction coil *a*, and the earthed plate 7; the primary winding 1 of the coil is connected in

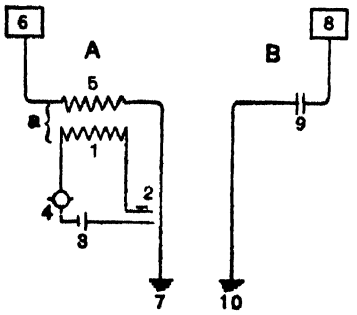

FIG. 3. ELECTROSTATIC METHOD.

series with a telegraph key 2 and a battery 3, 4 being an interrupter; the receiver (*B*, Fig. 3) comprises an electrostatic telephone receiver 9, made of two thin diaphragms of metal and placed very closely together; the two diaphragms are connected to the capacity area 8, and earth plate 10. When the key 2 is closed a difference of potential is established between 6 and 7, causing a charge to appear on 6 and an equal and opposite charge to spread over the earth. Part of this latter goes to the left-hand plate of the condenser 9, the other plate taking an equal and opposite charge by induction; this action is also increased by the inductive action of plate 6 and plate 8. The charge on condenser 9 is indicated by a relative motion of its plates.

In 1891 Thomas A. Edison took out a United States patent on an electrostatic inductive method of communicating with a moving railroad train.

ELECTROMAGNETIC-WAVE METHOD—RADIOTELEGRAPHY AND TELEPHONY

The fundamental principles upon which modern systems of radiotelegraphy and telephony are based were discovered by Oerstedt of Denmark, Faraday of England, and Henry of America. In 1820 Oerstedt discovered that an electric current flowing through a wire builds up a magnetic field surrounding the wire. In 1831 Faraday and Henry independently discovered the converse of the above, viz., an electric current in a conductor was obtained therein as a result of a "change" in the magnetic field surrounding the conductor. Eleven years later, in 1842, Henry made the further discovery that under certain conditions the discharge of a Leyden jar through a coil of wire, representing an inductance and a resistance, occurred in an oscillatory fashion: i.e., the current flowing in the coil did not persist in one direction but oscillated back and forth, rapidly changing its direction.

Sir William Thomson, later Lord Kelvin, in 1853 discussed mathematically the subject of the discharge of a Leyden jar through a resistance and an inductance, and concluded that under certain conditions depending upon the relative values of the capacity *C*, inductance *L*, and resistance, the discharge would take place in an oscillatory manner. It was shown by Thomson that the oscillatory current flowing in the coil is not constant in intensity, but its amplitude decreases from a maximum value to zero in geometric progression, as shown in Fig. 4. This decrease in amplitude is due, among other things, to the dissipation of energy in the form of heat, and radiation of electric

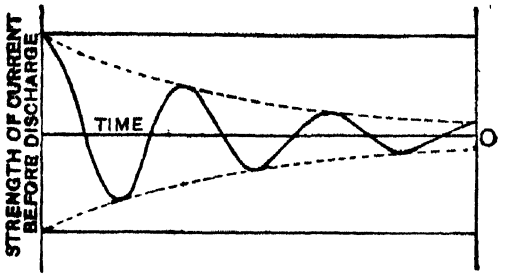

FIG. 4. CURVE OF OSCILLATORY CURRENT.

waves. The frequency of oscillation is determined by the electrical dimensions of the circuit, and when the resistance is negligible is determined by the formula $N = \frac{1}{2\pi\sqrt{LC}}$.

This action finds its analogue in mechanics in the vibration of a weight attached to an elastic spring. The capacity, inductance, and resistance of the electric circuit are respectively analogous in action to the elasticity of the spring, inertia of the weight, and friction, including that inherent to the system and of the surrounding medium. If the weight be given a displacement the resulting vibrations will gradually decrease in amplitude and finally cease, because of the dissipation of energy in overcoming the internal friction of the spring and of the medium in which the movement of the weight takes place.

Experiments in 1905 showed that if the circuit contains a spark gap whose resistance is high in comparison to the resistance of the circuit, the current amplitudes will not decrease in geometric progression, but according to a linear law, as shown in Fig. 5, and will

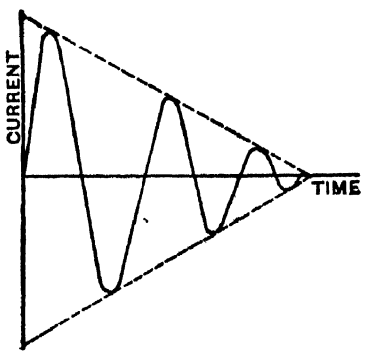

FIG. 5. RELATION OF CURRENT AMPLITUDE TO TIME.

reach zero, theoretically as well as practically, in a certain time.

In 1865 Clerk Maxwell in England deduced mathematically the theory that electric oscillations resulting from the discharge of a Leyden jar produce electric waves which are propagated outwards into the surrounding space with the velocity of light. Maxwell's deductions were based upon the experimental researches of Henry and Faraday, and that his mathematical predictions were correct was demonstrated physically by Heinrich Hertz of Bonn, Germany, in 1888. Hertz succeeded not only in producing electromagnetic waves, but devised a means for their detection, measured their length, showed that they could be reflected and refracted, and that as their wave length was shortened they exhibited properties analogous to light waves.

Hertz's apparatus for the production of electric waves, termed by him an "oscillator" (Fig. 6), consisted of a pair of metallic plates or spheres (1) attached to rods (2) placed in the same line, their contiguous ends equipped with knobs (3) separated by a distance of a fraction of a centimeter. These knobs were connected

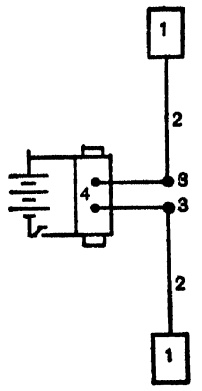

FIG. 6. HERTZ'S OSCILLATOR.

to the secondary of an induction coil (4). If a difference of potential be created between the knobs by completing the primary of the coil through a battery, an electrostatic field, consisting of lines of electric force stretching between the two halves of the oscillator, will be established; if the secondary potential difference be further increased the air between the knobs will break down and a spark will pass. The whole oscillator then becomes conductive, the electric field will change over into a magnetic field and oscillatory currents of extremely high frequency will exist in the oscillator. The action is identical in every respect to the discharge of a Leyden jar, with the exception that with each passage of the spark the lines of electric force are snapped off, so to speak, and the electric and magnetic fields are propagated outwards,

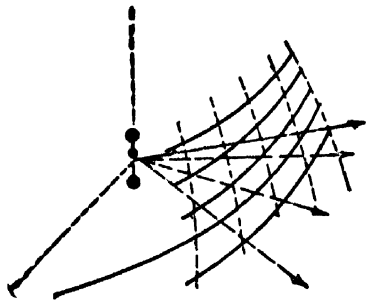

FIG. 7. PROPAGATION OF ELECTRIC AND MAGNETIC FIELDS.

each at right angles to the other, in a direction at right angles to both as indicated in the diagram. (See Fig. 7.) The movement of the two fields constitutes a flow of energy.

Hertz's wave detector or resonator was especially crude, consisting merely of a circlet of wire severed at a given point so that an air gap formed a microscopic portion of it. Hertz found that when the resonator was placed in certain positions in the immediate neighborhood of the oscillator, with the latter in operation, minute sparks passed across the microscopic gap, thus indicating that energy was being conveyed across the space between the oscillator and resonator. This was the real beginning of radiotelegraphy whose development may be said to date from this time.

Prior to Hertz's work, Sir Oliver Lodge in England, in 1888, had studied the discharge of a Leyden jar and its effects on an adjacent circuit. The apparatus employed by Lodge is shown in Fig. 8. Leyden jar *A* 1, charged to a high potential, is connected in series with spark

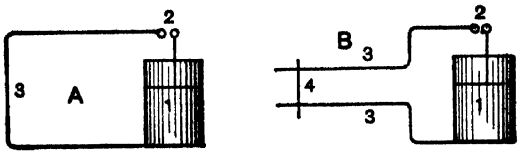

FIG. 8. LODGE'S SYNTONIC JARS.

gap 2 and loop of cone 3. Leyden jar *B* 1 is connected through a spark gap 2, and a closed circuit 3, 3, the inductance of which is made variable by slider 4. When sparks pass across gap 2, of *A*, it was observed by Lodge that sparks could be obtained at gap 2 of *B*, only for a certain position of the slider 4. The two circuits were then synchronized, or in resonance, having the same period of electrical oscillation.

In 1893 Nikola Tesla proposed a system for the wireless transmission of energy and telegraphic signals, consisting of the use of an elevated capacity and a ground connection at each station. Alternating currents were employed for transmission, the novel feature being that the receiving apparatus was adjusted so as to be in resonance with the transmitted waves. Tesla's apparatus was never developed beyond the experimental stage.

In 1896 Guglielmo Marconi, an Italian, took out a British patent on a system of radiotelegraphy, i.e., a definite system of sending signals, based on the radiation and reception of grounded or guided electromagnetic waves. Marconi employed as a transmitter a Hertzian oscillator, improving it, however, by elevating one plate to a considerable height above the earth and connecting the other plate to the earth as in Tesla's arrangement. By making and breaking the circuit in the primary of the induction coil corresponding to a prearranged code of signals—usually the ordinary Morse code—the electromagnetic waves were sent out into space. For receiving a "coherer" was substituted in the circuit in place of the spark gap, and around this

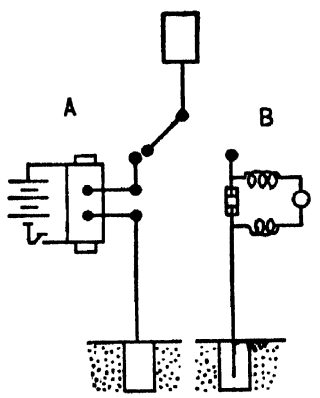

FIG. 9. MARCONI ORIGINAL ARRANGEMENT.

was shunted the proper decohering and signal-indicating devices. The coherer, which was invented by Professor Branly of Paris in 1890, consists essentially of a glass tube fitted with metallic plugs between which is a small quantity of metallic fillings in a more or less loose condition, presenting normally a high electrical resistance. If an electric impulse be passed through the filings they are rendered conductive,

but they can be restored to their high resistance by tapping the glass tube.

The action of Marconi's transmitter is exactly that of the Hertzian oscillator with the exception that the electric waves given off are grounded or guided, traveling over the earth's surface as indicated in Fig. 10. These waves impinging

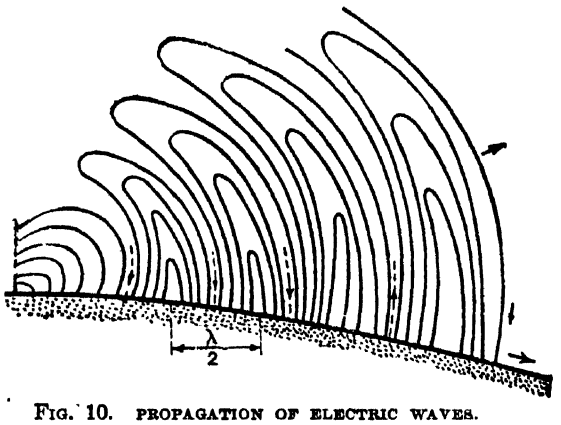

FIG. 10. PROPAGATION OF ELECTRIC WAVES.

upon the elevated capacity of the receiver induce currents therein which flow through the coherer to the ground, and the passage of such currents decreases the resistance of the coherer, permitting the flow of sufficient current from the local battery to operate the decohering and signal-recording instruments and to indicate the corresponding signals from the transmitting station.

The simple grounded antenna of Fig. 11 as originally used by Marconi is incapable of storing up any large amounts of energy. The

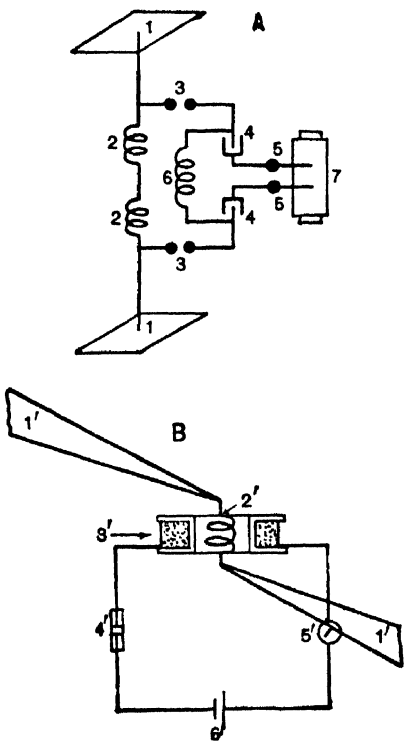

FIG. 11. LODGE'S SYNTONIC METHOD.

emitted waves are highly damped, and as a result set up forced oscillations over a wide range of frequencies in the receiving antennæ. When used as a receiver a similar condition prevails, viz., the antenna will respond equally well to a number of different frequencies, thus prohibiting selective reception. This disadvantage was recognized early by a number of scientists interested in the development of radiotelegraphy, among whom may be prominently mentioned Lodge, Marconi, and Braun in Europe, and Stone in the United States. Methods for overcoming it are described below.

Syntonic Radiotelegraphy. The first system of radiotelegraphy based on the principle of electrical resonance was invented by Sir Oliver Lodge of England. The transmitter and receiver are illustrated diagrammatically in Fig. 11. Referring to the diagram, *A* and *B* represent the sending and receiving circuits respectively, 1, 1 and 1′, 1′ are capacity areas made of sheet metal connected together through inductance coils 2 and 2′. The function of these coils, according to Lodge, is to prolong the electric oscillations occurring in the radiator, so as to establish a definite frequency or pitch, and thereby render syntony in a receiver possible. Shunted about coils 2, 2 is the circuit made up of the spark gaps 3, 3, condensers 4, 4, inductance 6, and gap 5. The latter is connected to the secondary of an induction coil 7. Inductively coupled to the receiving antenna inductance 2′ is a secondary coil 3′ which contains in its circuit a coherer 4′, telegraphic instrument 5′, and battery 6′. The reason for placing the coherer in the secondary rather than in the antenna circuit was that with the former arrangement the electric vibrations of the antenna circuit were not interfered with.

Slaby-Arco Tuned System. Dr. Adolph Slaby and Count George Arco of Germany improved slightly upon Marconi's apparatus by connecting to the base of the elevated wire a horizontal wire of the same length, grounding the free end. The transmitter and receiver are shown in Fig. 12. By this arrangement

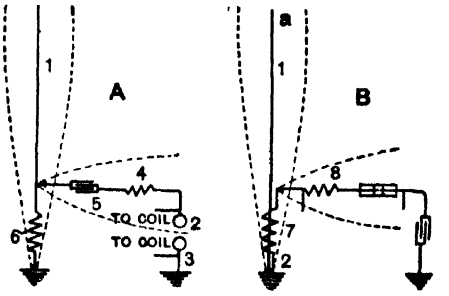

FIG. 12. DIAGRAM OF SLABY-ARCO SYSTEM

both the spark gap and the detector are placed at the crest of the voltage wave, as shown by the dotted lines in the figure. In the receiver *B* this will cause an increase in the strength of the received signals.

Braun System. Prof. Ferdinand Braun of Strassburg in 1898 patented a system of radiotelegraphy utilizing coupled circuits. Braun's apparatus is illustrated diagrammatically in Figs. 13 and 14. The transmitter, Fig. 13, is composed essentially of two circuits, a closed circuit L_1, C_1, S, coupled inductively to an open or radiating circuit, A_1, L_2, G. The condensers C_1, when charged to a sufficient potential by the coil, will discharge through the coil L_1 and gap S, transferring its energy to the antenna circuit through the agency of the magnetic field common to the coils L_1 and L_2. The receiver was also of the coupled type containing directly in the closed circuit a detector D, of which by

this time types other and more sensitive than the coherer had been developed, many of which

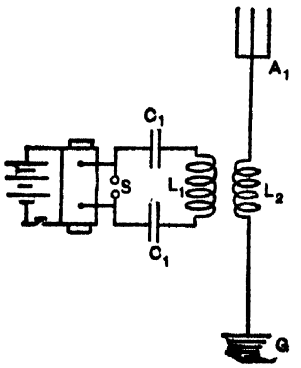

FIG. 13. BRAUN SYSTEM, TRANSMITTER.

used a telephone receiver in connection with them.

In 1898 Marconi in England also patented the usage of coupled circuits for receiving, and in 1900 extended the improvement to the transmitter, pointing out that the antenna and

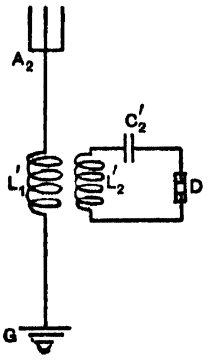

FIG. 14. BRAUN SYSTEM, RECEIVER.

closed circuits of both transmitter and receiver should all have the same electrical time periods. The companies controlling the patents of Slaby, Arco, and Braun in 1903 were combined and amalgamated into a single company, called the Telefunken Company, which soon became one of the largest manufacturing and operating enterprises in Germany. The year 1903 also witnessed the transmission across the Atlantic Ocean, a distance of 2300 miles, of a message from President Roosevelt to King Edward VII of England.

Nearly all of the systems of radiotelegraphy in operation in 1903 were based upon the prin-

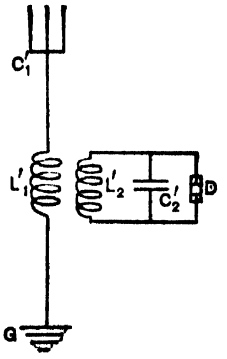

FIG. 15. RECEIVING CIRCUIT.

ciples laid down by Lodge, Marconi, Braun, and Stone, and were essentially connected as indicated in Figs. 13 and 15. Their operation is summed up as follows: The induction coil, or transformer, when actuated by the key charges the condensers C_1 (Fig. 13) to a voltage determined by the length of the spark gap S; this voltage being attained, the condenser will discharge through the coil L_1 and the gap, and establish powerful oscillatory currents of very high frequency in the circuit $S\ L_1\ C_1$; the frequency is determined by the product $L_1 \times C_1$. The antenna circuit consisting of the inductance L_2 and the distributed capacity C_2 of the elevated wires, when adjusted to be in resonance with $L_1\ C_1$, will withdraw energy from the closed circuit and radiate it into space as grounded electromagnetic waves. These waves impinging upon the receiving antenna C'_1 (Fig. 15) will set up in the circuit $C_1\ L'_1$ very feeble oscillatory currents, which in turn induce corresponding currents in $L'_2\ C'_2$, provided that the two circuits of the receiver are in resonance with each other and with the transmitter. Shunted about the circuit $L'_2\ C'_2$ is some form of signal-indicating device D. This type of apparatus, because of the reaction between the two circuits of the transmitter, suffered the disadvantage that unless special precautions were taken two waves of different lengths were emitted simultaneously.

In 1906 Max Wien of Danzig, Germany, discovered that if the damping of the primary circuit of the transmitter ($SL_1\ C_1$, Fig. 13) be made very great by the rapid extinguishing of the spark, very feebly damped waves of only one frequency, containing a much larger percentage of energy, would be radiated by the antenna. This mode of electric excitation corresponds to the sounding of a gong by striking it with a padded hammer. Both the primary electric circuit and the padded hammer have very high damping, and are in action only a very small fraction of the time, while the secondary circuit and the gong vibrate persistently. Wien's discoveries in 1916 formed the basis of practically all transmitters operating upon the spark principle.

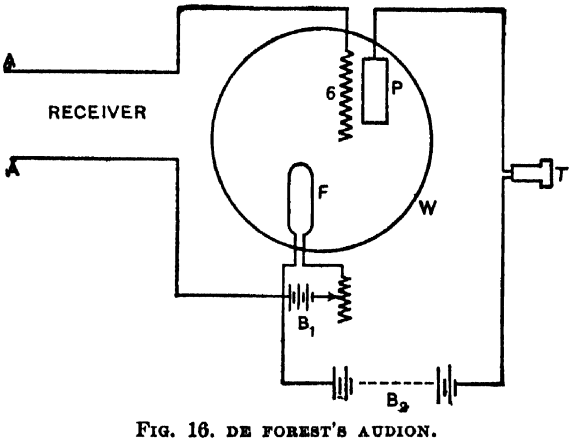

FIG. 16. DE FOREST'S AUDION.

In order to give to the transmitted signal a musical note a transformer excited by a high-frequency (500 cycle) alternating current was substituted in place of an induction coil.

In the United States, commencing about 1898 a great many patents were issued for improvements and developments of radiotelegraphic apparatus. Chief among the patentees were R. A. Fessenden, John Stone Stone, Lee De Forest, Harry Shoemaker, H. C. Dunwoody, and G. W. Picard. Chief among De Forest's inventions was a detecting device called the "audion" (Fig. 16), consisting primarily of an exhausted

glass tube W, containing a wire grid 6, a metallic plate P and a filament F, which is heated to incandescence by battery B_1. The plate P is connected in series with the telephone receivers T and battery B_2 to the negative side of the filament. The incandescent filament gives off electrons or negative electricity, forming in effect an electric valve or rectifier, which is made use of both in detecting and amplifying radio signals. The audion is also manufactured in large types which are used for generating high-frequency alternating current (see following section) both for measuring purposes and for radio and wire telephony.

In 1906 Gen. H. H. C. Dunwoody, United States army, found that with suitable supports a piece of carborundum would act as a detector of electric waves. After Dunwoody's discovery G. W. Picard of Boston patented the use of a great number of minerals, including silicon, zincite, chalcopyrite, bornite, etc., as contact detectors. It was at first thought that the detecting action of these minerals was due to some type of thermoelectric action between the mineral itself and its metallic supports. However, it was proved by Dr. G. W. Pierce of Harvard University that this was not the case, but the detecting action was due to rectification of the high-frequency currents.

UNDAMPED WAVES AND RADIOTELEPHONY

Electric Arc. It was soon discovered by the early experimenters in the radio field that best results were secured if the transmitted waves were very feebly damped or were entirely undamped. Marconi's first transmitter gave off very highly damped waves which, as far as receiving was concerned, were very difficult to tune to, and to remedy this defect the two-circuit transmitter was devised. When the radio transmission of speech was attempted, where the question was not merely interrupting the train of waves to give the dot and dash signals of the Morse code at a rate of not more than two or three breaks per second, but so to modulate them as to correspond with the vibrations of the human voice which may average from 500 to 20,000 per second, it was found that, to obtain any satisfactory results at all, not only should the transmitted waves be undamped, but they should be of considerably higher frequency than the highest tones used in speech. In the transmission of sound the intensity or amplitude of the waves sent out must be altered at the transmitting station corresponding to the modulations of the voice through the agency of a carbon transmitter, but the frequency of vibration remains constant. These modulations correspondingly affect the circuit of the receiving telephone and reproduce the original sound.

In 1903 V. Poulsen of Denmark devised a method for producing high-frequency undamped oscillations, suitable for use either in radio telegraphy or telephony. Poulsen's method consisted in establishing a direct current arc in an atmosphere of hydrogen, the arc taking place in a strong transverse magnetic field between copper and carbon electrodes. Shunted about the arc is a circuit containing a capacity C_1 and inductance L_1 of appropriate values to give the frequency desired (see Fig. 17), and it is in this circuit that the high-frequency currents exist. For telegraphing, a key is arranged for short circuiting a number of turns of the inductance L_2, by which means signals are made; for telephoning, a special type of microphonic transmitter is inserted directly in the antenna circuit. The Poulsen system was

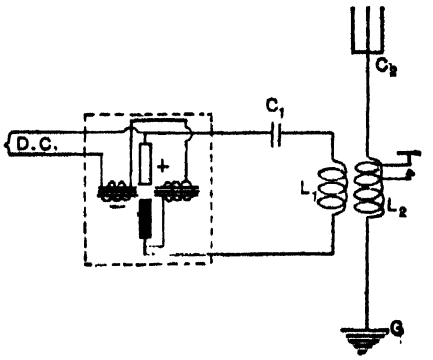

FIG. 17. POULSEN METHOD.

controlled and operated in the United States by the Federal Telegraph Co., which company, however, does not couple the arc to the antenna but places it in series with the antenna and the ground, as shown in Fig. 18. The United States

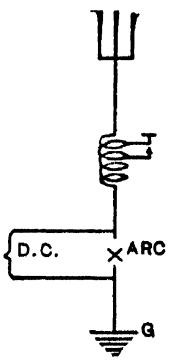

FIG. 18. POULSEN METHOD, AMERICAN MODIFICATION.

navy in 1916 used this type of transmitter very extensively.

Multitone Transmitter. In order to take advantage of the best features of arc operation and at the same time to eliminate the more undesirable ones, the multitone transmitter was devised. A diagram of connections is shown

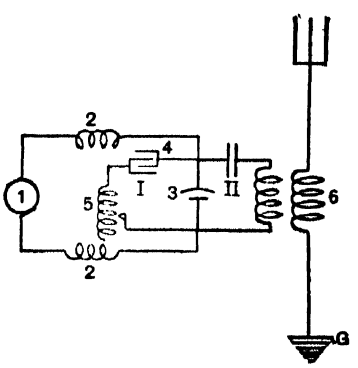

FIG. 19. MULTITONE TRANSMITTER.

in Fig. 19. In the diagram 1 is a direct-current generator connected through choke coils 2, 2 to a specially designed spark gap 3, shunted about which is the so-called tone circuit I, tuned to audible frequencies, and the radio-frequency circuit II. The latter contains a transmitting key, and is coupled to the antenna 6. Circuit 1 is comparatively undamped and the values of the capacity 4 and inductance 5 are so ad-

justed as to give audible frequencies. Circuit II, on the other hand, is tuned to radio-frequencies. The effect of circuit I is to superimpose upon the direct current flowing across the gap an alternating current of frequency determined by capacity 4 and inductance 5, and by adjusting the latter the tone-transmitted signal may be varied. Such a system is extremely valuable from a military standpoint, as in accordance with a prearranged schedule the tone of each signal may be changed, thereby insuring secrecy in transmission.

High-Frequency Alternators. Several methods for producing high-frequency currents directly by rotating machinery have been devised. Principal among these are: (1) Alexanderson alternator, which is of the inductor

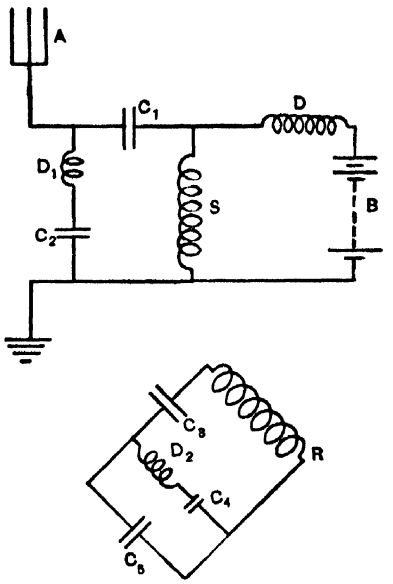

FIG. 20. DIAGRAM OF HIGH-FREQUENCY ALTERNATOR.

type, running at a speed of 20,000 revolutions per minute, and giving frequencies up to 200,000 cycles per second. This machine is an outgrowth of the early work of Tesla and Fessenden along the same line. It is supplied in powers as high as 75 kilowatts. With the proper controlling devices it is claimed that this alternator may be placed directly in the antenna circuit exciting it at the desired frequency; (2) Goldschmidt alternator, which is of the reflector type, running at a speed of approximately 4000 revolutions per minute and giving a fundamental frequency of about 10,000 cycles a second.

The operation of this alternator is based primarily on the principle, disclosed by Ferrari, that a magnetic field which is varying in sign and magnitude but stationary in space (i.e., an alternating field) may be resolved into two component fields, each of half amplitude but revolving in opposite directions with the same frequency at the exciting current. In Fig. 20 the stator S is excited by a battery B or direct-current generator. Revolving in this magnetic field is the rotor R, which has induced in it an alternating current of a frequency N, which is dependent upon the speed and number of poles. The rotor circuit $RC_3D_2C_4$ is tuned to the frequency N and forms a path of low impedance. The same result would be accomplished if the rotor remained stationary and the stator revolved. As explained above, the alternating magnetic field of the rotor may be resolved into two fields, one revolving with frequency $2N$ with respect to the stator and the other in synchronism with the stator. The field of frequency $2N$ will induce electromotive forces of the same frequency in the stator, to which frequency the circuit $SC_1D_1C_2$ is tuned. In an exactly similar manner the magnetic field set up by the currents in this circuit reacts upon the rotor producing in the circuit RC_3C_5 currents of frequency $3N$. This field is in turn reflected back to the stator, generating in the circuit, SC_1 antenna ground, currents of frequency $4N$. In this manner starting with a fundamental frequency of between 10,000 and 15,000 cycles, radio-frequencies as high as 60,000 cycles a second have been produced. Alternators of 150 kilowatts capacity have been constructed. The radio station at Tuckertown, N. J., which during the European War was in constant communication with Eilvese, Germany, was of the Goldschmidt type.

Static Frequency Changers. Though it has been a comparatively simple matter to construct alternators giving frequencies directly up to 15,000 cycles a second, special designs have to be resorted to when this limit is exceeded. To overcome this difficulty, methods have been devised, principally by Epstein in Germany, Vallauri in Italy, and Joly in France, for increasing such audio frequencies by static transformers. The operation of these transformers depends in general on the currents in two-branch circuits, in one of which the hysteretic lag of the iron core is greater than in the other. Two of the principal methods are described below.

Method of Epstein.—In this method two iron core transformers are employed with primaries wound in opposition. Auxiliary coils are supplied on each core, also wound oppositely and connected in series to a source of direct current, the strength of which is so adjusted as to work the iron at the knee of the magnetization curve. In Fig. 21, *b* and *c* the amount of this magnetization is represented by the dotted lines. If then an alternating current is supplied to the primaries, connected either in series or in parallel, it is evident that there is only a slight increase in the flux density, when the alternating and direct current magnetization is in the

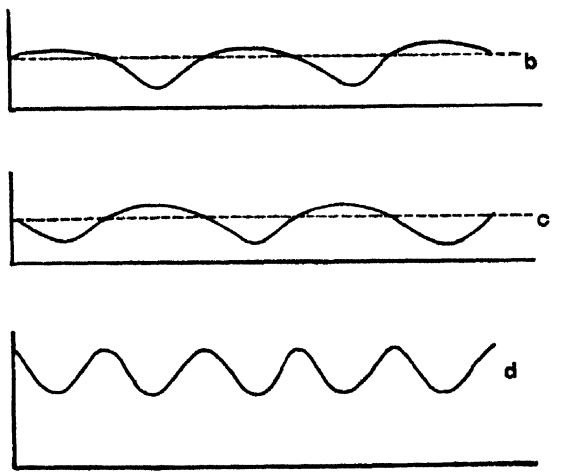

FIG. 21. MAGNETIZATION CURVE.

same direction, but there will result a considerable decrease in the flux density when they are in opposite directions. The full lines in Fig. 21, *b* and *c*, represent the resulting induction. Because of the fact that the direct current and primary coils of the two trans-

formers are so wound that during the positive half cycle they assist each other on one transformer and oppose each other on the other. the induction of the second transformer, represented by Fig. 21, *c*, lags 180° behind that of the first, Fig. 21, *b*. The resulting induction is given in Fig. 21, *d*, and is of double frequency. If the secondaries of the transformers are wound in the same direction and form part of a tuned circuit adjusted to the proper frequency there will be induced therein a voltage of twice the primary frequency.

Method of Joly.—A method for tripling the frequency depending upon the use of two iron core transformers, has been worked out by Joly. The primaries are, as in the preceding method, connected in series and wound in opposition; the number of turns is so adjusted that at the maximum current point of each half cycle one transformer is operating well below saturation, while the other operates practically saturated. The induction curve for the first transformer will be peaked, and for the second will be flat topped. If the secondaries are connected in series through a condenser of appropriate value, there will be set up in the circuit currents of triple the primary frequency, as is seen from curve *d*, Fig. 22, which is the difference of the two induc-

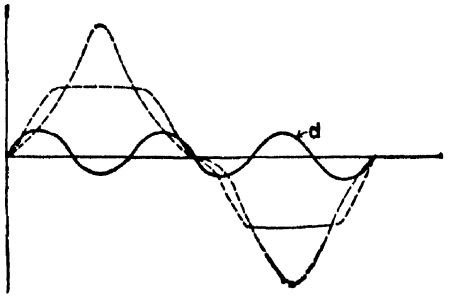

FIG. 22. INDUCTION CURVES OF JOLY SYSTEM.

tion curves of the separate transformer. The method employing static frequency transformers has been developed to a state of practical efficiency by Arco and apparatus of high power was installed in the United States at Sayville, L. I., with which communication was maintained with Nauen, Germany.

Audion and Pliotron. The "audion" (previously described), originally invented by De Forest, has been developed and improved to such an extent by the Western Electric and American Telephone and Telegraph companies, that in addition to serving as a detector it can be made to generate high-frequency currents of considerable amplitude. By making use of the wonderful amplifying powers of the audion it has been possible to radiate several kilowatts of high-frequency energy, and it was in this manner that in 1915 telephonic communication was established between the United States Navy Station at Arlington, Va. (outside of Washington), Paris, France, and Honolulu. Since that time, on various occasions, orders and messages have been transmitted from Arlington directly to vessels of the United States navy lying 100 or so miles off the Atlantic coast. An interesting feature in connection with this method of radiotelephony is that it may be used in conjunction with the land wire lines. Speech transmitted via wire from New York to Arlington is automatically transferred and sent out by radiotelephony.

By pushing the vacuum of the bulbs to a point hitherto unobtainable, and by thoroughly removing the gas from the electrodes and the glass itself, Dr. Irving Langmuir has been able to obtain high-frequency oscillations by means

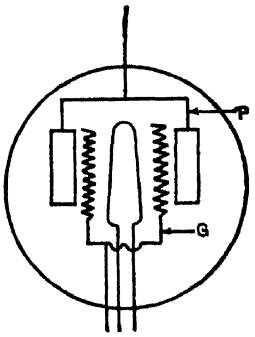

FIG. 23. PLIOTRON.

of the pure electron discharge. Langmuir apparatus called the "pliotron" is shown in Fig. 23. The advantage possessed by the Pliotron over the so-called "gas valves" is that with the former all of the irregularities which are present in the latter are absent.

The pliotron can be used either to control or to generate relatively large amounts of high-frequency energy. Because of its characteristics a number of pliotrons may be operated in parallel, thus still further increasing the amount of energy available. As applied to radiotelephony, the pliotron may be used either as a source of energy or as a means of control of a high-frequency alternator. A single pliotron of the 5-inch bulb type is able to control 2 kilowatts of energy in an antenna by means of currents obtained from an ordinary telephone transmitter.

Directed Radiotelegraphy. Electromagnetic waves given off by an ordinary transmitter will as a rule be propagated in all directions with equal intensity. It early was recognized that greater efficiency in transmission would be secured if the radiated energy were confined to a single direction and not diffused generally in all directions. With regard to the receiver, it is quite evident that any apparatus which is capable of determining the direction from which signals are received would prove of inestimable value to navigation as well as to naval and military operations. Among the scientists who have attacked this problem are listed the names of Braun, Stone. Bellini and Tosi, Marconi, and Meissner.

The method of Bellini and Tosi has been developed to a certain extent by the Marconi companies, a few vessels having been equipped with apparatus; good results have been reported. Apparatus known as the "Telefunken Compass" has been developed by the Telefunken Company, by means of which a receiving station is enabled to ascertain from what direction signals are coming. A number of directive transmitting antennæ are arranged radially about a station, which is also equipped with a single nondirective antenna. By means of an automatic contractor, first the nondirective antenna, and then in succession each of the directive antennæ are excited at given intervals. The operator at the distant receiving station starts a specially designed stop watch, which is in effect a compass, when he hears the beginning signal and stops it when the signals are of

maximum intensity. The pointer of the watch which runs in synchronism with the automatic contractor will then indicate the direction of the transmitting station relative to the points of the compass. Methods have been developed in the Radio Laboratory of the United States Bureau of Standards whereby with comparatively simple and inexpensive apparatus the direction of transmitting stations may be determined with great accuracy.

DEVELOPMENTS

Train Dispatching. Experiments carried on by the Delaware and Lackawanna Railroad, running west out of Hoboken, N. J., indicate that radiotelegraphy can be used in train dispatching. Powerful stations were erected at Hoboken, N. J., Binghamton, N. Y., and Scranton, Pa., and several passenger trains were equipped. Continued tests were conducted which proved very successful as it was found possible not only to telegraph between a station and a moving train, but also to telephone as well.

Automatically Operated Transmitters. Apparatus has been developed at the United States Bureau of Standards for automatically transmitting at definite intervals danger or warning signals. The plan was to equip lighthouses and lightships with such transmitters, having a range of from 10 to 20 miles, which would automatically send out certain prearranged signals, for example the number of the lighthouse or ship, at definite intervals. This apparatus when used in connection with a direction-indicating receiver would enable the navigator in times of fog or storm, not only to locate the direction of a light station, but to obtain his position as well.

Time Signals. The United States Naval Station at Arlington, Va., working in conjunction with the time service of the Western Union Telegraph Company, transmits time signals at 12 noon, and at 10 P.M. Eastern time. Time signals are also sent out from the Eiffel Tower in Paris and by various large radio stations throughout the world.

Radiotelegraph Companies. In 1916 the Marconi Wireless Telegraph Company of America manufactured its own apparatus and rented it to steamship companies, maintaining its own traffic and operating departments. The Tropical Radio Company, while purchasing its apparatus, maintained its own traffic and operating departments. The Federal Telegraph Company, which manufactures the Poulsen Arc apparatus in the United States, has a number of stations on the Pacific coast and maintains commercial radio service between San Francisco and Honolulu and other points. This company in 1916 proposed to erect near New York a 300-kilowatt station with 1000 foot towers, for the purpose of communicating directly with the Argentine Republic.

RADIOTELEGRAPH LEGISLATION

Because of its direct bearing upon naval and military operations and upon the maritime intercourse between different countries it soon became evident that radiotelegraphy was a subject for international legislation. Accordingly, in 1903, an International Radio Telegraphic Conference was held in Berlin, principally for the purpose of securing the transmission and reception of messages between stations regardless of the system or type of apparatus employed. In 1906 a second conference was held in Berlin in which was considered the advisability of international control of radiotelegraphy, and a convention was signed by a majority of the principal countries of the world. In 1910 an Act was approved by the United States government requiring radio equipment and operators on certain passenger-carrying vessels, and in 1911 the radio service was organized by the Department of Commerce and Labor to enforce the provisions of the Act. Radio inspectors, under the Bureau of Navigation, were stationed at New York, Baltimore, and San Francisco, whose duties were to inspect and test the radio apparatus of foreign and American vessels that entered those ports.

On June 4, 1912, a third international conference opened at London. This conference was attended by delegates from all of the principal countries of the world, and resulted in the adoption by the participating nations of an international code of laws regulating and standardizing the radiotelegraphic intercourse between the ship and shore stations of different countries. Among other things it was recommended that every commercial ship and shore station should be equipped to operate on two-wave lengths, 600 and 300 meters. The international distress call, S O S, was specified, a standard method of calling was adopted, and in order to insure regularity and rapidity in the handling of messages between stations of different nationalities, a set of service questions and answers for the use of operators was devised. A system of three-letter calls was adopted, certain series letters being assigned to each country.

On July 23, 1912, an Act was approved by the United States government extending the Act of 1910 to cover cargo vessels, and requiring auxiliary source of power, efficient communication between the radio room and the bridge, and two or more skilled radio operators in charge of the apparatus on certain passenger-carrying vessels.

About this time, probably due to the extremely fascinating character of the subject, a great many amateur stations had sprung up in different parts of the country, particularly along the coasts and in the neighborhood of the large seaports. Within a short time the volume and activities of these stations had increased to such an extent that they were commencing to interfere seriously with the operations of the commercial and government stations, and means were considered by Congress for bringing all radio stations, commercial and amateur, under the control of the government. On Aug. 13, 1912, a third Act was approved by Congress which was designed to enforce on behalf of the United States the London International Convention. This Act provided principally that radio operators and transmitting stations coming within the jurisdiction of the United States should be licensed, and made it unlawful to operate any unlicensed transmitting station, or for any unlicensed person to serve in charge or in supervision of such apparatus. It provided further that all licenses should be issued by the United States government at the discretion of the Secretary of Commerce, and might be withdrawn by him as a penalty for violation of the law. It designated the wave lengths of 200 meters to amateur stations, 300 or 600 meters

for calling, for commercial stations, and reserved wave lengths between 600 and 1600 meters for government use; it provided that the logarithmic decrement of the transmitted waves should not exceed 0.2 per complete oscillation and limited the power input of amateur stations to 1 kilowatt.

Operators were divided into different classes, depending upon their ability and experience, and were licensed to operate certain types of stations. Commercial and special stations were also divided into different classes, determined by the character of service, the grade of operators indicated, and call letters assigned.

To enforce these regulations the Department of Commerce divided the country into nine districts, each in charge of a radio inspector, with headquarters respectively at Boston, New York, Baltimore, Savannah, New Orleans, San Francisco, Seattle, Chicago, and Cleveland. The duties of the inspectors in each of these districts consisted in inspecting and testing such radio apparatus as might come under his supervision, examining and licensing operators, licensing amateur stations, and in general insuring that the radio laws were enforced.

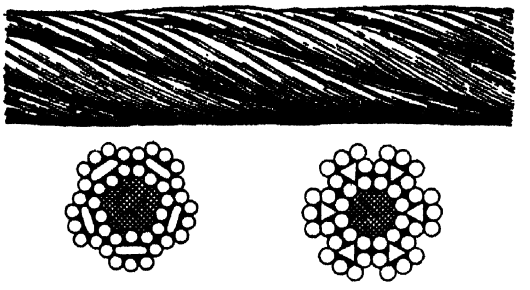
WIRELESS TELEPHONY. See WIRELESS TELEGRAPHY AND TELEPHONY.

WIRE ROPE. Rope composed of twisted strands each composed of metal wires twisted together. Wire ropes are now used generally for all purposes for which fibre ropes have been employed, and for many purposes they have displaced fibre ropes entirely. For most kinds of wire ropes steel is the metal employed, but other metals can be twisted into rope equally well, and such rope is made in limited quantities for special purposes. Steel wire rope is referred to alone in the statements which follow. To explain the construction of wire rope it is essential to note first that it is composed of two or more units called strands, and, second, that each strand is composed of two or more units or wires. Rope making consists, therefore, first in making the individual strands, and second in combining these strands into rope. In ordinary rope—special forms of rope will be considered later—the wires forming the strand are twisted together to the left; for running ropes 19 wires usually form a strand, and for standing ropes seven wires form a strand. To make the rope, six strands are twisted together to the right. The reason for using a greater number of wires for running rope is that rope which works over pulleys must be flexible, and the greater the number of component wires is, the more flexible is the rope. Ropes for certain purposes are made with as many as 400 wires. Flexibility is also increased by twisting the



STANDING ROPE (seven-wire strands around hemp core).

strands around a centre core of hemp, and in some instances by also twisting the wires of each strand around a hemp core. The length of twist or the lay adopted in rope depends upon the diameter of the wires employed and upon the size of the rope. Broadly speaking, the lays in strands vary from 6 to 12 inches. Short-laid ropes are more flexible than those with a comparatively long lay. It has just been stated that round wire ropes of ordinary construction have the composite wires of their strands twisted in one direction, while the strands forming the ropes are closed the opposite way about. In 1880 Mr. G. Craddock, an Englishman, introduced a construction of roping

PATENT LOCK COIL WIRE ROPE.

known as "the Lang lay," in which the wires forming the strands and the strands composing the rope are all laid in the same direction. Ropes of this type have been extensively used for running or winding purposes. In recent years many special forms of wire ropes have been invented. They are generally made of wires of special section designed to interlock with each other, and increased strength and

PATENT FLATTENED STRAND WIRE ROPE.

wearing capacity may be secured by having the strands so woven as to form a flat surface which will take up the wear more evenly, as it comes on a number of wires instead of the single one nearest the periphery of the rope. The strength of wire rope varies, of course, with the strength

of the material from which the wire is made, and it is usually about 10 to 15 per cent less than the aggregate strength of the component wires. Flat wire ropes are now little used; they were generally formed of four, six, or more round ropes of alternate lays sewn together by wires in a zigzag direction. The earliest form of wire rope was the selvagee construction, in which several wires were laid parallel to each other and wound with fine wire; such ropes are still used for suspension-bridge cables.

The manufacture of wire rope appears to have originated in Germany about 1821; in this year ropes of the selvagee type were made for the Geneva suspension bridge. Shortly afterward formed or stranded wire ropes were made and utilized. Wire-rope manufacture in England dates from about 1838; in that year R. S. Newall, of Dundee, invented a rope-making machine, and later he established a wire-rope works. From this origin the vast wire-rope industry of Great Britain, and afterward of the United States, was developed. Wire rope is now made altogether by machinery. The machines used are all built on the same principle, although they vary in form and arrangement and in their capacity. To understand the principle of a wire-rope machine, picture a large wheel free to revolve on a horizontal axle. At regular intervals on the side of the wheel rim assume spools or reels of wire to be attached so that they revolve with the wheel. If now we carry the free end of the wire on each wheel through a hole in a block of metal placed in line with the axle, and some distance away from the wheel, we have a crude form of rope-making machine, since by revolving the wheel the wires leading from the reels are twisted together at the metal block or head. Generally separate machines are used for twisting the wires into strands and for twisting the strands into rope, but some machines accomplish both processes simultaneously. Consult J. B. Smith, *Wire: Its Manufacture and Uses* (New York, 1891); William Kent, *Mechanical Engineers' Pocket Book* (9th ed., ib., 1916), and the catalogues of the leading manufacturers.

WIRE-TAILED BIRDS OF PARADISE. See BIRD OF PARADISE.

WIRE WORM. The larva of any one of the click beetles of the family Elateridæ. (See CLICK BEETLE; ELATERIDÆ.) The name is also sometimes applied to certain small myriapods.

WIRE-WOUND GUN. See GUNS, NAVAL; ORDNANCE.

WIRNT VON GRAFENBERG, vêrnt fôn grä'fen-bĕrk (or GRAVENBERG). A Middle High German poet of the thirteenth century. He was a Bavarian nobleman who between 1202 and 1205 wrote an epic, entitled *Wigalois*, which describes the adventures of Gawain's son, the name *Wigalois* being a corruption of Guinglain le Galois. Wirnt took his material from the French romance *Li bel inconnu* of Renaud de Beaujeu, and used it with great freedom. Though extravagant and didactic, the poem is one of the best romances of the Arthurian cycle written in Germany, apart from the work of Wolfram von Eschenbach and Hartmann von Aue. A popular prose version appeared in Augsburg in 1493, in Strassburg in 1519, in Frankfort in 1564 and 1586. *Wigalois* was edited by F. Pfeiffer (Leipzig, 1847). Consult F. Saran, *Beiträge zur Geschichte der deutschen Sprache und Litteratur*, vol. xxi (Halle, 1896).

WIRT, wêrt, WILLIAM (1772–1834). An American lawyer, statesman, and author, born at Blandensburg, Md. He studied law, and moving to Virginia, practiced his profession and held office. In 1803 he printed his *Letters of a British Spy*, containing sketches of popular speakers, which were Addisonian in style and highly popular. A second series of essays, entitled *The Rainbow* (1808), appeared later in the Richmond *Enquirer*, and *The Old Bachelor* (1812) was first published in the same paper by Wirt and some of his friends. Wirt achieved more fame by his readable, though not very accurate, *Life of Patrick Henry* (1817). Meanwhile he had settled in Richmond in 1806 and gained a high reputation by his speech in prosecution of Aaron Burr. He supported Jefferson in politics, and became a member of the Virginia Legislature (1807–08), and United States District Attorney (1816) and Attorney-General of the United States during the administrations of Monroe and J. Q. Adams (1817–29). On retiring he settled in Baltimore, and in 1832 accepted the Antimasonic nomination for the presidency. He was an able and amiable man, a good speaker, an effective though somewhat florid writer, and a lawyer and statesman of tried integrity and success. Consult the *Memoir* by J. P. Kennedy (Philadelphia, 1849); also W. P. Trent, "English Culture in Virginia," in *Johns Hopkins University Studies* (Baltimore, 1889).

WIRT, WILLIAM ALBERT (1874–). An American educator, born at Markle, Ind. He graduated at De Pauw University in 1898, did postgraduate work at the University of Chicago, and studied the educational systems of England, France, and Germany. After an experience as superintendent of schools at Redkey, Ind., he became superintendent in 1899 at Bluffton, Ind., where he worked out some experiments in educational administration and pedagogy that attracted attention throughout the country. In 1906 he was invited to complete these experiments as superintendent of schools at Gary, Ind. His success in Gary secured for him in 1914 the position of expert adviser to the Board of Education and Board of Estimate in the reorganization of the New York City schools. For the Gary Plan or Wirt Plan, as it is variously called, see SCHOOLS, *The School of Varied Activities*.

WISBECH, wĭs'bēch *or* wĭz'-, or **WISBEACH.** A river port in Isle of Ely, Cambridgeshire, England, on the Nene, 12 miles above its mouth in the Wash (North Sea), and 40 miles north of Cambridge (Map: England, G 4). One of the principal buildings is the restored church of St. Peter and St. Paul. There are manufactures of rope. Wisbech is mentioned in 664, became noted for its extensive fisheries, in 1190 it received privileges from Richard I, and in 1549 was incorporated by Edward VI. Pop., 1901, 9831; 1911, 10,822.

WISBY, wĭz'bĭ, or **VISBY,** vēs'bŭ. The capital of the Swedish island and län of Gotland, on the west coast of the island, about 44 miles from the mainland of Sweden (Map: Sweden, F 8). The town is imposingly situated amid gardens on and at the foot of a rugged cliff. It has greatly declined, as is attested by the half-vacant area inclosed within the interesting mediæval walls with their 38 ancient towers. The many houses dating back to the period from the thirteenth to the seventeenth century give the place a very quaint

appearance. Of the original 16 churches, only one, the cathedral of St. Mary, at the foot of the cliff, now remains in service. It was erected by the Germans and was completed in 1225. The interesting ruined church of St. Nicholas, partly Romanesque and partly Gothic, dating from about 1250, has two beautiful rose windows, supposed to have contained the two carbuncles which, tradition says, now lie at the bottom of the sea with the bones of Valdemar. The charming Gothic St. Catharine Church dates from about 1230. Near the southeast corner of the walls is a monolithic cross marking the sepulchre of the defenders of the city in 1361. The Gotland Museum, rich in antiquities, the high school with a museum, the chemical station, and the library are the principal public buildings. The modern harbor, south of the old Hanseatic harbor, which has disappeared, has two basins to accommodate traffic. Pop., 1900, 8376; 1910, 9961.

The history of Wisby is that of Gotland (q.v.). The town was probably a place of human sacrifice and a trading place of some importance in pagan times. In the Middle Ages, when it was a member of the Hansa, it was a great distributing centre for the commerce between the Orient and the Baltic countries. A famous maritime code bore its name. Valdemar IV Atterdag of Denmark conquered the town in 1361, and it never regained its supremacy.

WISBY (wiz'bĭ), LAWS OF. A collection of mercantile customs and regulations, dating from the last years of the thirteenth century and taking its name from the celebrated trading town in Gotland, Sweden. The laws of Wisby were in force throughout the Baltic Sea and were made the basis of the ordinances of the Hanseatic League. They were an important factor in the development of the modern system of maritime law.

WISCONSIN. A State in the Middle West, popularly known as the "Badger State." It is 320 miles long and 295 miles wide, ranks twenty-fifth in size among the States of the Union, and covers 56,066 square miles, of which 810 are water.

Topography. Wisconsin is naturally divided into the following geographical provinces: the Northern Highland, the Lake Superior Lowland, the Central Plain, the Eastern Ridges and Lowlands, the Western Upland. The Northern Highland is a dome-shaped, slightly dissected peneplain. It contains: the highest point in Wisconsin, Rib Hill, 1940 feet; Penokee Range, a long narrow ridge nearly 1800 feet high; parallel ridges of trap rock; isolated hills of quartzite; and glacial hills. The Lake Superior Lowland is divided into two drift-floored plains, not far above lake level. It is a reëxcavated rift valley, due originally to faulting and separated from the Northern Highland by a steep escarpment. The Eastern Ridges and Lowlands, Central Plain, and Western Upland constitute a belted plain. The ridges and uplands, called cuestas, are unsymmetrical, having steep escarpments on one side. The latter include: (*a*) Niagara Escarpment, parallel to Lake Michigan; (*b*) the Magnesian Escarpment west of it, sometimes with an intermediate Trenton Escarpment; (*c*) the continuation of the Magnesian Escarpment in western Wisconsin; (*d*) Military Ridge, whose northern face is an east-west escarpment, running from Madison to the Mississippi and westward into Iowa. These escarpments, lines of cliffs and steep slopes 150 to 300 feet high, face northwest, north, or northeast. The cuesta surfaces, sloping gently in the opposite directions, are (*a*) plains of slight relief, as in eastern Wisconsin, (*b*) exceedingly hilly regions with ridges rising to the level of the cuesta surface, as in the Western Upland. In the edge of the latter is the Baraboo Range, 1620 feet, a buried and partly exhumed quartzite ridge, rising 800 feet above the Central Plain. The gorge of the Mississippi, with bluffs 230 to 650 feet high, is 1 to 6½ miles wide and receives similar tributary gorges. Most of the Western Upland, together with small parts of the Central Plain and Northern Highland, constitute the Driftless Area, within which lack of glacial modification seems responsible for the retention of hilliness, especially in the Western Upland, where there are many caves and sinkholes made by underground water. The Niagara Escarpment and part of the Magnesian Escarpment have notable simplicity of outline, while Military Ridge and the portion of the Magnesian Escarpment in the Driftless Area are markedly irregular. In front of the indented Driftless Area escarpments are isolated outlying hills. Those in the Central Plain are castellated sandstone mesas and buttes of an arid-land type, well seen near Camp Douglas, Merrillan, and Roche à Cris. Blue Mound, 1716 feet, is a limestone outlier, one of many left behind in the recession of the Niagara Escarpment, the nearest part of which now lies about 50 miles to the southwest.

The lowlands of the belted plain include (*a*) the crescentic Central Plain, (*b*) the Green Bay-Lake Winnebago-Rock River Lowland, (*c*) the basin of Lake Michigan. All three lie in belts of weak rock. The last named is thought to have been tremendously deepened by glacial erosion. In eastern Wisconsin are oval hills of glacial drift called drumlins. There are 1400 drumlins in 4200 square miles, and at least twice that number in all.

Drainage. The chief rivers are: the Mississippi; the Wisconsin, flowing southward through the centre of the State and then westward into the Mississippi, which also receives the Black, Chippewa, and St. Croix; the Rock, flowing southward into Illinois; the Menominee on the Wisconsin-Michigan boundary. The diagonal valley extending southwestward from Green Bay to the Mississippi is occupied by (*a*) lower Fox River, whose water power supports a flourishing industrial district, (*b*) Lake Winnebago (q.v.), the largest inland lake in Wisconsin, (*c*) upper Fox River, which is only 1½ miles from the Wisconsin River at Portage, where the waters sometimes unite on a swampy divide, (*d*) the lower Wisconsin. This river has a beautiful postglacial gorge—the Dalles—west of Portage. Devil's Lake, in the Baraboo Range, occupies an abandoned watergap of Wisconsin River. Lake Pepin interrupts the course of the Mississippi, where the latter is partially dammed by the deposits of the Chippewa. The Mississippi similarly forms Lake St. Croix. Numerous lakes, all small, lie in northern and eastern Wisconsin. Rapids and waterfalls furnish much water power.

Coast Line. The Lake Michigan and Lake Superior coasts include 500 miles of shore line. Milwaukee, Racine, Sheboygan, and Green Bay harbors are improved mouths of small rivers. Superior and Ashland harbors lie behind great sand spits.

Climate. Wisconsin has a variable continental climate with hot summers and cold winters,

modified slightly by the Great Lakes. The mean annual temperature is 43° F. The average temperature ranges from 47° in southwestern Wisconsin to 39° in the Northern Highland. The extreme range is from 110° above to 50° below zero. The mean annual rainfall is about 36 inches, May to July being the wettest months. Tornadoes sometimes occur in summer. Thunder showers are severe. Near certain lakes there are dense winter fogs.

Soil. The residual soils, chiefly in the Driftless Area, are sands, loams, and clays derived from the weathering of sedimentary rocks and older glacial drift. The transported soils are glacial till and outwash, lake clay and sand, alluvium, dune sand, peat, and marl. There are about 7,000,000 acres of swamp land. A loam, covering large areas in western Wisconsin, is the loess, brought by the wind during and soon after the Glacial Period.

Geology. The State has pre-Cambrian metamorphic, igneous, and sedimentary rocks in the Northern Highland. Paleozoic sediments occupy the belted plain to the south and are folded into a broad anticlinal arch. The geological history of the State has included the following: (1) all Wisconsin was mountainous 25 to 100 million years ago, after the pre-Cambrian rocks were deposited and folded; (2) a peneplain, with a few eminences; (3) alternately submerged and elevated while the Paleozoic rocks were being deposited; (4) again dry land and being fashioned into its present form; (5) all but the southwestern quarter buried beneath a continental ice sheet; (6) the ice sheet melted away, leaving Wisconsin somewhat as before the Glacial Period, but with notable modification of topography, soil, and drainage.

Mineral Resources. Wisconsin ranked thirty-first among the States in value of mineral products in 1914. The most important products in order of importance are zinc, stone, iron ore, and clay products. Though ranking fourth in the production of spelter produced, Wisconsin ranked fifth in zinc production in 1914. The amount of zinc produced in that year was 31,113 short tons, valued at $3,173,526. The most important varieties of the stone industry are limestone and granite. The value of the output of limestone in 1914 was $1,007,106, and of granite $1,238,734. The total stone production in that year was valued at $2,413,435. Wisconsin is included in the Lake Superior District as a producer of iron ore, though it is far below Michigan and Minnesota in quantity and value of product. The production of pig iron in 1914 was 250,144 short tons valued at $3,350,199, and the State ranked fifth in this regard. The value of clay products in that year was $950,999. Other minerals produced are lead, with a production of 227,469 short tons valued at $871,820 in 1914; mineral paints; mineral waters, valued at $588,373; pyrite, and sand and gravel. The total value of the mineral production in 1914 was $11,022,643.

Agriculture. Of an approximate land area of 35,363,840 acres in 1910, 21,060,066 acres were in farms, of which 11,907,606 was improved land. The total number of farms was 177,127 and the average number of acres to the farm was 118.9, the average value per acre of farm land $43.30. The total value of all farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was $1,413,118,785. Of the total number of farms 152,473 were operated by owners and managers and 24,654 by tenants. The native white farmers numbered 107,180, the foreign-born white 69,356, and the negro and other nonwhite 591. Nearly fifty per cent of the foreign-born white farmers were born in Germany, and more than 15 per cent in Norway.

The following table shows the acreage, production, and value of some of the most important crops for 1915 as estimated by the United States Department of Agriculture.

CROPS	Acreage	Prod. in bu.	Value
Corn	1,775,000	40,825,000	$27,761,000
Wheat	205,000	4,662,000	4,429,000
Flaxseed	7,000	94,000	169,000
Oats	2,150,000	99,975,000	35,991,000
Rye	420,000	7,770,000	6,760,000
Potatoes	298,000	25,926,000	11,667,000
Hay	2,576,000	*4,508,000	44,629,000
Barley	656,000	23,288,000	13,041,000
Tobacco	41,000	†36,900,000	2,214,000
Buckwheat	18,000	234,000	194,000

* Tons. † Pounds.

The total value of all crops in 1909 was $148,359,216. The leading crops are hay and forage, oats, corn, barley, and potatoes. According to the thirteenth census there were devoted to hay and forage 3,079,102 acres which yielded 5,002,644 tons valued at $40,866,396. The acreage of oats was 2,164,570 and the production 71,349,038 bushels valued at $28,663,257; the acreage of corn 1,457,652 and the production 49,163,034 bushels valued at $25,727,654; the acreage of barley 816,449, and the production 22,156,041 bushels valued at $12,682,136; the acreage of potatoes 290,185 and the production 31,968,195 bushels valued at $7,917,754. Tobacco had an acreage of 40,458 and a production of 46,909,182 pounds valued at $3,855,033. Rye covered 339,213 acres and had a production of 4,797,775 bushels valued at $3,163,520. The acreage of vegetables (other than potatoes) was 70,123 and their value $4,593,865.

The total acreage of small fruits was 6305 and the production 9,782,779 quarts valued at $765,437. Most important among such fruits were strawberries, cranberries, and raspberries. Orchard fruits had a production of 2,343,517 bushels valued at $2,087,202; more than nine-tenths of the product were apples. The production of grapes amounted to 701,329 pounds valued at $25,537. The total value of the maple sirup and maple sugar made in 1909 was $150,038. The production of sugar beets was 127,526 tons valued at $667,185. Some 13,735 tons of sorghum cane was grown from which 139,667 gallons of sirup valued at $83,026 was made.

Live Stock and Dairy Products.—The total value of livestock on farms in 1909 was $153,700,250. According to the estimates of the United States Department of Agriculture there were (Jan. 1, 1916) on the farms 712,000 horses valued at $88,288,000; mules, 3000 valued at $360,000; milch cows, 1,675,000 valued at $92,125,000; cattle other than milch cows, 1,313,000 valued at $33,088,000; sheep, 664,000 valued at $3,519,000; swine, 2,142,000 valued at $19,278,000. The total value of milk, cream, and butter fat sold, and butter and cheese made, was $53,868,028. The milk sold amounted to 297,251,969 gallons valued at $28,640,661; the butter made amounted to 27,200,509 pounds valued at $7,101,237. The

total number of fowls of all kinds on the farms was 9,433,110 and their value $4,468,703.

Forest Products. Wisconsin, formerly of first rank in the production of lumber, had, by reason of depleted forests, dropped to eighth rank in 1909. The rough lumber cut in that year amounted to 2,025,038 M feet B. M., the laths numbered 299,845 thousand, the shingles 392,863 thousand. Of the total cut 1,399,398 M feet B. M. was soft wood, of which 709,347 M feet were hemlock and 612,327 M feet white pine. The chief hard woods in order of importance were birch, basswood, maple, oak, and elm. Considerable quantities of spruce, cedar, tamarack, beech, and ash were also cut. In addition to the figures quoted above there were produced on the farms of the State forest products valued at $9,559,428.

Fisheries. The three fishing districts of the State named in order of importance are the Lake Michigan District, the Mississippi River District, and the Lake Superior District, the value of the output of the first named being more than double that of the other two combined. The gross value of equipment and other capital was $1,100,000 in 1908, and was about evenly divided between boat and shore and vessel fisheries. The industry gave employment to 2011 persons in that year. The most important species caught together with the value of the catch in 1908 are: lake trout ($340,000), lake herring ($322,000), and Buffalo fish ($103,000). The total value of all products was $1,067,000.

Manufactures. Wisconsin ranked eighth in gross value of manufactured products in 1909, in which year the total value of such products per capita was $253. The following table gives the principal figures relative to manufactures of the State as a whole and the 10 leading industries.

SUMMARY OF MANUFACTURES FOR 1909 AND 1904

THE STATE — TEN LEADING INDUSTRIES.

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY: Total	PERSONS ENGAGED IN INDUSTRY: Wage earners (average number)	Capital	Wages	Value of products	Value added by manufacture
					Expressed in thousands			
All industries	1909	9,721	213,426	182,583	$605,657	$93,905	$590,306	$243,949
	1904	8,558	173,572	151,391	412,647	71,472	411,140	183,885
Lumber and timber products	1909	1,020	37,134	34,093	68,309	16,059	57,979	32,382
	1904	777	36,961	34,457	48,456	16,674	58,531	33,948
Foundry and machine-shop products.	1909	444	28,075	24,219	86,898	14,601	54,124	31,590
	1904	362	17,469	15,330	48,390	8,589	31,370	17,747
Butter, cheese, and condensed milk	1909	2,630	5,161	2,863	9,766	1,877	53,843	5,837
	1904	2,360	4,479	2,298	5,897	1,328	29,995	3,589
Leather, tanned, curried, and finished.	1909	32	7,977	7,548	49,412	3,988	44,668	9,839
	1904	33	5,905	5,556	30,409	2,687	25,845	5,974
Liquors, malt.	1909	136	6,076	5,061	69,683	3,045	32,126	24,228
	1904	139	5,612	4,872	53,349	2,860	28,692	23,507
Flour-mill and gristmill products.	1909	322	1,931	1,184	10,663	695	31,667	4,629
	1904	380	2,096	1,351	10,546	720	28,352	3,596
Slaughtering and meat packing	1909	48	2,263	1,890	6,629	1,042	27,217	3,814
	1904	23	1,762	1,580	4,887	782	16,569	2,497
Paper and wood pulp	1909	57	7,878	7,467	33,738	3,891	25,962	9,269
	1904	52	6,627	6,338	24,409	2,988	17,844	7,152
Furniture and refrigerators	1909	114	12,161	11,118	21,229	5,136	18,656	9,861
	1904	107	10,353	9,702	16,340	3,750	12,370	6,605
Cars and general shop construction and repairs by steam-railroad companies.	1909	22	9,419	8,994	3,279	5,234	14,332	5,656
	1904	30	5,745	5,444	3,916	3,128	6,512	3,441

The lumber and timber industry is the most important, and in 1909 gave employment to 18.7 per cent of the wage earners and contributed 9.8 per cent of the total value of products. (See *Forest Products.*) Foundry and machine-shop products are more important than apparent from the table below. Many machine shops manufacture distinct products, such as automobiles, etc., and were given individual classification under the Thirteenth Census. Wisconsin ranks first in the production of butter and cheese and condensed milk. Of these, butter and cheese constitute 95.6 per cent of the value of products. The principal products of the leather industry are shoe and harness leather. The hides consumed in this industry amounted to 2,471,848 valued at $16,373,708, while of skins 6,986,673 were used valued at $12,379,806. The State contributed, in 1909, 8.6 per cent of the total value of malt liquors and 25.1 per cent of the malt produced in the United States, ranking third among the States in the production of the one and second in the other.

The average number of wage earners was 182,583, of whom 159,101 were male; 5267 of the total were under sixteen years of age. For more than five-sixths of the wage earners the prevailing hours of labor were from 54 to 60 per week. The eighteen cities having over 10,000 population reported 61.8 per cent of the value of manufactured products and 62.3 per cent of the wage earners. Milwaukee, by far the most important of the cities, gave employment in 1909 to 59,502 wage earners and yielded products valued at $208,323,630. Racine gave employment to 8381 wage earners and had an output valued at $24,672,669; Kenosha gave employment to 6449 wage earners yielding products valued at $23,181,672. Other important manufacturing cities are Oshkosh, La Crosse, Sheboygan, Fond du Lac, Appleton, and Superior. See articles on these cities.

Transportation. Water transportation is supplied Wisconsin by its long coast lines on Lakes Michigan and Superior, and in the interior by the Mississippi and St. Croix rivers on the western boundary and the Fox River between Green Bay and Lake Winnebago. The railroads cover the State rather evenly, centring particularly about Grand Rapids and Madison. The total mileage of main track in 1915 was 7518, the most important roads and their mileage being

the Chicago and Northwestern, 2168; the Chicago, Milwaukee, and St. Paul, 1796; the Minneapolis, St. Paul, and Sault Ste. Marie, 1351.

Banking. A general banking law was passed in 1852, and in 1903 a State banking department was created with a commissioner of banking at its head. The condition of the banks in 1915 is shown in the following table:

	National banks	State banks	Savings banks
Number	136	653	5
Capital	18,115,000	18,095,450	.....
Surplus	8,376,000	5,450,223	103,040
Cash, etc	7,953,000	6,934,967	12,109
Deposits	147,830,000	169,914,288	2,043,219
Loans	123,879,000	145,374,840	1,184,110

Government. The present constitution was formulated in 1847 and 1848, but has been amended in important particulars. Amendments may be proposed in either house of the legislature, but to become a part of the constitution must be carried by a majority of both houses, agreed to by the next succeeding legislature, and approved by the voters at large. A majority of the members of both houses may recommend to the electors to vote for or against a constitutional convention at the next election of the members of the legislature. If a majority of the electors vote affirmatively the legislature at its next session provides for calling such a convention.

Legislative.—The legislative power is vested in the Senate and Assembly. The Assembly must never number less than 54 members, nor more than 100. The Senate consists of not more than one-third, or less than one-fourth of the number of the members of the Assembly. Members of the Assembly are chosen biennially, on the Tuesday following the first Monday of November.

Executive.—The executive power is vested in a governor and lieutenant governor, who hold office for two years. Other executive officers are secretary of state, treasurer, and attorney-general, who are elected at the same time as the governor.

Judiciary.—The judicial power of the State is vested in a supreme court, circuit courts, courts of probate, and justices of the peace. Justices of the Supreme Court are elected for a term of ten years; circuit judges for six years, probate judges for four years, and justices of the peace for two years. The State is divided into twenty judicial circuits.

Suffrage and Elections.—Every male person of the age of 21 years or upwards, who is a citizen of the United States, or if of foreign birth has declared his intention to become a citizen prior to Dec. 1, 1908, and who has resided in the State for one year preceding the election, and in the election district at least 10 days, is entitled to vote. Women have the privilege of voting in school elections. Candidates for the various State offices and for the Senate and Assembly, nominated by each political party at the primary, and the State senators who "hold over," meet at the Capitol, for the purpose of formulating the State platform of their party and electing a State central committee. General elections are held on the Tuesday succeeding the first Monday in November in even-numbered years. Judicial and school elections are nonpartisan. The use of voting machines is permitted. There is a stringent corrupt practices law which prohibits one candidate from contributing to the campaign fund of another candidate; limits the purposes for which candidates may expend money; and compels candidates to file monthly sworn statements of moneys received and expended.

Local and Municipal Government.—Towns are governed by an annual town meeting, at which all officers required by law are elected. County officers are: county clerk, treasurer, sheriff, clerk of the circuit court, district attorney, coroner, register of deeds, surveyor, and superintendent of schools, all elected for two years. Cities may be governed by special or general charter, or, if they so elect, by commission form of government. In all cities the mayor is the chief executive officer and head of the police and fire departments.

Miscellaneous Provisions.—The Industrial Commission administers all labor laws, factory regulations, and the workman's compensation act. Hours of labor for women are strictly regulated. The employment of children under 14 years, and in some occupations under 16 years, is prohibited. There also is a minimum wage law and a law providing for mothers' pensions. The sale of intoxicating liquor is regulated by local option in towns, villages, and cities.

Finance. The constitution places the usual restrictions upon all expenditures. The State, with the assent of a majority of all members elected to either branch of the Legislature, may contract a public debt to defray extraordinary expenses, but the amount must not exceed $100,000. A debt of $2,251,000, incurred during the Civil War, is held by the various State educational funds. The State has no bonded debt. The chief sources of revenue are the taxes on railroads, life and fire insurance companies, and inheritances. The total receipts for the year ending July 1, 1915, amounted to $19,431,931, the disbursement $19,789,188. On July 1, 1914, there was a balance on hand of $4,300,854, and on July 1, 1915, one of $3,945,597.

Militia. The males of militia age in the State in 1910 numbered 497,922. The organized militia was composed in 1915 of 896 enlisted men and 52 officers. It included three regiments, a separate battalion of infantry, a troop of cavalry, a battery of field artillery, and four detachments of sanitary troops.

Population. The population at each Federal census was: 1840, 30,945; 1850, 305,391; 1860, 775,881; 1870, 1,054,670; 1880, 1,315,497; 1890, 1,693,330; 1900, 2,069,042; 1910, 2,333,869. The estimated population for 1915 was 2,473,533. The average number of persons to the square mile in 1910 was 42.2. The urban population, i.e., that in places of 2500 or more, was 1,004,320. The native whites of native parentage numbered 763,225; the native whites of foreign or mixed parentage 1,044,761; the foreign-born whites 512,569; the negro and other nonwhites 13,305. Of the foreign-born population 45.5 per cent were born in Germany, 11.1 in Norway, 7.5 in Austria, and 5.8 in Russia. Of the nonwhites 10,142 were Indians. Of the native born 85.6 per cent were born in the State, 2.5 per cent in Illinois, and 2.3 per cent in New York. By sex the population was divided into 1,208,578 males and 1,125,282 females. The males of voting age numbered 683,743. There were, in 1910, 23 cities with a population of 8000 or more. Those having more than 15,000, together with their population for 1910 and 1915 (estimated) are: Milwaukee, 373,857 and 428,062; Superior, 40,384

and 45,285; Racine, 38,002 and 45,507; Oshkosh, 33,062 and 35,581; La Crosse, 30,417 and 31,522; Sheboygan, 26,398 and 28,211; Madison, 25,531 and 30,084; Green Bay, 25,236 and 30,084; Kenosha, 21,371 and 30,319; Fond du Lac, 18,797 and 20,740; Eau Claire, 18,310 and 18,727; Appleton, 16,773 and 17,663; Wausau, 16,560 and 18,778; Beloit, 15,125 and 17,597.

Education. Wisconsin has one of the best school systems in the Union. There were in the State, in 1910, 57,769 persons 10 years or over who could not read or write. The percentage of illiteracy among native whites was 0.6. Among native whites of foreign or mixed parentage 1.0, and among foreign-born whites 11.1 per cent. The total school population ages 6 to 20 in 1910 was 732,544. Of these 484,629 attended school. The school population in 1915, according to the reports of the State superintendent of education, numbered 782,246, of which 464,108 were enrolled in all the schools. The total number of public-school teachers was 15,531, of whom 13,839 were women. The rural schools numbered 6635, the State graded schools 542, free high schools 324, independent high schools 12. The total enrollment in the high schools was 41,823. The total amount expended for the common schools in 1914 was $15,410,868. The Department of Public Instruction handles the administrative side of school supervision while the State Board of Education, a body created by the Legislature of 1915, will have charge of school finances. The schools are visited by supervising teachers, of whom in 1915 there were 81. Agriculture is taught in the high schools, and provision is made for the consolidation of districts where desirable. There are normal schools at Eau Claire, La Crosse, Milwaukee, Oshkosh, Plattville, River Falls, Stevens Point, Superior, and Whitewater. The University of Wisconsin is a part of the educational system of the State. Other institutions of collegiate rank are Beloit College at Beloit, Lawrence College at Appleton, Milton College at Milton, Mission House at Plymouth, Ripon College at Ripon, Carroll College at Waukesha. These are all coeducational. Concordia College at Milwaukee is for men only, as is Marquette University, a Roman Catholic institution, at Milwaukee. Milwaukee-Downer College is the only college exclusively for women in the State.

Charities and Corrections. The charitable and correctional institutions of the State include the State Hospital for the Insane at Mendota, Northern Hospital for the Insane at Winnebago, Milwaukee Hospital for the Insane at Wauwatosa, School for the Deaf at Delavan, School for the Blind at Janesville, Hospital for the Criminal Insane at Waupun, Industrial School for Boys at Waukesha, the State Prison at Waupun, the State Public School at Sparta, the Home for Feeble-minded at Chippewa Falls, the State Reformatory at Green Bay, and the State Tuberculosis Sanatorium at Wales. These institutions are managed by the State Board of Control. Persons who are convicted for the first time of felony may be placed under probation. An industrial home for women and a home for feeble-minded and epileptics were authorized by the Legislature of 1913. Convicts in the State prison are employed in the construction of highways. The total expenditures for the maintenance of the charitable and penal institutions of the State for the year ending June 30, 1915, were $1,526,415.

Religion. The combined membership of organized religious bodies includes about half the population. The Roman Catholics outnumber the total communicants of the Protestant bodies, which rank in the following order of numerical strength: Lutherans, Methodists, and Congregationalists.

History. At the time the region now included within the State was first made known to Europeans it was the borderland between the hunting grounds of the Algonquian tribes, which were gradually pushing westward, and the Dakotas or Sioux, the great body of whom already lay beyond the Mississippi. In 1634 Champlain, Governor of New France, dispatched Jean Nicolet, a *coureur de bois*, westward along the Great Lakes to make treaties with the remote tribes of Indians, and to encourage them to trade with the French. Nicolet first set foot upon what is now the State of Wisconsin late in 1634 or early in 1635. He landed first at Green Bay, where he found a large Indian settlement, thence ascended the Fox River to a point beyond its passage through Lake Winnebago, and then turned southward. He probably proceeded as far south as the site of Chicago, and returned east by way of Lake Michigan. The next white explorers in the Wisconsin region of whom we have any record were Radisson and Groseilliers, two fur traders, who reached the country in 1658–59. They followed in the track of Nicolet, but probably crossed the Fox-Wisconsin portage and descended the latter river almost, if not quite, to its mouth. Recent investigations make it seem more than probable that they were actually the first discoverers of the Upper Mississippi. In the winter of 1661 they built a stockade on the south shore of Chequamegon Bay, near the present site of Ashland. On the same spot Father Allouez, in 1665, established the La Pointe Mission—the first in Wisconsin. Subsequently (1669) he built the Mission of St. Francis Xavier at the Rapides des Peres on the Fox River, on the site of the city of De Pere. Here was built the first church in Wisconsin, and about this mission grew up the first white settlement of any permanence. In 1673 Louis Joliet and Jacques Marquette, setting out from the St. Francis Mission, sailed up the Fox and descended the Wisconsin to the Mississippi. In 1674 Marquette made a canoe trip from Green Bay to the site of what is now Chicago along the shores of Lake Michigan. In the years that followed the region became one of the principal fields of activity of the *coureurs de bois*, prominent among whom were Nicolas Perrot and Daniel de Grecylon du Luth, from whom the city of Duluth takes its name. La Salle (q.v.) thoroughly explored the Wisconsin region before he attempted his remarkable trip down the Mississippi. Although the region became dotted with trading posts and missions, there was no permanent settlement in Wisconsin until towards the middle of the eighteenth century, when the De Langlade family established themselves at Green Bay, the first permanent settlement. In the French and Indian War Charles de Langlade led a body of *coureurs de bois* and Wisconsin Indians to the aid of the French, and commanded them in the battle which resulted in Braddock's defeat. After the Revolution, in which De Langlade and the Wisconsin Indians remained true to the British, although by the terms of the treaty Wisconsin became part of the United States, the British continued to exercise authority in the region. Nor did Jay's treaty of 1794,

in spite of its provisions for the surrender of the outposts, result in a change of authority. During the War of 1812 the French and Indians took the field against the Americans, and an expedition starting from the British fort at Green Bay assaulted and captured an American garrison at Prairie du Chien.

For a decade after the close of the war the fur trade remained the principal business of the inhabitants of the region between Lake Michigan and the Mississippi River, and the growth in population was slow, the number of white inhabitants as late as 1824 being not more than 6000 or 7000. The authority of the United States was firmly established in 1816, when several detachments of the regular army were sent into the Territory, and forts built at Green Bay (Fort Howard) and at Prairie du Chien. In 1820–21 several bands of Oneida and Brotherton Indians from New York State were settled in the Territory. In 1822 the opening of the lead diggings in the southwestern part of the Territory was followed by an influx of immigrants, largely Southerners, many of whom brought their slaves with them. By 1828 the population of the lead region was over 10,000. An uprising of the Winnebago under Red Bird in 1825 was suppressed with little bloodshed, and no further trouble was experienced from the Indians until the outbreak of the Black Hawk War (q.v.) in 1832. After the defeat of Black Hawk a large immigration of agricultural settlers from New England and New York set in and the movement for the erection of Wisconsin as a separate Territory was begun in earnest. Wisconsin had formed a part of the old Northwest Territory from 1787 to 1800, of Indiana Territory from 1800 to 1805, of Michigan Territory from 1805 to 1809, of Illinois Territory from 1809 to 1818, and in the latter year was again placed under the jurisdiction of Michigan Territory. In 1836, on the admission of Michigan into the Union, Wisconsin—including then the present States of Iowa and Minnesota and parts of the Dakotas—was erected into a Territory. Belmont and Burlington were successively temporary territorial capitals; the Legislature met at Madison for the first time in 1838. The next decade was a period of wonderful growth in population. In 1844 at Ripon was founded "The Wisconsin Phalanx," a communistic settlement organized on the Brook Farm plan. This proved one of the most successful communities of the sort ever attempted. At about the same time a Mormon settlement was planted in Racine and Walworth counties.

In 1847, a bill having passed Congress for the admission of Wisconsin as a State, a constitutional convention was held, but the instrument drawn up was rejected by popular vote. In the following year a second constitution was prepared, submitted, and adopted, and Wisconsin was formally admitted to the Union May 29, 1848. The extensive German and Scandinavian immigration which began about 1840 increased annually for a dozen years after the admission of the State, and at one time, shortly after 1848, when the revolutionary movements of that year in Europe had driven thousands of cultured Germans to this country, the project was formed of concentrating German immigration in Wisconsin and making it a German State. The early history of the State was marked by scandals in connection with the sale of public lands and the granting of railroad charters, but before the outbreak of the Civil War a better tone pervaded political life. The antislavery sentiment in the State was strong, and at Ripon in 1854 began one of the earliest movements which resulted subsequently in the organization of the Republican party. In the same year occurred the noteworthy rescue of the fugitive slave Grover at Milwaukee, which resulted in prolonged litigation, one of the most interesting points of which was the development of a pronounced nullification sentiment among the Republican and Free-Soil elements of the population, and which reached its climax when the State Supreme Court decided that the Fugitive Slave Law was unconstitutional in the State. Wisconsin's share in the Civil War was noteworthy. The State furnished a total of 91,379 men, more than the required quota, the ratio being one man to every nine of its inhabitants. In 1871 the northeastern portion of the State was visited by destructive forest fires, and in 1894 the northwestern part of the State suffered from a similar visitation. In 1886 labor riots at Milwaukee necessitated the calling out of the State militia, which came into armed conflict with the mob. The first Republican Governor was elected in 1856, when Coles Bashford was chosen after a bitter contest. Since that time the State has been Republican in every presidential election except that of 1892. Democratic fusion with the Greenback movement in 1874 resulted in the defeat of the Republican candidate for Governor, since which year, with the exception of 1890 and 1892, when the issue was again complicated by a school law which alienated the support of the Germans, the State has been regularly Republican. The Legislature of 1907 passed a public-utilities law. It has enacted stringent insurance legislation, which resulted in many important companies abandoning operations in the State after Jan. 1, 1908. In the presidential election in this year Taft received 247,747 votes, and Bryan 166,632. J. O. Davidson, Republican candidate, was elected Governor. In the congressional election of 1910 Victor Berger, a Socialist, was elected to the House of Representatives. In the State election held November 8, F. C. McGovern, the Republican candidate, was elected Governor. In June, 1911, the Legislature passed a resolution calling on the United States to investigate the charges of corruption in the election of Senator Stephenson, and a committee on privileges and elections reported in January, 1912, that the charges of bribery and corruption had not been proved. In the presidential election of 1912 Wilson received 164,228 votes, Taft 130,695, and Roosevelt 62,460. In the elections of 1914 E. L. Philipp, Republican, was elected Governor.

WISCONSIN, University of. The highest institution of learning in the educational system of Wisconsin, situated at Madison. It was founded in 1838, organized in 1848, and opened for instruction in 1851. In 1865 the attendance was only 304, of which number all but 51 were preparatory students. In 1880 the preparatory department was abolished. The period of rapid expansion began about 1885, the number of students reaching 500 in the college year of 1886–87. In 1915–16 there were 612 on the regular force of instruction, and an attendance of more than 7500 students, nearly 5000 being in residence during the regular session. The institution is coeducational in all its departments. The College of Letters and Science is the centre of the institution, about which the technical work has grown up. The university includes undergraduate colleges of Agriculture and Engineering. The College of Engineering includes courses in civil engineering, mechanical engineering, electrical engineering, chemical engineering, and mining engineering. In the College of Letters and Science are included special courses in commerce, pharmacy, journalism, library training, chemistry, physical education, the training of teachers, and music. The College of Agriculture includes various courses in agriculture, and a four years' course in home economics. In advance of the undergraduate colleges are the Medical, Law, and Graduate schools. The medical school offers the first two years of a medical course; the law school a three-year course; and the graduate school opportunities for advanced study and research. All schools and colleges have a summer session. A special summer school for artisans and apprentices is in operation. The division of University Extension undertakes the function of disseminating useful knowledge as widely as possible. The university confers the baccalaureate degree in arts, science, law, and philosophy; the Master's degree in arts and science; the Doctor's degree in philosophy; and the degrees of Civil, Mechanical, and Electrical Engineer. The university grounds, of remarkable beauty, cover about 1000 acres, and extend for several miles along the shores of Lake Mendota. There were in 1915 39 large buildings devoted to the work of teaching and investigation, besides a number of buildings upon the farm. In 1915 the estimated value of the buildings and equipment was over $5,000,000. The State Historical Library building was completed at a cost of $650,000, and is one of the finest and best-appointed library buildings in the United States. It contains the library of the State Historical Society, 191,047 volumes; the library of the university, 213,595 volumes; the library of the Wisconsin Academy of Sciences, Arts, and Letters, 5000 volumes; and many thousands of unbound documents and pamphlets. The income of the university for the year 1914–15 was $2,758,118. Tuition is free to all students from the State of Wisconsin. The president in 1916 was Charles R. Van Hise, Ph.D. Consult E. E. Slosson, *Great American Universities* (New York, 1910).

WISCONSIN RIVER. The principal river in the State of Wisconsin. It rises on Lac Vieux Desert, lying directly on the boundary line between Michigan and Wisconsin, and flows southwest for about 300 miles to the city of Portage, where it turns sharply westward and flows west and southwest to the Mississippi at Prairie du Chien, Wis. (Map: Wisconsin, D 5). Its entire length is about 429 miles and its drainage basin includes about 12,280 square miles. Lac Vieux Desert is about 1650 feet above the sea and the river at its mouth is at an elevation of about 604 feet. Between Rhinelander and Nekoosa, 150 miles, the fall is 634 feet, an average of more than four feet to the mile. The river is navigable to Portage.

WISDOM, Book of. See Solomon, Wisdom of.

WISE, Daniel (1813–98). A Methodist Episcopal clerical author. He was born in Portsmouth, England, came to America in 1833, and was a pastor (1837–52), editor of *Zion's Herald* (1852–56), and corresponding secretary of the Sunday School Union and Tract Society of his church (1856–72). The rest of his life was spent in literary work. Part of his duty as secretary was to edit all the publications of the society. His published works include more than 40 titles. The best known are: *The Path of Life* (1847); *The Saintly and Successful Worker* (1879); *Heroic Methodists of the Olden Time* (1882); *Our Missionary Heroes and Heroines* (1884); *Young Knights of the Cross* (1887); and *Faith, Hope, Love, and Duty* (1891).

WISE, Henry Alexander (1806–76). An American political leader, born at Drummondtown, Accomac Co., Va., Dec. 3, 1806. He graduated at Washington College, Pa., in 1825, was admitted to the bar in 1828, and settled in Nashville, Tenn., the same year, but returned to Accomac County in 1830. He was elected to Congress in 1832 as a Jacksonian Democrat and was twice reëlected. On the question of the

rechartering of the United States Bank he broke with the Jackson administration, and became a Whig, but was sustained by his constituents. After his first election in 1832 he fought a duel with his competitor for the seat in Congress. He was reëlected to Congress as a Whig in 1837, serving till 1841, and was reëlected as a Tyler Democrat in 1843. Wise was active in securing the nomination of John Tyler as Vice President in 1840. From 1844 to 1847 was Minister to Brazil. After his return he identified himself with the Democratic party, and in 1855, after a remarkable campaign, he was elected Governor of Virginia over the Know-Nothing candidate. During his administration the John Brown raid occurred, and one of the last acts of his term was the signing of Brown's death warrant. Wise was a member of the Virginia secession convention of 1861, and opposed immediate secession. Upon the withdrawal of the State from the Union, however, he joined the Confederate army as brigadier general and afterward was promoted to the rank of major general. He took part in the campaigns of western Virginia, commanded at Roanoke Island, and was present at Appomattox. After the war he resumed his law practice, and wrote an historical work entitled *Seven Decades of the Union* (1872). He died Sept. 12, 1876. Consult his *Life* (New York, 1899), written by his grandson, B. H. Wise.

WISE, Henry Augustus (1819–69). An American naval officer and author, born in Brooklyn, N. Y. He entered the navy in 1834. During the Mexican War he was lieutenant on board the razee *Independence*, and took part in the operations in the Gulf of California. In the Civil War he served for a time on board the *Niagara* off Charleston, was promoted to the rank of commander in 1862, and served during the remainder of the war as assistant chief of the Bureau of Ordnance and Hydrography. He was promoted captain in 1866, and while on leave of absence died at Naples. Under the pseudonym of Harry Gringo he wrote: *Los Gringos, or an Interior View of Mexico and California, with Wanderings in Peru, Chili, and Polynesia* (1849); *Tales for the Marines* (1855); *Scampavias, from Gibel-Tarek to Stamboul* (1857); *The Story of the Gray African Parrot* (1859); and *Captain Brand of the Centipede* (1860–64).

WISE, Isaac Mayer (1819–1900). An American rabbi and educator, born at Steingrub, Bohemia. He graduated at the University of Vienna in 1843 and became a rabbi at Radnitz. So advanced were his opinions in both religion and politics that he decided to seek a land of greater liberalism, and went to the United States in 1846. His first charge was at Albany, N. Y., and from 1854 until his death he was rabbi of the Congregation Bene Yeshurun, Cincinnati. Here he became a recognized leader of progressive Judaism. In 1854 he established *The Israelite* (subsequently *The American Israelite*) and afterward *Die Deborah* (published in German) and the Chicago *Israelite*. He remained the editor of these publications, and was president of the Hebrew Union College, which he founded at Cincinnati in 1873, up to the time of his death. In 1889 he organized the Central Conference of American Rabbis and became its president. His works include: *History of the Israelitish Nation* (1854), severely criticized by both Jews and Christians and said to be the first rationalistic account of Judaism in English; *Origin of Christianity* (1870); *Judaism: Its Doctrines and Duties* (1872); *The Martyrdom of Jesus of Nazareth* (1874); *The Cosmic God* (1876); *Judaism and Christianity* (1883); *Reminiscences* (1901).

WISE, John (c.1652–1725). A New England clergyman and author, born in Roxbury, Mass. He graduated at Harvard in 1673, and in 1683 settled in Ipswich as pastor of the Second Church, where he remained until his death. He was noted for great physical strength and for moral and intellectual courage. In 1688 he resisted the tyranny of Andros and was in consequence fined and imprisoned. When Andros was expelled, Wise came to the front as a legislator, and in 1690 he accompanied as chaplain Sir William Phips's expedition against Canada. He is chiefly noted for the democratic stand he took against the Mathers in the ecclesiastical controversies that marked the opening of the eighteenth century. His liberal views were presented with much force and eloquence in two treatises, in *The Churches' Quarrel Espoused* (1710) and, more fully, in *A Vindication of the Government of New England Churches* (1717)—both of which were reissued on the eve of the Revolutionary and the Civil wars. Consult M. C. Tyler, *History of American Literature*, vol. ii (new ed., New York, 1897).

WISE, Stephen Samuel (1872–). An American liberal Jewish rabbi, born at Budapest, Hungary. In 1887–91 he studied at the College of the city of New York, and in 1892 graduated from Columbia (Ph.D., 1901). He served as pastor of the Congregation of the Madison Avenue Synagogue, New York (1893–1900), and of Beth Israel, Portland, Oreg. (1900–06), and in 1907 founded the Free Synagogue of New York, of which he was thenceforth rabbi. Besides gaining a great reputation as an eloquent preacher, Rabbi Wise became widely known as a publicist and as a leader in social welfare work. During the European War he took a stand opposed to increased military preparations on the part of the United States. In addition to editorial contributions to the *Survey* and other journals, his writings include *The Ethics of Solomon Ibn Gabirol* (1901), and *Beth Israel Pulpit* (2 vols.) and *Free Synagogue Pulpit* (2 vols.), collections of sermons.

WISEMAN, Nicholas Patrick Stephen (1802–65). An English Roman Catholic prelate. He was born at Seville, of an Irish family. He was brought to Ireland in his childhood, and received his education at the College of St. Cuthbert at Ushaw, near Durham, and at the English College at Rome. He received holy orders at Rome in 1824, and was appointed professor of Oriental languages in the University of the Sapienza, 1828, in recognition of the value of his *Horæ Syriacæ*, and in the end of that year was named rector of the English College. It was while he held this office that he delivered his *Lectures on the Connection of Science and Revealed Religion* (1836). But in England he first became known by a series of lectures on *The Principal Doctrines and Practices of the Catholic Church*, delivered at Moorfields Church (1836; 3d ed., 1851). In 1836 he established, in concert with Daniel O'Connell, the *Dublin Review*, to which Wiseman, even while residing abroad, was a regular contributor. In 1840 he was named coadjutor vicar apostolic of the central district of England, with the title of

Bishop of Melipotamus. At the same time he was appointed president of St. Mary's College, Oscott, where he took up his residence. In 1850, when the Roman Catholic hierarchy in England was restored by the Pope, he was made Archbishop of Westminster and cardinal. Protestant England generally regarded the assumption of territorial titles by Catholic prelates as illegal, and excitement ran high; but Wiseman published an explanatory address of great ability and moderation, yet firmly asserting the strictly constitutional rights of his fellow Catholics, entitled *An Appeal to the Reason and Good Feeling of the People of England on the Subject of the Catholic Hierarchy* (1850), which did much to mitigate the excitement. He published numerous volumes upon controversial and literary topics, but they are mostly forgotten. Two, however, seem destined to live: *Recollections of the Last Four Popes* (Pius VII, Leo XII, Pius VIII, and Gregory XVI) (1858), and *Fabiola, or the Church of the Catacombs* (1854), the best-known Roman Catholic story in English upon this theme. Consult: W. P. Ward, *Life and Times of Cardinal Wiseman* (new ed., 2 vols., New York, 1900); Fitzgerald, *Fifty Years of Catholic Progress* (London, 1900); W. P. Ward, *Ten Personal Studies* (ib., 1908); Paul Thureau-Dangin, *English Catholic Revival in the Nineteenth Century*, Eng. trans. by Wilfred Wilberforce (rev. ed., 2 vols., New York, 1916).

WISE MASTERS, The Seven. See Seven Wise Masters.

WISE MEN OF THE EAST. See Cologne, Three Kings of.

WISHART, wĭsh'ẽrt, George (c.1513–46). A Scottish reformer and martyr. He was probably born in 1513 at Pittarrow, and is thought to have studied Greek at Montrose. He is known to have taught the New Testament in Greek at the same place. In 1538 he fled from Scotland to escape persecution for heresy and was absent for about six years. From 1539 or 1540 to about 1543 he was in Germany and Switzerland, and on his return translated the *Confession of Faith of the Church and Congregation of Switzerland.* In 1543 he was teaching in Corpus Christi College, Cambridge, with Latimer and other reformers. In the same year or the following he returned to Scotland. The last two years of his life were spent in preaching in various parts of Scotland, in Dundee, Montrose, Ayrshire, and East Lothian. He hastened back to Dundee when he learned that the plague was raging there. When driven from the churches he preached in the fields. His most important convert and disciple was John Knox, who has left a detailed account of these two years of his life. Wishart was burnt for heresy by Cardinal Beaton, March 1, 1546, at St. Andrews. Three months later Beaton was murdered, principally in revenge for Wishart's death. Consult John Knox, *History of the Reformation*, in *Works*, ed. by David Laing (Edinburgh, 1846–64); Rogers, *Life of George Wishart the Scottish Martyr* (ib., 1876).

WISHAW, wĭsh'ą. A town in Lanarkshire, Scotland, 13 miles east-southeast of Glasgow, near the South Calder Water (Map: Scotland, E 4). Its growth and importance are due to its collieries, blast furnaces, iron and steel works, etc. Pop., 1901, 20,869; 1911, 23,742.

WISHOSKAN, wĭsh'ŏs-kan. See Wiyat Stock.

WISH'RAM. See Chinook.

WISLER (wĭs-lẽr) **MENNONITES.** See Mennonites.

WISLICENUS, vĭs'lê-tsā'nụs, Gustav Adolf (1803–75). A German theologian, one of the leaders of the Free Congregations (q.v.). He was born at Battaune, Prussian Saxony, studied theology at Halle, and as member of the Burschenschaft was sentenced in 1824 to 12 years' confinement in a fortress. He was pardoned in 1829 and continued his studies in Berlin. After 1841, pastor at Halle, he became associated with the "Friends of Light," and in consequence of a lecture delivered at Köthen in 1844 was deprived of his pastorate in 1846. Henceforth preacher of the free congregation at Halle, his pamphlet *Die Bibel im Lichte der Bildung unserer Zeit* caused him to be sentenced to two years' imprisonment, in 1853, when he fled to America, lectured at first in Boston and in 1854 established a school at Hoboken, N. J. Returning to Europe in 1856, he opened a school at Zurich, where he wrote his principal work, *Die Bibel, für denkende Leser betrachtet* (2 vols., 1863–64; 2d ed., 1866).

WISLICENUS, Johannes (1835–1902). A German chemist, born at Kleineichstädt, Prussian Saxony, a son of Gustav Adolf Wislicenus (q.v.). He studied at Halle, then went with his father to the United States, and for a time was an assistant at Harvard. In 1861 he became professor in the canton school of Zurich, in 1864 was called to the university there, and in 1870 became professor in the Polytechnic Institute at Zurich, of which in the following year he was made director. A year later he was called to Würzburg, and in 1885 to Leipzig. He did valuable work on the alcohols, on lactic acid, and on acetic ether. Among his larger works are *Theorie der gemischten Typen* (1859) and *Lehrbuch der Chemie* (9th ed., 1876–81).

WISMAR, vĭs'mär. A seaport of the Grand Duchy of Mecklenburg-Schwerin, Germany, at the head of a bay of the same name, one of the best harbors of the Baltic, 18 miles north of Schwerin (Map: Germany, D 2). It has manufactures of tobacco, sailcloth, machinery, paper, malt liquors, and sugar. Shipbuilding and fishing are important industries. Pop., 1900, 19,758; 1910, 24,376. Wismar was the capital of Mecklenburg from 1256 to 1358 and a Hanseatic town of importance. In 1648 it passed to Sweden and in 1803 to Mecklenburg-Schwerin, Sweden, however, retaining certain rights which were not renounced till 1903.

WISSLER, Clark (1870–). An American anthropologist, born in Wayne Co., Ind. He graduated from Indiana University in 1897, later studied at Columbia (Ph.D., 1901), and, after two years as an instructor in education at New York University (1901–02), returned to Columbia to be assistant in anthropology (1903–05) and lecturer (1905–09). From 1903 to 1906 he served as assistant in ethnology and thereafter as curator of anthropology in the American Museum of Natural History. Besides contributing to the New International Encyclopædia, he published *The Correlation of Mental and Physical Tests* (1901), *North American Indians of the Plains* (1912), and anthropological papers on the Blackfoot and Sioux Indians.

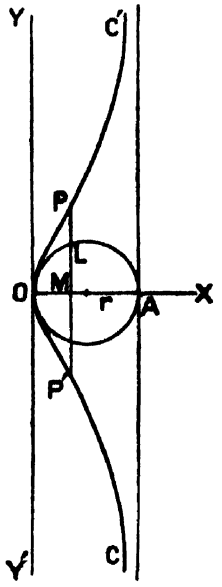
WISSMANN, vĭs'män, Hermann von (1853–1905). A German-African explorer, born at

Frankfort-on-the-Oder. He entered the army and became lieutenant in 1874. In 1880, with Paul Pogge (q.v.) he set out from St. Paul de Loanda on the west coast of Africa, discovered the Batwa pygmies, and reached Nyangwe in April, 1882. Thence Pogge returned to the west coast, but Wissmann kept on eastward and reached Zanzibar. In 1883–85 he explored the region of the Kassai River and other parts of the Congo Basin for the Belgian government, and in 1886–87 traveled from Lubuku on the Congo to Mozambique, by way of Nyangwe and lakes Tanganyika and Nyassa. In 1889–90, as Imperial commissioner, he suppressed the Arab uprising in German East Africa. In 1892 he failed in an attempt to take two steamers to the Victoria Nyanza via lakes Nyassa and Tanganyika. In 1895–96 he was Governor of German East Africa. He wrote: *Im Innern Afrikas* (3d ed., 1891); *Unter deutscher Flagge quer durch Afrika*, 1880–83 (7th ed., 1890); *Meine zweite Durchquerung Aequatorial-Afrikas vom Kongo zum Zambesi während der Jahre 1886 u. 1887* (1890); *Schilderungen und Ratschläge zur Vorbereitung für den Aufenthalt und den Dienst in den deutschen Schutzgebieten* (1895). Consult Ruhle, *Hermann von Wissmann* (Münster, 1892); Perbandt and others, *Deutschlands grösster Afrikaner* (Berlin, 1906).

WISSOWA, vĭs-sō'vȧ, GEORG (1859–). A German classical philologist, born at Breslau. In 1895 he became professor at Halle. He is distinguished for his studies in the field of Roman religion, and was editor of Pauly's *Real-Encyclopädie der classischen Altertumswissenschaft* (2d ed., 8 vols., 1892–1907). His more important works are: *De Veneris Simulacris Romanis* (1882); *Säkularfeier des Augustus* (1894); *Religion und Kultus der Römer* (1902; 2d ed., 1912); *Tertulliani Opera*, vol. i (1890); *Gesammelte Abhandlungen zur römischen Religions- und Stadtgeschichte* (1904); *Bestehen und Vergehen in der römischen Literatur* (1908). He also edited the second edition of Marquardt's *Römische Staatsverwaltung*, vol. iii (1885).

WISTAR, wĭs'tar, CASPAR (1761–1818). An American physician, born in Philadelphia, of German extraction. He graduated in medicine at the University of Edinburgh in 1786, and in 1789–92 was professor of chemistry and physiology at the College of Philadelphia. This institution in the latter year united with the medical department of the University of Pennsylvania, and Wistar was made adjunct professor of anatomy and surgery. In 1808 he became full professor and remained such till his death. In 1815 he succeeded Thomas Jefferson as president of the American Philosophical Society, and held the position until his death. He published, among other works, *A System of Anatomy* (1811–14), the first book on anatomy published in the United States. The Wistar Institute of Anatomy and Biology at the University of Pennsylvania was named for him, and also the wistaria vine.

WISTARIA, wĭs-tā'rĭ-ȧ (Neo-Lat., named in honor of Caspar Wistar, q.v.). A genus of climbing deciduous shrubs of the family Leguminosæ. The species have drooping racemes of bluish flowers, for which they are commonly grown against the walls of houses or over arbors and trellises. Some of them are among the most magnificent ornamental climbers known in flower gardens. The Chinese wistaria (*Wistaria chinensis*), the finest and most popular cultivated species, produces long clusters of showy blue flowers. It sometimes blossoms a second time in the fall. There are white, double-flowered, and variegated-leaved horticultural varieties. This species is not hardy in the northern United States. The American wistaria (*Wistaria frutescens*) produces clusters of dark blue flowers a little later in the season than the foregoing species. Wistarias grow in almost any soil and are propagated by seeds, layers, cuttings, and division. The young shoots are frequently layered in the summer and the young plants separated from the parent plant the next spring.



AMERICAN WISTARIA.

WISTER, OWEN (1860–). An American author, born in Philadelphia. He graduated at Harvard in 1882 and at the Harvard Law School in 1888, and was admitted to the Philadelphia bar in 1889, but after 1891 devoted himself almost wholly to literature. His stories, some of which deal with Western life and character, are skillfully and entertainingly written and became widely popular. He was elected to the American Academy of Arts and Letters. Besides contributing short stories and verse to the magazines, he published: *The Dragon of Wantley: His Tail* (1892; new ed., 1902); *Red Men and White* (1896); *Lin McLean* (1898); *The Jimmy John Boss and Other Stories* (1900); *U. S. Grant, a Biography* (1900); *The Virginian* (1902); *Benjamin Franklin* (1904), in the "English Men of Letters Series"; *Philosophy Four* (1903), a short story; *A Journey in Search of Christmas* (1904); *Lady Baltimore* (1906), southern in setting; *How Doth the Simple Spelling Bee* (1907); *The Seven Ages of Washington* (1907); *Members of the Family* (1911); *Padre Ignacio* (1913); *The Pentecost of Calamity* (1915), on the European War. Consult F. T. Cooper, *Some American Story Tellers* (New York, 1911).

WITAN, wĭt'an. A term frequently used for the national council in Anglo-Saxon England, more formally known as the Witenagemot (q.v.).

WIT AT SEVERAL WEAPONS. A comedy by Beaumont and Fletcher, possibly with assistance from Middleton, produced in 1614, printed in 1647. It gives a humorous picture of contemporary London life. Fleay suggests that it is an alteration of the *Devil of Dowgate*.

WITCH (AS. *wicca*, wizard, *wicce*, witch, probably from *witga*, *witiga*, *witega*, OHG. *wizago*, *wizzago*, seer, soothsayer, magician, from AS., Goth. *witan*, OHG. *wizzan*, Ger. *wissen*, to know; connected with Lat. *videre*, Gk. *ἰδεῖν*, *idein*, OChurch Slav. *vidyeti*, Skt. *vid*, to see, know) (versiera). A higher plane curve. It resembles somewhat the shell-shaped branch of the conchoid (q.v.) and is defined as follows: The locus of a point P so taken on the perpendiculars to the diameter OA of a circle that in the figure $\frac{LM}{PM} = \frac{MA}{OA}$. If r is the radius of the circle, the Cartesian equation of the witch referred to the axis OX, OY in the figure is $y_2 = \frac{4r^2x}{2r - x}$ (See COÖRDINATES.) The curve is symmetric with respect to the X-axis, lies between the Y-axis and the line $x = 2r$, and has the line $x = 2r$ as an asymptote (q.v.) to its two infinite branches. The area of the witch is four times that of the auxiliary circle and has 4-point contact (see CONTACT) with the circle at the origin.

Consult: Aubry, in the *Journal de mathématiques spéciales* (Paris, 1895); Loria, "Versiera visiera e pseudoversiera," in *Bibliotheca Mathematica* (Leipzig, 1897); Brocard, *Notes de bibliographie des courbes géométriques* (Barle-Duc, 1897, 1899).

WITCH, THE. A comedy by Thomas Middleton, produced about 1621, and printed in 1778 from a manuscript in the Bodleian Library. The plot is from Machiavelli's *Florentine History*, and from R. Scott's *Discovery of Witchcraft*.

WITCH BROOMS. Peculiar tufted shoots upon various trees, especially conifers, produced by certain parasitic fungi. The branches ordinarily have their structure modified, becoming larger and softer in texture. The direction and mode of branching is altered, and the number of branches much increased. The tufts of branches are often very conspicuous. See ASCOMYCETES; MALFORMATION.

WITCHCRAFT (AS. *wiccecræft*, *wiccraft*, from *wicce*, *wicca*, wizard, witch + *cræft*, OHG. *chraft*, Ger. *Kraft*, strength, power, art). The art and trade of a witch or of a wizard. In primitive society witchcraft is not always differentiated from the legitimate exercise of magical art or other powers derived from a supernatural source. The Ute of Utah and southern Colorado did not distinguish one class of benevolent and another of malevolent practitioners but put to death any medicine man who failed to cure his patient. To the Plains Indians such a method of procedure was unthinkable. Any unusual powers were attributed by the Crow Indians to the revelation of a supernatural being. If their possessor used them against a personal enemy, the aggrieved would have recourse to another medicine man but never thought of taking the law into his own hands, nor were any shamans of supposedly evil designs set apart in a distinct category. Where a classification occurred, the cleavage might follow quite different lines. Thus, the Ojibwa and related Algonquian tribes recognized one group of doctors who knew the properties of herbs and extracted malignant spirits from the body by the aid of slender tubes; another class that was immune to the effects of heat and fire; a third that practiced prophesy; a secret order that promoted the safety of the soul after death; while in addition to such arts any of the aforementioned, and the laity as well, might practice sympathetic and imitative magic to cause love, lure game, or wreak vengeance on an enemy. Nevertheless, even in primitive conditions the line is often drawn according to whether the practitioner promotes the general welfare or only his private interests. Thus, the Eskimo angakok is a shaman blessed by a guardian spirit and enabled to divine the cause of misfortune and to visit the deity controlling human destiny, while the practitioner of witchcraft uses parts of corpses and other objects to exercise sympathetic magic. The European conception of witchcraft is, however, most clearly prefigured in Africa. Throughout the Sudanese and Bantu Negro area the sorcerer suspected of evil practices is subjected to a formal juridical investigation that usually takes the form of a poison ordeal and suggests corresponding mediæval European usages.

That in Rome the witch was also exposed to the public vengeance is manifest from the account which Horace gives in his fifth Epode of Canidia, whom he threatens with stoning at the hands of the people. Her crimes form a curious parallel to those ascribed to her class in modern times, and show that these accusations depended on world-old superstition. She is made to devise the death of a boy, who is buried to the neck in the earth, and mocked by the offer of food out of his reach, to the end that the marrow of the victim, being full of desire, may be used as a love charm. Her rites included invocation of the gods below, the use of the poison of a toad, the plumage of birds of darkness, and the sprinkling of water from Acheron; yet it is not to be supposed that Horace, herein like all his contemporaries of the higher class, actually believed in the efficacy of such witchcraft. There could be no general prohibition by law of a trade which corresponded to that of the accepted augur (see AUGURIES AND AUSPICES), and enchantment, when directed against individuals with murderous intent, would be criminal exactly as any other attack on their welfare. Considering that the employment of such practitioners was universal, and their activity must constantly have been intended to destroy, it is singular that legal proceedings offer few processes. Evidently the lawgivers and judges were not in sympathy with the popular fear and indignation, and were inclined to regard the business as one followed by charlatans.

This laxity of the law was handed down to Christian time. The opinion of the Church oscillated between contempt of witchery as a delusion and abhorrence of it as a form of intercourse with evil spirits. One opinion was that belief in the existence of such power was in itself heretical, and that Christians were bound to believe in the impotence of magicians. During the Middle Ages the Church had little to do with promoting the punishment of witches,

who suffered rather from the fury of the populace, or at times from the severity of secular authority. The accepted punishment, as in the case of heresy, was by fire. These punishments were sporadic, and involved no systematic attempt to suppress the practice. It is one of the anomalies of history that the legal crusade against witchcraft should be modern, belonging to the time of the Renaissance. The impulse was religious, and witchcraft was identified with heresy, as consisting in converse with the source of all evil. With this movement the Inquisition had much to do, and the bull *Summis desiderantes*, of Innocent VIII, in 1484, gave the occasion for unexampled severity. The composition by Sprengel, one of the Inquisitors appointed by Innocent, of the *Malleus Maleficarum*, or *Hammer of Witches*, gave precision and fixed form to the charges of witchcraft. The weight of accusation now consisted, not in the evil use made of the enchanter's power, but in every exercise of that power; the witch was punished as an idolater and servant of Satan. This attitude was promoted by the imperfectly understood language of the Bible, in which witchcraft was identified with the worship of idols, and by the command of Exod. xxi. 18, "Thou shalt not suffer a witch to live." Judicial procedure, by the employment of torture, placed in the hands of the judge a means to enforce confession of any charges he might please to approve. Very soon, therefore, a body of evidence was constructed, supported apparently by irresistible experience. The accusations took a definite form, which was repeated with uniform persistency. The supposed witches were made to confess that they were able to fly through the air on brooms or by the aid of their familiar spirits, and thus to resort to desolate localities, where they held a Sabbath, or religious festival, in the presence of Satan, to whom they offered worship, and with whom they had criminal relations. The character of the services at the Sabbath consisted in the Black Mass, a parody and inversion of the ceremony of the mass; homage was paid to the demon in the shape of goat, dog, or ape; the worshipers held lighted candles and spat on the ground; a banquet was attended with sacrifice of children and cannibalism, and the whole meeting concluded with an orgy. Herein lies an important source of modern Satanism (q.v.). The witches, who at all times might call on the aid of their Satanic master, were supposed to have the power of transformation (especially into cats and hares), and could torment persons whom they wished to injure by thrusting invisible needles into their flesh. Accusations were multiplied by malicious intentions, and in many cases a charge of witchcraft was only a method of getting rid of an enemy or of confiscating the property of the rich. During two centuries the destruction was terrible; one judge of Nancy is said to have put to death 800 culprits in six years; at Toulouse 400 perished in a single execution; in the city of Treves alone 7000 perished. In Great Britain a peculiarly bad record belongs to Scotland. In England the law enacted in 1603 against those "making invocation or conjuration of any evil and wicked spirit, or taking up any dead person with view to employing in sorcery, or practicing witchcraft," remained on the statute book for a century. Examinations were conducted in the spirit of pure superstition; one way of ascertaining guilt was by forcing the witch to swim, it being believed that the devotee of Satan would be lighter than water. Certain bodily marks, insensible to pain, were supposed to indicate guilt, and were sought by pricking with a needle.

At all times there were incredulous persons, but their disbelief was generally held to be synonymous with atheism; this was the attitude of Luther, and of John Wesley as late as 1768. In America prosecutions for witchcraft during the seventeenth century occurred in Massachusetts, Connecticut, Virginia, and elsewhere, but the only extensive panic was that which prevailed at Salem, Mass., in 1692, near the end of the delusion, being especially nourished by the extravagant opinions of Cotton Mather. The accusations were only an echo of those credited through Europe, but the colony soon became ashamed of its credulity. In England the last trial for witchcraft was that of Jane Wenham in 1712, who was not put to death; in Scotland an execution took place in 1722, and the witchcraft statute was repealed in 1735. Among the people belief in witches continued, and has hardly become extinct even yet.

WITCH HAZEL (*Hamamelis virginiana*). A North American shrub or small tree of the family Hamamelidaceæ. It sometimes attains a height of 20 or 30 feet. The clustered, yellow, showy flowers appear in very late autumn; the fruits ripen the following year. The English name is derived from the supposed virtues of a forked twig as a divining rod. A fluid extract made from the leaves is used as a tonic, sedative,

and astringent. The bark, which is similarly employed, contains tannin, resin, and a volatile oil, is bitter and astringent, and has a sweetish

WITCH HAZEL.

pungent taste. Several investigators have failed to find any active physiological properties in it.

WITCH HILL. See GALLOWS HILL.

WITCH OF ATLAS, THE. A poem written 1819–20, by Percy Bysshe Shelley, and published in London in 1824.

WITCH OF EDMONTON, THE. A play by Rowley, Dekker, and Ford, acted in 1623 and printed in 1658.

WITCH OF ENDOR. See ENDOR.

WITENAGEMOT, wĭt'ĕ-nä-gĕ-mōt', or **WITAN** (AS., assembly of counselors). The supreme council of the English nation in Anglo-Saxon times. Each of the separate kingdoms in the so-called heptarchy (q.v.) had its Witenagemot, and when the kingdoms were brought under a common overlord he had his Witenagemot. The members of the Witenagemot were usually the King, the bishops, the ealdormen, and the dependents of the King, who were called ministri, or thanes. It is probable that the Witenagemot was earlier a much larger body, and that the less wealthy and less powerful members ceased to attend because of the expense or from lack of interest. The actual numbers recorded as present on various occasions are not large. Stubbs regards the Witenagemot of the year 966 as a fair example; there were present then the King's mother, 2 archbishops, 7 bishops, 5 ealdormen, and 15 ministri. The Witenagemot participated in the enactment of laws, both civil and ecclesiastical; assented to grants of land; was a court of last resort; gave its consent for extraordinary taxation; advised as to the determination of war and peace; consented, in theory, to the appointment of ealdormen and possibly of bishops; and elected and sometimes deposed the kings. Kemble gives some canons about the power of the Witenagemot. His first, which, as Stubbs says, "is large enough to cover all the rest," is: "First, and in general, they [the members of the Witenagemot] possessed a consultative voice and a right to consider every public act which could be authorized by the King." Its actual power would vary inversely with that of the King; under a strong King the Witenagemot would tend to become merely his council. Especially so if the King had, as seems, the right of packing the Witenagemot by introducing more ministri. Consult: E. A. Freeman, *History of the Norman Conquest* (5 vols., Oxford, 1872–79); J. M. Kemble, *History of the Anglo-Saxons in England*, vol. ii (London, 1876); Rudolf Gneist, *History of the English Constitution* (Eng trans., ib., 1891); Sir William Stubbs, *Constitutional History of England*, vol. i (6th ed., Oxford, 1897); H. M. Chadwick, *Studies on Anglo-Saxon Institutions* (Cambridge, 1905).

WITHER, wĭTH'ẽr, or **WITHERS,** wĭTH'-ẽrz, GEORGE (1588–1667). An English poet, born at Bentworth, near Alton, in Hampshire. He spent two years at Magdalen College, Oxford (1604–06), but left without a degree. In 1610 he settled in London as a student of the law and made the acquaintance of the poet William Browne (q.v.). He published *Mournful Elegies* (1612) on the death of Prince Henry, and a collection of *Epithalamia* (1613) on the marriage of Princess Elizabeth with the Elector Palatine. A volume of satires, entitled *Abuses Stript and Whipt* (1613), led to his imprisonment for a few months in the Marshalsea. To Browne's *Shepherd's Pipe* (1614) he contributed two eclogues, and wrote, while in prison, the beautiful *Shepherd's Hunting* (pub. 1615), containing the famed address to Poesy. To about the same time belongs *Fidelia* (pub. 1617), the lament of a maiden forsaken by her lover. To the edition of 1619 was added the precious lyric beginning "Shall I, wasting in despair." This poem was followed by "Fair Virtue, or the Mistress of Philarete" (1622, but composed much earlier), the last of his pure lyrics. Wither now turned to religious verse, publishing the *Songs of the Old Testament*, to each of which was added "a new and easie Tune" (1621), and *Hymns and Songs of the Church* (1623); both volumes had considerable vogue. He collected his early poems under the title *Juvenilia* (1622; revised 1626; 2d ed., 1633). Religious verse was continued in *The Psalms of David* (1632), *Emblems* (1635), and *Halelujah* (1641).

Joining Parliament against King Charles I, Wither sold his estates and raised a troop of horse (1642). Though unsuccessful in the field, he was appointed major. He took an important hand in the scurrilous pamphlets known as *Mercuries* and squandered his fine talents. After the Restoration he was sent to Newgate and then to the Tower for a verse pamphlet called *Vox Vulgi*. He remained in prison from March 24, 1662, till July 27, 1663. Most of Wither's works were issued by the Spenser Society (20 parts, Manchester, 1870–83). Consult: Selections from *Poems of Wither*, ed. by Henry Morley, in *Companion Poets* (London, 1891); *Fidelia* and *Fair Virtue*, ed. by E. A. Arber, in *English Garner*, vols. iv and vi (ib., 1882–83); T. H. Ward, *English Poets*, vol. ii (ib., 1880); and Charles Lamb's essay entitled "Poetical Works of Goerge Wither," in *Works* (ib., 1818; new ed., New York, 1903). The poems of Wither, under the title *The Poetry of George Wither* (London), were excellently edited by F. Sidgwick in 1902.

WITHERITE, wĭTH'ẽr-īt. A carbonate of barium occurring in orthorhombic crystals of pseudohexagonal shape. It is mined at Fallowfield, England.

WITHERS, wĭTH'ẽrz, HARTLEY (1867–). A British financial expert. He was educated at Westminster School and at Christ Church, Ox-

ford, and served as an assistant master at Clifton College in 1890. In 1891–93 he was a clerk on the stock exchange, in 1894 entered the city office of the London *Times*, of which he was city editor in 1905–10, and held the corresponding position on the London *Morning Post* in 1910–11. Withers then entered the employment of Seligman Brothers, bankers, and in 1915 became director of financial enquiries in the Treasury. His writings include: *The Meaning of Money* (1909; 3d ed., 1912); *Stocks and Shares* (1910); *Money-Changing* (1913); *Poverty and Waste* (1914); *War and Lombard Street* (1915).

WITHERSPOON, wĭth'ẽr-spo͞on, HERBERT (1873–). An American basso, born at Buffalo, N. Y. While pursuing academic studies at Yale University he also studied harmony and theory with Horatio Parker, and later with MacDowell, and singing he studied with M. Treumann and W. J. Hall of New York. He made his début in recital in New Haven in 1895, and the next year appeared as soloist with the New York Symphony Orchestra. After further study with Dubulle, Faure, and Bouhy in Paris he made his operatic début in 1898 as Ramfis in *Aïda* with the Castle Square Opera Company of Boston. In 1908 he became a member of the Metropolitan Opera, appearing principally in Wagnerian rôles. He gained equal reputation as a dramatic, oratorio, and concert singer.

WITHERSPOON, JOHN (1723–94). An American Presbyterian clergyman and statesman. He was born at Gifford, Scotland, graduated at the University of Edinburgh in 1742, and served as minister of several parishes in Scotland from 1745 to 1768, winning a high reputation. In 1768 he became president of Princeton College in New Jersey and held the position till his death. During the suspension of the college by the war he was a member of the constitutional convention of New Jersey in 1776, and for six years of the Continental Congress; he advocated and signed the Declaration of Independence and the Articles of Confederation; was an active member of the board of war, visiting the camps to increase the comfort of the troops. When the college was reopened he lectured on moral philosophy and rhetoric. He visited England in 1783 and 1784 to solicit funds, but without much success. For the last two years of his life he was blind. His works were collected at New York in four volumes (1800–01), and at Edinburgh in nine volumes (1804). Among them are: *Ecclesiastical Characteristics* (1753); *Essay on Justification* (1756); *Serious Inquiry into the Nature and Effects of the Stage* (1757); *Essays on Important Subjects* (1764); and *Authority of the British Parliament* (1774). A memoir by his son-in-law, the Rev. Samuel S. Smith, prefaced the New York edition of his works and also appeared separately (New York, 1795). Consult: J. Sanderson, *Biography of the Signers of the Declaration of Independence* (Philadelphia, 1865); *Proceedings at the Unveiling of the Statue of John Witherspoon*, edited by W. P. Breed (ib., 1877); D. W. Woods, *John Witherspoon* (New York, 1906).

WITHERSPOON, JOHN A. (1864–). An American physician, born at Columbia, Tenn. He graduated M.D. from the University of Pennsylvania in 1887. Settling in Nashville, Tenn., he was from 1889 a member of the medical faculty of Vanderbilt University, where he accepted the chair of clinical medicine, and from 1889 to 1894 was also connected with the University of Tennessee. He was president of the American Medical Association in 1913–14.

WITHINGTON, wĭth'ĭng-tŭn. A town in Lancashire, England, 4 miles southeast of Manchester, of which it is a residential suburb and with which its chief public industries are connected. Pop., 1901, 36,201; 1911, 41,578.

WITHROW, wĭth'rō, WILLIAM HENRY (1839–1908). A Canadian author, born at Toronto, and educated at Victoria College and at Toronto University where he graduated in 1863. He entered the Methodist ministry in 1864 and served on various circuits till 1874, when he became editor of the *Canadian Methodist Magazine*. Among his published works are: *The Catacombs of Rome* (1874, and several editions); *Worthies of Early Methodism* (1878); *The Romance of Missions* (1879); *Valeria, the Martyr of the Catacombs* (1880); *Barbara Heck: a Story of the Founding of Upper Canada* (1882); *Life in a Parsonage* (1882); *A Popular History of the Dominion of Canada* (1886); *The Native Races of North America* (1893); *Makers of Methodism* (1898); *Religious Progress of the Century* (1900); *The Underground Railway* (1903).

WITIZA, wē-tē'zȧ, or BENEDICT OF ANIANE, ȧ'nyȧn' (750–821). A French monk, born in Languedoc. He entered the Benedictine Order in 774, and five years later founded a monastery on the banks of the river Anianus. He devoted himself chiefly to the task of reforming the order by restoring its original principles, and Louis the Pious appointed him supervisor of all Frankish monasteries and decreed that the adoption of the rules advocated by Benedict should be binding upon the Benedictine Order throughout France. He was canonized upon his death in 821, the 12th of February being dedicated by the Roman Catholic church to his memory.

WITKOWITZ, vĭt'kō-vĭts. A town of Moravia, Austria, near Mährisch-Ostrau. It is noted for its extensive iron works. Pop., 1900, 19,128; 1910, 20,756.

WITMER, wĭt'mẽr, LIGHTNER (1867–). An American psychologist and educator, born in Philadelphia. He graduated from the University of Pennsylvania in 1888, and studied at Leipzig (Ph.D., 1892). At the former institution he served as assistant professor (1892–1904), and thereafter as professor of psychology. In addition he lectured at Bryn Mawr College in 1896–98, was psychologist of the Pennsylvania Training School for Feebleminded Children at Elwyn, Pa., after 1896, and gave courses on psychology at Lehigh University in 1903–05. In 1907 he founded and edited *The Psychological Clinic*. He published *Analytical Psychology* (1902), and, in championship of Scott Nearing (q.v.), *The Nearing Case* (1915).

WITNESS (AS. *witnes*, from *witan*, to know). One who gives testimony in a judicial proceeding. The term is commonly used to denote any one who has knowledge of a fact sufficient to testify thereto. Thus the persons who are present at the execution of a formal instrument, such as a deed or will, are called witnesses. By statutes a certain number are usually required who must affix their signatures to make the instrument legal. The term is also used to include those who make affidavits. In a strict legal sense it means only those who

give oral testimony before a court. Legislatures frequently compel the attendance of witnesses before committees, but the investigations of such legislative committees partake of the nature of judicial proceedings. The attendance of a witness is compelled by the issue of a subpœna from the court requiring him to appear. If he fails to obey, he may be punished for contempt and his person attached and brought before the court. In some jurisdictions he is liable for damages to the party subpœnaing him. He must have been properly served and paid his legal fee for attending and traveling to and from court, the amount of which is fixed by statutes. He is free from civil arrest and service of summons while so attending or coming and going. If he is to bring books or papers with him he must be served with what is known as a subpœna duces tecum. Attendance may be compelled only of witnesses within the jurisdiction of the court. Thus the service of a subpœna of the court of one State outside the State or in a foreign country would be of no avail. By courtesy the courts of other States will compel the attendance of witnesses before duly appointed commissioners to take testimony. The giving of testimony in the interest of truth and justice has always been considered one of the highest public duties, and every safeguard surrounds the fulfillment of that duty. Commissions are also issued to take the testimony of aged or infirm persons or those about to leave the jurisdiction of the court. The question as to who may or may not become witnesses belongs properly to the law of evidence (q.v.). Under Roman law women and slaves could not act as witnesses to a will. Minors and women convicted of adultery could not testify. Heretics were not allowed to testify in England. Under the Canon law excommunicated persons were disqualified. It may be generally stated that the English and American law evolving from the Roman and Ecclesiastical law has gradually assumed and is still assuming a more liberal point of view. Now the only general competency is understanding. Even children may be allowed to testify when they do not understand the value of an oath. See CONTEMPT; DIES NON; EVIDENCE; HOLIDAY; JURISDICTION; OATH; PERJURY; SERVICE OF PAPERS AND PROCESS; SUBPŒNA; SUNDAY.

WITS, THE. A popular comedy by Sir William Davenant, generally considered his masterpiece, produced in 1633, printed in 1636.

WITT, CORNELIUS DE. See DE WITT, CORNELIUS.

WITT, JAN DE. See DE WITT, JAN.

WITT, vĭt, OTTO NIKOLAUS (1853–1914). A German chemist. He was born in St. Petersburg and studied chemistry in Zurich, where he received the degree of Ph.D. At first, turning his attention to industrial chemistry, he served in technical establishments in Germany, Switzerland, and England, but in 1885 he was appointed professor of technical chemistry in the Royal Technical School in Charlottenburg, Berlin, of which he also served as rector during 1898. His contributions to our knowledge of dyestuffs were very great, his work including the preparation of chrysoidine and the tropäolins. In the azine series he discovered the eurhodines and eurhodols, and prepared a number of new safranines and higher indulines. He discovered in 1881 the indophenols and also prepared their leuco compounds. Witt was president of the Fifth International Congress of Applied Chemistry in 1903 and served on the juries of the international expositions at Chicago (1893) and Paris (1900). The German Chemical Society made him its permanent president and he received numerous decorations and other honors. He contributed largely to the literature of technical chemistry in varied fields; founded, and also edited for many years, the journals *Prometheus* and *Die Chemische Industrie;* and published *Chemische Homologie und Isomerie in ihrem Einflusse auf Erfindungen aus dem Gebiete der organischen Chemie* (1889) and *Chemische Technologie der Gespinstfasern, ihre Geschichte, Gewinnung, Verarbeitung, und Veredlung* (1888; new ed. with L. Lehmann, 1910–12).

WITTE, vĭt'*e*, KARL (1800–83). A German jurist and Dante scholar, born at Lochau, near Halle. At the age of 10 he began studying at Leipzig, continuing at Göttingen, Giessen, and Heidelberg. Rejected for extreme youth at 16 as privatdocent (Berlin), he was sent on a fellowship to Italy. Appointed lecturer on jurisprudence at Breslau in 1821, he became professor there in 1823 and at Halle in 1834. In collaboration with Kannegiesser, he published a translation with commentary of Dante's lyric poems (2d ed., 1842), and prepared a critical edition of the *Divina Commedia* (1862), which was followed by a metrical translation in blank verse, with commentary (3d ed., 1876). He also edited *De Monarchia* (2d ed., 1874) and *Vita nuova* (1876), translated Boccaccio's *Decamerone* (3d ed., 1859), and wrote *Alpinisches und Transalpinisches* (1858), and *Danteforschungen* (2 vols., 1869, 1870).

WITTE, vĭt'tĕ, SERGEI YULIEVITCH, COUNT (1849–1915). A Russian statesman. He was born at Tiflis, where his father, of German extraction, was an official. His mother was a daughter of Fadeev, Governor of Saratov, who married into one of the oldest Russian noble families. Witte was educated at the University of Odessa. He engaged in journalism, in 1870 entered the railway service, and during the Russo-Turkish War (1877–78) distinguished himself in managing the transportation of troops on the Odessa Railway. In 1879 he was appointed to an executive position on the Southwestern Railway. He was a member of Baranov's Imperial railway commission. In 1883 he published *Principles of Railway Tariffs.* In 1886 he became director of the Southwestern Railway, and in 1888, through Finance Minister Vishnegradsky, chief of the Imperial Railway Department and president of the tariff commission. He was appointed Minister of Communications in 1892 and soon afterward succeeded Vishnegradsky as Minister of Finance. He promoted industrial development, favored protection of home industries, introduced the gold standard, and established government monopoly of the sale of vodka. Witte increased the revenue and negotiated large loans abroad, particularly in France. These were used partly for railway extension, especially trans-Siberian. He concluded commercial treaties with Germany and Austria-Hungary. In 1903 he was removed from his post as Minister of Finance and was appointed president of the Committee of Ministers. He exercised little power during the war with Japan. In August, 1905, however, he came to the United States as senior Russian

plenipotentiary to negotiate peace with Japan, and at the Portsmouth Conference succeeded in obtaining for Russia terms far more favorable than it had been thought Japan would grant. (See RUSSO-JAPANESE WAR.) On his return to Russia he was created count, and by force of the liberal upheaval then in full sweep (see RUSSIA) was once more placed in a position of power. He obtained from the Czar the manifesto of Oct. 30, 1905, and became the first Russian Prime Minister.

Witte's tenure of the premiership was disturbed by liberal opposition and disagreements with the crown, and his resignation was accepted the next year. Afterward he spent much time abroad. Witte was regarded as a supporter of the Jews. His second wife was a Jewess.

WITTEKIND, wĭt'ē-kĭnd, or **WIDUKIND,** wĭd'ụ-kĭnd (?–c.807). A Westphalian chieftain, the most celebrated leader of the Saxons against Charles the Great. When most of the Saxon nobles submitted to the Frankish King, at the Imperial Diet at Paderborn, in 777, Wittekind fled to Siegfried, King of Jutland, whose sister Geva he is said to have married. In 778 he returned, and while Charles was absent in Spain, began to lay waste the Rhine country. In 782 he may have participated in the attack upon and annihilation of the Frankish army at the Süntelberg—an act for which Charles took frightful vengeance by the execution of 4500 Saxons at Verden. On this, all the Saxon tribes rose in arms, and the war was again led by Wittekind until 785, when Charles entered into negotiations with him; the result of which was that Wittekind repaired to the King's camp at Attigny in Champagne, and received baptism. After that he appears no more in history. According to the legend, however, that is still current among the people in Westphalia, Charles promoted Wittekind to be Duke of the Saxons, and made over Enger to him. From his castle, called Babilonie, situated in the neighborhood of Lübeck, he is said to have ruled with gentleness and justice till 807, when he met his death in a campaign against Duke Gerold of Swabia. His tomb was shown in the parish church of Enger, in the County of Ravensberg, where Charles IV in 1377 erected a monument to him. On Oct. 18, 1812, another monument in his honor was erected at Minden by the Westphalian Society. The higher of the two hills which form the Westphalian gates on the Weser, near Minden, bears the name of Wittekindsberg. Consult: Wilhelm Diekamp, *Widukind, der Sachsenführer, nach Geschichte und Sage* (Münster, 1877); Johann Dettmer, *Der Sachsenführer Widukind nach Geschichte und Sage* (Wurzburg, 1879); J. I. Mowbert, *Charles the Great* (New York, 1888).

WITTEN, vĭt'ten. A town in the Province of Westphalia, Prussia, on the Ruhr, 31 miles northeast of Cologne (Map: Germany, B 3). Coal is mined in the surrounding district, and there are extensive manufactures of machinery, iron, steel, glass, wire ropes, chemicals, beer, leather goods, soap, and wagons. Pop., 1910, 37,450.

WITTENBERG, vĭt'ten-bĕrk. A town of the Province of Saxony, Prussia, on the Elbe, 55 miles southwest of Berlin (Map: Germany, E 3). It is celebrated as the cradle of the Reformation, and the seat of the university in which Luther was professor, and which was incorporated with that of Halle in 1817. In the Schlosskirche (restored 1885–92) are the tombs of Luther and Melanchthon. Upon the doors of this church, replaced by new ones of metal in 1858, Luther hung up his 95 theses against the doctrine of indulgences. The house of the great reformer, almost unaltered, and the houses of Melanchthon and Cranach are preserved. In the market place is a bronze statue of Luther by Schadow, not far from which is also one of Melanchthon; and outside the Elster Gate a spot is pointed out where Luther burned the Papal bull. Manufactures of woolen and linen goods, hosiery, machinery, essential oils, pottery, cement, bricks, electrical apparatus, and leather are carried on. Wittenberg was down to 1422 the capital of the electors of Saxony of the Ascanian line. Later it was the residence of the electors of the Ernestine line. (See SAXONY.) The Elector Frederick the Wise founded the university in 1502. Pop., 1900, 18,333; 1910, 22,419.

WITTENBERG (wĭt'en-bûrg) **COLLEGE.** An educational institution at Springfield, Ohio, founded by the Lutherans of Ohio in 1845. Women are admitted to the undergraduate courses on the same terms as men. The institution maintains a preparatory school, with a summer school of methods and reviews, a school of expression, elocution, and oratory, a conservatory of music, and a theological seminary. In 1916 the faculty numbered 30, and the students in all departments 1119. The library contained 22,000 volumes. The productive funds amounted to about $650,000. The president in 1916 was C. G. Heckert, D.D.

WITTHAUS, wĭt'hous, RUDOLPH AUGUST (1846–1915). An American toxicologist, born in New York City. He graduated from Columbia University in 1867, and from the medical department of New York University in 1875; studied in the Sorbonne and the College of France; and was professor of chemistry and toxicology at the universities of New York, Vermont, and Buffalo successively, and at Cornell (1898–1911). He acted as toxicological expert in several famous criminal cases. His publications include: *Essentials of Chemistry* (1879); *Manual of Chemistry* (1879; 6th ed., 1908); *General Medical Chemistry* (1881); and *Laboratory Guide in Urinalysis and Toxicology* (1886). With T. C. Becker he also edited *Medical Jurisprudence, Forensic Medicine, and Toxicology* (2d ed., 4 vols., 1906–11), to which he contributed the introduction and vol. iv.

WITTY FAIR ONE, THE. A comedy by James Shirley (q.v.), licensed in London Oct. 3, 1628, printed in 1633.

WITU, vē'tōō. A nominally independent sultanate on the east coast of Africa, forming a part of the Tanaland Province of the British East Africa Protectorate. The area is about 1200 square miles and the population about 10,000, mostly Swahili. The Sultan rules but the government is conducted by the British resident. Near the capital, Witu, are valuable forests of timber suitable for furniture. Witu has a good harbor in Manda Bay. From 1885 to 1890 the district was a German protectorate.

WITWATERSRAND, wĭt-wä'tērs-rănt (South African Dutch, White-Waters Range). A gold-mining district in the southern part of the Transvaal, the most productive in the world, extending some 40 miles along a low range of hills known by the same name (Map: Cape of Good Hope, H 5). The gold-bearing conglomer-

ate or banket was first discovered in 1885, and active mining operations began two years later, when the output amounted to 23,000 ounces of gold. Since this date the development of the gold mines has proceeded very rapidly, as is well shown by the growth of the town of Johannesburg, which is situated near the centre of the district and which in 1911 contained 237,104 inhabitants, of whom 119,953 were whites. The gold is found in certain mineralized beds called reefs formed of quartz pebbles cemented by silica, iron oxides, and pyrites. In the principal series of deposits there are as many as three separate auriferous beds which have an aggregate width of 5 or 6 feet and carry about one-half an ounce or $10 per ton in gold. While the ore is low grade, the great extent of the deposits both laterally and in depth has permitted its exploitation on a large and very profitable scale. In 1913 there were 83 mines engaged in productive operations. Up to the end of 1913 the total output of the Witwatersrand was 187,656,000 tons of ore from which gold to the value of $1,536,035,105 was extracted. It has been estimated by high authorities that the deposits lying within 6000 feet of the surface will yet produce gold to the value of $6,000,000,000, and there is every probability that mining will be carried on below that depth. No other district in the world is known to have such enormous stores of gold. See TRANSVAAL; GOLD.

WIT WITHOUT MONEY. A comedy by Fletcher, produced about August, 1614, and printed in 1639.

WIYAT (wē'yŭt) **STOCK.** A small tribe of Indians constituting a linguistic family, sometimes designated as Wishoskan, residing on the coast of northern California about Humboldt Bay. In culture they resemble the Hupa (q.v.), except that they depend more upon sea food. They numbered 152 in 1910.

WIZARD OF THE NORTH. A title frequently given to Sir Walter Scott.

WLADISLAW, vlă-dĭs'lăf. See JAGELLONS.

WOAD, wōd (AS. *wād, waad,* OHG. *weit,* Ger. *Waid, Wait,* woad), *Isatis.* A small genus of plants of the family Cruciferæ, mostly natives of the Mediterranean region. Dyer's woad (*Isatis tinctoria*) is a biennial herb about 3 feet high, with much-branched leafy stems and small yellow flowers. It was formerly cultivated for its large root leaves, which furnish a blue dye now largely replaced by indigo. The leaves when cut are reduced to a paste, fermented in heaps for about two weeks, and then formed into balls for sun drying. These balls, which have an agreeable odor and are blue internally, are subjected to a further fermentation before being used. Woad is generally used with indigo. Woad should not be confused with weld, *Reseda luteola,* which yields a yellow dye.

WOAD'WAX'EN. See DYER'S BROOM.

WOBBERMIN, vôb'ĕr-mēn, (ERNST GUSTAV) GEORG (1869–). A German Protestant theologian, born at Stettin. He studied at Halle in 1888–90, and at Berlin in 1890–94, and traveled in Greece and Asia Minor in 1896–97. He became a privatdocent at Berlin (1898), professor at Marburg (1906), professor of systematic theology and the philosophy of religion at Breslau (1907), and subsequently was called to Heidelberg. His works include: *Religionsgeschichtliche Studien zur Frage der Beeinflussung des Urchristentums durch das antike Mysterienwesen* (1896); *Theologie und Metaphysik* (1900); *Der christliche Gottesglaube in seinem Verhältnis zur gegenwärtigen Philosophie* (1902; 3d ed., 1911); *Ernst Haeckel im Kampf gegen die christliche Weltanschauung* (1906); *Aufgabe und Bedeutung der Religionspsychologie* (1910); *Monismus und Monotheismus* (1911); *Zum Streit um die Religionspsychologie* (1913); *Die religionspsychologische Methode in Religionswissenschaft und Theologie* (1913).

WOBURN, wōō'bûrn. A city in Middlesex Co., Mass., 10 miles north-northwest of Boston, on the Boston and Maine Railroad (Map: Massachusetts, E 3). It is attractively laid out and has many handsome residences. The public library is the most noteworthy building in the city. It contains about 50,000 volumes and a valuable art collection. The industrial interests of Woburn are chiefly confined to the manufacture of leather and leather machinery. Large chemical works are situated at North Woburn. Woburn was settled as Charlestown Village in 1640; was incorporated as a town in 1642; and chartered as a city in 1888. From its original territory several townships have been created. Woburn was the birthplace and early home of Benjamin Thompson, Count Rumford. Pop., 1900, 14,254; 1910, 15,308; 1915 (State census), 16,410. Consult Sewall, *History of Woburn* (Boston, 1868), and Hurd, *History of Middlesex County* (Philadelphia, 1890).

WODE'HOUSE, JOHN, first EARL OF KIMBERLEY. See KIMBERLEY.

WODEN, wō'den. See ODIN.

WODROW, wŭd'rō, ROBERT (1679–1734). A Scotch ecclesiastical historian, born at Glasgow, and educated at the university there. At an early age he devoted a considerable portion of his time to historical researches, and was appointed librarian to the university (1697–1701). In 1703 he took charge of a pastorate at Eastwood, near Glasgow, where he remained till his death. Soon after his settlement he began writing *The History of the Sufferings of the Church of Scotland from the Restoration to the Revolution,* published in 1721–22. Wodrow contemplated other works, chiefly biographical, illustrative of the ecclesiastical history of Scotland. None were published till the following century, when three volumes of his collections on *The Lives of the Scottish Reformers and Most Eminent Ministers* (1834–45), and four volumes entitled *Analecta, or a History of Providences* (1842–43) were printed by the Maitland Club. Three volumes of his correspondence were published by the Wodrow Society instituted in 1841. This correspondence covers the period 1709–31.

WOERMANN, vēr'măn, KARL (1844–). A German art-historian and museum director. He was born in Hamburg, studied at various universities (art-history at Heidelberg and Munich), and traveled widely. He was called to the academy at Düsseldorf in 1874 as professor of the history of art and literature. In 1882 he became director of the picture gallery at Dresden, of which he wrote the first scientific catalogue (1897). His works include: *Die Landschaft in der Kunst der alten Völker* (1876); *Die antiken Odysseelandschaften vom Equilinischen Hügel in Rom* (1877); *Kunst- und Naturskizzen aus Nord- und Südeuropa* (1880); *Was uns die Kunstgeschichte lehrt* (4th ed., 1894). To the *Geschichte der Malerei,* begun by Alfred Woltmann (q.v.), he contributed the

part on antique painting, and after Woltmann's death completed the entire work. He published also *Geschichte der Kunst aller Zeiten und Völker* (3 vols., 1900–05). His work unites sound scholarship with sympathetic appreciation, and displays a generous attitude towards the research of others. He wrote, besides, several series of poems.

WOERNER, wĕr'nĕr, JOHN GABRIEL (1826–1900). An American judge and author. Born at Moehringen, Württemberg, Germany, he came to the United States with his parents in 1833. In 1844 he became a printer's devil on the St. Louis (Mo.) *Tribune* (published in German), of which he was subsequently editor and proprietor until 1852. Admitted to the bar in 1855, he was thenceforth active in politics, serving as city attorney for two terms and as president of the city council in 1862. As a war Democrat he served two terms in the State Senate. After 1870 he was judge of the probate court of St. Louis County. Judge Woerner was author of two standard legal works, *The American Law of Administration* (1889; 2d ed., 1899; abridged ed., edited by W. F. Woerner and F. A. Wislizenus, 1913), and *American Law of Guardianship* (1897). He wrote also several novels, including *Die Sclavin* which was dramatized, and *The Rebel's Daughter* (1899).

WOFFINGTON, MARGARET (PEG) (c.1714–60). A celebrated Irish actress, born of poor parents in Dublin. When about 10 years old, she appeared in a lilliputian production of *The Beggar's Opera*, and for several years played at one of the newer Dublin theatres, often dancing between the acts. In 1737 she took the rôle of Ophelia at the Smock Alley Theatre, and this began her success. Her London début came in 1740 at Covent Garden, as Silvia in *The Recruiting Officer*. She was an immediate favorite, and when a few weeks later she repeated her Sir Harry Wildair (in *The Constant Couple*), which had already excited the enthusiasm of Dublin, she showed great versatile power. During her career at Drury Lane and Covent Garden, she played most of the heroines who then ruled the stage, in both comedy and tragedy; in the former with the greater distinction. She also played fine ladies, like Lady Betty Modish and Lady Townley. Rôles in which the heroine appears in masculine disguise afforded some special triumphs. Her last appearance was as Rosalind in *As You Like It*, in 1757. Though ill, she persisted in going on with the play, till in the epilogue she suddenly broke down with a cry of horror and was led from the stage. Three years later, in Westminster, she died. Countless stories are told both of her frailty and of her goodness of heart. Garrick, with whom she lived for a time, was only one of her lovers; but she ended her days in respectable retirement, leaving much of her property in charity. Much of her charming and generous personality is revealed in Charles Reade's novel of *Peg Woffington* and the play *Masks and Faces*. Consult: Daly, *Woffington, a Tribute to the Actress and the Woman* (Philadelphia, 1888); J. F. Molloy, *The Life and Adventures of Peg Woffington, with Pictures of the Period in which She Lived* (New York, 1899); John Fyvie, *Comedy Queens of the Georgian Era* (ib., 1906).

WOFFORD (wŏf'ĕrd) **COLLEGE**. An institution of higher learning at Spartanburg, S. C., founded in 1854 by a legacy of $100,000 from the Rev. Benjamin Wofford. The institution is under the control of the Methodist Church, South. It offers an academic course leading to the bachelor's degree, and maintains a preparatory school on the college campus. The courses of instruction are arranged in four groups, within which considerable freedom of election is permitted after the sophomore year. The campus of 70 acres contains 21 buildings, together valued at $350,000. In 1916 the students numbered 445 and the faculty 19. The library contained 25,000 volumes. The endowment was $193,000, with an income of $25,000. Extension work is carried on through lectures. The president in 1916 was Henry N. Snyder, LL.D.

WÖHLER, vē'lĕr, FRIEDRICH (1800–82). A German chemist, born near Frankfort-on-the-Main. He studied medicine and chemistry at Marburg and Heidelberg, and subsequently worked under the direction of Berzelius at Stockholm. In 1825 he returned to Berlin to teach chemistry at the newly established industrial school of that city. In 1831 he received a similar appointment at Cassel. In 1836 he was made professor of chemistry in the medical department of the University of Göttingen and inspector general of the pharmacies of Hanover. He died at Göttingen. Wöhler is justly considered as one of the founders of organic chemistry, his name being connected with the most important discoveries in the early history of the science. In 1828 he effected the synthesis of urea—the first organic compound produced by artificial laboratory means, without the agency of life. The first cases of isomerism (i.e., the existence of different compounds having the same composition) were likewise observed by Wöhler (see CHEMISTRY; CARBON COMPOUNDS), and no less a contribution was formed by the classical research on the benzoyl compounds, carried out by Wöhler in conjunction with Liebig. (See CHEMISTRY, historical section.) Many other results of importance were achieved by Wöhler in all branches of chemistry. He isolated the elements aluminium, glucinum, yttrium, and titanium, and founded the nickel industry by devising a process of manufacturing the pure metal on a large scale. As a teacher, too, he was brilliant and many-sided. His *Grundriss der Chemie* and *Die Mineralanalyse in Beispielen* passed through numerous editions and were translated into several languages. He also edited in German Berzelius's voluminous *Lehrbuch der Chemie* and *Jahresberichte*. Hofmann published an excellent biography of Wöhler in the *Berichte der deutschen chemischen Gesellschaft* (1882), and edited *Aus Justus Liebigs und Friedrich Wöhlers Briefwechsel* (1888). Wöhler published the results of his investigations in Liebig's *Annalen der Chemie und Pharmacie*, of which he became coeditor in 1838. In 1890 a monument was erected to his memory at Göttingen.

WOHLGEMUTH, or **WOLGEMUT**, vōl'gemōōt, MICHEL (1434–1519). A German painter and engraver, the chief master of the older Franconian school. Born at Nuremberg, he was a pupil of Hans Pleydenwurff, but may also have studied in Flanders or at least formed his style after Flemish models. He first appears on record in 1473 as having married Hans Pleydenwurff's widow, in whose house he established a studio which was frequented by Albrecht Dürer, among others, and exercised a far-reaching influence. From it issued a large number of carved altarpieces with painted wings, executed

for the greater part rather mechanically with the aid of journeymen. The most prominent among these include the Hofer altar (now four panels) with "Episodes from the Life of Christ" (1465, Pinakothek, Munich), an altar piece with "Scenes from the Youth and Passion of Christ" (1479, St. Mary's, Zwickau), and the Peringsdörffer altar with "Scenes from the Legend of St. Vitus, and Saints" (c.1490, Germanic Museum, Nuremberg). His last recorded work is the altar in St. John's Church, Schwabach (1508). As compared with the Flemish masters of his day, Wohlgemuth, even in his best panels, appears inferior as regards sentiment and delicacy of execution, aside from the prevalence of angular forms and the monotony of homely types. He also painted portraits and designed for wood cuts, notably the spirited illustrations for Schedel's *Weltchronik* (1493). All his paintings are reproduced in the publication *Die Gemälde von Dürer und Wohlgemuth*, 117 plates with text by Riehl and Thode (Nuremberg, 1889–95). Consult Thode, *Die Malerschule von Nürnberg* (Frankfort, 1891); F. J. Stadler, *Michel Wolgemut und der Nürnberger Holzschnitt* (Strassburg, 1913); H. Dickinson, *German Masters of Art* (New York, 1914).

WO'KING. A market town in Surrey, England, 24½ miles southwest of London (Map: London, H 2). Its chief importance is derived from the proximity of the London Necropolis Cemetery, which covers 2000 acres and to which special funeral trains are dispatched from London daily. It contains a crematory, erected in 1878, the first one established in England. It is also notable for its Oriental Institute, containing a mosque and residences for Indians visiting England. Pop., 1901, 16,222; 1911, 24,808.

WOLCOT, wụl'kot, JOHN (1738–1819). An English poet, better known under the pseudonym of PETER PINDAR. He was born at Dodbrook, in Devon. He was educated by an uncle, at Kingsbridge and in France, and subsequently studied medicine in London and in Aberdeen. In 1767 he went to Jamaica with Sir William Trelawny, the newly appointed Governor. After serving two years as physician general, he went to England, and was ordained priest in the English church. He immediately (1770) returned to Jamaica, where he received a small living. On the death of his patron (1773), he left the island for good. After practicing medicine with little success in Truro and other places, he settled in London as a writer of audacious squibs and satires on all sorts of persons from George III down to liverymen. Among his 70 distinct pieces were *Lyric Odes to the Royal Academicians* (1782–86); *The Lousiad: An Heroic-comic Poem*, five cantos, in ridicule of the King's domestic life (1785–95); *Ode upon Ode . . . a Comic Account of a Visit of the Sovereign to Whitbread's Brewery* (1787); *Bozzy and Piozzi*, on Boswell and Mrs. Piozzi (1786); and *A Poetical Epistle to a Falling Minister*, i.e., Pitt (1789). These and other verses achieved wide popularity. From their sale the author received annually some £250; and the government attempted to buy him off with a pension of £300. Wolcot was severely handled by William Gifford (q.v.) in his *Epistle to Peter Pindar* (1800). Unscrupulous, impudent, and coarse, Wolcot was yet a master of burlesque humor and caricature. During his lifetime Wolcot's satires were issued in cheap quarto pamphlets. About 20 editions of the collected works appeared between 1788 and 1837. That of 1812 contains a memoir and portrait. For the latest and best account, consult Theodor Reitterer, *Leben und Werke Peter Pindars* (Vienna, 1900).

WOLCOTT, EDWARD OLIVER (1848–1905). An American lawyer and politician, born at Long Meadow, Hampden Co., Mass. Towards the close of the Civil War he served in the 150th Ohio Volunteers. He studied at Yale, graduated at Harvard Law School in 1871, and settled in Colorado. In 1876 he was elected district attorney for the first judicial district of Colorado, and in 1878 was Republican leader in the State Senate. In 1879 he became attorney for the Denver and Rio Grande Railroad, and in 1884 was appointed general counsel for the road. From 1889 until 1901 he was a member of the United States Senate. He was an ardent champion of bimetallism, but supported the Republican candidates in the free silver campaign of 1896, and in 1897 was named by President McKinley as chairman of the commission sent to Europe to report on international bimetallism.

WOLCOTT, OLIVER (1726–97). An American soldier, and a signer of the Declaration of Independence; the son of Roger Wolcott (q.v.). He was born in Windsor, Conn., graduated at Yale in 1747; and in King George's War (q.v.) commanded a company of volunteers, raised by himself, on the northern frontier. In 1775 Congress appointed him one of the Indian Commissioners for the Northern Department, with instructions to secure the neutrality of the Iroquois. He was a member of the Continental Congress in 1776–78 and in 1780–84, and was one of the supporters and a signer of the Declaration of Independence. Entering the army as colonel of the Connecticut militia in 1775, he became a brigadier general in August, 1776, and took an active part in the campaign against Burgoyne; and in May, 1779, he was appointed a major general. Again in 1784 he was an Indian Commissioner for the Northern Department, and as such negotiated a treaty with the Iroquois. He was Lieutenant Governor of Connecticut from 1786 to 1796, and Governor from 1796 until his death. Consult John Sanderson, *Biographies of the Signers of the Declaration of Independence*, vol. iii (new ed., Philadelphia, 1865).

WOLCOTT, OLIVER (1760–1833). An American political leader, son of the preceding. He was born in Litchfield, Conn., graduated at Yale in 1778, and served in the Connecticut militia, as an aid to his father, during the latter part of the Revolutionary War. He was admitted to the bar in 1781, and was employed for several years in the financial department of the State government, acting in 1784 as commissioner, with Oliver Ellsworth, to adjust the accounts between Connecticut and the United States. He was Comptroller of the Treasury for the United States in 1788–89, was Auditor of the United States Treasury in 1789–91, and was again Comptroller of the Treasury from 1791 to 1795, when he succeeded Alexander Hamilton as Secretary of the Treasury. He was retained in this position by John Adams, and while performing the duties of his office took an active part in Hamilton's opposition to the President, but resigned from the Cabinet in November, 1800. Subsequently he was a judge of

the United States Circuit Court (1801–02), was engaged in mercantile pursuits in New York from 1802 to 1812, establishing several large factories at Wolcottville (near Litchfield); was president of the Bank of North America in 1812–14; presided over the Connecticut constitutional convention in 1817, and was Governor of that State from 1817 to 1827, when he returned to New York. He wrote several pamphlets, including an *Address to the People of the United States on the Subject of the Report of a Committee of the House of Representatives* (1802), and *British Influences on Affairs in the United States Proved and Explained* (1804). His papers have been edited by Gibbs as *Memoirs of the Administrations of Washington and John Adams* (New York, 1846).

WOLCOTT, ROGER (1679–1767). A Colonial Governor of Connecticut. He was born in Windsor, Conn., was apprenticed to a weaver at the age of 12, and began an independent business career at 21. In the campaign against Canada in 1711 he was commissary of the Connecticut troops, and in the celebrated Louisburg expedition of 1745 he was second in command, with the rank of major general. After serving as a member of the executive council, judge of the Supreme Court, and Deputy Governor, he was for four years (1750–54) Governor of the Colony. He wrote some crude verse, including *Poetical Meditations, being the Improvement of some Vacant Hours* (1725), and a *Brief Account of the Agency of the Honorable John Winthrop, Esq., in the Court of King Charles the Second, A.D. 1662, when he obtained a Charter for the Colony of Connecticut* (printed in the *Collections* of the Massachusetts Historical Society, 1st series, vol. iv). His journal of the Louisburg expedition was published by the Connecticut Historical Society in 1860.

WOLCOTT, ROGER (1847–1901). An American political leader. He was born in Boston, and graduated at Harvard in 1870, and at the Harvard Law School in 1874. He was a member of the Boston Common Council in 1877–79, of the State House of Representatives in 1882–85, and again a member of the Common Council in 1887–90. In 1892 he was elected Lieutenant Governor of the State, although W. E. Russell (q.v.), the Democratic candidate for Governor, was chosen. He was reëlected in 1893, 1894, and 1895. Before the termination of his fourth term he became by the sudden death of Governor Greenhalge, in May, 1896, acting Governor. In the following November he was elected Governor by the largest majority ever given to any candidate for that office in the history of the State, and was reëlected in 1897 and 1898. Subsequently he was offered by President McKinley the position of a member of the Philippine Commission, and later the Ambassadorship to Italy, both of which honors he declined. Consult William Lawrence, *Roger Wolcott* (Boston, 1902).

WOLF (AS. *wulf*, Goth. *wulfs*, Ger. *Wolf*, wolf, connected with Lat. *lupus*, Gk. λύκος, *lykos*). The name of several typically canine animals; specifically *Canis lupus*. This, the wolf of the whole Northern Hemisphere, is yellowish gray, with strong coarse hair, which is longest on the ears, neck, shoulders, and haunches, and especially on the throat; the muzzle is black, the upper lip and chin white. The ears are erect and pointed, the muzzle sharp; the legs rather longer than those of the shepherd dog; the tail bushy, but not curling; the eyes oblique, giving a vicious expression to the countenance. The wolf is swift of foot, and hunts deer and other animals, packs of wolves associating for this purpose; it often commits great ravages at night among sheep, and attacks calves, but seldom full-grown oxen or man, unless hard pressed by hunger. It is not easily trapped, being extremely cautious, and appearing to understand somewhat the nature and purpose of a trap.

Few diversities appear in the wolves of different countries of Europe and Asia. The French wolves are generally browner and smaller than those of Germany; the wolves of Russia are larger, with longer hair; in Italy and Turkey a tawny color predominates. The great black Pyrenean wolf is the most marked variety. Wolves are still very plentiful in some parts of Europe—in the Pyrenees and Ardennes, among the Carpathian Mountains, and in Turkey, and in the forests of Poland and Russia.

Although systematic naturalists have named numerous species and subspecies among American wolves, there are practically only two very distinct kinds—the large gray, timber, or Canadian wolf, which is practically identical with the wolf of the Old World; and the prairie wolf, or coyote.

The American form of the first-named species is more robust, and has longer, lighter hair on the average, than the Old World form, and throughout the West and Canada it is quite uniform, and known as *Canis occidentalis*. It is possible that the black wolf (*Canis ater*), a few of which remain in the Florida Everglades, and an Arctic species (*Canis albus*), pure white except the black tip of the tail, may prove to be distinct species. Once numerous all over the country, wolves are now unknown east of the Mississippi and Lake Huron, never having been able to hold their place, in spite of plentiful refuges in the forests and mountains, as have the wolves of Europe. They are numerous in the Rocky Mountains and on the Pacific coast, and in the northern part of British America, where they live upon the game and occasionally do great damage to the horses, sheep, and cattle on open ranches. They keep themselves hidden in the woods, and hence are known everywhere in the West as timber wolves.

The other American wolf, smaller, redder, and addicted to an open country, rather than to the forests, is the red or prairie wolf, or coyote. Until recently this wolf, which formerly ranged eastward as far as the prairies extended, but now is not known east of the dry plains, was regarded as only a single widespread and variable species (*Canis latrans*); but systematists now recognize several distinct species and subspecies of these small wolves. See COYOTE.

South America has several wolflike canine animals, described under FOX DOG, MANED WOLF, and other names. For illustrations and bibliography, see CANIDÆ; DOG.

WOLF, TASMANIAN or ZEBRA. See DASYURE.

WOLF, vôlf, ADAM (1822–83). An Austrian historian, born at Eger. He studied jurisprudence and philosophy in Prague and in Vienna, where he established himself as docent of history at the university, in 1850. Appointed professor at the University of Pest in 1852, he became tutor of the daughters of Archduke Albrecht in 1856 and professor at the University

of Graz in 1865. His works, based on thorough investigations, are valuable contributions to the history of Austria under Maria Theresa and her successors, and include: *Oesterreich unter Maria Theresia* (1855); *Aus dem Hofleben Theresias* (2d ed., 1859); *Marie Christine, Erzherzogin von Oesterreich* (1863); *Kaiser Franz I., 1804 bis 1811* (1866); *Die Aufhebung der Klöster in Innerösterreich, 1781–1790* (1871); *Geschichtliche Bilder aus Oesterreich* (1878–80); *Oesterreich unter Maria Theresia, Joseph II. und Leopold II.* (1882); and others, besides many treatises on Austrian history in the publications of the Vienna Academy of Sciences.

WOLF, FERDINAND (1796–1866). An Austrian Romanic scholar, born in Vienna and educated at the University of Graz. Upon his return to Vienna his tastes led him to the study of mediæval literature, and he became connected in 1827 with the Imperial Library. When the Academy of Sciences was founded, he was made a member and secretary of the institution. Wolf did work of sterling value in opening the field of Romanic literature, especially that of Spain, to modern scholarship. With Ebert he founded in 1858 the *Jahrbuch für romanische und englische Litteratur*, and he edited, either alone or in company with others, a large number of texts. Some of his more important independent publications are: *Die Sage vom Bruder Rausch* (1835); *Floresta de rimas modernas castellanas* (2 vols., 1837); *Ueber die Lais, Sequenzen und Leiche* (1841); *Ueber die Romanzenpoesie der Spanier* (1847); *Studien zur Geschichte der spanischen und portugiesischen Nationallitteratur* (1859); and *Histoire de la littérature brésilienne* (1863). With Konrad Hofmann he published *Primavera y flor de romances* (2 vols., 1856).

WOLF, FRIEDRICH AUGUST (1759–1824). A German classical scholar, born at Haynrode, Prussian Saxony. He studied at Göttingen and began his career as a teacher in the seminary at Ilfeld in 1779, then became rector of the Gymnasium at Osterode (1782), and in 1783 was called to the chair of philosophy and pedagogy at Halle, where he taught until the university was closed after the battle of Jena (1806). Wolf founded his teaching upon the proposition that classical study or "Altertumswissenschaft" should properly deal with all phases of the life and thought of antiquity, as expressed in all the evidence, both literary and monumental, that has been preserved. He saw in classical antiquity a model public and private life, resting on the highest ideals, and the development of the study of antiquity along broad lines since his time may be largely traced to his influence.

In 1807 Wolf went to Berlin, where he was active in the founding of the new university. In April, 1824, he undertook a journey to southern France, in the hope of regaining his impaired health, but died at Marseilles in August of the same year. Wolf's fame rests chiefly upon his *Prolegomena ad Homerum* (Halle, 1795). In this work he traced the history of the Homeric poems from about 950 B.C., the date at which he placed the maturity of Ionic poetry, to the time of Pisistratus (about 550 B.C.), and endeavored to show that the *Iliad* and the *Odyssey* as we now have them have been materially changed from their original form, and that they are made up of separate poems, not all by the same author, but he did not deny the existence of a personal Homer, as has often been stated. This view is not entirely original with Wolf, as many of his arguments had been anticipated by Giambattista Vico (whose work, however, was not known to Wolf), and by Robert Wood, but he was able to enforce his theory with many new arguments drawn from the scholia of the Venice manuscript of Homer, which had been published by Villoison (q.v.) in 1788. The *Prolegomena* called forth a storm of criticism and attack, and the Homeric question, as the question of one or many Homers came to be called, easily overshadowed all other philological discussions of the last century. (See HOMER.) Although many of Wolf's arguments, especially his principal argument based upon the age of writing in Greece, have been seriously weakened by later discoveries, the book remains of fundamental importance for the student, and the minute examination of the Homeric writings which the *Prolegomena* called forth has been of inestimable value for the knowledge and appreciation of the poems.

Bibliography. Aside from the *Prolegomena*, and editions of Homer (*Iliad*, Halle, 1794; *Iliad* and *Odyssey*, Leipzig, 1804–1807), Wolf's works include an edition of Demosthenes' speech *Against Leptines*, with introduction and commentary (1789); editions of Plato's *Symposium* (1782); *Hesiod's Theogony* (1783); selections from Lucian (1791); the history of Herodian (1792); Cicero's *Quæstiones Tusculanæ* (1792; 4th ed., 1825); Cicero's speeches *Post Reditum in Senatu, De Domo Sua ad Pontifices, De Haruspicum Responsis*, and *Pro Marcello* (1801)—wrongly regarded as spurious by Wolf; *Suetonius* (1802); and selected dialogues of Plato—the *Euthyphro, Apology*, and *Crito* (1812 and 1820). His editions of the *Clouds* of Aristophanes (1812) and a part of the *Acharnians* (1811) are accompanied by a translation. Other works include: *Geschichte der römischen Litteratur* (1787); *Vermischte Aufsätze in lateinischer und deutscher Sprache* (1802); *Litterarische Analekten*—a periodical, with interesting sketches of English philologists (Berlin, 1817–1820). Several of his writings were published after his death—*Vorlesungen über die vier ersten Gesänge von Homers Ilias*, edited by Usteri (1830–31); *Encyklopädie der Philologie*, by Stockmann (1831; 2d ed., 1845); *Darstellungen der Altertumswissenschaft*, by Hoffmann (1839); and *Consilia Scholastica*, by Föhlisch (1829–30). A collection of Wolf's minor works was published by Bernhardy (Halle, 1896). Consult also: Hanhart, *Erinnerungen an Friedrich August Wolf* (Basel, 1825); Körte, *Leben und Studien Friedrich August Wolfs, des Philologen* (Essen, 1833); Arnoldt, *Friedrich August Wolf in seinem Verhältnisse zum Schulwesen und zur Pädagogik* (Brunswick, 1861–62); Bernays, *Goethes Briefe an Wolf* (Berlin, 1868); Bursian, *Geschichte der klassischen Philologie in Deutschland* (Munich, 1883); Mark Pattison, *Essays* (Oxford, 1889); W. Freund, *Wie studiert man klassische Philologie* (6th ed., revised by H. Deiter, Stuttgart, 1903); J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

WOLF, wulf, HENRY (1852–1916). An American wood engraver. He was born at Eckwersheim (Alsace), studied under Jacques Lévy in Strassburg, and removed to New York in 1871. His principal works include the American Artist Series; Gilbert Stuart Portrait

Series, Portraits of Women, and Masterpieces in Galleries. Among his original engravings are "Lower New York in a Mist"; "Evening, Swan Lake, Central Park"; and "Scattering Mists." His work is characterized by suavity and distinction of line and refined and sensitive interpretation, especially notable in his blocks after contemporary painters, such as J. A. Weir, Edmund Tarbell, and J. W. Alexander. In 1908 he became a member of the National Academy of Design and he was awarded many prizes, including medals at Chicago (1893), Paris (1895, 1900), and St. Louis (1904), and a grand prize at the Panama-Pacific Exposition, San Francisco (1915).

WOLF, vôlf, HUGO (1860–1903). An Austrian composer, born March 13, 1860, at Windischgraz, Styria. He received his first musical instruction on the piano and violin from his father and the village schoolmaster. In 1875–77 he studied at the Vienna Conservatory. For several years he eked out a wretched living by giving piano and violin lessons, until in 1881 he secured an appointment as second conductor in Salzburg. After four months, however, he was again in Vienna struggling once more against poverty. From 1884 to 1887 he occupied the post of musical critic for the *Salonblatt*, making many bitter enemies through his enthusiastic championship of Wagner and his violent attacks on Brahms. After that he never filled another position, but lived a free life devoted entirely to composition. Unfortunately his temperament was such, that periods of highest exaltation and feverish productivity alternated with periods of depression and inactivity. In 1897 his mind became affected so that, except for a few months, the rest of his life was spent in an insane asylum. From 1898 he was also paralyzed. He died Feb. 22, 1903.

Wolf's claim to immortality rests upon his songs, the number of which is 266. His earliest works are *Zwölf Lieder aus der Jugenzeit*, written in 1877–78. During the next 10 years he composed practically nothing, devoting all his time to reading and studying the scores of the classic masters and the songs of Schubert, Schumann, and Franz. In 1888 his inspiration broke forth with almost volcanic force, for from February to May he wrote no less than 43 of his Mörike songs. It is characteristic of the master's method that he did not write music for single poems, but always for entire cycles by one poet. Thus he set to music in 1888 the Mörike cycle of 53 songs. This was followed by the Eichendorff cycle of 20 songs and the Goethe cycle of 51 songs (1888–89). Each of these three great cycles possesses a distinct style. The *Spanisches Liederbuch* of 44 songs (translations by Heyse and Geibel) was written in 1889–90; the Keller cycle (6 songs) and *Italienisches Liederbuch* (46 songs, translations by Heyse) in 1890–91 and 1896; the Michelangelo cycle of three songs in 1897. His other works are a string quartet in D minor (1879); six a cappella choruses on texts by Eichendorff (1881); *Penthesilea*, a symphonic poem (1883); *Italian Serenade*, for small orchestra (1893); three choral works with orchestra, *Christnacht* (1891); *Elfenlied* (1894); *Dem Vaterland;* and an opera, *Der Corregidor* (1895). When his mind became clouded in 1897 Wolf was working on a second opera, *Manuel Venegas*, which remained unfinished. Of his songs Wolf himself orchestrated 20, and among these *Der Feuerreiter* from the Mörike cycle has become immensely popular.

The songs of Hugo Wolf mark the highest development of the art song (Kunstlied) as established by Schubert and developed by his great successors Schumann, Franz, and Brahms. As in Wagner's music-dramas, so in the songs of Wolf words and music are so closely wedded, so inseparably one, that it seems as if one mind had conceived both simultaneously. Had Wolf merely transferred Wagner's dramatic method to the song, he would not be the great master that he is. Aside from the intensity and expressiveness of his music and the faultless declamation of the text, Wolf's surpassing greatness consists in this, that he combined within his own genius all the chief excellences of his great predecessors. In universality he rivals Schubert, in effective polyphonic treatment Franz, in the expressive power of the instrumental part Schumann, in breadth and sweeping outline Brahms; while in the intimate welding of word and tone he surpasses all. Consult: E. Decsey, *Hugo Wolf* (4 vols., Berlin, 1903–06); K. Heckel, *Hugo Wolf in seinem Verhältniss zu Richard Wagner* (Munich, 1905); E. Schmitz, *Hugo Wolf* (Leipzig, 1906); E. Newman, *Hugo Wolf* (London, 1907); Batka and Werner, *Hugo Wolfs musikalische Kritiken* (Leipzig, 1911); E. von Hellmer, *Hugo Wolf: eine Persönlichkeit in Briefen* (ib., 1912).

WOLF, MAX FRANZ JOSEPH CORNELIUS (1863–). A German astronomer. He was born at Heidelberg, studied at the university there and at Strassburg, and at Heidelberg rose to be professor of astrophysics in 1902. He became also director of the Königstuhl Observatory in 1893. Wolf discovered in 1884 a periodical comet with a course of seven years, and after 1891 discovered more than 200 small planets by means of photography. His publications include: *Sur les termes élémentaires dans l'expression du rayon-vecteur* (1890); *Die Aussen-Nebel der Plejaden* (1900); *Die Entdeckung und Katalogisierung von kleinern Nebelflecken durch die Photographie* (1901); *Publikationen des astrophysikalischen Königstuhl* (3 vols., 1902–07); *Die Photographie des Sternhimmels* (1904); *Stereoskopbilder von Sternhimmel* (1907; 4th ed., 1913); *Die Milchstrasse* (1908).

WOLFBERRY, wụlf'bĕr-ĭ. See SNOWBERRY.

WOLF DOG, or WOLFHOUND. A kind of dog used for hunting the wolf. One breed, now almost extinct, was the old Irish wolfhound. Another formerly abundant in Norway and Sweden is now almost exclusively found in Spain, into which it is supposed to have been introduced by the Goths. It is of large size, with pointed nose, erect ears, long silky hair, and a very bushy tail curled over the back. In color it is mostly white, with large clouds of tawny color or brown. Similar characteristics belong to the Russian wolfhound or borzoi. See GREYHOUND, and Plate of DOGS.

WOLFE, wụlf, CATHERINE LORILLARD (1828–87). An American philanthropist, born in New York City. After the death of her parents she devoted her life to works of charity and philanthropy, on which she expended about $200,000 annually. She gave large sums to Grace Church and St. Luke's Hospital, New York City, Union College, and the American School at Athens; founded a home for incurables at Fordham, N. Y., and a newsboys' lodging house in the lower part of New York City; supplied the

funds for Dr. Ward's archæological expedition to Asia Minor; and gave to the Metropolitan Museum of Art a valuable collection of paintings, together with an endowment of $200,000 for its preservation and enlargement. For descriptions of this collection, consult *The National Magazine*, vol. xviii (New York, 1891), and the Catalogues issued by the Metropolitan Museum of Art.

WOLFE, CHARLES (1791–1823). An Irish clergyman and poet. He was born at Blackhall, County Kildare, Ireland. He was educated at the Abbey High School, Winchester, England, and at the University of Dublin, where he received a scholarship in 1812 and took his degree in 1814. Later he was actively employed as a tutor. His celebrated lines on *The Burial of Sir John Moore* were written in 1816, and soon afterward found their way into the newspapers. The author was at first unknown. In 1817 Wolfe became curate of Ballyclog, in the County of Tyrone, from which he was shortly transferred to the larger parish of Donoughmore. He died of consumption on Feb. 21, 1823. His literary *Remains*, consisting chiefly of sermons and a few poems, were published with a memoir in 1825 by the Rev. John A. Russell.

WOLFE, JAMES (1727–59). A British general, born at Westerham, in Kent, Jan. 2, 1727. He was the son of Gen. Edward Wolfe, an officer of merit and distinction under Marlborough and Prince Eugene. James at an eary age evinced a strong inclination for the army. After study at a school in Greenwich, he obtained his father's consent to participation in the Cartagena expedition of 1740, but was kept back by sickness. In 1741 he received a second lieutenant's commission in his father's regiment. His services were brilliant, and his rise rapid. Ensign in 1741, two years' service in Flanders and Germany, during which he was present at the battle of Dettingen (1743), secured for him first an adjutancy, then a first lieutenancy, and finally in 1744, a captaincy. He fought against the Young Pretender in 1745–46, sharing in the defeat of Falkirk and in the victory at Culloden. Returning to Flanders, he took a notable part in the battle of Laffeld, July 2, 1747. He became major in 1749 and lieutenant colonel in 1750. In the mismanaged expedition against Rochefort in 1757 Wolfe acted as quartermaster-general. The attention of Pitt was now drawn to him as an officer of whom, in any enterprise, great things might be expected. The high opinion was confirmed the next year, when he was intrusted with command of a brigade in the expedition against Louisburg, under Amherst. On June 8 he effected a landing at Freshwater Cove, in the face of a heavy fire from the enemy. The successful siege of Louisburg followed. Wolfe's skill, boldness, and activity were quite clearly understood, and he became known as "the hero of Louisburg." Pitt was now organizing his grand scheme for the expulsion of the French from Canada, and the expedition which had for its object the capture of Quebec, the enemy's capital, was confided to the care of Wolfe. On Feb. 17, 1759, Wolfe, now major general, set sail from England, and on June 27 landed on the Isle of Orleans, some four miles below Quebec. His forces numbered about 9000 men, including six companies of New England troops, while the French strength comprised a garrison of 2000 men in Quebec and 14,000 men, of whom only a small part were regulars, at Beauport, below the town. From the Isle of Orleans and from Point Levi, on the right bank of the St. Lawrence, which he occupied on June 30, Wolfe began the bombardment of Quebec, while part of his forces were sent across to the left bank of the river, where they faced the French across the small stream of the Montmorenci. On July 31 Wolfe delivered a frontal attack on the French intrenchments at Beauport, his grenadiers advancing to the assault in boats, while the forces on the left bank were ordered to cross the Montmorenci and take the enemy in flank. The movement failed and the British were compelled to retire with the loss of 400 men. But Wolfe was determined to strike a decisive blow and decided upon the desperate expedient of crossing the river and scaling the heights above the town. At 2 o'clock on the morning of September 13 the landing of the British troops began at a point now known as Wolfe's Cove. The French sentinels were surprised, and before the day broke 4500 men with two guns had climbed the steep heights and were drawn up on the Plains of Abraham, about a mile from Quebec. About 10 A.M. they were attacked by Montcalm, who had at his disposal a force equal to the British, but of inferior training. The French lines were shattered by the British fire and broke; Wolfe, as he led the charge, was struck thrice, the last time in the breast. He was compelled to lie down, and while the pursuit was still on he died.

WOLFENBÜTTEL, vŏl'fen-bŭt'el. A town of the Duchy of Brunswick, Germany, on the Ober, 7 miles south of Brunswick (Map: Germany, D 2). The famous seventeenth-century ducal library, with 300,000 volumes and 8000 manuscripts, containing mementos of Luther and of Lessing, once its librarian, has been housed in a spacious building completed in 1886. An old castle with a notable tower, a theatre, the house in which Lessing wrote *Nathan der Weise*, now a museum, a Gymnasium, seminary, and normal school are the other prominent buildings and institutions. Iron and machine manufactures, copper-smelting, yarn-spinning, and preserving, constitute the chief industries. Wolfenbüttel dates from 1046. Pop., 1910, 18,934.

WOLFENBÜTTEL FRAGMENTS. See REIMARUS.

WOLFF, vŏlf, ALBERT (1814–92). A German sculptor, born at Neustrelitz, Mecklenburg. He studied under Rauch at Berlin, and his work represents the tendencies of that school in an idealistic direction. His chief works include the figures on the upper terrace of Sans-Souci, Potsdam; "Minerva and a Warrior," on the Palace bridge, Berlin; the reliefs on the "Warriors' Monument" (1854) in the Invaliden Park, ib.; the relief of "Return of the Troops in 1871" (1872), on the monument of victory, ib.; the statue of "Peace" (1878) on the Belle-Alliance Platz, ib.; "Fight with a Lion," on the stairway

of the New Museum, ib.; a group of "Bacchus with Cupid and a Panther" (1884), in the National Gallery, ib.; the bronze equestrian statue of Frederick William III in the Lustgarten, ib.; the colossal statue of Frederick William IV in Königsberg, and a number of allegorical statues decorating the university building in that city.

WOLFF, or **WOLF**, CHRISTIAN (1679–1754). A German philosopher, born at Breslau. He studied at Jena, and from 1703 to 1706 taught mathematics and philosophy at Leipzig. In 1707, on the recommendation of Leibnitz, he became professor of mathematics and natural science in Halle, where he acquired great fame. In 1723 he was banished from Prussia by a cabinet order, on the ground that his teachings were fatalistic and atheistic. He received an appointment at the University of Marburg; but in 1740 he was restored by Frederick the Great, and was welcomed in Halle with the greatest enthusiasm. From this time he devoted himself to authorship, and produced a long line of voluminous books. He was the successor of Leibnitz in the series of Cartesian philosophers, and did much to complete and develop Leibnitz's system, whence his school is often called the Leibnitz-Wolffian school. Without special genius or originality, he performed great service as an organizing and systematizing philosopher. He created a distinctly German philosophy. He divided philosophy into ontology, cosmology, psychology, and natural theology. He accepted Leibnitz's theory of monads, though he would not carry the preëstablished harmony to the length of denying a natural interaction of soul and body. He held fast to Leibnitz's optimism and determinism. His great principle was that of the sufficient reason. In theology, he admitted the possibility of revelation and miracles, but so restricted them by rational principles that he substantially denied them. He was a voluminous writer; among his works are included *Cosmologia Generalis* (1737); *Jus Gentium* (1749); *Œconomica* (1750); *Philosophia Moralis* (1750–53); *Philosophia Practica* (1744–50); *Philosophia Prima* (1730); *Philosophia Rationalis* (1740); *Psychologia Empirica* (1738); *Theologia Naturalis* (1739–41); *Vernünftige Gedancken von dem gesellschaftlichen Leben* (1740); *Vernünftige Gedancken von den Kröfften des menschlichen Verstandes* (1738); *Vernünftige Gedancken von der Menschen Thun und Lassen* (1743); *Vernünftige Gedancken von Gott, der Welt und der Seele des Menschen* (1751). Consult: Watcke, *Wolffs eigene Lebensbeschreibung* (Leipzig, 1841); Piur, *Studien zur sprachlichen Würdigung C. Wolffs* (1903); Pichler, *Ueber C. Wolffs Ontologie* (1910). See PHILOSOPHY.

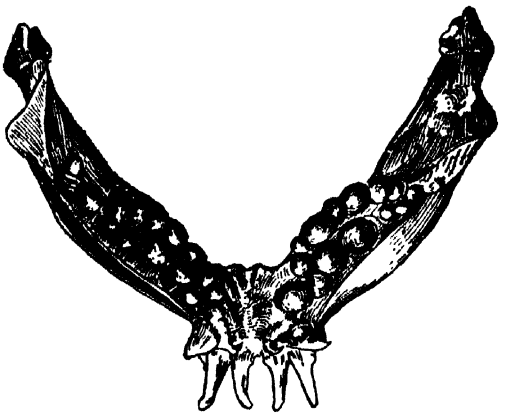
WOLFF, EMIL (1802–79). A German sculptor, born in Berlin, where he became the pupil of his uncle, Gottfried Schadow. In 1822 he proceeded to Rome, where, barring several visits to Greece and to Berlin, he thenceforth remained and yielded himself entirely to the influence of Thorvaldsen. He took over the studio and unfinished commissions of his cousin, Rudolf Schadow, and in 1871 was appointed director of the Academy of St. Luke. Of his own compositions, for which he chose the subjects chiefly from Greek mythology and ideal genre, the most noteworthy are: "The Fisher-boy" (Potsdam, 1833); "Victory Teaching Youth History" (1846, Palace bridge, Berlin); "Judith" (1868), and "Circe" (National Gallery, Berlin). Among his busts and statues of celebrated persons are those of Thorvaldsen, Winckelmann, and Palestrina.

WOLFF, JULIUS (1834–1910). A German poet and novelist, born at Quedlinburg. After studying philosophy and literature in Berlin, he took charge of his father's manufactory at Quedlinburg. Unfavorable circumstances causing his withdrawal from business, he founded, in 1869, the *Harzzeitung*. In 1870–71 he took part in the Franco-German War and then settled in Berlin, devoting himself exclusively to his literary labors. Besides the cycle of war lyrics *Aus dem Felde* (1871, 1907), glorifying the events of 1870–71, he produced a number of lyric and humorous epics and novels, of a clever archaic flavor. His epics and other poems are entitled: *Till Eulenspiegel redivivus* (1874); *Der Rattenfänger von Hameln* (1876); *Der wilde Jäger* (1877); *Tannhäuser, ein Minnesang* (1880); *Singuf, Rattenfängerlieder* (1881); *Lurlei*, a romance (1886); *Die Pappenheimer* (1889); *Renata* (1892); *Der fliegende Holländer* (1892); *Assailde, Dichtung aus der Zeit der provenzalischen Troubadours* (1896); and *Der fahrende Schüler* (1900); while his novels include: *Der Sülfmeister* (1883); *Der Raubgraf* (1884); *Das Recht der Hagestolze* (1887); *Das schwarze Weib* (1894); and *Die Hohkönigsburg* (1902). Wolff's complete works with biography by Lauff in two series of 18 volumes each began to appear in Berlin in 1912. Most of his writings went through many editions. Consult Ruhemann, *Julius Wolff und seine Dichtungen* (Leipzig, 1886).

WOLFF, KASPAR FRIEDRICH (1733–94). A German anatomist, physiologist, and embryologist, born in Berlin and educated there and at Halle. During the Seven Years' War he was actively employed in the Silesian hospitals. In 1763–65 he lectured in Berlin and in 1766 he accepted an appointment in the Academy of Sciences at St. Petersburg, in which city he lived thereafter. Wolff will be remembered for combating, at the age of 26, in his *Theoria Generationis* the preformation (q.v.) views then prevalent. But it was not until after Wolff's death that, through the translations of Meckel and the writings of Oken, he obtained proper recognition as the real founder of embryology. His chief works are: *Theoria Generationis* (1759; Ger. trans., *Theorie von der Generation*, Berlin, 1764); *De Formatione Intestinorum* (1768; trans. into Ger. by Meckel as *Ueber die Bildung des Darmkanals im bebrüteten Hühnchen*, Halle, 1812). Many of his unpublished writings are preserved as manuscripts in the library of the St. Petersburg Academy.

WOLFF, vôlf, PIERRE (1865–). A French dramatist, born in Paris. His dramas, characterized by bitingly ironical observation of contemporary life, and by witty dialogue, include: *Jacques Bouchard* (1890); *Leurs filles* (1891); *Les maris de leurs filles* (1892); *Celles qu'on respecte* (1893); *Celles qu'on aime* (1895); *Le boulet* (1898); *Le béguin* (1900); *Vive l'armée!* (1901); *Le secret de polichinelle* (1903); *Le ruisseau* (1907); *Le lys* (1908); *Les marionettes* (1911); *L'amour défendu* (1912).

WOLFF, vôlf, WILHELM (1816–87). A German sculptor and bronze caster. He was born at Fehrbellin, and after working in the Royal Iron Foundry at Berlin, and studying modeling with Wichmann, he perfected himself in bronze casting at Paris and Munich. Upon his return

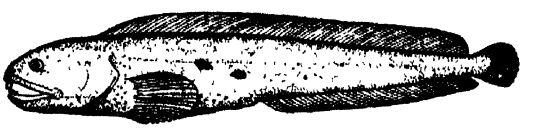


to Berlin he established a foundry of his own, which soon became famous for animal figures. Later he devoted himself exclusively to modeling, and produced a number of animal groups, remarkable for a freer, more naturalistic treatment than had before found favor in Germany. Among the best known examples are a "Bulldog with Her Young" (Berlin National Gallery), the "Dying Lioness," in the Tiergarten, Berlin; and a "Boar Attacked by Dogs," in the Grünewald, near Berlin.

WOLF-FERRARI, vôlf'fĕr-rä'rē, ERMANNO (1876–). An Italian composer, born in Venice. From 1893 to 1895 he was a pupil of Rheinberger at Munich. In 1902 he became director of the Liceo Benedetto Marcello in Venice, but resigned in 1909 and took up his residence in Munich. As a composer he attracted attention with his first opera, *La Sulamita* (1898). His reputation was increased by *Cenerentola* (1900), and especially by *Le Donne Curiose* and a large choral work, *La Vita Nuova* (after Dante), both produced in 1903 in Munich. Thereafter all his works had their first performance in Germany. The operas that followed are: *Die vier Grobiane* (1906), *Susannens Geheimniss* (*Il Segreto di Susanna*, 1909), *Der Schmuck der Madonna* (*I Gioiellj della Madonna*, "The Jewels of the Madonna," 1911), *Der Liebhaber als Arzt* (*L'Amore Medico*, 1913). With the exception of *I Gioiellj della Madonna*, which in its brutal treatment shows the influence of the modern Italian veristic style, Wolf-Ferrari's operas are typical opere buffe, distinguished by charming melody and solid technical workmanship. He wrote also a *Kammersymphonie* in B, a piano quintet in D, two piano trios, two violin sonatas, and piano pieces.

WOLFFIAN (wụl'fĭ-an) **BODY** (named in honor of Kaspar Friedrich Wolff). One of the pair of excretory organs that is functional in the adult of many fishes and of Amphibia; the mesonephros. In reptiles, birds, and mammals the Wolffian body is a purely embryonic structure, being replaced in the adult by the permanent kidney of those groups, the metanephros. In the tailed Amphibia, where the organ is typically developed, there are two, one lying on each side of the dorsal part of the body cavity as elongated structures richly vasculated and having each an efferent (the Wolffian) duct passing back to the cloaca. In the male the ducts leading the sperm from the testes enter the Wolffian body and connect with the Wolffian duct. Consult Field, "Development of the Pronephros and Segmental Duct in Amphibia," in *Bulletin of the Museum of Comparative Zoölogy*, vol. xxi (Cambridge, Mass., 1891).

WOLFFIAN BOTTLE. A form of apparatus used for washing gases, that takes its name from the English chemist Peter Wolff. It consists usually of a glass bottle with three separate openings or mouths on the neck. The gas which it is desired to wash enters through a tube, which extends to the bottom of the purifying material and then bubbles up and passes out through another tube, which enters the mouth on the opposite side of the bottle. The opening in the centre, which during the operation is usually kept closed, is used to introduce the liquid required for washing or to regulate the pressure. For manufacturing purposes Wolffian bottles of a large size are employed, and in many operations a number of them are placed side by side.



WOLF FISH. A large, carnivorous, grayish fish (*Anarrhichas lupus*) of the North Atlantic of little use as food, but noted for its voracity and ugliness. It reaches a length of 4 or 5 feet. The mouth is large, opens obliquely, and is furnished with formidable teeth; the sides of the lower jaw have very strong front teeth, big canines, and tubercle-like molars which shut against coarse molars on the palatines. This dentition is adapted to crushing mollusks and sea urchins. It bites savagely when caught, and

LOWER JAW AND TEETH OF WOLF FISH.

fishermen therefore generally dispatch it as soon as possible by knocking it on the head. It is often very destructive to nets. It is much used in Iceland, both fresh and salted; and a kind of shagreen, used for bags and pouches, is made of its thick skin.

There are other species of the genus in the North Atlantic and Pacific oceans, one of which (*Anarrhichas lepturus*) is well known in Alas-

ALASKAN WOLF FISH.

kan waters. Another Pacific coast species is the curious wolf eel (*Anarrhichthys ocellatus*). These fishes compose the family Anarrhichadidæ, and are closely related to the blennies. See CATFISH.

WÖLFFLIN, wĕlf'lên, EDUARD, KNIGHT VON (1831–1908). A German classical scholar, born at Basel, Switzerland. He held a professorship at the University of Munich (1880–1905). He is especially known for his contributions to the knowledge of colloquial Latin and for his long-continued and successful efforts to inaugurate a complete scientific lexicon of the Latin language. To further the latter plan, he established in 1880, with the aid of the Bavarian Academy of Science, the *Archiv für lateinische Lexikographie und Grammatik*, and under his direction a collection of lexicographical material was begun (15 vols. were published, 1880–1908). Later the Royal Academies of Berlin, Leipzig, Göttingen, Munich, and Vienna united in support of the plan for a complete thesaurus of the Latin language. A commission was appointed to carry forward the collection of material and later to edit the work, and in 1900 the first part of the work appeared. Wölfflin's publications include: a large number of articles

in various scientific journals, especially in his own *Archiv; Antiochus von Syrakus und Cœlius Antipater* (1872; 5th ed., 1900); *Lateinische und romanische Komparation* (1879); *Regula Benedicti* (1895); editions of Ampelius, Cœcilius Balbus, Polyænus, Publilius Syrus, etc.

WÖLFFLIN, HEINRICH (1864–). A German art historian. He was born at Winterthur (Switzerland), and studied philosophy and art history at the universities of Munich, Basel, and Berlin. From 1893 he was professor successively at Basel, Berlin, and, after 1912, Munich. His principal works are *Renaissance und Barock* (2d ed., 1908); *Die Jugendwerke des Michelangelo* (1891); *Die klassische Kunst* (5th ed., 1912; Eng. trans., *The Art of the Italian Renaissance*, London, 1903); *Die Kunst Albrecht Dürers* (2d ed., 1908). His work combines sound scholarship with remarkably keen and original criticism, and is especially illuminating in the comparison of general styles.

WOLF HOLES. See TROUS-DE-LOUP.

WOLFHOUND. See WOLF DOG; GREYHOUND.

WOLFRAM, wụl'fram. A name sometimes applied to the element tungsten (q.v.).

WOLFRAMITE, wụl'fram-īt (from Ger. *Wolfram*, from *Wolf*, wolf + *Ram, Rahm*, froth, cream, soot). A mineral iron manganese tungstate crystallized in the monoclinic system. It has a submetallic lustre, and is dark brown or dark gray in color but always nearly black. It occurs associated with tin ores in quartz and with galena, pyrite, and sphalerite. It is found in Saxony, in France, in Cornwall, England; in Bolivia, South America; and in the United States. A variety consisting almost entirely of manganese tungstate, known as *hübnerite*, is found in Colorado, Nevada, and Montana. See TUNGSTEN.

WOLFRAM VON ESCHENBACH, vôlf'räm fôn ĕsh'en-bäĸ (c.1165–c.1220). The greatest of Middle High German epic poets. He was born at Eschenbach, near Ansbach, in Bavaria, and passed his life chiefly at Wildenberg, now Wehlenberg, near Ansbach, but made frequent visits at the court of Hermann, Landgrave of Thuringia, where he was associated in friendly rivalry with Walther von der Vogelweide (q.v.) and is supposed to have taken part in the poetical contest of the Wartburg (q.v.). He tells us that he could neither read nor write; but he treasured in his memory as literary material all the learning of his day accessible to the layman. His thought is clear and deep, his humor unfailing, his grasp on life strong. He begins his literary production with *Dawn-Songs* (*Tagelieder*) of love in the Provençal manner, but he soon bade farewell to these exquisite trifles to deal with great spiritual questions in *Parzival* (an epic of 25,000 lines, produced between 1200 and 1210) and *Willehalm*. In the former the author borrows from French poems of Celtic origin, in the latter from French national poetry. But the treatment is entirely original. *Parzival* (see PERCEVAL), adapted from *Le conte del Graal* of Chrestien de Troyes, and the poem of an unknown author named Kyot, gave to the saga of the Grail its final form and contains much shrewd criticism of chivalry and court life. It is the story of the soul development of a young knight, and has many points of resemblance to the later *Simplicissimus* and also to Goethe's *Faust*. *Willehalm* is in the main historical and philosophic, with charming scenes of household joys and wedded love. Two fragments of another epic, *Titurel*, are dubiously attributed to Wolfram. No work of the poets of his period is more instinct than his with the ideals and aspirations of chivalry at its best.

Wolfram's *Works* were edited by Lachmann (Berlin, 1833; 5th ed., 1891); *Parzival* and *Titurel* also by Martin (Halle, 1903) and by Bartsch (2d ed., Leipzig, 1875–77), with explanatory notes. Of *Parzival* there are modernized versions by Simrock (6th ed., Stuttgart, 1883); San-Marte (Halle, 1886), who has written also a volume of *Parzival-Studien;* Bötticher (2d ed., Berlin, 1893), and Hertz (Stuttgart, 1898). There is also an admirable English version by Jessie Weston (London, 1894). Consult: San-Marte, *Leben und Dichten Wolframs von Eschenbach* (Magdeburg, 1836–41); Böttticher, *Die Wolframlitteratur seit Lachmann* (Berlin, 1880); id., *Das Hohelied vom Rittertum* (ib., 1886); Sattler, *Die religiösen Anschauungen Wolframs von Eschenbach* (Graz, 1895); Panzer, *Bibliographie zu Wolfram von Eschenbach* (Munich, 1897).

WOLFRUM, vôl'frụm, PHILIP (1854–). A German composer and conductor, born at Schwarzenbach (Upper Franconia). After receiving his musical education at the Royal Music School at Munich, where he studied under Bärmann, Rheinberger, and Wüllner, he began his career as music teacher at the seminary in Bamberg. In 1884 he was called to the University of Heidelberg as university music director and organist. At the same time he assumed the conductorship of the Bachverein, which soon became famous for its excellent renditions of the works of Bach. In 1898 he was made professor at Heidelberg and in 1907 general musical director. He wrote three organ sonatas, three tone poems for organ, several choruses, some chamber music, many songs, and a large choral work with orchestra, *Weihnachtsmysterium*. In 1906 he published an excellent biography of J. S. Bach.

WOLGEMUT, MICHEL. See WOHLGEMUTH.

WOLKENSTEIN, OSWALD VON. See OSWALD VON WOLKENSTEIN.

WOLLASTON, wụl'as-ton, WILLIAM HYDE (1766–1828). An English chemist and physicist, born at East Dereham, in Norfolk. He received his general education at Cambridge and also studied medicine there. After practicing as a physician at Bury St. Edmunds, he removed to London, and devoted himself wholly to scientific investigation. His researches were prosecuted over a wide range of sciences, but were preeminently fruitful in chemistry and in optics. Besides important work in connection with the atomic theory, his name is connected with the discovery of several elements, including palladium and rhodium, and with a method of making platinum malleable, which rendered the metal useful as it is. His contributions to optics are not less important. He was the first to observe the dark lines of the solar spectrum, which were later rediscovered independently and explained by Fraunhofer. Wollaston also made many valuable observations on the refraction of light and invented an apparatus for measuring the refractive power of solids. His most valuable inventions were the camera lucida, which has since proved indispensable in microscopic work, and the reflecting goniometer,

an apparatus used for determining the geometrical form of crystals. The results of his research work were published, partly in the *Philosophical Transactions*, partly in the *Annals of Philosophy*. He left a sum to the Geological Society of London to provide for the Wollaston medal to be awarded in recognition of "researches concerning the mineral structure of the earth."

WOLLASTONITE, wụl'*as*-tun-īt (named in honor of William Hyde Wollaston, q.v.). A mineral of the pyroxene group (q.v.), calcium silicate crystallized in the monoclinic system. It has a vitreous lustre, and is white, gray, yellow, red, or brown in color. It occurs in granular limestone and in regions of granite as a contact formation, or in ejected masses in connection with basalt and lava. It is found in Finland, Norway, Sweden, the Harz, Italy, Portugal, Ireland, and in the United States.

WOLLE, wŏl'ē, JOHN FREDERICK (1863–). An American organist and conductor, born in Bethlehem, Pa. He began his musical education with D. D. Wood at Philadelphia in 1883. In 1884–85 he was a pupil of Rheinberger at the Royal Music School of Munich, and after his return studied organ for a year with S. P. Warren in New York. From 1885 to 1905 he was organist of the Moravian Church at Bethlehem, and, from 1887, also of the Packer Memorial Church, Lehigh University. In 1905 he was called to the newly created chair of music in the University of California, where he remained till 1912, then returning to his former activity in Bethlehem. His enthusiasm for Bach led him to establish in 1898 the annual Bethlehem Bach Festival (q.v.), an event of the first importance among American music festivals. While in California Wolle tried to give the same festivals at Berkeley, but conditions were not favorable. In 1914 he founded the Choral Society of Harrisburg, Pa., and the Oratorio Society of York, Pa., in 1916 the Oratorio Society of Lancaster, Pa. In the same year he also accepted the post of organist at Trinity Church (P.E.), Bethlehem. In 1904 the Moravian College conferred upon him the degree Mus. Doc. He became known as one of America's foremost concert organists, and as the composer of several anthems and songs.

WOLLSTONECRAFT, wụl'stŭn-krăft, MARY. See GODWIN, MARY WOLLSTONECRAFT.

WO'LOF. An African negro race. See YOLOF.

WOLOWSKI, vô-lôf'skē, LOUIS FRANÇOIS MICHEL RAYMOND (1810–76). A French political economist and statesman, born in Warsaw. He was educated in France and took part in the Polish revolution of 1830. He then settled in Paris and founded the *Revue de Législation et de Jurisprudence* (1833). In 1839 he became professor of commercial law in the Conservatoire des Arts et Métiers. In 1852 he founded in Paris the first Crédit Foncier bank; in 1864 became professor of political economy in the Conservatoire; and in 1875 was appointed a life Senator. Among his numerous published works are: *Mobilisation du crédit foncier* (1839); *De l'organisation industrielle de la France avant Colbert* (1842); *Le grand dessein de Henri IV* (1860); *Les finances de la Russie* (1864); *L'or et l'argent* (1870); *Résultats économiques du paiement de la contribution de guerre en Allemagne et en France* (1875).

WOLSELEY, wụlz'lī, GARNET JOSEPH, first VISCOUNT (1833–1913). A British soldier, born at Golden Bridge, County Dublin, Ireland, June 4, 1833. He entered the army in 1852, and in the Burmese War of 1852–53 was severely wounded. He was twice wounded in the Crimean War. For his bravery in the latter struggle he was given the cross of the Legion of Honor by Napoleon III. He served as captain in the Indian Mutiny, and as lieutenant colonel in the Chinese expedition of 1860. He then went to Canada, and in 1870, as commander of the Red River expedition, he suppressed the Riel insurrection at Fort Garry. For this service he was made knight of the Order of St. Michael and St. George. As major general he commanded the British troops in the Ashanti War, 1873–74. For his courage, energy, and perseverance in these campaigns, he received the thanks of Parliament and a grant of £25,000. In 1875 he was dispatched to Natal to superintend the affairs of the colony; the next year he was nominated a member of the Indian Council; and in 1878 he was made high commissioner and commander in chief in Cyprus, from which post he was recalled in 1879 in order to proceed to the seat of the Zulu War, with supreme civil and military command in Natal, the Transvaal, and adjacent disturbed territories. He arrived just before the power of the Zulu King was broken at Ulundi, and arranged the terms of peace with the enemy. Thereupon he organized the government in Zululand. In 1882–85 he was adjutant general. His victory over Arabi Pasha (q.v.) at Tel el Kebir, in Egypt, Sept. 13, 1882, brought him a grant of £30,000 and admission to the peerage as Baron Wolseley. He had been made K.C.M.G. as early as 1867. Again commander in Egypt in 1884–85, he attempted in vain to relieve Khartum, where Gordon was besieged, the place falling into the hands of the Mahdi just as Wolseley's advance reached the vicinity; nevertheless his able service in the Sudan campaigns won him a viscountcy. In 1890 he became commander in chief of the troops in Ireland, in 1894 field marshal, and in 1895 commander in chief of the British army. This position he resigned in 1900 in favor of Lord Roberts. Wolseley was decorated with the Order of Merit in 1902. His chief writings are: *Soldier's Pocketbook for Field Service* (1882); "Narrative of the Red River Expedition," in *Travel, Adventure, and Sport* (1889); *Life of John Churchill, Duke of Marlborough* (1894); *The Decline and Fall of Napoleon* (1895); *The Story of a Soldier's Life* (1903), an autobiography.

WOLSEY, wụl'zĭ, THOMAS (?1475–1530). A famous English cardinal and statesman. He was born at Ipswich, in Suffolk. His father was a butcher and a small merchant of somewhat unscrupulous character. Young Wolsey was sent to Oxford, where he entered Magdalen College, and graduated at 15. He was selected fellow about 1497, and ordained priest in the spring of the following year. He was appointed master of the college school soon after. In 1500 the Marquis of Dorset, three of whose sons he had educated, presented him to the living of Limington in Somerset. His career was marked by a steady rise. Besides receiving two other benefices, he became chaplain to Archbishop Deane of Canterbury, and afterward to Sir Richard Nanfan, deputy of Calais, who commended him to Henry VII. As royal chaplain he made many friendships at court, and acquitted himself so well in special embassies to the King of

Scotland and the Emperor that he rose higher. Just before Henry's death he became dean of Lincoln, and on the accession of Henry VIII, royal almoner. Other ecclesiastical dignities followed, and he took his seat in the Privy Council towards the end of 1511.

The influence which Wolsey exercised in public affairs was such as has seldom been enjoyed by a subject. After holding for a short time the deaneries of Hereford and York, he was appointed Bishop of Tournay, which had just fallen into the hands of the English, though he never actually held the see. In the spring of 1514, however, he became Bishop of Lincoln, and six months later he was translated to the archbishopric of York. His foreign policy favored the alliance with France, and gradually led the young King away from the Emperor. His position in Europe was recognized by his nomination as Cardinal by Leo X in September, 1515; and before the year's end he was Lord Chancellor in Warham's place. His revenues were of princely magnitude, and were further enlarged by subsidies from foreign potentates, anxious for his favor. He did not bear his honors meekly; in his manner of life he affected a sumptuous magnificence, and his bearing was imperious. He openly aspired to be Pope; there seemed more than once ground for supposing that this crowning object of his ambitions was actually within reach. He became the direct representative of the papacy in 1518, as legate *a latere* in conjunction with Cardinal Campeggio, and this was afterward prolonged indefinitely, with increased powers.

His purpose in cementing the alliance with France was not to commit England exclusively to that country, but to put her in a position to control the fate of Europe. In 1521, accordingly, circumstances having changed, we find him acting as commissioner for the King in negotiating an offensive and defensive alliance with Charles V against France. He was obliged to side with the war party in the Council, and his measures for raising money caused him to be very unpopular with the nation at large. His enemies were many: eager, on occasion, to discredit him with the King; and the occasion came when the King set his heart on divorcing Queen Catharine and marrying Anne Boleyn. Wolsey was definitely hostile to the King's project, and his negotiations with the Pope for securing his consent to the divorce were conducted, it seemed to Henry, in a half-hearted manner. In 1527 he set out for France as the King's ambassador, and concluded a number of treaties with Francis I at Amiens. But during his absence Henry's displeasure was carefully fanned, and the disgrace of the once powerful Minister was accomplished. In 1529 Wolsey was stripped of his honors and driven from the court. A bill of attainder was passed against him in the House of Lords, though it was thrown out in the Commons. He retired to Esher, a house belonging to the bishopric of Winchester, which by this time he had acquired, and lived in seclusion until he received orders to go to his diocese of York. He moved slowly towards Yorkshire, but on the way was arrested by the Earl of Northumberland at Cawood on a charge of high treason. Less than a month afterward (Nov. 29, 1530), as he was being conveyed towards London in custody, he died of dysentery at the abbey of Leicester.

The faults of Wolsey are obvious; but his pride, ambition, and luxury were counterbalanced by redeeming qualities. He was generous and affable to his dependents, not a few of whom remained faithful to him, at considerable risk. Of learning he was a liberal and enlightened patron; the endowment of Christ Church, Oxford, which he had designed to call Cardinal College, is a monument of this. He was a man of large capacity, and on the whole a faithful, conscientious, and salutary counselor to the monarch who so long entirely trusted him. Consult, besides the state papers of the period, which are condensed in J. S. Brewer, *Reign of Henry VIII from his Accession to the Death of Wolsey* (London, 1884); Mandell Creighton, *Cardinal Wolsey* (ib., 1888; new ed., 1903); James Gairdner, "The Fall of Cardinal Wolsey," in *Transactions of the Royal Historical Society* (ib., 1899); E. L. Taunton, *Cardinal Wolsey* (London, 1900); and the contemporary *Life* by George Cavendish, as edited by Henry Morley (new ed., Boston, 1905).

WOLSTAN. See WULFSTAN.

WOLTER, vôl'tẽr, CHARLOTTE (1834–97). A German actress, one of the great tragic actresses of the nineteenth century. She was born at Cologne and began her career in Budapest. Then she joined a traveling company, played at the Carltheater in Vienna, and from 1859 to 1861 was engaged at the Victoriatheater in Berlin. The sensation created there by her impersonation of Hermione in *The Winter's Tale* led in 1862 to a permanent engagement at the Hofburgtheater in Vienna where she was one of the prime favorites. From the rich repertory at her command may be singled out as her best rôles: Adrienne Lecouvreur, Maria Stuart, Lady Milford, Messalina, Iphigenie, Sappho, Medea, and Lady Macbeth. In 1874 she married Count O'Sullivan de Grasz (died 1888).

WOLTMANN, vôlt'mân, ALFRED (1841–80). A German art historian. He was born at Charlottenburg, studied at Berlin and Munich, and was appointed professor of art history successively at the Polytechnicum in Karlsruhe (1868) and at the universities of Prague (1874) and Strassburg (1878). Besides his principal work, *Holbein und seine Zeit* (2d ed., 1873–76), he wrote *Die deutsche Kunst und die Reformation* (2d ed., 1871), *Die Baugeschichte Berlins* (1872), *Geschichte der deutschen Kunst im Elsass* (1876), *Die deutsche Kunst in Prag* (1877), and *Aus vier Jahrhunderten niederländisch-deutscher Kunstgeschichte* (1878). Conjointly with the author he adapted the fifth volume of Schnaase's *Geschichte der bildenden Künste* for the second edition (1872), and with Karl Woermann (q.v.) began a *Geschichte der Malerei* (1878), completed after his death by his collaborator.

WOLVERHAMPTON, wụl'vẽr-hăm'tŭn. A manufacturing town in Staffordshire, England, 13 miles northwest of Birmingham (Map: England, D 4). On the south and east are coal mines, ironstone pits, blast furnaces, forges, rolling mills, and foundries. Its chief manufactures are tin plate and japanned goods, enameled hollow wares, locks and keys, edge tools, iron braziery and galvanized iron goods, gas and water tubes, cycles, automobiles, cables and railway fastenings, and iron-foundry goods of many kinds. The town possesses an exchange, an agricultural hall for the use of farmers and corn dealers, a spacious cattle market, a market hall, and a commodious and handsome town hall. St. Peter's Church, built in the fourteenth cen-

tury and recently restored, is a stately edifice. The town maintains hospitals, free libraries, a school of art, and an art gallery. Originally called Hanton or Hamtune, the town was named Wilfrunahamton after Wilfruna, sister of Ethelred II, who founded a college here in 996. During the Civil War it was for a time the headquarters of Prince Rupert. Pop., 1901, 94,180; 1911, 95,328.

WOLVERHAMPTON, Henry Hartley Fowler, Viscount. See Fowler, H. H.

WOLVERINE, wụl'vēr-ēn' (probably French-Canadian, from Eng. *wolf*), or Carcajou. The largest of the American fur-bearing animals (q.v.) of the family Mustelidæ (*Gulo luscus*), and closely related to the glutton (*Gulo gulo*) of the Old World. It is bearlike in form, about 40 inches in total length, less than a quarter of which is taken by the tail, and is short-legged and square-headed. In color it is deep blackish brown, with a pale area on the back, and light spots on the throat or chest; legs, feet, and belly nearly black. It is found throughout Canada, the northern Rocky Mountain region, and thence to the Arctic shores, wherever the country is wooded; and is everywhere regarded by the trappers and Indians as the most powerful, cunning, and diabolical of creatures, because it disturbs and robs their traps and breaks into their caches and lodges. For superstitions about the animal in Europe, see Glutton. In reality the wolverine is simply a large, clumsy, shaggy marten, of great strength, and displaying great sagacity in procuring food where the supply is limited or precarious. It is imperfectly plantigrade, unable to climb trees, lives in dens or burrows, and does not hibernate. It feeds upon carcasses of large animals when it finds them slain, but does not destroy such creatures itself, its ordinary prey being small, a fox being about the largest of its victims. It exhibits extraordinary cunning in escaping destruction by the various methods designed to kill or capture it. Consult Elliott Coues, *Fur-Bearing Animals* (Washington, 1877), and E. T. Seton, *Life Histories of Northern Animals* (New York, 1909). See Plate of Fur-Bearing Animals.

WOLVERINE STATE. Michigan. See the article States, Popular Names of.

WOLZOGEN, vôl'tsō'gen, Ernst, Baron von (1855–). A German novelist and playwright, born at Breslau, brother of Hans Wolzogen. His mother was an English woman. He studied philosophy, German literature, and art history at Strassburg and Leipzig, and in 1901 established the so-called "Ueberbrettl," a kind of artistic variety show for the performance of lyric and minor dramatic poems, for vocal recitals, and for pantomimes. A moderate adherent of the modern realistic tendency in literature, he kept aloof from its pessimistic and erotic perversities, and, endowed with keen power of observation, proved to be a humorist in the best sense of the word. He lectured in America in 1910. A partial list of his writings includes: *Um dreizehn Uhr in der Christnacht* (1879); *Immaculata* (1881); *Heiteres und Weiteres* (1886); *Basilla, ein Thüringer Roman* (1887); *Die Kinder der Exzellenz* (1888); *Blau Blut* (1888–91), a three-volume cycle of stories; *Erlebtes, Erlauschtes, und Erlogenes* (1892); *Die Entgleisten* (1893); *Ecce Ego! Erst komme ich* (1895); *Die Erbschleicherinnen* (1895); *Der Kraft-Mayr* (1897); *Das dritte Geschlecht* (1899; 150th ed., 1905); *Feuersnot* (1901; 20th ed., 1910); *Der Hilfs-bremser* (1905), an opera with music by R. Strauss; *Seltsame Geschichten* (1906); *Der Bibeltase* (1907); *Der Erzketzer* (1911); *König Karl* (1913); *Das Lumpengesindel,* serio-comedy (1892), and other successful dramas; the critical essays *George Eliot* and *Wilkie Collins* (1885); a translation of Sheridan's *The Rivals;* and *Die fünf Enakssöhne* (1914), stories.

WOLZOGEN, Hans, Baron von (1848–). A German author, born at Potsdam, brother of Ernst Wolzogen. He studied philosophy and philology and settled in 1878 at Bayreuth as editor of the *Bayreuther Blätter,* founded by Richard Wagner. He wrote: *Der Nibelungenmythos in Sage und Litteratur* (1876); *Poetische Lautsymbolik* (1876); *Ueber Verrottung und Errettung der deutschen Sprache* (3d ed., 1890); *Die Religion des Mitleidens* (1883); *Die Idealisirung des Theaters* (1887); *Grossmeister deutscher Musik* (1897 et seq.); and for the promotion of Wagner lore: *Erläuterungen zu Wagners Nibelungendrama* (4th ed., 1878); *Richard Wagners Tristan und Isolde* (1880); *Die Tragödie in Bayreuth und ihr Satyrspiel* (5th ed., 1881); *Die Sprache in Wagners Dichtungen* (3d ed., 1889); *Was ist Stil? was will Wagner?* (3d ed., 1889); *Richard Wagners Heldengestalten erläutert* (1886); *Erinnerungen an Richard Wagner; Wagneriana* (1890); *E. T. A. Hoffmann und Richard Wagner* (1906); *Aus Richard Wagners Geisteswelt* (1908). He also produced Modern High German versions of *Der arme Heinrich* by Hartmann von Aue (1872), of *Beowulf* (1873), of the *Edda* (1877), and of Aeschylus and Euripides.

WOLZOGEN, Karoline von (1763–1847). A German poet and novelist, born (von Lengefeld) at Rudolstadt, a sister of Schiller's wife, Charlotte. Married early to Councilor von Beulwitz and separated from him in 1794, she contracted in 1796 a second union with Baron Wilhelm von Wolzogen, a court official at Weimar and a schoolmate and friend of Schiller's. After 1825 she settled at Jena. Her first novel, *Agnes von Lilien* (1798), published anonymously, was by some attributed to Goethe or Schiller. At Jena she wrote *Erzählungen* (1826–27) and the novel *Cordelia* (1840), but her most important work is *Schillers Leben, verfasst aus den Erinnerungen der Familie, seinen eigenen Briefen und den Nachrichten seines Freundes Körner* (1830; 5th ed., 1876), a faithful portrayal of the poet, based upon personal observation.

WOMAN. See Women.

WOMAN HATER, The. 1. A burlesque, the earliest-known play of Beaumont and Fletcher, printed anonymously in 1607. 2. A novel by Charles Reade (1877).

WOMAN IN WHITE, The. A popular novel by Wilkie Collins (1860).

WOMAN KILLED WITH KINDNESS. A tragedy by Thomas Heywood, produced in 1603, printed in 1607.

WOMAN'S CHRISTIAN TEMPERANCE UNION. A well-known organization which had its origin in the great temperance crusade of 1874. When the force of that remarkable uprising had been spent, and reaction was felt, a call was issued from Chautauqua in August, signed by Mrs. Mattie McClellan Brown, Mrs. Jennie Fowler Willing, Mrs. Emily Huntington Miller, and others, summoning a national convention of temperance women to be held in

Cleveland, Ohio, Nov. 17, 1874. Sixteen States were represented at the convention. Conventions have been held annually since then and in 1916 there were State and Territorial organizations in every State and Territory in the United States. (See WORLD'S WOMAN'S CHRISTIAN TEMPERANCE UNION.) The conditions of membership in the W. C. T. U. are signing the total abstinence pledge, and paying annually into the treasury of the local union a sum of not less than 50 cents. Part of the money is retained for local work, and a part is used for auxiliary fees to State, national, and world's unions. The total paid membership in the United States in 1916 was about 500,000. The badge of the society is a bow of white ribbon. Mrs. Annie Wittenmyer was the first president of the national society. Miss Frances E. Willard (q.v.) succeeded her in 1879. She held the position until her death in 1898, when Mrs. L. M. N. Stevens of Maine became the national president; and she was succeeded by Miss Anna A. Gordon in 1914. The work is carried on by means of departments, under six general heads. There are also two branches, the Young Woman's Branch and the Loyal Temperance Legion Branch, the latter having over 300,000 members.

Following is a list of the departments, under their proper groupings: (1) ORGANIZATION: Organizers, Lecturers and Evangelists; Young Woman's Branch; Loyal Temperance Legion Branch; Work Among Foreign Speaking People; Work Among the Colored; Work Among the Indians. (2) PREVENTIVE: Health in Medical Temperance. (3) EDUCATIONAL: Scientific Temperance Instruction; Physical Education; Sunday School; World's Missionary Fund; Presenting Our Cause to Influential Bodies; Temperance and Labor; Parliamentary Usage; Coöperation with Missionary Societies; W. C. T. U. Institutes; the Press; Antinarcotics; School Savings Banks; Juvenile Courts, Industrial Education and Anti-Child Labor; Medal Contests. (4) EVANGELISTIC: Evangelistic, Almshouse, and Unfermented Wine at Sacrament; the Bible in the Public Schools; Proportionate and Systematic Giving; Prison Reform; Work Among Railroad Men; Work Among Soldiers and Sailors; Work Among Lumbermen and Miners; Sabbath Observance; Humane Education; Moral Education and Race Betterment; Mothers' Meetings and White Ribbon Recruits; Rescue Work; Purity in Literature and Art. (5) SOCIAL: Social Meetings and Red Letter Days; Flower Mission and Relief Work; Fairs and Open Air Meetings. (6) LEGAL: Legislation; Christian Citizenship; Franchise; Peace and International Arbitration. There are also a Bureau of Publicity; a Bureau of Uniform Legislation; and a Special Committee on Antipolygamy Amendment to the Federal Constitution.

In pursuance of the "Do Everything" policy, the Woman's Christian Temperance Union has come to stand not only for total abstinence, but for an equal standard of purity for men and women, and for woman's equality in the home, the Church, and the State. Under its leadership every State in the Union has enacted legislation providing for the teaching of physiology and hygiene in the public schools, with especial reference to the effects of alcohol and narcotics. Similar legislation has been passed by Congress providing for such instruction in all schools under national control, including naval and military academies. It has successfully urged legislation raising the age of consent; demanded equal pay for equal work, and equal educational, professional, and industrial opportunities for women. For many years Mrs. Margaret D. Ellis has been its representative at Washington, D. C., and through her considerable influence on legislation has been exerted. The Sunday-school department aided greatly in securing the international series of quarterly Sunday-school lessons, and the observance of World's Temperance Sunday. The headquarters of the National Woman's Christian Temperance Union are at Rest Cottage, the former home of Miss Willard, at Evanston, Ill. Its official organ is *The Union Signal;* and it issues *The Young Crusader,* official organ for the Loyal Temperance Legion Branch, both published at Evanston. In addition there are published monthly papers by the W. C. T. U.'s of 44 of the States. See WORLD'S WOMAN'S CHRISTIAN TEMPERANCE UNION.

WOMAN'S COLLEGE OF BALTIMORE. See GOUCHER COLLEGE.

WOMAN'S EXCHANGE. An organization for the purpose of helping women in reduced circumstances to become self-supporting through the sale of articles of their handiwork. The first Woman's Exchange in the United States was founded by Mrs. William G. Choate in New York City in 1878. Thirty articles represented the entire stock, while in 1916 the work in every department numbered thousands of articles and compared favorably with that found in the best shops. There was also a lunch room in connection with the Exchange. Similar organizations may be found in nearly every large city of the United States, while several have been established in Europe. Each, however, is entirely separate and independent. The report of the original New York Exchange for Woman's Work for the year ending Feb. 29, 1916, showed that the sum of $105,731.27 was realized from the sale of consigned goods, and the annual subscriptions aggregated $7458.50. The total amount paid to consignors since the organization was started was $2,010,346.35.

WOMAN'S RELIEF CORPS. A woman's patriotic society organized in July, 1883, and known as an auxiliary to the Grand Army. The society is composed chiefly of the mothers, wives, daughters, and sisters of Union soldiers of the Civil War, although all loyal women are eligible to membership. The organization, like the Grand Army, is divided into departments, of which there are 35, and into smaller divisions called corps, of which there are about 3000, with a total membership of about 150,000. The society has expended over $2,000,000 in charities among the widows and orphans of Union veterans. An organization, known as the Ladies of the Grand Army, is composed of the wives, mothers, daughters, sisters, blood-kin nieces, and all lineal descendants of soldiers and sailors of the Civil War; but army nurses may become members.

WOMAN'S RIGHTS PARTY. See PARTY NAMES.

WOMAN SUFFRAGE. The rise of equal suffrage is the latest and the most democratic stage in the general process of social liberation which has been gaining velocity and strength ever since the Reformation. The general tendency is to abolish sex privilege and to recognize the equal personality of woman in the household and in the state. In particular, the

woman's rights or feminist movement (see FEMINISM) is an organized effort to secure for women and men educational, economic, and political equality. The following discussion deals with the movement down to the year 1916.

RISE OF EQUAL SUFFRAGE IN EUROPE

Agitation in Europe. At the time of the Revolution in France, under leadership of Olympe de Gouges, Theroïgne de Méricourt, and especially of Condorcet, a strong appeal was made for social justice to women; but, except in proclaiming the logical theory of human rights, it bore no fruit in the action of the revolutionary legislative bodies. The Code Napoléon was unjust, almost barbarous, in its provisions relating to wife and mother. At the Bourbon restoration mediævalism triumphed; and it was not until after the Revolution of 1848 that the general woman's rights movement slowly gathered force. Measures favoring equal suffrage and equal civil privilege, backed by petitions, have often been proposed. Since 1908, women may vote for and be elected members of the courts of arbitration in trade disputes. A French Woman's Suffrage Union was formed in 1909, and became a member of the International Suffrage Alliance. According to Dr. Schirmacher, the most radical party of French woman's rights advocates demanded "absolute coeducation; antimilitary instruction in history; the admission of women to government positions; equal pay for both sexes; official regulation of the work of domestic servants; the abolition of the husband's authority; municipal and national suffrage for women."

Until deprived of it by the constitution of 1831, the women of Belgium had municipal suffrage. In 1908 Brussels and in 1909 Ghent each formed an equal suffrage society, which united in the Woman's Suffrage League and joined the International Alliance. Under leadership of Emilia Pardo Bazán, Concepción Arenal, and others, Spanish women began to demand release from patriarchalism and the priestly yoke. In the Cortez of 1908 a bill granting tax-paying women a voice in municipal elections was lost by a vote of 65 to 35. The deputy who introduced the measure "argued that the suffrage of a woman who is the head of a family seems more reasonable to him than the suffrage of a young man, 25 years old, who represents no corresponding interest." Since 1877, various attempts have been made in the Italian parliament to enfranchise women. The National Woman's Suffrage League, composed of several local societies, joined the International Alliance in 1906. A report of the Amsterdam Congress of the Alliance declares that the women of the Italian "aristocracy wish to vote because they are intelligent; they feel humiliated because their coachman or chauffeur is able to vote. The workingwomen demand the right to vote, that they may improve their conditions of labor and be able to support their children better." For the consideration of equal suffrage a parliamentary commission was created in 1908.

The movement for economic and educational emancipation was gaining some headway among Slavic peoples. It was so in Russia; but in that country agitation for political equality was difficult in the face of a suspicious or hostile government. Nevertheless a beginning has been made. If owners of large estates women may vote for the provincial assemblies. In rural districts, the wife who is head of the family may vote when the husband is absent or dead; and in cities women exercise the franchise by proxy if they own houses or pay taxes. Suffrage societies have been formed and united in a league. By permission of the government, a national congress of women was held in 1908. "The discussion," says Schirmacher, "concerned education, labor problems, and politics. Publicity was restricted; police surveillance was rigid; addresses on the foreign woman's suffrage movement were prohibited." Nevertheless the congress declared that "only the right to vote can secure for the Russian women a thorough education and the right to work."

In the Austrian Empire conditions were scarcely better. Universal equal suffrage was favored by the Socialists. Since 1849, except in Illyria, Carinthia, and Lower Austria, tax-paying women may vote by proxy in municipal elections; since 1861, for the members of the provincial legislatures; and since 1873, if owners of large estates, for the Imperial Parliament. In 1910 women owners of real estate in Bosnia gained the parliamentary franchise. The Imperial law regulating public meetings and organizations "excludes women from political organizations, thus making the forming of a woman's suffrage society impossible." A government resolution for the early introduction of a measure to grant national equal suffrage in Bohemia had not been carried out in 1916. In 1908 Madam Kunetica was elected a representative to the Bohemian Parliament. Her election was regular and her popularity pronounced, particularly in the Social-Democratic party. Yet "the Lord Lieutenant constantly put off the formal recognition of the results of the election; and through these technical delays the validity of the election was automatically canceled by the dissolving of Parliament July 26, 1913" (Sarka B. Hrbkova). In the Hungarian division of the dual monarchy a vigorous campaign for woman's suffrage has been in progress since 1904 under auspices of the Feminist Society.

Social and moral conditions in Germany have been very unfavorable to the feminist movement. The dominance of militarism; the tenacity with which the dual standard of sex-morality is upheld; the survival of mediæval ideals of woman's sphere; the clash between the "woman's rights movement of the middle class" and that of the socialists; the sectarian schism: all these have combined to retard and to embitter the struggle for equal rights. The woman's movement was well organized; and in many positions women were proving their capacity for public affairs. Until 1908, when an Imperial law removed the disability, women could not legally share in political meetings or organizations, except in some South German states. After the passage of this law, a National Women's Suffrage Society was formed; and since 1908, Schirmacher says, the "political woman's rights movement has been of first importance in Germany. As the women tax-payers in a number of states can exercise municipal suffrage by proxy, and the women owners of large estates in Saxony and Prussia can exercise the suffrage in elections for the diet of the Circle (*Kreistag*) by proxy, an effort is being made to attract these women to the cause of woman's suffrage."

The first appearance of a woman as a public speaker in the Netherlands, 1846, was the presage of the equal rights movement among the Dutch women. In 1883 the petitions of Alletta Jacobs, the first woman physician in the Netherlands, to secure municipal and parliamentary suffrage were denied. Interest aroused by this event resulted in the creation of a Woman's Suffrage Society in 1894. A part of its members separated from it in 1906, to form the Woman's Suffrage League; and both organizations conducted an active campaign, aided by a Men's League for Woman's Suffrage.

"Since 50 per cent of the Swiss women remain unmarried, the woman's rights movement is a social necessity" (Schirmacher, 134). Especially in gaining equal educational opportunity, progress has been rapid in Switzerland since 1880. Women in Switzerland may exercise the municipal suffrage "in those localities whose male population is absent at work during a large part of the year." They may be elected members of school boards in Canton Neuchâtel; as "members of school boards and as poor-law administrators" in Canton Zurich. The credit of starting the movement for the wider political suffrage of women belongs to Professor Hilty of Bern, in 1897. Since then organized propaganda has made some headway, under leadership of the National Woman's Suffrage League.

Adoption in Scandinavia. In Europe the honor of priority in sanctioning the actual full political enfranchisement of woman belongs to the Scandinavian peoples. Here the environment was favorable to the realization of social justice and morality. Intelligent public opinion existed and wise educational methods fostered an enlightened spirit of community action. Extraordinary progress has been made in projects for industrial and general social betterment. It was inevitable that woman should be admitted as an even partner in the nation's work. The Finnish women were first to gain equal suffrage. For five centuries preceding the cession to Russia in 1809, Finland was an appanage of the Swedish crown. Its democratic spirit and unique civilization have withstood even the Russifying policy of Nicholas II since 1898. Municipal suffrage was gained by tax-paying women living in country districts in 1863, and by tax-paying women living in cities in 1872. Under the new constitution granted by the Czar in 1906, the Finnish diet of that year granted women the full parliamentary suffrage, over 700,000 women being thus enfranchised. Of these from 55 to 60 per cent were actual voters; and to each diet from 16 to 25 women have been elected as members. "The women legislators have come from all classes of society," says Björkman. "Most of them have been over 40, and most of them have been married women. Three have husbands sitting in the diet with them. Three have given birth to children during their terms of office, but without absenting themselves from the sessions for more than a few weeks."

The first independent European nation to establish full equal suffrage was Norway. Tax-paying women gained the municipal franchise in 1901, and the full franchise in 1907. To all women the municipal suffrage was extended in 1910, and the full parliamentary suffrage, with eligibility to all offices, in 1913. About 500,000 women were thus added to the electorate; and of these from 20 to 55 per cent regularly made use of the vote.

As early as 1882 the Parliament (Althing) of Iceland granted the municipal or communal suffrage to tax-paying widows and spinsters; in 1907 it was extended to all women; while in 1914 the Althing adopted an amendment to the constitution establishing equal suffrage for women 40 years of age and over. From 50 to 80 per cent of the 11,000 enfranchised women of Iceland vote at the elections. Following the example of her nearly autonomous Norse colony, Denmark was the second independent nation to grant full political franchise to women. Since 1908 all tax-paying women, 25 years of age, and the wives of men who pay taxes have had the municipal suffrage. They have made efficient use of their vote. Owing to this fact and to the influence of the Great War, the long struggle for universal suffrage was won; on June 5, 1915, the new constitution granting full universal suffrage to both women and men was signed by the king. It went into effect June 5, 1916.

Sweden lagged behind its former dependency, Finland. In 1862 every unmarried woman or widow over 21 years of age paying a tax of 500 crowns (c. $135) was granted the municipal vote, without the right to hold office. Forty-seven years later, in 1909, the municipal suffrage, with eligibility to office, was extended to all women on equal terms with men. In that year and again in 1912 a bill to grant full national suffrage to women was passed by the lower house of the Riksdag; but in each instance it was thrown out in the conservative upper chamber; it was again passed by the lower house in 1914. In Sweden about 1,400,000 women have the vote in municipal affairs; although only 15.2 to 32.9 per cent of them make use of it.

EQUAL SUFFRAGE IN THE BRITISH EMPIRE

English women were not expressly denied the parliamentary suffrage until 1832 nor the municipal suffrage until 1835, when in each case the restrictive word "male" appears in the election law. By custom, however, the exercise of the theoretical legal right of women to vote had long, though not always, been practically in abeyance. In the middle ages noblewomen as peeresses by inheritance or in their own right were sometimes summoned to appear in Parliament in person or by proxy, just as noblemen were summoned. Contrary to the dictum of Sir Edward Coke, the ancient election indentures bear witness that women below the rank of peers were legally empowered as suitors in the county court or as freeholders to join in the choice of knights of the shire; while after Henry III in some towns women could vote for the borough representatives to the House of Commons.

The express disfranchisement of women by the statutes of 1832 and 1835, which violate the principle of "no taxation without representation," gave rise eventually to the organized equal suffrage movement in Great Britain. "As long as both sexes and all parties are not given a just representation, good government is impossible," declared Anne Knight in a strong pamphlet in 1847. In 1851 the Earl of Carlisle presented to the Lords a petition drafted at a public meeting in Sheffield for the extension of parliamentary suffrage to women. This was the first address on equal suffrage formulated by English women. In the same year appeared Mrs. John Stuart Mill's powerful article on the "Enfranchisement of Women" in the *West-*

minster Review. This essay, together with Mr. Mill's masterly *Subjection of Women*—published in 1869 but written in 1861—supplied the agitation with a definite program. The struggle of 1866–68, which resulted in a further extension of male suffrage, gave the women an opportunity. In 1866 Disraeli had said, "In a country in which a woman can be ruler, peer, church trustee, owner of estates, and guardian of the poor, I do not see in the name of what principle the right to vote can be withheld from her." Numerously signed petitions were presented through John Stuart Mill who had entered the House of Commons in 1865. On May 20, 1867, his motion to grant the parliamentary suffrage to tax-paying women was rejected by a vote of 196 to 73. The replacement of the term "male person" by "man" in the new election law gave a chance to win by interpretation; for a statute of 1851, "for shortening the language of the acts of Parliament," provided that man should always include woman except where otherwise expressly stated. Hence 5347 women in Manchester and many in other places had themselves registered as electors. On their votes in most cases being rejected by the revising barristers, an appeal was taken to the court of common pleas which in the case of Chorlton *v.* Lings (Nov., 1868), while conceding that in early times there may have been instances of "women having voted," decided adversely to the appellants on the ground that the fact of the right to vote "not having been asserted for centuries raises a very strong presumption against its ever having had legal existence."

From this date onward, especially after 1903, the British equal suffrage movement steadily gained in volume and force. In 1884, when a new election law, by lowering the property qualification, once more greatly increased the number of male voters, a motion in Parliament to enfranchise women was defeated. Such has been the fate of the many women's suffrage bills introduced since 1870, although the second reading was secured in 1886 and again in 1897; while in 1904 McLaren's resolution was carried by a majority of 114 in the House.

After 1903 public interest centred in the campaign carried on by the National Women's Social and Political Union, which was the organization of the suffragettes or militants, as contrasted with the suffragists of the National Union of Women's Suffrage Societies who preferred less aggressive methods and who constituted a large majority of the equal franchise advocates in Great Britain. Unfair treatment in Parliament and in political meetings, by the government leaders and their male party followers, was the primary cause assigned for the rise of the militant movement which was rendered spectacular by arrests, imprisonments, hunger strikes, and forcible feeding. The leaders of all the political parties have publicly favored votes for women. Among these are Sir Henry Campbell-Bannerman, John Redmond, Keir Hardie, A. J. Balfour, and Lord Salisbury (1891). Later, at least 420 of the 670 members of the Commons individually declared themselves in sympathy with equal suffrage. Yet both Conservative and Liberal ministries steadily refused to introduce a bill for the purpose. That is, they declined to avail themselves of an apparent majority in the House that would vote for such a government measure. Under these conditions, it was inevitable that a sentiment should arise in favor of coercing the ministry. The policy of coercion was suggested by the militant tactics often employed by men to influence Parliament. On Oct. 13, 1905, Sir Edward Grey, the future cabinet minister, spoke at a great Liberal meeting in Manchester. In true British fashion, various questions were asked by men in the audience and answered by the speaker. To Annie Kenney's question, "Will the Liberal government give women the vote?" no reply was given. When in substance the question was repeated, the "audience became a seething infuriated mob. Thousands of angry men were upon their feet shouting, gesticulating, and crying out upon the woman who had again dared to disturb their meeting." Then Annie Kenney and Christabel Pankhurst, her companion, were seized by the police and dragged from the Hall. Attempting to speak in the street, they were both arrested, charged with obstruction, and one of them, Miss Pankhurst, with assaulting the police. The next day, after a very summary trial in the police court, they were sent to prison on their refusal to pay a fine.

Thus, under the leadership of such able women as Miss Kenney, Mrs. Pethick Lawrence, Mrs. Drummond, and especially Mrs. Emmeline Pankhurst, with her daughters Christabel and Sylvia, was inaugurated a remarkable struggle for human rights. In spirit, the militancy of the women did not differ essentially from the militancy of men in like situations. In method, the suffragettes were far more ingenious, persistent, and self-sacrificing. Whether or not their methods were wise, assuredly they helped to convince the public that there was urgent need of woman's suffrage in Great Britain. Intelligent women of the leisure as well as of the working class do not endure suffering, invite martyrdom, without adequate cause. The "grounds for revolt" have been thus classified by an American observer during the years 1913–14: "The miserable status of English women; the impossibility of obtaining attention for, much less redress of, their grievances by constitutional methods; the historic precedents established by the use of force by the British people whenever the progress of freedom has been blocked by the British government; the insincerity and brutality shown by the present Liberal government in dealing with the women's agitation as compared with the leniency shown to male political offenders both past and present; the determination of the newspapers to stifle the movement by persistently excluding suffrage news and propaganda from their columns." In particular, the backward legal status of married women and the hardships of female wage earners constituted strong grounds of rebellion (Mary Winsor, in *Annals*, Oct. 1914, 135–136).

According to Christabel Pankhurst, although the demonstrations of the suffragettes brought down on their heads much hostile criticism, they "destroyed the apathy which enveloped the woman's suffrage movement as with a cloud. They have brought to the notice of both men and women the fact that there is a movement for woman's suffrage. They have made people think about the question." It "has taken half a century to teach women suffragists the lesson that political rights are never granted save in response to irresistible pressure"; and "the means of bringing that pressure to bear have now been discovered" (cf. *Bliss's New Encyclopedia of Social Reform*, 1301).

Though British women had not in 1916 won the parliamentary suffrage, they might share in all local elections. In England and Wales both single and married women might vote for and be elected overseers, waywardens, churchwardens, poor-law guardians, rural and urban district councilors, and various other minor officers. Throughout the United Kingdom, they might vote for and—except in the county of London—be chosen members of school boards. In Scotland and Ireland both single and married women possessed the county and municipal franchise and might be elected mayors, aldermen, and councilors on the same terms with men. This was true also of single women throughout England and Wales and of married women in the county of London. Elsewhere in these lands married women might vote for, but not be elected, borough and county councilors. In the Isle of Man qualified women may vote for members of the Manx Parliament.

Among the organizations working for equal suffrage in Great Britain—besides the two national unions already mentioned—were the Woman's Freedom League, the Men's League for Woman's Suffrage, the Artists' Suffrage League, the Conservative and Unionist Women's Franchise Association, the Actresses' Franchise League, the Writers' League, and the Women's Liberal Federation.

Adoption in Australia and New Zealand. In each of the nine provinces of the Dominion of Canada property-owning spinsters and widows were granted municipal suffrage; while in one of them, New Brunswick, property-owning married women also might vote in city elections if their husbands were not electors. Moreover, in all these provinces taxpaying or property-owning women secured the school franchise: all such qualified women, married or single, in Alberta, Manitoba, Ontario, and Saskatchewan; widows and spinsters, in New Brunswick, Nova Scotia, Prince Edward Island, and Quebec; while in British Columbia the wives of school electors might also vote whether they owned independent property or not. Women were not eligible to city office even when they had the municipal vote; but all women who had the school franchise might be elected as school trustees. Organizations favoring full state and federal equal suffrage were formed, and in 1914 the National Union of Woman Suffrage Societies of Canada was organized.

In 1916 all women of 21 years, married or single, in Alberta, Manitoba, and Saskatchewan were granted full suffrage in provincial (state) elections on the same terms as men.

An equal suffrage movement began in South Africa; but the social and climatic conditions were not favorable to early success. Suffrage societies were formed in Cape Colony, Natal, and Transvaal. The taxpaying women of Natal and Cape Colony voted in city affairs. Moreover, women had the municipal suffrage in Rangoon, the capital of Burma; in Belize, the capital of British Honduras; in Bombay and Baroda in British India.

The actual experience of the enfranchised women of New Zealand and of the Australian Commonwealth afforded a practical test of the workings of equal suffrage which the world was studying with keen interest. School suffrage in 1877, municipal suffrage in 1886, and full suffrage in 1893, were granted the women of New Zealand. They were eligible to all elective offices except membership in Parliament. In 1916 about 300,000 women were in possession of the ballot and were making practical use of it in nearly the same relative numbers as men.

In the six federated states of the Australian Commonwealth women were admitted to the school and the municipal franchise, beginning with New South Wales in 1867 and Victoria in 1869; but in none of these states were eligible to the municipal councils. Under a provision of the Commonwealth constitution (1900) full parliamentary suffrage was extended to the women of the federation in 1902. Before this date state equal suffrage had been established in South Australia, 1895; and West Australia, 1900. Then followed New South Wales, 1902; Tasmania, 1903; Queensland, 1905; and Victoria, 1908. Thus in four states women were voting for members of the federal Parliament before they could share in the election of the state legislators. They might be elected to the Senate or to the house of the federal Parliament; but only in South Australia and Queensland were they eligible to the state legislative bodies. In 1916 the number of women who might vote in the Commonwealth was about 1,100,000.

EQUAL SUFFRAGE IN THE UNITED STATES

America may justly be called the cradle of the equal suffrage movement. There it was first permanently organized, and there are recorded the earliest-known demands for representation by taxpaying women. In the United States the sentiment in favor of the full and equal educational, economic, and political freedom of both men and women has steadily grown in volume and strength ever since the Revolution. The beginning was even earlier. In 1647 Margaret Brent, "heir of Lord Calvert, the brother of Lord Baltimore, and executor of the estates of both in the colony," demanded "place and voyce" in the Legislature of Maryland; for representation was based upon property. "Her petition," says Mrs. Harper, "was hotly debated for several hours and finally denied." The Colonial records of Massachusetts, she continues, "show that women property holders voted under the old Province Charter from 1691 to 1780 for all elective officers"; and when the constitution of that year deprived them of the vote for Governor and Legislature they still retained it for other officials. In 1776 Abigail Adams wrote to her husband, John Adams, then in the Continental Congress: "I long to hear that you have declared an independence, and by the way, in the new code of laws which I suppose it will be necessary to make, I desire you would remember the ladies and be more generous and favorable to them than were your ancestors." If "particular care and attention are not paid to the ladies we are determined to foment a rebellion, and will not hold ourselves bound to obey any laws in which we have no voice or representation." Two years later, "Mrs. Corbin, sister of Richard Henry Lee, of Virginia, presented her own petition for the right to vote."

The Continental Congress, like the national Constitutional Convention of 1787, left the determination of the conditions of suffrage to the respective States. Only New Jersey conferred it on women, the constitution of 1776 giving the franchise to "all inhabitants" worth "fifty pounds proclamation money," etc. "In 1790 a revision of the election law used the words 'he or she,'

thus emphasizing the inclusion of women in the electorate. Enough women voted to gain the enmity of politicians, and in 1807 the Legislature passed an arbitrary act limiting the suffrage to 'white male citizens'" (Harper, *Brief History*, 1-3). This action was probably a usurpation of authority, although the constitution is not clear regarding the mode of amendment.

The first half of the nineteenth century was a period of rising humanism in which a number of courageous and gifted women came to the front. Their first task was to secure for their sex facilities for higher education as an absolute condition of intelligently sharing in the world's work. Later they enlisted for the antislavery and the temperance campaigns, although the more conservative among their male allies, with society in general, were shocked by the public appearance of women as speakers or delegates. Yet slavery and intemperance were not the only evils which stirred the awakening social consciousness of women. Here and there even in these early decades a clear voice was raised for political liberation. Beginning in 1826 Frances Wright braved the derision of the public by advocating woman's suffrage on the lecture platform. For several years, commencing in 1836, Ernestine L. Rose, daughter of a Polish rabbi, in her lectures on the science of government argued for the full enfranchisement of women; and she initiated the 12 years' agitation which in 1848 resulted in securing for the married women of New York State the first installment of the property rights which the common law had denied. Other pioneers were Margaret Fuller (1840), the Rev. Samuel J. May (1845), and Lucy Stone (1847). After 1839 these were joined by such men as William Lloyd Garrison, Wendell Phillips, and Gerrit Smith, who defended the right of women to take part in the business meetings and debates of the American Antislavery Society, and who became strong champions of votes for women.

The year 1848 marks the origin of the organized movement for equal political rights which, except during the Civil War, went on continuously gaining in force. On July 19 and 20 of that year a convention, called by Lucretia Mott, Martha C. Wright, Mary Ann McClintock, and Elizabeth Cady Stanton, was held at Seneca Falls, N. Y., the deliberations being continued at a second meeting held at Rochester in August. A strong "Declaration of Sentiments" or list of grievances, drafted by the callers of the convention and modeled on the Declaration of Independence, was signed; and resolutions were adopted setting forth the remedies required to redress such wrongs.

The keynote was thus sounded, and for nearly 40 years the chief stress was laid on the abstract right of woman to vote and the denial of that right by man. This phase of the agitation was perhaps inevitable; and on this basic principle the suffrage movement soon felt the controlling spirit of a gifted and intrepid leader. Susan B. Anthony (q.v.) joined the band of suffragists in 1852.

In the opening years of the twentieth century the extension of the ballot to women came to be looked upon less as a question of abstract or natural right, and more and more as a many-sided practical problem in which the welfare of society was deeply concerned. Discussion became more tolerant and serious, with constant appeal to facts. Twelve States and Territories granted full suffrage to women: Wyoming, 1869; Colorado, 1893; Utah and Idaho, 1896; Washington, 1910; California, 1911; Arizona, Kansas, and Oregon, 1912; Alaska, 1913; Montana and Nevada, 1914. In 1913 the Legislature of Illinois gave women as large an installment of the electoral franchise as could be granted without an amendment to the constitution. They might vote for presidential electors, some county and some State officials, and for all municipal officers. Relatively the grant of such partial suffrage in Illinois was very important, because of the probable influence of the women's vote on the moral, social, and political welfare of Chicago, which contained nearly half the population of the State. By the census of 1910, in the 12 suffrage States, excluding Alaska, there were 3,665,445 women aged 21 years or more. In 1915 it was safe to say that in the United States about 4,000,000 women were eligible to vote. In all of the suffrage States the men greatly outnumbered the women. In two States, Montana and Wyoming, they were more than two to one; while in five others—Arizona, Idaho, Nevada, Oregon, and Washington—there were from 152 to 187 men to 100 women of voting age.

Many States which did not grant full or partial State suffrage to women gave them a vote in local affairs. Beginning with Kentucky in 1838 and Michigan in 1875, at least 18 non-suffrage States extended to women the school franchise, usually to those who paid taxes or who had children of school age. In Iowa and New York qualified women might vote on bonding propositions; in Louisiana, New York, and Michigan, on taxation questions.

In 1914 the National Education Association and the General Federation of Women's Clubs declared in its favor. The American Federation of Labor, the National Women's Trade Union League, and several other labor organizations, have taken the same stand. By large majorities the legislatures of Iowa, Massachusetts, New Jersey, New York, Pennsylvania, South Dakota, and West Virginia submitted to popular vote constitutional amendments extending full suffrage to women. Tennessee adopted a similar resolution, subject to approval by the next Legislature. On Jan. 10, 1915, in the national House of Representatives the Mondell resolution proposing an equal suffrage amendment to the Federal Constitution was lost by a vote of 174 to 204, failing by 78 votes to get the requisite two-thirds of the House.

EXTENT OF THE WOMEN'S VOTE

It has often been asserted as an objection to equal suffrage, that women make small use of the ballot when they get it. Only 66.4 per cent of the eligible males of the United States cast their ballots in the presidential election of 1904; 67.6 per cent in 1908; and 60.4 per cent in 1912. In other elections the extent of the vote was often much smaller. However unfair or irrelevant it may be, suffragists did not fear the test of the relative number of eligibles making use of the ballot. Everywhere enfranchised women were taking a surprisingly active part in the elections; and it was a significant proof of the stimulating or socializing effect of the equal participation of the sexes in public affairs that generally the average percentage

of men voting rose after women went with them as full active citizens to the polls. In 1903, at the first Federal election in which women voted in Australia, 53 per cent of the eligible men cast their ballots; whereas the percentage had risen to 56 in 1906 and to 67 in 1910.

In the first two elections after obtaining the suffrage in New Zealand the women voted in larger proportion than the men; in the five subsequent elections they nearly held their own; while the percentage of males voting rose from 66.61 to 84.43 during the 18 years.

The laws of the American suffrage States, unlike those of Europe and Australia, did not provide for a separate record of the number of persons of each sex eligible (enrolled), registered, and voting. Yet through special investigations and from careful estimates, it was clear that in all the equal suffrage States women were voting in large numbers. As a general rule, the proportion of eligible women who vote is smaller than that of the eligible men. Sometimes, however, in particular places or in particular elections, the reverse is true. It was estimated that in Utah and Wyoming the eligible men and women went to the polls in about equal proportion, while in Idaho the estimated vote of eligible women was about 10 per cent less than that of the men. In Oregon and Washington the proportion of eligible women taking part in rural and even city elections was smaller than that of the men; the same is true of Colorado and of its capital, Denver. In Illinois, notably in Chicago, the vote of the newly enfranchised women became a real menace to the vice and liquor interests. In 37 representative counties of California the percentage of eligible women who registered varied from 20 to 100; and the percentage of registered women who voted ranged from 20 to 90, the average being about 60. "Five out of 34 counties show a larger percentage of women than of men registered"; and in the State at the election of 1913 not less than 251,847 women voted (Björkman).

The contention that under equal suffrage the vote of the women of the red-light districts was a social menace was not sustained by the available statistics. In Seattle and Denver this vote was relatively so small as to be negligible. In Seattle and Los Angeles the larger women's vote was cast in the best residential wards; the smaller, in the poorer districts; and the "average in the precincts inhabited by people of modest means" (Creel). Such is not always the case, as some of the districts of Denver, where many foreigners dwell, show a surprisingly high percentage of women voters.

EFFECT OF THE WOMEN'S VOTE

It was asserted by the antisuffragists that women voters had not improved the laws or the social conditions in the suffrage States. Suffragists did not expect an immediate revolution; did not hope to correct all the man-made blunders in law or politics; nor promised as a return for the grant of the ballot to make no similar errors. The extension of the suffrage to each "lower" religious, economic, or race class of men has never been conditioned by a pledge to make better laws than those made by the men already enfranchised.

Nevertheless no well-informed, disinterested person can doubt that women actually improved law and government in the suffrage States. Modern law and administration are largely concerned with the affairs in which from the infancy of the race woman has been the expert: viz., the welfare of mother, infant, and child, the ordering of the household life.

The equal suffrage States were conspicuous for their remedial and constructive social legislation; and for some of the good laws of nonsuffrage States it was claimed chief credit belonged to leaders in the suffrage movement. Antisuffragists persistently denied that woman's vote bettered conditions in Colorado. The evidence to the contrary appears to be decisive. Women did something to cleanse partisan politics, and in social politics they made a splendid record of efficient legislative and administrative service. Perhaps only California could show a more remarkable achievement.

The newer forms of social control were accented in the other equal suffrage States. Effective "abatement and injunction" laws—the best weapon against commercialized vice—were enacted in California, Colorado, Idaho, Kansas, Oregon, Utah, and Washington. Everywhere women were voting against the brothel and white slavery. For the protection of young girls, the "age of consent" was raised to 18 in California, Colorado, Idaho, Kansas, Utah, Nevada, Washington, and Wyoming. Only four nonsuffrage States had reached this high standard with really effective laws. Colorado, Oregon, and Washington were "experiment stations" in prison reform, and they proved the practicability of the "honor and trust" system in managing convicts. Good mother pension laws were in force in Arizona, California, Colorado, Idaho, Illinois, Kansas, Montana, Nevada, Oregon, Utah, Washington, and Wyoming (1915). Nine equal suffrage States had excellent laws restricting child labor. Arizona was the first State to adopt the model draft Act prepared by the National Child Labor Committee.

Equal suffrage was a menace to the liquor traffic, although the suffrage associations studiously kept aloof from temperance organization endorsements. In New Jersey a federation of liquor organizations was formed to combat the equal suffrage amendment which was voted upon in 1915. In the same year four equal suffrage Commonwealths—Arizona, Colorado, Oregon, and Washington—adopted State-wide prohibition by popular referendum. Idaho was 66 and Wyoming 90 per cent dry. In 1914, 18 of Utah's 28 counties were wet; but 16 of these were mining camps. Many towns in California banished the saloon after woman began to vote, but in 1914 State-wide prohibition was defeated. In Illinois, since the women were enfranchised (1913), not less than 22 counties were made entirely dry; and in the State many hundreds of saloons were closed through the women's vote.

In legislation for the protection of wage-earning women the equal suffrage States were easily the leaders (see WOMAN'S WORK). Six of the 11 Commonwealths which sanctioned a minimum wage for female toilers, granted votes to women. Only in the five equal suffrage States—Arizona, California, Colorado, Washington, and Wyoming (1915)—were women safeguarded by an eight-hour working day. In the States where women vote school teachers, men and women, received equal pay for equal service. In fact the suffrage question was very

largely a labor question. Without the ballot the 8,000,000 women in the United States engaged in gainful occupations could not have an equal voice in social control. The ballot was held to be needed to stop the exploitation of the labor of women and children through low wages, thus driving men out of employment.

The antisuffragist believed that "if women are to assume onerous duties previously discharged by men," their "traditional duties" will be less efficiently discharged. This theory ignored the true function of the ballot as "the register of the individual's will in determining the character of social control." The ballot was held to be an instrument through which woman might lighten and perform more efficiently the domestic duties which devolved upon her. The evil as well as the good in the industrial and social life came into the home. It was believed that the problems of disease and vice, so far as they menaced the family welfare and threatened the happiness of mother and child, could be more rationally treated when woman might help make laws which should ignore the dual standard of sex morality. The ballot aided the mother in the education of her child, especially of her boy. Because of inefficient family training, the State was forced to hand over to the teacher a very large share in the nurture of the young. For this the father was most to blame, as, absorbed in business, he had practically abdicated his function as domestic teacher, and laid that task on the shoulders of the mother, thus doubling her burden. The boy and the girl should be trained for citizenship; for the wise conduct of persons intrusted with the ballot; yet so far as the young boy in the home was concerned, the needed training must come chiefly from the mother whose prestige was crippled as she was not a full active citizen. Not having the ballot, what could she know of its proper use? That was the psychology of the suggestion in the case. The ballot would give her prestige equal to that of the father in her boy's mind; and lighten her task as chief family teacher.

The suffragists held that two things were urgently needed in the process of socialization: that the woman should have an opportunity to do a full share of the world's work; and that the man should take a full share in the work of the home. It was true that woman's place was in the home, but it was not less true that man's place was also in the home.

WOMAN'S VETERAN RELIEF UNION. A patriotic society that admits to membership mothers, wives, widows, sisters, daughters, and granddaughters of soldiers, sailors, or marines of the Union army who are eligible to the Union Veteran Union (q.v.), of which organization it is an auxiliary society similar to the Woman's Relief Corps.

WOMAN'S WORK. The work of primitive woman—of woman in the savage, barbaric, or other lower stage of progress—is of basic value for the evolution of industry and social culture. Research clearly discloses the great variety and relative importance of her achievements.

WOMAN THE MOTHER OF INDUSTRY

While primitive man was hunting and fighting, primitive woman was creating and practicing the arts of peace. Indeed the habit of work—of labor as a conscious and persistent employment of effort for the attainment of some end—was primarily woman's contribution. Mankind had to be trained to labor, and woman was the original learner and teacher. Much of the activity of early man was not labor. "The pursuit of food wherever it can be found by the members of the primitive horde," says Ward, "can no more be called labor than can the grazing of a buffalo or the browsing of an antelope. . . . Only the work of the women in caring for the men and the children, and in performing the drudgery of the camp, approaches the character of labor" in the economic or institutional sense. "In early society," says Westermarck, "just as among ourselves, each sex has its own pursuits." Man's "occupations are such as require strength and ability"; while the "principal occupations of the woman are universally of a domestic kind," including agriculture. Only in a very general sense is this statement true. There was not always a thorough division of activities on the sex line. Men sometimes shared in the work usually done by women; and women sometimes accompanied men in hunting or other pursuits commonly monopolized by the male.

When slavery arose as an economic institution women were the favorite, though not the exclusive, subjects of exploitation. If, as some sociologists believe, mankind was first inured to labor by slavery, then primitive women chiefly benefited, as they chiefly suffered, from this harsh discipline. Often the wife was the chattel slave of her husband; yet such absolute subjection was not the universal condition of primitive, especially of barbaric, woman.

Decidedly the woman was the chief provider for the family in its early stages. This fact may be accented by a fairly typical case. An investigation of the *Family among the Australian Aborigines*, by Malinowski, shows that "woman's work is on the whole much heavier than that done by man; her work is much more regular; it is compulsory, and it forms the chief support of the household." There is no true cooperation in economic functions; but the "relation of a husband to his wife is, in its economic aspect, that of a master to his slave." The woman's "share in labor was of much more vital importance to the maintenance of the household than man's work." Even the food supply contributed by women was more important than man's share. Moreover, "it seems as if the man's contribution, which in the main was reduced to his hunting products, was devoted much less exclusively to his family's benefit."

Woman was the chief inventor of the original types of the useful arts. Psychologically, cunning and invention are identical. This faculty enabled mankind to master the forces of nature. In the male, it was drawn out by warfare and the chase, and fostered through his later control of the state and the economic system. On the other hand, the whole struggle for food, clothing, and shelter—for race preservation—has challenged the inventive powers of the female. In countless ways woman created the archetypes, designed the first patterns, of man's later and more specialized inventions. First of

all, she developed household science. She searched for edible fruits, herbs, roots, seeds, and nuts; brewed and concocted drinks; tried out processes of cooking, seasoning, etc.

Many other inventions must be credited to primitive woman. The variety in design, the technical skill, the beauty of decoration, and the inventive genius revealed by the pottery, basketry, and textile fabrics of aboriginal tribes, such as the American Indians, challenge our admiration and render the great National Museum a monument to woman's early achievement.

Most important of all, woman was par excellence the social creator. The mother more than the father was the builder of the first types of the family constitution. The establishment of the earliest forms of marriage, that is, the usages and folkways by which for the good of the race sex relations were controlled and disciplined, was chiefly woman's work. She was the first molder of social custom. Probably there never was a general stage of gynocracy, implying the social leadership of women and eventually the political and even the military subordination of men. The inheritance of name and family rights through the mother does not necessarily mean the headship of woman in the family. Yet the very wide prevalence of mother right, even in this restricted sense, must often have tended, as among American aborigines, to place woman at the point of vantage in the development of household and matrimonial institutions.

These institutions were chiefly shaped by economic forces controlled by the mother in her struggle for the conservation of the child. From the first, well says Anna Garlin Spencer, woman "enjoyed the special tutoring of that most persistent and effective trainer in industrial education which the world of nature has yet produced, the human infant." In particular, if the "prolongation of human infancy," as John Fiske suggests, is the "chief agency towards civilization," it is because the demands of the child have made the mother, aided by the father, the principal bearer and disseminator of cumulative culture. During the years of relative helplessness the child appropriates, takes over, the elements of domestic morals and folklore. Because of this overlapping of the generations the stream of tradition, of *mores*, of "down-imitation" never stops flowing; and the heritage of knowledge is thus preserved. The function of teacher belonged to the primitive mother in quite as full measure as to the modern. The vocational training of the daughter was almost wholly in her hands; and until puberty, when his education was handed over to the "men's house," or other public control, she shared with the father in the nurture of the son.

DOMESTIC OR HAND INDUSTRY

The pursuit of war and the chase gave the male the advantage of superior bodily strength and initiative. The protector of the family became the founder of the state and the warrior became the ruler. With the decrease of warfare and the rise of the institution of property men more and more turned their attention to the industrial arts. The talent for invention forced out by militarism was used for the more specialized development of the arts which women had founded. Men discovered that labor was the best means for satisfying their multiplying wants, and a partial realignment of the social services took place. By preference men appropriated the work requiring skill and strength, while women more and more withdrew from agriculture and the other outdoor callings to devote themselves to the arts and crafts which centred in the immediate household life. With the rise of feudalism in Europe the woman of leisure, the "lady," appeared. The wife or daughter of the feudal chief, of the "gentleman," must abstain from gainful or menial toil. Thus war developed the false ideal of chivalry of helpless dependence of the female on the male.

Still the woman of the castle or the manor house was by no means always a parasite. Decidedly, under very unfavorable conditions, the woman of the feudal leisure class, in quite as full measure as her lord, contributed to the culture and refinement which constitute a precious spiritual asset of advancing civilization. On the other hand, in their homes the women of the masses were busy with many kinds of productive industry. The greater part of this work, by no means the least important, consisted of the unpaid domestic labor which everywhere women continue to perform. Nor has woman's work ever been exclusively confined to indoor activities or to the lighter kinds of toil. In modern times in Europe much of the heavy labor on the farm and in the city was done by women. The traveler might sometimes see them serving as beasts of burden and also as traction animals dragging the cart or the plow. Moreover, women in America share with the men in a vast number of the coarser and heavier kinds of gainful toil.

A picture of industrial life before the age of factory production shows that nearly all kinds of manufacture—the iron, steel, and wood crafts chiefly followed by men, as well as the textile, sewing, and other arts by preference belonging to women—were installed in the home or near by. To some extent milling, brewing, and distilling were exceptions to this rule. The industrial group was the family group, embracing the mother, father, and child, as well as the indentured apprentice. Not until the second decade of the nineteenth century was machine production well started in the United States. For the colonial period woman's share in industry is meagre. Still, research enables us to see that relatively it was very important. The prevailing economic interests of the country were agriculture and commerce; and in these the men were chiefly engaged. Manufactures, such as the men would naturally have taken up, were often hampered or entirely suppressed by act of Parliament. Woman's work was not thus hindered. Besides the unpaid household arts and miscellaneous gainful activities, the textile industries and the clothing and sewing trades were largely, though not wholly, in the hands of women. Except some of the heavier kinds, this industry included weaving, which in England was mainly men's work. In America "men were sometimes weavers, shoemakers, or tailors; and here and there women of notable executive ability, such as the famous Eliza Lucas of South Carolina, managed farms and plantations" (Abbott). Among gainful occupations undertaken by the Colonial woman—other than the usual domestic employments—were shopkeeping, the keeping of taverns and ordinaries, chair-frame making, the

running of sawmills, grist mills, distilleries, and even slaughterhouses. Sometimes a woman kept a "dame school," became a nurse or midwife, printed books and pamphlets, or even published a newspaper.

These occasional occupations were of minor importance compared with the many-sided textile industry in which the mass of women were employed in their homes. This manufacture of textiles includes knitting, lacemaking, the making of "cards for combing cotton and wool, as well as sewing, spinning, and weaving." Almost literally—from the raw wool, cotton, or flax to the finished garment—the Colonial population was clothed by its women. The surplus products of the spindle and the loom were sold from the home to customers; or, like butter and eggs, were exchanged at the neighboring store for other goods. Sometimes they were sold outright to the trade. Old account books of merchants reveal the important contributions of woman spinners and weavers to the family income. With the "expansion of industry, especially in the latter half of the eighteenth century, a considerable part of the work was done more in the manner of what is known as the commission system. As yarn came to be in great demand, many women were regularly employed spinning at home for purchasers who were really commission merchants. These men sometimes sold the yarn, but often they put it out again to be woven and then sold the cloth." In the clothing and garment industry, too, the product, after supplying the family needs, was usually made to order and sold to customers.

There was no cry of woman's invasion of men's work in the Colonial period. Public sentiment strongly favored the employment of women and girls in manufacturing or other productive labor. Idleness, especially for women, was a grievous sin in the eyes of the Puritan, and laws were enacted to provide work and to encourage thrift. To relieve the poor or to promote American production, so-called manufactories were built by legislative authority, by voluntary associations, or through individual enterprise. These manufactories were merely a new organization of handwork. Only in the fact that a number of employees were assembled in a special room or building, where hand looms, sometimes spindles, were installed, do they represent a transition to the modern factory system. During the second half of the eighteenth century many such manufactories were built. In Boston, New York, Philadelphia, Baltimore, and some smaller towns hundreds of women and girls were employed, chiefly in weaving, but occasionally "in all the processes of cloth making." Thus it is clear that wage-earning women made their appearance in the handicraft stage. Furthermore, many girls, nominally bound out to domestic service, were in reality thus earning wages as spinners and weavers. Both girls and boys were indentured as apprentices; but the girl's indenture was really a mere binding out to service. It did not mean that she should be taught a trade. Thousands of women did indeed acquire skill, craftsmanship, in weaving, spinning, and sewing; but in very slight degree was this due to conscious private or public care for their vocational education.

THE INDUSTRIAL REVOLUTION

The change from the handicraft or domestic stage to that of factory production is rightly called the "industrial revolution." The advent of machines for manufacturing processes, with the application of power, had tremendous consequences: economic, social, and political. The solidarity of the industrial family group was broken up. Gainful work passed out of the home; and men, women, and children followed it into the factory. There was a period of transition, measured by the progress of invention and by industrial opportunity. For England the change was fairly inaugurated in 1800; in America the transition from the old system to the new was much slower. In the textile industry, e.g., factories for spinning preceded those for weaving. Most of the 168 cotton factories in the United States in 1810 were probably merely spinning mills. In some of them, weaving on hand looms was combined with spinning by machinery. Usually, according to Dr. Sumner, in these early spinning factories, the spinners were "girls from the neighboring towns, and the weaving was done by women, or by both men and women of the neighborhood." Occasionally the introduction of spinning machines caused a displacement of women by children; sometimes a displacement of women by men; but generally the factory was looked upon as a new opportunity to utilize women and children in productive work.

In textiles the complete factory system in the United States began in 1814 with the setting up of the first successful power loom at Waltham, Mass. First in cotton, later in wool, and gradually in all kinds of textiles the power loom stopped hand work. Women, just as they had followed their spinning, now followed their weaving into the factory. It is not surprising that for many years after the advent of the complete factory system in the United States, a larger number of women than men were employed in textile industries. Public sentiment strongly favored the utilization of the labor of women and children in the factory at a time when there was a pressing demand for the labor of men in agriculture. In England the conditions were different. There, under the domestic system, weaving had been largely in the hands of men. Before the industrial revolution the manufacture of cloth had became an important industry; and the establishment of the "factory system created a disaffected class of unemployed workmen who were jealous of the new machinery which could be easily managed by women and children and which was taking the work away from them." In the United States many more females than males were engaged in manufacture; but they were not looked upon by the men as intruders. They were welcomed by moralist, economist, and statesman alike.

WOMEN VS. MEN IN INDUSTRIAL OCCUPATION

For the century since the establishment of the complete factory system in the United States the statistics of the relative employment of the sexes are enlightening and decisive. Both in the textile industries as a whole and in the very important branch of cotton manufactures the proportion of females as compared with males engaged has declined.

Cotton Industry. In 1810 Albert Gallatin, from returns from 87 mills, estimated that in the cotton industry 87.5 per cent of the employees were women and children; while in 1816 an estimate based on a report to the House of

Representatives made the percentage of women and female children about 66. In the same industry since 1831, the percentage that women formed of all employees was 68 in 1831; 64 in 1850; 62 in 1860; 60 in 1870; 57 in 1880; 54 in 1890; 49 in 1900; 47 in 1905; and 44.1 in 1910. During the same period, the relative decrease in the number of females employed in the cotton mills of Massachusetts is even more striking. The percentage was 80 in 1831; 75 in 1837; 70 in 1845; 62 in 1865; 59 in 1875; 55 in 1885; 50 in 1895; and 48 in 1905. Thus during the century in cotton manufacture, woman's chief industry, women have steadily been displaced by men.

All Textile Industries. A similar though less steady displacement has taken place in the entire group of textiles. In 1850 the percentage which women wage earners formed of all employees was 50.2; in 1860, 53.4; in 1870, 43.3; in 1880, 44.8; in 1890, 47.6; in 1900, 40.6; in 1905, 44.4.

Five Chief Industries. Most enlightening as to the question of displacement of the wage earners of one sex by those of the other is Dr. Abbott's study of the five industrial groups which at the beginning of the twentieth century employed the greatest number of women; and in all of which women had been engaged for more than a century.

NUMBER OF PERSONS EMPLOYED IN 1905

	Women	Men
In the cotton mills	128,163	147,283
In the clothing industry	147,710	101,373
Total	275,873	248,653
In boots and shoes	49,535	95,257
In printing and publishing	19,975	65,293
Total	69,510	160,550
In cigars and tobacco	57,174	72,970

At the beginning of the century, cotton manufacture and the clothing trades were almost exclusively women's work; while "printing and shoemaking are examples of skilled trades which may be said on the whole to have belonged to men." In the "cotton and the clothing trades, therefore, men are doing work which for the most part was once done by women. In the printing trade and in the manufacture of boots and shoes, women are doing the work which would a century ago have been done by men." But the table shows that "to-day the men's share in the two women's industries is much greater than the share of women in the two men's industries." In the readjustment of work, "men have gained more than women." Cigar making "has been carried on at different times both by men and by women, and furnishes an example of the way in which work originally done by women, but later taken by men, may come to be women's work again."

There has been hardly any conscious intrusion by either sex into the occupations of the other. When the demand for labor has been keen and competition not feared men have urged women to enter industrial occupations. With an oversupply of cheap labor and menace of unemployment, men have sometimes complained of woman's invasion. Women have occasionally charged men with like conduct. The relative shares which men, women, and children have at any stage in the world's work is determined mainly by physical, economic, and social laws. Essentially the readjustment of vocations between the sexes is a bread-and-butter problem; while the division of labor incident to machine production has ever given new opportunities to women, the physically weaker sex. In fact, as Scott Nearing has demonstrated, the new alignment of occupations shows that in the main women are choosing the trades requiring dexterity and perseverance; while men are following those demanding strength and skill. Thus in his graph the percentage which women form of all employees gradually falls from 99.4 in dressmaking to 2.9 in manufacturing and mechanical pursuits. It is important, too, to consider that in proportion to the population the number of both men and women engaged in manufacturing industry has rapidly increased. In 1850, according to Dr. Abbott's critical estimate, 87 men and 28 women out of every thousand persons of each sex over 10 years of age were so employed, as compared with 142 men and 39 women in 1900. Relatively, therefore, the number of men engaged in manufacturing and mechanical pursuits is increasing much faster than that of the women. During the 50 years ending in 1900, while the female workers of this division show an increase of 11 per 1000 persons over 10 years of age, male workers gain five times as many. Moreover, for the years 1900–10 the relative decline in the proportion of female workers in the same industrial division is greater than in any preceding decade.

NUMBER AND DISTRIBUTION OF FEMALES IN ALL GAINFUL OCCUPATIONS

Volume IV of the *Thirteenth Census of the United States*, for "occupation statistics," contains an impressive exhibit of the vast amount and variety of woman's gainful service. It is the more imposing when one considers that the equally valuable unpaid toil of women in the household is not included. For continental United States in 1910, of the 34,552,712 females of 10 years of age and over, 8,075,000, or 23.4 per cent, were engaged in gainful occupations; as compared with 2,647,157 or 14.7 per cent in 1880. During the same period for the same age class, the number of male breadwinners advanced from 14,744,942 to 30,091,564, or from 78.7 to 81.3 per cent. Thus a still clearer light is thrown on the process of readjustment in the choice of occupations between the sexes; for, as above seen, while in the division of manufacturing and mechanical pursuits the relative gain in the number of male workers is much greater than in that of the females, in the whole field of paid labor the relative gain in the number of female workers is much larger than that of the males.

The relative distribution of the total number of male and female breadwinners in the five great divisions of occupation for 30 years is shown in the following table taken from vol. iv of the Census of 1910.

In each of the great divisions, it will be seen the absolute number of females employed has increased from decade to decade; but in the relative proportions there are sharp variations and contrasts. While in two divisions—domestic and personal service and manufacturing and

mechanical pursuits—the relative percentage has fallen, notably in the last decennium; in two other divisions—trade and transportation and agricultural pursuits—the last decade shows a decided gain in the relative distribution. More enlightening is the classification of the number and proportion of females in the specified occupations into which the grand divisions are separated. Women have a share in 386 of the 428 gainful pursuits tabulated, although nearly 82 per cent of the female breadwinners are engaged in 19 such pursuits. That is, in all but 42 of the specified occupations women are doing the same kind of work as men. In agricultural pursuits, e.g., in 1910, 1,807,050 (1,807,501 by the new classification) were engaged; and of these 1,514,423 were farm laborers—including of course the negro field hands in the Southern States. It is clear that economic necessity is forcing women to take up work which commonly is looked upon as suitable only for men. For detailed statistics consult vol. iv, *Thirteenth Census of the United States.*

For England and Wales in 1911 the number of females over 15 years returned as occupied was 4,648,241 or 35.4 per cent of all living. In addition 182,496 or 10.4 per cent of the girls aged 10 to 15 were gainfully employed. Dress, textiles, and domestic service employ about 67 per cent of these women. The changes in the relative distribution of woman's work were slight compared with the variations in the United States. Between 1881 and 1901 there was a net gain in percentage in the following groups: government, commercial, professional, 3.3; conveyance, 0.1; metals and precious metals, 0.5; bricks, chemicals, skins, paper, 1.5; food 3.3. On the other hand, there was a net loss in domestic offices and services of 4.4; agriculture, 0.5; mines, 0.1; textiles, 2.0; dress, 1.1; unspecified, 0.6 (Hutchins). The seemingly decided loss in domestic offices and service, however, was due largely to a change in classification, not to any actual decline. The census of 1911 shows but slight changes in gains and losses.

SEX AND GENERAL DIVISION OF OCCUPATION	1910		1900		1890		1880	
	Number	Per cent distribution	Number	Per cent distribution	Number	Per cent distribution	Number	Per cent distribution
Male								
All occupations	30,901,564	100.0	23,753,836	100.0	19,312,651	100.0	14,744,942	100.0
Agricultural pursuits	10,760,875	35 8	9,404,429	39.6	8,378,603	43 4	7,119,365	48 3
Professional service	1,151,709	3 8	827,941	3.5	632,646	3.3	425,947	2 9
Domestic and personal service	2,740,176	9 1	3,485,208	14.7	2,553,161	13.2	2,237,493	15.2
Trade and transportation	6,403,378	21.3	4,263,617	17.9	3,097,701	16.0	1,808,445	12.3
Manufacturing and mechanical pursuits	9,035,426	30.0	5,772,641	24 3	4,650,540	24.1	3,153,692	21.4
Female								
All occupations	8,075,772	100.0	5,319,397	100.0	4,005,532	100.0	2,647,157	100.0
Agricultural pursuits	1,807,050	22.4	977,336	18.4	769,845	19 2	594,510	22.5
Professional service	673,418	8 3	430,597	8.1	311,687	7 8	177,255	6.7
Domestic and personal service	2,620,857	32.5	2,095,449	39.4	1,667,651	41.6	1,181,300	44.6
Trade and transportation	1,202,352	14.9	503,347	9.5	228,421	5.7	63,058	2.4
Manufacturing and mechanical pursuits	1,772,095	21.9	1,312,668	24.7	1,027,928	25.7	631,034	23.8

In Great Britain and Ireland the relative distribution of the sexes in gainful occupations affords even more striking proof of woman's service. Of the population of England and Wales aged over 10 years, 83.8 of the males and 32.5 of the females were reported in 1911 as occupied. Thus the proportion of female breadwinners in those lands was much larger than in the United States. The proportion (1901) was less in Ireland and greater in Scotland than in England or Wales. In 1911 the whole population of England and Wales comprised 17,445,608 males and 18,624,884 females. The excess of 1,179,276 females has great economic meaning, especially when it is considered that the disproportion is much higher in urban than in rural districts. It is chiefly due to the lower death rate of the females. For males the average duration of life in 1900 was 44.13 as contrasted with 47.77 years for the females. It appears that women, though physically weaker, are constitutionally stronger, "have a more tenacious hold on life than men." They have a longer period for productive work. Even in an industrial district, such as Lancashire, "where a large proportion of young women work in the mills, their life is still conspicuously better than of men at the same age."

In England and Wales, the census of 1911 shows 39,124 women engaged in making brick, cement, pottery, and glass; 36,870, in chemicals, oil, grease, soap, and resin; 30,208, in skins, leather, hair, and feathers; 94,722, in agriculture; and 101,050 in metals, machines, implements, and conveyances. In 1911 about 14 per cent of all female breadwinners, over 10 years of age, were married or widowed. In Germany it is estimated that 12 per cent of married women and 44 per cent of widowed women were in gainful occupations. The probabilities are that in Great Britain, too, the "proportion of widowed who are occupied is much higher than the proportion of the married who are occupied." In 1901 one-fourth of the 208,000 married or widowed breadwinners, aged 45 to 55, were charwomen and laundresses. In proportion to the total number of women occupied and in proportion to the total population the number of women engaged in industrial pursuits was decreasing. It was decreasing in coal mining; the making of furniture, lace, gloves, and paper. To some extent, because of the introduction of machinery, they were displaced by men in printing offices and laundries; although in laundries women still constituted 94 per cent of the employees. On the other hand, in va-

rious industries the relative proportion was increasing. Thus in the two decades, 1881–1901, the percentage which females formed of all employed rose from 67.9 to 70.6 in bookbinding; 3.3 to 9.7 in printing and lithographing; 75.7 to 79.9 in tobacco manufacturing. Women were not driving men out of employment. The changes in the distribution of men and women were in part due to influences which were segregating them in noncompeting occupations. Two principal causes were the division of labor and the introduction of machinery. "Women are employed in place of men, because (1) they become more dexterous in the purely mechanical work, (2) they are less impatient over its monotony, and (3) they are cheaper." According to a report of the Board of Trade, there was "not a single case of absolute decrease in the number of males in any group (of occupations) which did not show an absolute decrease in the number of females." It should be noted, that trade-unions resisted the entrance of women into "all industries where labor is organized and where women have become real competitors with men"; and this was notably the case in the printing trades. Doubtless the exploitation of women's labor through a wage lower than that which men received for like service was the basic cause of this opposition.

STRUGGLE FOR THE SHORT WORK DAY

The movement for safeguarding the interests of wage-earning women had in view mainly the sanctioning of a normal short labor day, with restriction of night work; the securing of a living wage; the improvement of the sanitary and other conditions affecting the welfare of females; and the raising of the efficiency of woman's work through industrial education. The modern factory system was first installed in Great Britain; and there the first factory laws were enacted. The first half century of the dramatic struggle to socialize industry centres in the movement for a 10-hour day. Under influence of Dr. Percival, pioneer of sanitary reform, the credit for starting that movement belongs to the magistrates of Manchester, who in 1784 refused to allow indentures binding apprentices to owners of "cotton mills and other works in which children are obliged to work in the night or more than 10 hours in a day." The early acts of Parliament were confined to the labor of children and young persons, including girls. Women were wholly unprotected. In consequence, employers often substituted them for children in the low-paid occupations. First, in the Act of 1844 relating to textiles, women were restricted to a 12-hour day which had been granted to young persons in 1833. The Act of 1847, for young persons and women engaged in textiles, established from July 1, 1848, a workday of 10 hours and a work week of 58 hours. Soon operators took advantage of the wide range of 15 hours—from 5:30 A.M. to 8:30 P.M.—within which they were able legally to select the period for the 10 hours' work. By a cunning system of shifts, women were sometimes worked 13½ or even 15 hours a day. To prevent this abuse, an amendment was secured in 1850, lengthening the work day to 10½ continuous hours, except for meals, and to 60 hours in one week.

Since 1850 various improvements have been made in the details of the law; and many other occupations have been included. In the textile industry the work of young persons—those aged 14 to 18—and women is restricted to 55½ hours a week. In other regulated industries the weekly limit is 60 hours, except that in some occupations women may work a carefully defined amount of overtime. When employed in a domestic workshop—which often is a sweatshop—women may toil as many hours as they like every day except Sunday. Practically speaking, a "domestic workshop" means the home turned into a factory, provided "neither steam, water, nor other mechanical power is used in aid of the manufacturing process carried on there," and that only members of the family are employed. The work of young persons and women in factories at night is forbidden; and knowingly an operator may not employ a woman within four weeks after childbirth. The tendency in Great Britain was thus described: "The agitation for shorter hours is not so active as it would be were not labor unions, improved machinery, and the general transformation of industry bringing these about without further assistance from legislation. In many industries and establishments women and children are not at present employed the full hours allowed by law, because better results are obtained by a shorter working day." On the other hand, public sentiment favored the bringing of new and quasi-manufacturing industries—such as laundry work—under the law. The Act of 1907 came far short of securing the normal day for women workers in laundries. The hours of male workers were not regulated by the factory acts. Men relied on their bargaining power through the trade-unions; but in industries where the work of men and women was correlated the effect of the short hour laws for women was to establish the same limit for men.

In the United States, legislation for shorter hours for women made a feeble beginning in 1847, the year of the triumph of the 10-hour movement in Great Britain. Previously the working day was very long. In the cotton factories of Lowell and the whole eastern district of the United States in 1832, the working week was 73½ hours; in the middle and southern districts, 75½ hours. Some classes of operatives, whose toil was especially fatiguing, worked fewer hours; but overtime was a common abuse. The agitation for a 10-hour working day, beginning about 1831, bore fruit in 1847, when New Hampshire passed the first 10-hour law. By 1853 10-hour laws had been enacted in Maine, Pennsylvania, New Jersey, and Rhode Island; but they were generally evaded or not enforced. Usually they applied only to corporations. Sometimes, as by the New Hampshire Act, contracting for longer hours was permitted. If the operatives refused to sign contracts, they were summarily discharged; and often they were blacklisted. In New Jersey and Pennsylvania many factories adopted the 10-hour law; but with a reduction of wages, causing strikes. Meantime many of the mills of Massachusetts, in the efforts to stem the rising tide of the 10-hour movement, voluntarily adopted shorter hours. In effect, without legislation, Massachusetts thus took the lead in shortening the work day of factory women; and the passage of its 10-hour law in 1874 marks the beginning of the modern period of State regulation of woman's work. Since that date many States have reduced the length of the legal working day for both men and women. Later, under guidance

chiefly of the National Consumers' League, the short-hours movement made swift progress. At least 22 States took favorable action during the legislative sessions of 1913. In that year three great industrial States—Connecticut, New York, and Pennsylvania—joined Indiana, Massachusetts, Nebraska, and 14 nations of Europe in abolishing night work of women in factories—a principle sanctioned by the British Acts of 1844 and 1847. At the same time four States—California, Ohio, Oregon, and Wisconsin—adopted the novel method of vesting in industrial welfare or like commissions, within the maximum limit established by law, the authority to fix the hours of woman's work so as to conserve life, health, and welfare. Kansas created an Industrial Welfare Commission with similar powers in 1915.

In 1915, 39 States had regulated the daily or weekly hours of woman's work. The maximum was 11 hours a day and 58 hours a week in Vermont (1912); in South Carolina (1912), 11 hours a day and 60 hours a week for cotton and woolen mills, and 12 hours a day and 60 hours a week for mercantile occupations; in Tennessee (1913), 10½ hours a day and 58 hours a week, the one-half hour being expressly allowed in order to provide one short day; in New Hampshire (1913), 10¼ hours a day and 55 hours a week, except at night when the maximum period is 8 hours or 48 hours a week; in Kentucky (1913), Louisiana (1908), Maryland (1913), Oregon (1913), New Jersey (1912), and, for cotton and woolen mills, in Georgia (1911) the limit is 10 hours a day and 60 hours a week. But in Oregon the Welfare Commission (1914–15) was establishing shorter labor days for women. Illinois (1911), North Dakota (1905), South Dakota (1913), and Virginia (1912) had also established a 10-hour day without specifying the number of working days a week. In Connecticut (1913), Delaware (1913), and Wisconsin (1913) the maximum was 10 hours a day and 55 hours a week; while the same daily period with 54 hours a week was sanctioned in Massachusetts, Ohio, Pennsylvania, Rhode Island, and Texas, each in 1913, and in Michigan, 1911. In Kansas the Industrial Welfare Commission might limit the hours of women's work.

The movement for a still shorter working day was led by the equal-suffrage States. The law sanctioned 9 hours a day in Arkansas (1915), Idaho (1913), Kansas, Missouri (1913), Minnesota (1913), Montana (1913), Nebraska (1913), New York (1913), Utah (1911), and Maine (1915). By an amendment, 1915, the Nebraska Act was practically restricted to about one-fourth of the State. In New York the 9-hour maximum applied not only to factories, but also to "mercantile establishments in any second-class city"; while the Minnesota Act permitted a 10-hour day and a 58-hour week in mercantile and certain other enumerated occupations. Only in Arizona (1913), California (1913), Colorado (1913), Washington (1911), Wyoming (1915), and Porto Rico (1913) had women been granted a general working day of 8 hours. For public work or service Kansas (1913), Massachusetts (1909), Nevada (1912), Oregon, Ohio, and Wisconsin (each in 1913) adopted the same short day. Only in the case of night work for a public-service corporation in cities had Nebraska (1913–15) sanctioned the 8 hours' work period.

Several States, while not prohibiting, restricted the night work of females. For those under 18 years it was prohibited by Arkansas, California, and Michigan; under 21, by Georgia; in mercantile occupations, by South Carolina; for more than 8 hours in one night or 48 hours a week, by New Hampshire and Wisconsin. In some cases certain employments were exempt from the application of the short-hour statutes. Thus cotton mills are excepted in Texas; canneries in Delaware, Idaho, Ohio, Minnesota, Missouri, New York, Pennsylvania, and Washington. Child-bearing women were protected in Connecticut, Massachusetts, New York, and Vermont; and a number of States restricted the employment of women in dangerous occupations.

STRUGGLE FOR A LIVING WAGE

There has been no complete survey of women's wages in the United States; but through the investigation of experts, notably in the works of Abbott, Sumner, Nearing, and Persons, evidence has been gathered sufficient to reveal the essential truth. During the century following the rise of machine industry women received very low wages, and relatively, in like occupations, their wages were much lower than those of men. Thus in the cotton mills of Waltham, Mass., in 1821, 52 of the 63 men employed in all divisions of the industry received a weekly wage of $4 or more; while 136 of the 284 women were paid less than $2.50, and only one woman as much as $4. During the same period wages in Lowell corresponded closely with the rates in Waltham; and in Merrimack, 1824, the "lowest wage for men" was "higher than the highest wage for women." These figures may be taken as typical for the textile industry. Taking all trades together, in 1863 the average wages of women in New York were said to be about $2 a week. The above table, derived from the Dewey report prepared for the twelfth census, for the decade 1890–1900, shows the weekly median wage for all occupations in the New England cotton mills and in four other important industries in the whole country.

INDUSTRIES	NUMBER OF EMPLOYEES				MEDIAN WAGE PER WEEK			
	Men		Women		Men		Women	
	1890	1900	1890	1900	1890	1900	1890	1900
New England cotton mills	1,668	2,182	2,640	2,653	$8.00	$8.50	$5.50	$6.00
Boots and shoes	1,372	2,177	362	421	11.00	11.50	6.00	6.00
Cigar making	697	1,065	254	573	11.00	11.50	6.00	5.50
Clothing	737	1,094	1,263	2,051	11.50	10.00	4.50	4.00
Printing	3,082	3,033	374	572	16.00	15.00	5.00	5.00

The comprehensive "report of the Census Bureau in 1905 covering more than 588,000 female workers over 15 years of age, in manufacture . . . shows 18.4 per cent receiving under $4.00 per week; 49.8 per cent under $6.00; and 79.9 per cent under $8.00" (C. E. Persons, in *Quarterly Journal of Economics*, xxix (Feb., 1915), 208. More recent statistical reports afford similar results for various manufacturing industries (cf. Scott Nearing, in *Popular Science Monthly*, May, 1915).

From the Dewey report on 22 manufacturing industries, giving returns for 156,569 men 16 years old and over and for 16,724 women of the same age group, Dr. Abbott computed that in 1900 one-fourth of the men received a weekly median wage of less than $8.31; one-fourth of the women, below $4.49; one-half of the men, below $10.55; one-half of the women, below $5.64; three-fourths of the men, below $13.93; three-fourths of the women, below $6.86.

From the available statistical sources covering the years 1908–10 Dr. Nearing (*Wages in the United States*) computed the wage scale of adult males and females employed east of the Rockies and north of the Mason and Dixon line. Deducting 20 per cent for lack of employment, he estimated that the annual earnings of one-fifth of the women were under $200; of one-tenth of the men and six-tenths of the women, under $325; of one-half of the men and nine-tenths of the women, under $500; of three-fourths of the men and nineteen-twentieths of the women, under $600; of nine-tenths of the men, under $800.

Even from these general averages the inference is inevitable that many thousands of working women were receiving a wage insufficient to sustain a safe standard of living. Special investigations and estimates of experts for the great cities put this inference beyond question. In Boston, New York, or Chicago it is conservative to say that a just minimum wage would be not less than $8 a week; whereas in Chicago alone it was held by the Women's Trade Union League that the average wage of the 125,000 working women was less than $6 a week.

In 1912 the Massachusetts commission on minimum wage boards declared it "indisputable that a great part" of the 182,651 women employed in the industries of the State "are receiving compensation that is inadequate to meet the necessary cost of living"; and in 1914 the Factory Commission found like conditions in the principal trade centres of New York State.

Similar or worse conditions existed in some European countries, and misery, vice, and crime were the result. In the whole of Europe, according to Borosini, were 700,000 illegitimate births each year; and "most unmarried mothers are recruited from among the poorly paid and insufficiently protected industrial workers and domestics. The loneliness and lack of freedom of the latter all over Europe is pitiful. Long hours of work at low wages and abominable quarters is their lot."

Movement for a Legal Minimum Wage. As early as 1828 Mathew Carey began his now famous crusade against the low wages of that "numerous and very interesting portion of our population, the working women." About two-thirds of the women then employed in the sewing trades of Boston, New York, Philadelphia, and Baltimore, he said, "could not earn, by constant employment for 16 hours out of the 24, more than $1.25 per week" (Sumner). The effort to secure social control of the standard of living took in later years the form of minimum-wage legislation. Minimum-wage boards for private employments have been established by law in New Zealand since 1894, later followed by New South Wales, Western Australia, and the Australian Commonwealth; in Victoria since 1896, later followed by South Australia, Queensland, and Tasmania; and in the United Kingdom since 1909. In all these cases the minimum-wage laws affect both male and female workers. The New Zealand type of legislation aimed primarily at the settlement of trade disputes; while the Victorian type, followed by the United Kingdom, had in view chiefly the evils of the sweating system. In the United States the first laws establishing a minimum wage related to public employees in cities or States, both men and women. Thus in 1913 the city of Spokane by popular vote established a flat minimum wage scale of $3 a day on public work. Among the States which have provided a wage rate of from $2 to $3 a day are California, Indiana, Maryland (for the city of Baltimore), Massachusetts, Nebraska, and Nevada. The first attempt to protect the "American standard of living" in behalf of private employees was made by Nebraska in 1909. The unsuccessful bill of that year sought to establish a flat minimum rate of 20 cents an hour and $9 a week for men and women working in stores, factories, packing houses, and workshops. In 1912 Massachusetts enacted the first minimum wage statute. Similar laws were passed by California, Colorado, Minnesota, Nebraska, Oregon, Utah, Washington, and Wisconsin in 1913, and by Kansas in 1915. These Acts applied to females and to male minors under 18 in all States, except in Minnesota and Wisconsin where the age limit for males was 21; in Utah, where the statute applied to females, and in Kansas, where women, learners, and apprentices were included. The inclusion of adult men was opposed by the trade-unions, or objected to on alleged constitutional grounds.

Except in Colorado and Utah, the administration of these laws was vested in a State commission, working in connection with subordinate wage boards for each particular industry. The commission consisted of three members in all States, except in California and Washington, where there were five; and in Nebraska, where there were four. In Colorado the administration was vested wholly in a State wage board of three members. In all States except Oregon, Washington, and Wisconsin at least one member must be a woman; in Nebraska one must be a member of the Political Science department of the State University; and in Colorado, Minnesota, and Oregon both employers and employees must be represented on the commission. Utah in the Act itself fixed a daily flat minimum wage rate of $1.25 for experienced adults, 75 cents for females under 18 years, and 90 cents for adult learners and apprentices. Equal representation of employers and employees on the subordinate wage boards was required in all States except in Wisconsin, followed closely by Kansas, where the advisory wage board must be constituted "so as to fairly represent employers, employees, and the public." In all cases the commission had authority to make the initial investigation of industrial conditions, and to fix the minimum wage rates. It had power to

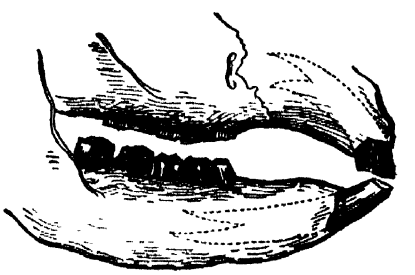
fix such rates and the "conditions of work" in Washington; such rates and conditions as well as the "hours of work" in California, Kansas, Oregon, and Wisconsin. In determining the rate for particular industries the commission might act on the reports of subordinate trade boards. The establishment of such boards was mandatory only in Kansas, Massachusetts, Nebraska, and Wisconsin. Jurisdiction extended to all trades (or industries) and occupations in each State, except in Colorado, where it covered only mercantile and manufacturing establishments, laundries, hotels, restaurants, and telephone and telegraph offices. By the California law the minimum rate was declared to be a wage adequate to sustain "the necessary cost of proper living and to maintain health and welfare." In Wisconsin a living wage was a wage sufficient to maintain conditions consistent with welfare; and welfare was defined to include "reasonable comfort, reasonable physical well-being, decency, and moral well-being."

Arkansas (1915), like Utah, established flat daily minimum rates: $1 for apprentices, and $1.25 for experienced workers. On April 13, 1914, for women over the age of 18, Washington adopted a minimum wage of $10 a week. The Oregon Industrial Commission established the following State-wide minimum rates: $1 a day for girls between the ages of 16 and 18 working in manufacturing or mercantile establishments, millinery, dressmaking, or hairdressing shop, laundry, hotel, or restaurant, telephone or telegraph office; $8 a week for experienced adult women and $6 for inexperienced adult women employed in any industry. Also in the city of Portland the following rates for experienced adult women: $8.64 a week of 50 hours in manufacturing establishments; $9.25 a week in mercantile establishments; and $40 a month in offices, including eleven classes of work. On Nov. 23, 1914, the commission of Minnesota fixed the minimum wage of women and minors as follows: in mercantile establishments, telephone and telegraph occupations, and all office work, $9 a week in cities of the first class; $8.50 in cities of the second, third, and fourth classes; and $8 in all other parts of the State; in manufacturing, laundry, restaurant, and hotel employments, 25 cents less than these weekly rates, except that the lowest rate sanctioned is $8. The Massachusetts commission first investigated conditions in the brush-making, corset, and confectionery industries. In its report to the commission, the brushmakers' wage board found $8.71 a week or $453 a year to be the minimum, "without which no girl worker can supply the necessary cost of living and maintain herself in health." For experienced female employees in this industry the commission decreed (Aug. 14, 1914) a minimum rate of 15 cents an hour; and 65 per cent of this amount for learners and apprentices, the period of apprenticeship to be not more than one year.

The constitutionality of the Oregon minimum wage law was twice sustained by the State Supreme Court, and was carried before the Supreme Court of the United States for final decision.

SOCIALIZATION OF INDUSTRIAL CONDITIONS

The low pay of women as compared with that of men is in part due to woman's relative inefficiency. In general their lower wage is "not unequal pay for equal work, but unequal pay for different and probably inferior work." The productive power of women in industry is often inferior in both quantity and quality. Justly as well as unjustly, looked at simply as an economic situation, men have monopolized the better paid and the more highly skilled employments. The chief causes of this relative inefficiency are not hard to find. In last analysis not woman but society is at fault. The working woman is the victim of social conditions and customs which may be changed. If she has been passive, lacking in class consciousness, it is partly because of ancient prejudices and traditions regarding her proper place in the social order. She has not enjoyed the same opportunity as man for industrial education. She has had small share in vocational training either in school or in apprenticeship. She has been slow to grasp the meaning of organization; and grudgingly, as a means of self-protection, have men admitted her to the trade-union. For many women wage earning was always looked upon as a transition stage of life while awaiting marriage. Girls living with their parents accepted low pay in store or factory as a means of adding to their luxuries; although this sort of parasitism, of pin money, was by no means so important a factor in the low wage standard as was once imagined. Yet, after due allowance is made for actual inefficiency, there is abundant evidence to prove that the bad, often the shameful, conditions of woman's work were due largely to merciless exploitation. The toiling woman suffered because she was a woman. In many European lands her lot is still deplorable. In Great Britain conditions were even worse than in the United States; although the "darkest spots in America are in many ways quite as dark as any of those in the older country."



In the second decade of the twentieth century there were distinct signs of an era of social justice for women engaged in the world's work. The battle for the short day and a living wage was being won. Old traditions and prejudices were giving way. Marriage was ceasing to be a trade for a great number of women. Slowly better facilities for industrial training were being provided. Departments of household economics were making home building a profession. In various ways toiling mothers were being protected. More efficient factory inspection was being established. Through requirement of toilet rooms, rest rooms, and other facilities, decency, morality, and health were being safeguarded. The National Consumers' League was successfully warring upon the sweatshop. Swiftly class consciousness was rising. Women were learning the value of organization. In the United States and in Great Britain they were increasing their bargaining power and bettering the conditions of labor by entrance into trade-unions and through such organizations as the Woman's Trade Union Leagues, the National League of Women Workers, and the National Women's Labor League. Moreover, through possession of the ballot in equal suffrage lands, they were winning a full share of social control by participating in law making and in government (see WOMAN SUFFRAGE).

WOMB. See UTERUS.

WOMBAT, wŏm'băt (from *womback, wombach*, the Australian name). One of the Australian marsupials of the phalanger family and genus *Phascolomys*, resembling in form a miniature bear or large blunt-nosed woodchuck, the best-known species of which is *Phascolomys wombat*. It is two or three feet long, plump, with a thick coat of long, grayish brown, coarse, woolly hair; the head large, flat, broad, with small eyes and ears, the upper lip cleft; the feet plantigrade; the tail very short. The incisors are two in each jaw, long, and chisel-like; they are hollow at the base, and continue to grow as they are worn away; there are no canine teeth; and the molars are five on each side in both jaws; there is a wide gap between the incisors and

DENTITION OF THE WOMBAT.

the molars. It is nocturnal in its habits, slow in its motions; feeds on vegetable substances, and digs up roots with its claws; makes its abode in holes among rocks, or in burrows dug by itself. It produces three or four young at a birth. It is a creature of little intelligence, but gentle, and easily domesticated to a certain extent. Its flesh is preferred to that of any other quadruped of Australia, as it is generally fat, and in flavor resembles pork. The hairy-nosed wombat (*Phascolomys latifrons*) is easily recognized by the silky fur, hairy muffle, and greater curvature of

the incisors. The third species (*Phascolomys platyrhinus*) is yellowish-brown and the largest of the group. Wombat remains have been found in recent bone caves in Australia. See Plate of PHALANGERS.

WOMBWELL, wōōm'wĕl. A coal-mining town in the West Riding of Yorkshire, 4½ miles southeast of Barnsley (Map: England, E 3). Pop., 1901, 13,252; 1911, 17,536.

WOMEN. In law, women have always enjoyed certain privileges and immunities and been under certain disabilities which are a curious intermingling of the ideas of protection and of subjection to man. Under the common law marriage changed the legal status of a woman completely, but modern statutes generally have abolished most of the disabilities of coverture. (See HUSBAND AND WIFE.) In most of the United States, both married women (*feme coverte*) and spinsters now enjoy practically equal property rights with men. This is true also of the right to enter into binding obligations or contracts. Women are liable for both their crimes and torts. They may keep and use their earnings in spite of the fact that the husband is still under the duty of support, and may at will cut off the husband's inchoate right of curtesy although the wife's dower right may not be destroyed without her consent. Statutes sometimes make certain distinctions in their favor, as, e.g., women are usually exempt from civil arrest. They have not been generally accorded the privilege of exercising the elective franchise, but enjoy freedom from jury duty and military service. They may sue and be sued in all States. Consult Blackstone's *Commentaries;* Parsons on *Contracts* (9th ed., Boston, 1904).

WOMEN, EDUCATION OF. Among Oriental nations generally little or no attention is paid to the education of women. The Chinese women of the wealthier classes may receive some literary training, but it is given privately. In India, excepting among the Parsis (q.v.), it is thought improper for any except the dancing women to be able to read and write. The Spartans provided physical exercise for girls in public gymnasiums similar to those prescribed for boys. The Athenian girls received no education outside of the home. The ideal woman was the prudent housewife. In the age of Pericles we find women of literary culture appearing. They were the so-called hetæræ (q.v.) and were typified by Aspasia. As they were not wives and mothers, their ideas of instruction for women cannot be said to have prevailed at Athens. Plato, who saw no essential difference between the natures of man and woman, planned the same education for both sexes in his ideal republic. At Rome, however, the education of women was mostly carried on at home or under private tutors. In some cases girls attended the *ludus* or primary school, but the higher schools were exclusively for boys.

The Christian conception of education as a preparation for the future life implied the necessity of education for women as well as for men. St. Jerome advocated the ascetic idea in female education and advised women to learn to read the Scriptures. The sister of St. Benedict, called Sister Scholasticus, established a conventual order that paid much attention to education. The Renaissance gave decided impulse to women's education. Polite learning became a social accomplishment, as desirable in women as in men. But there was no extensive movement for the establishment of schools for girls. Women were taught by leading masters of the period, and there were many notable women teachers—some even occupying chairs in the universities of Italy and Spain.

Luther urged the elementary education of both girls and boys, and advised the employment of women as teachers. The German *Volksschule* adopted the first of these ideas, but it was not until the nineteenth century that women were employed in teaching. A seminary for training women to teach was established at Münster in 1830. To-day in Germany about 10 per cent of the normal schools are for women, and a still larger proportion of the elementary teachers are of that sex. Higher schools for girls began to exist in Germany at the beginning of the nineteenth century. In 1872 the German Association for the Higher Education of Women came into existence. All teaching positions in girls' secondary schools were in 1894 thrown open to women. In 1893 a gymnasium for girls was established in Karlsruhe, duplicating the instruction given in gymnasiums for boys. The whole system of secondary education for girls was revised in 1908 in Prussia, and the schools now offer not only a type of education specially adapted to the needs of girls, but courses corresponding to those given in secondary schools for boys and preparing for the universities, to which women are now admitted as matriculated students.

The small amount of education given to most girls in France in the seventeenth century is shown in Fénelon's treatise *De l'éducation des filles.* He advocates literary and historical studies for women. Very little progress was made towards establishing girls' schools before the nineteenth century. Since 1833 the French have aimed to give public elementary instruction to both boys and girls. Indeed, national elementary education everywhere in Europe is for both sexes. In 1880 lycées for girls were decreed, and higher normals were soon established to prepare women to teach in them. A great number of secondary schools for girls sprang into existence, and in 1913 there were 52 lycées, 81 communal colleges, and 50 secondary courses maintained by the State for the education of girls.

In England, before the nineteenth century, girls were educated by tutors or in small private schools, most of which were of an inferior character. The development of the elementary schools has increased the facilities for the education of girls. In these schools both women and men were employed as teachers. In 1871 a National Union for Improving the Education of Women of All Classes was formed. It led to the formation in 1872 of the Girls' Public Day School Company, which still conducts a large number of schools. Since 1902 a large number of schools have been established for girls by public authorities under the Education Act of that year. There are, in addition, a large number of private semipublic schools.

In the English colonies in America no provision was made for the secondary education of women outside the home. Girls were given instruction in elementary schools and women often taught them. In the nineteenth century, however, in the United States, the opportunities for female education rapidly developed, until today the State schools provide equally well for both sexes. The first girls' high school was es-

tablished in 1826. It failed, but was reëstablished in 1852. In the early part of the century an important movement for the establishment of girls' seminaries sprang up.

For the higher education of women consult the articles on COLLEGIATE EDUCATION FOR WOMEN and COEDUCATION. See also NATIONAL EDUCATION, SYSTEMS OF.

WOMEN IN INDUSTRY. In primitive society men were fishers, fighters, hunters, while women fashioned the hut, gathered and stored the seeds, roots, and fruits, prepared the meat and skins from the animals slain by men, and made garments and utensils. When the pastoral stage followed immediately on the hunting stage, women's former varied activities were narrowed until only certain duties—those of indoor life and preparing products for home use—remained. Woman was looked upon as the rearer of children, the minister to men's comfort and pleasure, and the producer of domestic necessities, and was made economically dependent. It is of special interest that among savage tribes where women were as efficient food producers as men they held respected positions.

Woman's work through historic times has, however, been dependent upon the class to which she belonged. The principal wives of chiefs were the first to be relieved of all labor. The middle class show more clearly the changes of the centuries. In the lowest class even in the twentieth century, among barbarians as well as among European peasants, women undertake heavy manual labor. As long as a large portion of necessary articles were made by men in the homes or on a small scale, women supplemented household duties by aiding in weaving, sewing, and dairying. The factory system and the improvements of the nineteenth century changed the household from a centre of production to one mainly for consumption. These changes have had a momentous effect on woman's economic position. Women have now two important economic functions in the industrial world: (1) as buyers and (2) as producers. The invasion of the domestic sphere by factory-made products has made every woman a buyer. The importance of this function has only recently been recognized. Many women have also entered the field of production, and their number continues to increase. In 1835 only seven industries were open to women besides domestic service in the United States. The census of 1910 makes a return of 428 separate occupations, in only 43 of which are there no women workers.

The introduction of machinery created a demand for the cheap labor of women. In 1816 there were 66,000 women spinning; in 1860, 65 per cent of those employed in textile work were women. American and English women of the lower classes, both married and unmarried, entered factories. A large number filled positions as domestic servants, more servants being required as the country grew richer. This work soon fell into the hands of foreigners—Irish, Germans, Swedes, who in turn filled the factories. The steps have been from the kitchen to the factory, and then to shops. Women of the middle class were also forced into industrial life. The rising standard of living made it impossible for men to support so many idle women; the same reason made the prospect of marriage uncertain, especially in England and eastern America, where women are in excess. These women became dressmakers, teachers, and clerks. The Civil War was an important agent in determining the future of many women, as it left them dependent upon themselves. Among the well-to-do one class, stimulated by the spirit of the age, has made demands to enter business and the professions. From these women arose the cry for equal rights, equal education, and equal opportunities. The members of the other class, as the result of freedom from labor, have either become economic parasites, or they are using their freedom to improve social conditions.

Prejudice has met the efforts of women to enter the professions and higher positions, but the development of business after 1880 opened many positions in the clerical forces necessary for large establishments. The extension of the factory system to food, clothing, and laundry increased the demand for women workers.

The increase in female labor in the United States is shown by the fact that they constituted only 14.7 per cent of all persons gainfully employed in 1880 as compared with 17.4 per cent in 1890, 18.8 compared in 1900, and 23.4 per cent in 1910. A part of the increase from 1900 to 1910 was due to a difference in the basis of enumeration, especially of agricultural laborers. In the Southern States females constituted a larger proportion of persons gainfully employed than in the country as a whole. Their proportion varied from about one-fifth in the North Central, mountain, and Pacific States, to one-fourth on the New England, South Atlantic, and East South Central States, and to one-third in Mississippi, South Carolina, and the District of Columbia. These variations are due in part to the greater or less proportion of females in the population as a whole. Likewise the proportions of females who were employed varied from 16.1 per cent in the West, North Central, and mountain States to over 30 per cent in the Southern States. These variations are explained by the character of the industries, especially cotton growing and manufacture, by the larger numbers of foreign born in certain areas, and by the presence or absence of numerous urban centres. In the South the per cent of females employed is due largely to the great number of negro women employed in agriculture. In the East South Central States 61 per cent of negro females 10 years and over were gainfully employed. In 1910 there were 8,075,772 females 10 years of age and over gainfully employed as compared with 30,091,564 males. They were distributed by occupations as follows: agriculture, 1,807,050, of whom 1,514,423 were agricultural laborers; in mining, 1094; in manufacturing and mechanical pursuits, 1,820,980; in trade, 468,088; in transportation, 106,596; in public service (not otherwise classified), 13,558; in domestic and personal service, 2,530,846; and in clerical occupations, 593,224. There were 447,760 dressmakers; 520,004 laundresses; 352,039 textile workers; 257,720 saleswomen; 263,315 typewriters and stenographers; 67,103 retail dealers; 187,155

bookkeepers and accountants; 234,259 clerks; and 96,481 telephone and telegraph operators; 122,447 milliners; 117,117 midwives and untrained nurses, besides 76,508 trained nurses; and 1,309,549 servants. In higher positions were found 2634 bankers, brokers, and money lenders; 4699 manufacturers and officials of companies; 849 builders and contractors; 925 wholesale dealers; 2586 local officials and 9537 State and national officials; 15,429 artists and sculptors; 84,478 musicians; 478,027 teachers; and 9015 physicians. Women were found engaged in such unusual occupations as blacksmiths, brick and stone masons, elevator tenders, longshoremen and stevedores, machinists, sailors, etc.

The objections to women in industrial life are: (1) theoretical—the proper place for a woman is in a home, supported by a man; (2) their willingness to accept low pay; (3) the bad conditions under which they are frequently forced to work, with the resulting injury to health; (4) injury to morals, from working with men, subordination to men, and temptations accompanying freedom; (5) competition with men, depriving men of their occupations, lessening their respect for women, and frequently making them dependent upon women; and (6) demoralization of the home when married women with young children are employed. The advantages urged are the training resulting from industrial life under social rather than personal relations; the development of technical skill and the utilization of special abilities; the breadth of view obtained from contact with men; the moral training of self-support; and the importance of economic independence. Among the reasons for woman's low wages are: her position as a new economic factor; her low standard of living; her frequent partial support; the insufficiency of her equipment, often due to the expectation of marriage; the restricted field of employment; her anomalous political position; her lack of trade organization; protective factory legislation, limiting her when in competition with men; her loss of time through illness; and her traditional inferiority.

In England and on the Continent many women are employed in factories, domestic service, low-grade teaching positions, and low-paid government positions in the post office, telegraph offices, and as clerks. In England and Belgium agricultural courses are being provided. In Austria and other parts of Europe many women are day laborers. In France women assist their husbands and many have been successful in commerce. In Germany, Denmark, Great Britain, and the United States a successful effort is being made to organize working women. In the United States this movement is led by the National Women's Trade Union League.

In recent years marked attention has been given to the effects of industrial life on the health and vitality of women. There has resulted a general prohibition of night work, the closing of certain dangerous trades to women, a movement for an eight-hour day, pensions for working mothers before and after childbirth, and numerous lesser regulations. Moreover, to check the exploitation of women, minimum wage laws have become general. See DOMESTIC SERVICE; INDUSTRIAL REVOLUTION; LABOR PROBLEMS; WOMAN SUFFRAGE; WOMAN'S WORK.

Bibliography. C. P. Gilman, *Women and Economics* (3d ed., Boston, 1900); O. T. Mason, *Woman's Share in Primitive Industry* (New York, 1900); E. B. Butler, *Women and the Trades, Pittsburgh, 1907–1908* (ib., 1909); Edith Abbott, *Women in Industry: Study in American Economic History* (ib., 1910); Olive Schreiner, *Woman and Labor* (ib., 1911); L. M. Bosworth, *Living Wage of Women Workers* (ib., 1911); Josephine Goldmark, *Fatigue and Efficiency* (3d ed., ib., 1913); Women's Educational and Industrial Union, *Vocations for the Trained Woman* (ib., 1914). The most elaborate inquiry in this country was that of the Bureau of Labor Statistics, *Report on Condition of Woman and Child Wage Earners in the United States* (19 vols., 1910 to 1913), with a *Summary* (1915). Consult also reports of minimum wage commissions.

WOMEN'S CLUBS. Organizations of women which originated after the Civil War as an outcome of the new demand for coöperation and popular education, and which from 1880 to 1900 became a characteristic feature of woman's activity. Previous to the nineteenth century associations of women were practically unknown. The first in the United States were for religious and charitable purposes, such as the Female Society for the Relief and Employment of the Poor (1798), church societies auxiliary to men's associations, female Bible societies, the American Female Guardian Society (1834), and the Daughters of Temperance (1840–50). The organizations which arose during the Civil War—the Sanitary Commission, the Woman's Loyal League, the Freedmen's Bureau—showed women what they could do. After the war, economic changes long at work had freed the energies of a large class of women for new work. In 1868 Mrs. Croly founded Sorosis (q.v.). This gave the impulse for other clubs. The Woman's Club of Brooklyn was organized in 1869–70. The Association for the Advancement of Women, organized in New York in 1873, decided to stimulate the formation of clubs. Simultaneously with Sorosis the New England Woman's Club was started by Mrs. C. M. Severance, but with the coöperation of men. A horticultural school for girls, a coöperative building association, and a registry for higher employment were undertaken in addition to literary programmes. Mrs. Julia Ward Howe and Mrs. Ednah D. Cheney were prominent members. A correspondence with other clubs was started in 1888. Even older than these large clubs was the pioneer of the reading-circle type—the Friends in Council of Quincy, Ill. (1866). Many clubs have grown out of reading circles and classes.

Women's clubs usually are incorporated and are self-governing and self-supporting. Fees are low in comparison with men's clubs, and the aim is to be democratic. The work of clubs may be summed up as: (1) *Educational:* through classes in history, art, economics, literature; readings, preparation for travel, lectures, and preparation of papers; (2) *Social:* teas and receptions for prominent men and women, and at homes; (3) *Practical:* (*a*) originating and aiding all kinds of philanthropic movements; (*b*) civic betterment, sanitary, artistic, and political; (*c*) educational, for fostering schools, libraries, art galleries, kindergartens, vacation schools, and scholarships for women; (*d*) legislation, the promoting of laws for the benefit of women and children—factory inspection, child labor, age of consent, police matrons, tenement houses, and parks. Women's clubs have started special associations—Housekeepers' Alliance, Legal Aid

Societies, Free Bath and Sanitary Leagues; and they have worked with religious associations to aid public schools. An interesting development begun in certain middle Western cities has been the establishment of town rest rooms for farmers' wives.

There was no effort to unite the various clubs until 1889, when delegates from 61 clubs met in New York in response to an invitation from Sorosis, which wished to observe its twenty-first anniversary. At a convention in 1890 the General Federation of Women's Clubs was formed. The Federation began with 63 clubs in 17 States. Biennial meetings of the Federation are held in large cities.

The biennial meetings have been characterized by varying recommendations which have dominated each period. The first at Chicago, in 1892, was the time of acquaintanceship, then came the development of ideals of club and federation at Philadelphia in 1894 and Louisville in 1896. At this meeting the slogan became "Scientific knowledge of educational principles." At this time State federations were begun and fostered, 21 being formed from 1894 to 1898.

At Denver in 1898 and Milwaukee in 1900 industrial betterment and altruistic service were emphasized. The clubs worked for child labor and factory laws, and their concomitant compulsory education; they worked for manual training and domestic science in the schools. With the departure from their homes of the butcher, the baker, and candlestick maker, women were obliged to see that the municipal housekeeping was well done; the four walls of brick and mortar had broadened into the walls of the city, the State, and the nation.

In Los Angeles, 1902, and St. Louis, 1904, the literary and artistic instincts were given full sway. The period from 1904, through St. Paul in 1906, to Boston, 1908, marked the systematic coöperation between all the large and diverse units; the Bureau of Information as a permanent central force was then instituted. From 1908 through Cincinnati, 1910, to San Francisco, 1912, came unusual coöperation with national organizations. The clubs were constructive, alive to the needs of their special work; they recognized the persistent, conservative efforts of the General Federation towards right ends; they realized the power of organized, intelligent women and asked assistance. The Federation in turn realized that its power must come in urging its diverse elements to coöperate with the specific agency, whose work they wished to further.

The Federation did not intend to touch national issues, politics, suffrage, prohibition, or religious tenets, but in 1914 at Chicago and in 1916 at New York the pressure became insistent enough to pass resolutions bearing on questions of the day.

Until 1894 the Federation was composed of individual clubs. At that time the State Federation appeared. There were in 1915 48 State federations, besides those in Alaska and the District of Columbia. The membership of the Federation included individual clubs with 185,000 members, the State federations with 8800 clubs, including nearly 700,000 members, and allied national organizations in America and abroad with over 600,000 members. This allied membership included clubs in Canada, Canal Zone, China, India, Japan, England, Germany, France, Sweden, Philippine Islands, South America, South and Western Australia, and the West Indies. The General Federation has, besides its business and board committees, standing committees on art, civics, civil-service reform, conservation, education, home economics, industrial and social conditions, legislation, literature and library extension, music, and public health. Each of these has various subcommittees, as those on shelter, food, sanitation, textiles, clothing, and home management under home economics. The scope of activities of the State federations is similar, though diversified to meet local conditions. The New York State Federation with 436 clubs and 300,000 members is by far the largest of the State groups.

Foreign Clubs. In England the club arose out of the emancipation movement. The provision of smoking rooms is typical of the adaptation of men's club life to English women's associations. The Albemarle Club was started in 1874 for both men and women. In 1878 the Somerville Club provided a reading room, library, and lectures for women journalists. Later clubs are the Alexandra (1884), a social centre for 900 women who must be eligible to attend the Queen's drawing-room; the University Club (1887), limited to 300 college graduates; the Pioneer Club (1892) for professional women; the Writers' Club (1892); the Victoria (1894), providing a town home for country members; the Sesame (1895); and various social clubs; the Green Park, Empress, New Victoria, Ilchester, and Sandringham. Many clubs have been started since 1894, the most important of which is Grosvenor Crescent (1896), which is a centre for women's work. Women's clubs exist now in the principal cities of the United Kingdom. In central and eastern Europe the movement for women's clubs of the American type has made slow progress owing to the lesser degree of freedom, but in Scandinavia, Germany, and France a strong movement for woman suffrage (q.v.) and for many feminist demands exists (see FEMINISM). In Germany the woman's movement is led by the National Council of German Women, a federation comprising branches in every state and having more than 500 local associations. Its interests, however, are not primarily cultural, but connected with problems of economic and sex life.

Working Girls' Clubs. These were the outcome of the spirit of helpfulness which became manifest in the last 20 years of the nineteenth century. While learning much from women's clubs, these clubs were less spontaneous, more the result of outside influence. In London, the Soho Club and the House of 1880, the Club and Working Girls' House, and the St. Giles Evening Club for Working Girls were among the earliest. Libraries and evening classes, musical drill, safe pleasures, country visits and excursions, are provided, and the Girls' Club Union publishes a magazine. In America the movement began in 1883 with the Industrial Society of Hoboken and the Working Girls' Society of Thirty-eighth Street in New York (later Irene Club). The movement has since spread over the entire country. Some clubs were organized through the initiative of the girls themselves; others grew from church and related activities; and still others were formed by women's club leaders. The most important organization is The National League of Women Workers formed in 1897 at Philadelphia by the Irene Club of New York, the Industrial Society of Hoboken,

the New Century Guild and the St. James Guild of Philadelphia, and the Shawmut Club of Boston. By 1916 it had grown to include about 15,000 members in over 120 clubs embraced in six State federations in Massachusetts, Rhode Island, Connecticut, New York, eastern and western Pennsylvania; besides the Baltimore Council. It has an executive board of 25 members, maintains traveling secretaries, and a central correspondence office in New York City. It held conventions at Buffalo (1901), New York (1904), Providence (1905), Philadelphia (1906), and since then biennially at Washington (1908), Boston and Gloucester (1910), Montreal and Quebec (1912), New York (1914), and Pittsfield (1916). Its official publication is *The Club Worker*, issued monthly from October to June. It has aided in the organization of new clubs and in the training of club secretaries. Its principles are self-government, nonsectarianism, and self-help. It has a mutual benefit fund for savings and insurance; and it conducts important investigations into the industrial training of women. Individual clubs maintain one or all of the following: vacation houses, week-end camps, teas with music and lectures, club headquarters, club hikes, lunch and rest rooms, employment registers, educational classes.

Bibliography. List of books and articles in *Chautauquan*, No. 31; current notes on work of clubs in *Harper's Bazar* and *Ladies' Home Journal;* Croly (Mrs. J. C.), *The History of the Woman's Club Movement in America* (New York, 1898); Miller, *The Woman's Club* (United States Department of Labor, Bulletins Nos. 15 and 23, and New York, 1890); Stanley, *Clubs for Working Girls* (New York, 1890); Benton, *The Complete Club Book for Women* (Boston, 1915); Cass, *Practical Programs for Women's Clubs* (Chicago, 1915); Roberts, *The Club Woman's Handy-Book* (New York, 1914); Winslow (ed.), *Official Register and Directory of Women's Clubs* (Shirley, Mass., vol. xvii, 1915); also publications of The National League of Women Workers (New York).

WON'DERBERRY. See NIGHTSHADE.

WONDER BOOK, THE. A series of tales for children by Nathaniel Hawthorne (1851), founded on the most famous myths of classic mythology, and followed by a second series, the *Tanglewood Tales* (q.v.).

WONDERS OF THE WORLD, THE SEVEN. See SEVEN WONDERS OF THE WORLD.

WÖNSAN, wŭn'săn' (Sinico-Korean; in Chinese, *Yuen-san;* in Japanese, *Gensan*). A dirty, poorly built, but important town of Korea; situated at the head of the southern arm of Broughton Bay, near the middle of the east coast (Map: China, N 4). The harbor is large, having an area of nearly 40 square miles, and is both deep and well sheltered. The town was opened by treaty to Japanese residence and trade in 1880, and two and one-half years later to other treaty nations. The foreign settlements are on the west shore. Pop., about 20,000, including foreigners, of whom 2000 are Japanese.

WOOD (AS. *wudu, widu*, OHG. *witu*, wood; connected with OIr. *fid*, Welsh *guid, gwydd*). Popularly considered, the aggregated tougher portions of the vascular bundles of seed and fern plants. Only the seed plants yield wood which is of any value as lumber, and among them nearly all the wood of commerce is produced by the conifers and the dicotyledons, the monocotyledons producing comparatively little. In the latter group only the larger bamboos and a few of the palms yield important timber. The density, strength, and much of the grain of wood depend upon the rapidity of the growth of the cells composing it. In regions which have pronounced wet and dry periods, or where summer and winter are characterized by decided temperature changes, the effect of seasonal fluctuation is more apparent in the appearance of wood than where there are constant conditions for growth. In temperate regions the wood cells formed in the spring are of larger calibre and often have thinner walls than those formed later in the season, and the larger ducts of many dicotyledons occur in the spring wood. The small-celled tissue of the autumn wood abutting against the larger-celled tissue of the spring wood results in the distinct appearance of the growth rings. In most cases only one ring is found each year, but if a long Indian summer succeeds a period of rather cool weather or a severe drought is succeeded by abundant rainfall, or where growth is resumed after defoliation from any cause, additional rings may be formed, just as a second flowering may occur in fruit trees under similar conditions, so that the number of growth rings (annual rings) may not always indicate the age of the tree. As trees grow older the inner portion of the wood (heart wood or duramen) assumes a characteristic color, as white in holly, yellowish in many pines, brown in walnut, black in ebony, etc. The youngest few years' growth, surrounding the heartwood and usually lighter in color, is called sapwood or alburnum.

WOOD, ANTONY, or ANTONY À (1632–95). An English antiquary. He was born at Oxford, where the greater part of his life was spent. He studied at Merton College, and devoted his life to the collection of materials for the history of the city and University of Oxford. His first important published work was *Historia et Antiquitates Universitatis Oxoniensis* (1674), not published in English until 100 years after the author's death, by John Gutch, in five volumes under three separate titles—*The History and Antiquities of the Colleges and Halls*, in the University of Oxford (1786); *Fasti Oxonienses, or a Commentary on the Supreme Magistrates of the University* (1790), printed as appendix to the foregoing; and *The History and Antiquities of the University of Oxford* (1792–96). These volumes formed the standard treatise on the subject until very recent years. Hardly less important is Wood's *Athenæ Oxonienses*, a history of notable Oxford graduates from 1500 to 1690 (2 vols., London, 1691–92). A second edition was published in 1721. The Rev. Andrew Clark published *The Life and Times of Antony Wood* (Oxford Historical Society, 5 vols., 1891–1900), containing Wood's autobiography (first published in 1730), and diaries for the years 1657–95. These give the facts of his life in remarkable fullness. The greater part of his books and manuscripts are now to be found in the Bodleian Library.

WOOD, DE VOLSON (1832–97). An American engineer, physicist, and educator. He was born at Smyrna, N. Y., was educated at the State Normal School at Albany, and graduated C.E. at the Rensselaer Polytechnic Institute, Troy, in 1857. He taught mathematics in the Normal School, 1854–55, was professor of civil engineering in the University of Michigan, 1857–72, held the chair of mathematics in the Stevens Institute of Technology, at Hoboken, N. J., until 1885, and

that of mechanical engineering in the same institution until his death. Among his works were: *The Resistance of Materials* (1871; 7th ed., 1897); *Bridges and Roofs* (1873; 2d ed., 1880); *Elements of Analytical Mechanics* (1876); *Coördinate Geometry* (1879); *The Principles of Elementary Mechanics* (1882; 10th ed., 1902); *Thermodynamics* (1887; 8th ed., rev., 1905); *Turbines, Theoretical and Practical* (1896), besides various works which he edited. He invented a rock drill, an air compressor, and a steam pump. Consult obituary sketch in *Stevens Indicator*, vol. xiv, July, 1897 (Hoboken).

WOOD, EDMUND BURKE (1820–82). A Canadian administrator and jurist. He was born near Fort Erie, Ontario, was educated at Overton College, Ohio, and was called to the Upper Canada (Ontario) bar in 1848. He was a Liberal member of the Canada Legislative Assembly in 1863–67, and after confederation in the latter year was elected both to the Ontario Legislature and the Dominion House of Commons; but he resigned his seat in the House of Commons in 1872. He was provincial treasurer in the Ontario administration of John S. Macdonald (q.v.) in 1867–71, was elected to the House of Commons in 1873, and was Chief Justice of Manitoba in 1874–82. He was a remarkably forceful and eloquent political speaker. Consult J. C. Dent, *Canadian Portrait Gallery* (Toronto, 1880).

WOOD, EDWARD STICKNEY (1846–1905). An American chemist. He was born in Cambridge, Mass., and graduated from Harvard College in 1867 and from Harvard Medical School in 1871, after which he studied physiology and medical chemistry at Berlin and Vienna. In 1871 he was appointed assistant professor of chemistry in Harvard Medical School, and from 1876 to his death was professor. From 1873 he was also chemist to the Massachusetts General Hospital. He was a member of the Medical Commission on Boston's Water Supply in 1874 and of the Committee of Revision of the *United States Pharmacopœia* in 1880. An accepted authority on toxicology, he contributed largely to the literature of his specialty, including a translation of Neubauer and Vogel's *Analysis of Urine* (1879).

WOOD, ELLEN (PRICE), better known as MRS. HENRY WOOD (1814–87). An English novelist, born at Worcester, England. In 1836 she married Henry Wood (died 1866), a banker and merchant, with whom she lived for 20 years in France. There she began contributing largely to *Bentley's Miscellany* and the *New Monthly Magazine*. In 1867 she became the editor of the *Argosy*, in which appeared her later novels. Her first great success was *East Lynne* (1861), which was followed by about 40 long novels and many tales, including *Mrs. Halliburton's Troubles* (1862); *The Channings* (1862); *The Shadow of Ashlydyat* (1863), her own favorite among her novels; *Lord Oakburn's Daughters* (1864); *Roland Yorke* (1869); *Within the Maze* (1872); and *Edina* (1876). These novels represent the range of Mrs. Wood's powers from exciting melodrama to the portrayal of everyday life. Consult the *Memorials* by her son, C. W. Wood (London, 1894). Some of these novels had very large sales, particularly *East Lynne*, which also in various dramatized versions was widely successful on the stage in both England and America. Unduly prized at first, they are now unduly depreciated.

WOOD, SIR EVELYN (1838–). An English general. He was born at Braintree, Essex, entered the navy at 14, and took part in the siege of Sebastopol, where he served with great distinction. He subsequently entered the British army as ensign; in 1860 won the Victoria Cross, and in 1862 became major. He fought with great note during the Ashanti War of 1873–74 and received the brevet rank of colonel. In 1874 he was called to the bar in the Middle Temple. He served through the Zulu War of 1879, commanded in the Transvaal War (1880–81), and served in the expedition to Egypt (1882), receiving the thanks of Parliament. From 1882 to 1885 he was Sirdar or commander in chief of the Egyptian army. He was created K.C.B. (1879), G.C.M.G. (1882), and G.C.B. (1891). He was appointed a quartermaster-general to the forces (1893–97), adjutant general (1897–1901), and was made a field marshal in 1903. He wrote *The Crimea in 1854* (1894); *Cavalry at Waterloo* (1896); *From Midshipman to Field Marshal* (1906), an autobiography; *The Revolt in Hindustan* (1908).

WOOD, FERNANDO (1812–81). An American politician, born in Philadelphia, Pa., of Quaker parentage. He removed to New York in 1820, received a good education, and engaged in the shipping business, in which he was so successful that he retired with a large fortune in 1850. As a young man he took an active part in politics, and was widely known as a campaign speaker and writer. In 1840 he was elected a Democratic member of Congress and served one term. After 1850 he turned his attention to municipal politics, and within a few years his genius for political management and organization was made evident by his complete control of the Tammany Hall machine. In that year (1850) he was the unsuccessful Tammany candidate for mayor, but in 1854 he ran again under the same auspices and was elected. He was reelected in 1856, but internal strife in the Tammany organization forced him out of its membership, and he gathered his personal followers into a rival organization known as Mozart Hall. As the candidate of Mozart Hall he was defeated in 1858, but in 1860 was elected mayor for a third term over both the Tammany and Republican candidates. During his last term in office he attracted wide criticism and ridicule by suggesting the secession of New York City at the outbreak of the Civil War and its establishment as a free city. Subsequently he gave his support to the administration's war policy. He was elected to Congress as a Democrat in 1862, serving continuously until 1877, except for the years 1865–67, which he spent in Europe.

WOOD, FRANCIS ASBURY (1859–). An American philologist, born at Point Bluff, Wis. He was educated at Northwestern University (A.B., 1880; A.M., 1883), at Göttingen (1888–90), and at the University of Chicago (Ph.D., 1895). After holding several less important positions he was professor of German at Cornell College, Iowa, from 1897 to 1903, and thereafter was connected with the University of Chicago, where by 1914 he had become professor of Germanic philology. He contributed frequently to philological publications both in America and Europe, directing his attention principally to semasiology (q.v.; see also BRÉAL), and edited the series entitled "Linguistic Studies in Germanic," published by the University of Chicago. The following are the most important of his works: *Verner's Law in Gothic and the Reduplicating Verbs in Germanic* (1895); *Color-Names*

and their Congeners (1902); *Indo-European a: ai: au, A Study in Ablaut and in Word Formation* (1905); *Elckerlijo-Everyman, the Question of Priority* (1910); *Iteratives, Blends, and Streckformen* (1911); *Uebersichtstabellen zu Lautentsprechungen und zur Kasusbildung des Nomens und Adjektivs im Germanischen* (1911); *Some Parallel Formations in English* (1913); *The Hildebrandslied,* translated into English alliterative verse (1914).

WOOD, FRANCIS CARTER (1869–). An American pathologist, born in Columbus, Ohio. He graduated from Ohio State University in 1891 and from the College of Physicians and Surgeons, Columbia University, in 1894. After postgraduate work in Berlin and Vienna he settled in New York City, where he became pathologist and attending physician to St. Luke's Hospital, and held several positions at Columbia, being professor of clinical pathology in 1906–12, and thereafter professor and director of cancer research under the George Crocker Special Research Fund. He published, besides papers on cancer, *Clinical Diagnosis* (1899) and *Chemical and Microscopical Diagnosis* (1905).

WOOD, GEORGE BACON (1797–1879). An American physician, botanist, and author. He was born in Greenwich, N. J. After studying in New York City, he graduated in medicine at the University of Pennsylvania in 1818. He held the chair of medicine at the Philadelphia College of Pharmacy (1822–31) and the chair of materia medica (1831–35). In the University of Pennsylvania he was professor of materia medica (1835–50) and of the theory and practice of medicine (1850–60). After having served as president of the College of Physicians, Philadelphia, for many years, Wood endowed an auxiliary faculty of medicine in the University of Pennsylvania. In 1855 he was president of the American Medical Association. Among his works are: *A Treatise on the Practice of Medicine* (1847; 6th ed., 1866) and *A Treatise on Therapeutics and Pharmacology or Materia Medica* (1856). With Franklin Bache he prepared and published *The Dispensatory of the United States* (1833).

WOOD, HENRY A(LEXANDER) WISE (1865–). An American aëronautical engineer, inventor, and writer, son of Fernando Wood (q.v.), born in New York City. His autoplate, a machine for making printing plates for newspapers, brought him in 1908 the Elliott Cresson gold medal of the Franklin Institute; and he invented other mechanisms for the printing art. He acquired various corporation interests. Vice president of the Aëro Club of America and president of the American Society of Aëronautical Engineers, he was appointed from the latter body its representative on the Naval Consulting Board (1915); but he resigned in December of the same year because of his disagreement with the President's naval and military policy. Subsequently he was a leader in the movement for increased armament, as chairman of the Conference Committee on National Preparedness; and he urged the nomination of Roosevelt in 1916. He edited *Flying* and published: *Fancies* (1903), a volume of poems; *The Book of Symbols* (1904); *Money Hunger* (1908).

WOOD, SIR HENRY JOSEPH (1870–). An English orchestral conductor and composer. He received his musical education from his father and at the Royal Academy of Music. After 1895 he won for himself a European reputation as the conductor of the Queen's Hall Symphony and of the Promenade Concerts. He succeeded in bringing his orchestra to a rank with the best organizations of Great Britain. In 1904 he appeared in the United States as guest conductor with the New York Philharmonic Society, and thereafter was in great demand in the principal cities of Europe and at the great English festivals. He was knighted in 1911. His compositions include: the oratorio *Saint Dorothea* (1889); the comic opera *Daisy* (1890); the operettas *Returning the Compliment* (1890) and *A Hundred Years Ago* (1891); and many songs and instrumental numbers. Consult Rosa Newmarch, *Henry Joseph Wood* (London, 1904).

WOOD, HORATIO CURTIS (1841–). An American physician. He was born in Philadelphia, and in 1862 graduated in medicine at the University of Pennsylvania, where he was professor of botany (1866–76), clinical professor of nervous diseases (1875–1901), and professor of therapeutics (1876–1907). Besides monographs on acetic ether, nitrite of amyl, ergot, hyoscine, quinine, and on sunstroke, he published: *A Treatise on Therapeutics, Materia Medica, and Toxicology* (1874; 14th ed., rev. by his son, H. C. Wood, Jr., 1908), containing a standard classification of drugs; *Fever* (1880); *Nervous Diseases and their Diagnosis* (1887); and *Syphilis of the Nervous System* (1889). He was the editor of *New Remedies* (New York, 1870–73), of the Philadelphia *Medical Times* (1873–80), of the *Therapeutic Gazette* (1884–90), and, with others, of the *United States Dispensatory* (1883–1907).

WOOD, IRVING FRANCIS (1861–). An American biblical scholar, born at Walton, N. Y. After graduating from Hamilton College in 1885 he taught in Jaffna College, Ceylon, until 1889 and then studied at Yale (B.D., 1892). For a year he was a reader in the New Testament at the University of Chicago (where he took his Ph.D. in 1903), and in 1893 became professor of ethics and biblical literature at Smith College and, later, of biblical literature and comparative religion. Hamilton College gave him the degree of D.D. in 1915. He was author of *The Spirit of God in Biblical Literature—A Study in the History of Religion* (1904); *Adult Class Study* (1911); and coauthor with Elihu Grant of *The Bible as Literature* (1914), and with Newton M. Hall of the following: *The Bible Story* (5 vols., 1906); *Adult Bible Classes* (1906); *The Days of the Kings of Israel* (1908). He contributed to the NEW INTERNATIONAL ENCYCLOPÆDIA.

WOOD, MRS. JOHN (1833–1915). An English actress, born in Liverpool. Her maiden name was Matilda Charlotte Vining. She made her stage début in 1841, and first appeared in the United States in 1854 at Boston. From 1869 to 1873 she managed St. James's Theatre, London, which she made a great success, with a notable company. One of her best parts was that of Lady Franklin in *Money* (1882). Mrs. Wood reached the height of her popularity in the Pinero farces, *The Magistrate* (1885), *The Schoolmistress* (1886), *Dandy Dick* (1887), and *The Cabinet Minister* (1890), and in Ralph Lumley's plays *Aunt Jack* (1889) and *The Volcano* (1891). In 1905 she played at Drury Lane in *The Prodigal Son.*

WOOD, JOHN GEORGE (1827–89). An English writer on natural history, born in London. After graduating from Merton College, Oxford

(1848), he was employed in the anatomical museum. He was ordained priest in the English church (1854). From 1869 to 1875 he was precentor to the Canterbury Diocesan Choral Union, whose festivals he conducted with great ability. Widely known for his numerous popular books in natural history, he took up lecturing in 1879. He visited the United States in 1883–84, where he delivered Lowell Institute lectures at Boston. Among his 60 distinct publications, most of which have little scientific value, are *The Illustrated Natural History* (1851–53); *Sketches and Anecdotes of Animal Life* (1852); *Bees: Their Habits and Management* (1853); *My Feathered Friends* (1856); *The Common Objects of the Country* (1857); *Man and Beast* (1874). Consult the *Memoir* by his son, Rev. T. Wood (London, 1890).

WOOD, LEONARD (1860–). An American soldier and administrator, born at Winchester, N. H. He graduated at the Harvard Medical School in 1884, and in 1885 became a contract surgeon in the army. In the following year he was a medical and line officer in Lawton's campaign against the Apaches, led by Geronimo, and for his services he received the congressional Medal of Honor (1898). Upon the outbreak of the Spanish-American War he and Theodore Roosevelt organized the regiment of Rough Riders, with Wood as colonel and Roosevelt as lieutenant colonel. Wood commanded the regiment at Las Guasimas, and afterward was in charge of one of the brigades of General Wheeler's division in the battle of San Juan Hill On July 8, 1898, he was commissioned brigadier general of volunteers and on the 7th of the following December was promoted major general of volunteers. After the surrender of Santiago (July, 1898) he was put in command of the city, and in the following October was assigned to the command of the Department of Santiago. In the following year he was chosen to succeed General Brooke as Governor-General of Cuba. He held that position until the United States formally withdrew from the island. In 1903 he was placed in command of a division of the army in the Philippines, and in the same year he was made a major general in the regular army, having been brigadier general since 1901. He was commander of the Department of the East in 1908–09, and again after 1914. In the interval he was a special ambassador to Argentina (1910), and Chief of Staff of the United States army (1910–14). During the European war General Wood was a leading advocate, with his long-time friend, Colonel Roosevelt, of vigorous measures to place the United States in a position of military preparedness. He received the degree of LL.D. from several universities. An account of his administration in Cuba down to Jan. 1, 1901, is contained in *Cuba: Civil Report of General Wood* (Washington, 1901). In 1915 he published *The Military Obligation of Citizenship,* and in 1916 *Our Military History.*

WOOD, MARY ANNE EVERETT. See GREEN, MARY ANNE EVERETT.

WOOD, ROBERT WILLIAMS (1868–). An American physicist, born at Concord, Mass. He graduated at Harvard in 1891, and later studied at Johns Hopkins (1891–92) and at Berlin (1892–94). He taught at the University of Wisconsin (1897–1901), and thenceforth was professor of experimental physics at Johns Hopkins. In 1898 he originated the method of thawing frozen water mains and service pipes by passing a current of electricity through them. For his work in color photography he received a silver medal from the London Society of Arts (1900), the John Scott medal from the Franklin Institute in 1907, and the Ehrenpreis at the Dresden International Exhibition in 1909. He was also awarded the Rumford medal by the American Academy of Arts and Sciences for his researches pertaining to the theory of light. Besides scientific papers, he published: *Physical Optics* (1905; rev. ed., 1911); *Man Who Rocked the Earth* (1915), with A. C. Train; and two books of humorous verse, *How to Tell the Birds from the Flowers* (1907) and *Animal Analogues* (1908).

WOOD, THOMAS JOHN (1823–1906). An American soldier, born at Munfordville, Ky. He graduated at West Point in 1845; served under General Taylor in the Mexican War, and became captain in the First Cavalry in 1855. When the Civil War began he took the side of the Union. He was made a brigadier general of volunteers in October, 1861, and commanded a division at Shiloh, in the advance on Corinth, at Perryville, and in the battle of Stone River, where he was severely wounded. Later he commanded a division at Chickamauga, Missionary Ridge, the relief of Knoxville, at Dalton, Kenesaw Mountain, the siege of Atlanta, and Lovejoy's Station, where he was again severely wounded. He commanded the Fourth Corps in the battles of Franklin and Nashville, and in the pursuit of Hood. He was brevetted major general, United States army, in 1865, and retired from the service in 1868.

WOOD, THOMAS MCKINNON (1855–). An English cabinet officer. He was born in London, where he was educated in University College there. A leader of the municipal Progressive party of London, he served as a member of the London County Council from 1892 to 1907, and was chairman of that body in 1898–99. He was also chairman of the Parliamentary Committee in 1895–98, and an alderman in 1907. Elected a Liberal member of Parliament for Glasgow in 1906, he was Parliamentary Secretary to the Board of Education in 1908, Parliamentary Undersecretary to the Foreign Office in 1908–11, Financial Secretary to the Treasury in 1911–12, and thereafter Secretary for Scotland.

WOOD, THOMAS WATERMAN (1823–1903). An American genre painter. He was born at Montpelier, Vt., and studied art in Boston under Chester Harding and for two years in Paris. In 1867 he settled in New York, being elected an Academician in 1871. From 1878 to 1887 he was president of the American Water Color Society, and from 1891 to 1899 president of the National Academy of Design. The Metropolitan Museum, New York, possesses "The Contraband," "The Recruit," and "The Veteran," three pictures in one frame.

WOOD, WILLIAM (c.1580–1639). An English colonist in America. He was born and educated in England, emigrated to America in 1629, remained in New England several years, and in 1633 returned to England. There he published *New England's Prospect* (1634). This work, containing several curious maps, was the first published account of Massachusetts. It was reissued in Boston in 1764 and 1865, in the latter year by the Prince Society. On his return to America Wood settled in Lynn, which town he represented in the General Court in

1636. In 1637 he removed to Sandwich, where he was town clerk until his death.

WOOD, WILLIAM CHARLES HENRY (1864–). A Canadian historian. He was born at Quebec, and was educated at Wellington College, England, and in Germany. He returned to Canada, entered the militia service in 1887, and in 1907 became lieutenant colonel of the Eighth Regiment, Royal Rifles. He published: *The Fight for Canada* (1904); *Logs of the Conquest of Canada* (1909); *Tercentennial Quebec* (1910); *One Sea, One Fleet, and Canada* (1910); with Dr. A. G. Doughty, *The King's Book of Quebec* (2 vols., 1911); *Wolfe* (1912); *Montcalm* (1912); *In the Heart of Old Canada* (1913); *All Afloat* (1914); *The Passing of New France* (1914); *The Winning of Canada* (1914); *Folksongs of New France* (1915); *Select British Documents of the War of 1812* (3 vols., 1915); *Laurenciana: Lands and Waters of the Maritime St. Lawrence* (1916).

WOOD, WILLIAM PAGE, first BARON HATHERLEY. See HATHERLEY.

WOOD ALCOHOL. See METHYL ALCOHOL; WOOD DISTILLATION.

WOOD ANT. The English name of the red or hill ant (*Formica rufa*). It was formerly supposed to occur in the United States, but the American red ant is another species (*Formica exsectoides*). The wood ant forms large mounds of small sticks and straws and bits of leaves, so arranged as to leave many spaces and contain galleries which penetrate the mounds and the earth below. Paths extend in all directions from the mounds, usually straight towards the object aimed at. Frequently these objects are oak trees infested by Aphides, for which the ants are constantly in search. Another ant of the family Myrmicidæ (*Myrmica lævinodes*) sometimes lives in perfect harmony with the wood ant, together with several inquilines (q.v.). The workers have at least two different forms, the large workers carrying the building materials, and the smaller workers searching for honeydew. The mounds are frequently of great age, perhaps a century or more. See ANT.

WOODBERRY, wụd'bĕr-ĭ, GEORGE EDWARD (1855–). An American literary critic and poet, born in Beverly, Mass. He graduated at Harvard in 1877, and became professor of English at the University of Nebraska. In 1878–79 he was on the staff of the *Nation*, New York, and during the following two years was again at the University of Nebraska. From 1882 until 1891 he lived at Beverly, engaged in literary work; he contributed to the *Atlantic Monthly*, and for a time was literary editor of the Boston *Post*. In 1891–1904 he was professor of comparative literature at Columbia University. He was elected to the American Academy of Arts and Letters. His first book was *A History of Wood Engraving* (1883). This was followed by an authoritative *Life* of Edgar Allan Poe in the "American Men of Letters Series" (1885); *The North Shore Watch, and Other Poems* (1890); *Studies in Letters and Life* (1890); *Heart of Man* (1899); *Wild Eden* (1900); *Makers of Literature* (1900); *Nathaniel Hawthorne* (1902); *Collected Poems* (1903); *America in Literature* (1903); *Swinburne* (1905); *The Torch: Eight Lectures on Race Power in Literature* (1905); *Emerson* (1907); *The Appreciation of Literature* (1907); *Great Writers* (1907); *Life of Poe* (2 vols., 1909); *The Inspiration of Poetry* (1910); *Wendell Phillips* (1912); *The Kingdom of All Souls* (1912), poems; *A Day at Castrogiovanni* (1912); *North Africa and the Desert, Two Phases of Criticism, The Flight and Other Poems* (all 1914). He edited *The Complete Poetical Works of Percy Bysshe Shelley* (1892); *Lamb's Essays of Elia* (1892); *The Works of Edgar Allan Poe* (1894), with E. C. Stedman; and *Select Poems of Aubrey de Vere* (1894); besides the "National Studies in American Letters," and *Columbia University Studies in Comparative Literature* (9 vols.).

WOOD BETONY. See PEDICULARIS; STACHYS.

WOODBINE (AS. *wudubind*, from *wudu, widu*, wood + *bindan*, to bind). A popular name for one of the European honeysuckles (*Lonicera periclymenum*), and by extension for various other kinds of honeysuckle (q.v.); and in America, the Virginia creeper (*Ampelopsis quinquefolia*, or *Psedera quinquefolia*). See AMPELOPSIS.

WOODBINE. A borough in Cape May Co., N. J., 56 miles southeast of Philadelphia, Pa., on the Pennsylvania and the Atlantic City railroads (Map: New Jersey, C 5). It is known chiefly as the seat of the Baron de Hirsch Agricultural School. There are manufactories of clothing and an iron foundry. Pop., 1910, 2399.

WOOD'BRIDGE, FREDERICK JAMES EUGÈNE 1867–). An American philosophical scholar and educator, born at Windsor, Ontario, Canada. He graduated from Amherst in 1889 and from Union Theological Seminary (New York) in 1892, and attended the University of Berlin in 1892–94. Thereafter, until 1902, he taught philosophy at the University of Minnesota, from 1895 as professor. Accepting a professorship of philosophy at Columbia in 1902 he became Johnsonian professor there in 1904, and after 1912 was also dean of the faculties of political science, philosophy, pure science, and fine arts. He was one of the leaders in the neorealistic movement in philosophy (see REALISM). Woodbridge became editor of *The Journal of Philosophy, Psychology, and Scientific Methods*, and of the *Archives of Philosophy*. Besides articles in periodicals he wrote *Philosophy of Hobbes* (1903).

WOODBRIDGE, WILLIAM (1780–1861). An American political leader. He was born at Norwich, Conn., moved with his father to Marietta, Ohio, in 1791, was admitted to the Ohio bar in 1806, and was elected to the Assembly in the following year. He was prosecuting attorney of his county in 1808–14, and a State Senator, and was later appointed Secretary of Michigan Territory. In 1819–20 he was Territorial Delegate to Congress, was judge of the Superior Court in 1828–32, State Senator in 1837, Governor of Michigan in 1839–41, and United States Senator in 1841–47. Consult the *Life* by Charles Lanman (Washington, 1867).

WOOD'BURN, JAMES ALBERT (1856–). An American historian, born at Bloomington, Ind. In 1876 he graduated at Indiana University, where he taught in the preparatory department in 1878–86. He was a fellow at Johns Hopkins in 1889–90, then returning to his alma mater as professor of American history and politics. Besides editing several works, he published: *Higher Education in Indiana* (1890); *The American Republic and its Government* (1903); *American Politics: Political Parties and Party Problems in the United States* (1903;

rev. ed., 1914); *American History and Government* (1906), with T. F. Moran; *Elementary American History and Government* (1910; new ed., 1914): *Life of Thaddeus Stevens* (1913).

WOODBURY. A city and the county seat of Gloucester Co., N. J., 8 miles south of Philadelphia, Pa., on Woodbury Creek, and on the West Jersey and Seashore Railroad (Map: New Jersey, B 4). The principal manufactures are pianos, patent medicines, and glass, including cut glass. The Deptford Institute Free Library is noteworthy. Pop., 1900, 4087; 1910, 4642.

WOODBURY, wụd'bĕr-ĭ, CHARLES HERBERT (1864–). An American marine painter. He was born at Lynn, Mass., and studied in Paris under Boulanger and Lefebvre. On his return to America he settled in Boston and became well known for his fresh, broadly executed, and virile representations of the Atlantic seaboard. Good examples are: "The North Atlantic" (Worcester Museum); "At Sea" (Indianapolis Art Association); "Off the Florida Coast" (Boston Museum); "The Cliff" (Carnegie Institute, Pittsburgh); "The Ground Swell"; and "A Heavy Sea." He was elected to the National Academy of Design in 1907, and was awarded numerous prizes, including a gold medal at Atlanta (1895) and a gold medal and medal of honor at San Francisco (1915).

WOODBURY, DANIEL PHINEAS (1812–64). An American soldier, born at New London, N. H. He graduated at West Point in 1836, entered the artillery, and until 1840 served as assistant engineer in building the Cumberland Road (q.v.). He superintended the construction of Forts Kearny and Laramie (1847–50), but in 1851 he was recalled to the East. In 1861 he was promoted to be major of engineers and lieutenant colonel on the staff. He fought at the first battle of Bull Run, afterward was engaged until 1862 upon the defenses of Washington. He then commanded the Engineer Brigade during the Peninsula campaign. From December, 1862, to March, 1863, he participated in the Rappahannock campaign, and at Fredericksburg earned the brevet of brigadier general in the regular army. In 1863 he was commandant of the district of Key West and the Tortugas, where he died of yellow fever on Aug. 15, 1864. He published works on *Sustaining Walls* (1845) and the *Theory of the Arch* (1858).

WOODBURY, LEVI (1789–1851). An American jurist, born at Francestown, N. H. He graduated at Dartmouth College in 1809, and was admitted to the bar in 1812. In 1816 he was elected clerk of the State Senate, and near the close of the year he became judge of the State Superior Court. He was elected Governor of New Hampshire in 1823, and in 1825 was Speaker of the Lower House of the State Legislature. In the same year he was elected to the United States Senate, and soon became closely allied politically with Andrew Jackson. He was Secretary of the Navy in Jackson's cabinet (1831–34), and Secretary of the Treasury (1834–41), being retained in that office by President Van Buren. In 1841 he was again elected to the United States Senate, but resigned in 1845 to become an associate justice of the United States Supreme Court as the successor of Joseph Story (q.v.). His *Political, Judicial, and Literary Writings* were edited by N. Capen (Boston, 1852).

WOODBURY PROCESS. See PHOTOGRAPHY, *Photomechanical Processes.*

WOOD CARVING. A form of sculpture, employed from very early times. While virtually unknown in the Babylonian, Assyrian, Persian, and other styles of western Asia, it was common in very early Egyptian sculpture. Some of the most realistic portrait and genre statues of the Ancient Empire were carved in wood, such as the so-called "Sheikh-el-Beled" and his wife, and a number in the Bulak Museum (now removed to Ghizeh). Wood was a convenient ground for the polychromatic decoration so popular with Egyptian artists. In Greece it was probably the earliest form of archaic sculpture; and its connection with early sacred images, the xoana, led to the preservation of worship of many early wooden statues. The later Greeks and the Romans used it comparatively little, but among the most remarkable works of early Christian sculpture are the carved wooden doors of Santa Sabina, Rome.

When wood carving was revived in the eleventh century it was practiced especially in the north of Europe (Scandinavia, Germany, and part of France). The material was not only used in its native simplicity, but was covered with canvas or cloth, stuccoed and painted. Among the earliest Romanesque pieces are colossal wooden crucifixions in the Cluny and Louvre museums. Church furniture employed wood, and in Flanders and Germany especially altar-pieces, triptychs, station reliefs, passion crosses, and other monumental works were multiplied to such an extent that wood carvings formed the most important part of German sculpture during the fifteenth and sixteenth centuries, and stone sculpture was influenced by it. It came to delight in most wonderfully intricate or realistic details of handling. The art had its great masters, like Wohlgemuth, Veit Stoss, Riemenschneider, Pacher, Multscher, Hans Brüggemann, and Jan Borman, and its centres were Franconia (especially Nuremberg), Suabia, and the Rhine region. In the modern wood carvers of primitive Germanic districts, such as Tirol, we find survivals of these old schools.

The Italian Renaissance used wood carving in very different fashion. Its masterpieces were the elaborate choir stalls, in such superb examples as those at San Pietro, Perugia, at the cathedral of Orvieto, and at Santa Giustina in Padua; elaborately carved ceilings, as in the Palazzo Vecchio and the Laurentian Library, Florence; and minor works of industrial art, like carved wedding chests. In Spain wood carving flourished to a still greater extent, especially in the elaborate retablos, usually painted, and choir stalls. Here the art at first showed Moorish influence, but during the late Gothic period French, and in the sixteenth century Italian, influence. During the seventeenth century polychrome sculpture in wood was perhaps the most characteristic form of Spanish sculpture, which even the foremost sculptors, like Berruguete, did not disdain to create. In France it was also the choir stalls and screens that were the masterpieces of the art, as at Rouen, supplemented by carved doors.

Bibliography. The best general treatise in English is Alfred Maskell, *Wood Sculpture* (London, 1911). Good practical manuals are Eleanor Rowe, *Practical Wood Carving* (London, 1907), and P. N. Hasluck, *Wood Carving* (Philadelphia, 1908). For Germany, see J. Lessing, *Holzschnitzerlien des 15. und 16. Jahrhundert* (Berlin, 1882); for France, De Lostalot, *Les*

arts du bois (Paris, 1893); for Italy, Giulio Ferrari, *Il legno nell' arte italiana* (Milan, n. d.); for England, Francis Bond, *Wood Carving in English Churches* (2 vols., Oxford, 1910).

WOOD CHAT. An African shrike (*Lanius rufus*), frequently seen in southern Europe.

WOOD'CHUCK (corruption of *wejack*, *weejack*, from Cree Indian *otchock;* influenced by popular etymology with Eng. *wood*), or GROUNDHOG. A species of marmot (*Arctomys* or *Marmota monax*) inhabiting North America, from Hudson Bay to South Carolina and west to Nebraska. It is from 15 to 18 inches long, blackish or grizzled above, chestnut-red below; the form thick, the head broad and flat, the legs short and thick, the tail bushy. The hair is rather soft, the whiskers long and stout. This animal digs deep holes in fields, on the sides of hills, or under rocks in woods; its burrow slants upward, so that water may not enter, and within are several compartments. It passes the winter in the burrow, in a lethargic state, going to its hibernation in late September, and often coming out in March, before the snow and cold have ceased, when many starve or freeze to death. The food of the woodchuck is vegetable, and it is particularly destructive to crops of red clover and alfalfa, and to early garden crops. It is easily tamed, and may be fed on bread, milk, and vegetables. Its flesh is usually well flavored and that of young individuals is very good. The Eastern woodchuck is divided into several subspecies, and in Alaska and the West are four more species. Consult E. T. Seton, *Life Histories of Northern Animals* (New York, 1909), and Stone and Cram, *American Animals* (new ed., ib., 1914). See Plate of GOPHERS, ETC.

WOOD'COCK (AS. *wuducoc*, from *wudu*, wood + *coc*, cock). The popular name of certain birds closely related to the snipes (q.v.), but of more bulky form and having shorter and stronger legs. The common woodcock of the Old World (*Scolopax rusticola*), well known as a game bird in Great Britain, and highly esteemed as a table delicacy, is found also in all parts of Europe and the north of Asia, and in Japan. Its summer haunts are chiefly northern pine forests, and in winter it is found in moist woods and swamps, seeking for worms, snails, and slugs, boring with its long bill in the soft ground. The quantity of food which it devours is very great. The woodcock is about 13 inches in length; the upper parts varied with ruddy, yellowish, and ash color, finely intermingled, and marked by large black spots, the lower parts yellowish red with zigzag lines; the quill feathers striped with red and black on the edge; the tail feathers tipped with gray above and white below. The female is rather stouter and larger than the male, and sometimes attains a weight of 14 or 15 ounces. The woodcock makes its nest in warm, dry situations, on the ground, of dead leaves loosely laid together. It lays only three or four eggs of a pale-yellowish or reddish-brown color.

The American woodcock (*Philohela minor*) is a smaller bird than the woodcock of Europe, being only about 11 inches long, but is very similar in plumage and habits. Three transverse black bands mark the hinder part of the head. It is found in all parts of North America east of Colorado, and, though migratory in the north, is resident in the south. The eggs differ from those of the European species in being spotted. Its flesh is in high repute as food, so that in many parts of the country it has become very scarce. See Plate of BEACH BIRDS.

WOOD DISTILLATION. When wood is heated in the forest for the production of charcoal little account is taken of the volatile products, except the heavy tar, which is allowed to collect in a shallow pit under the stack, and is known as Stockholm tar. This is used for preserving cordage and as a calking compound.

This practice is highly uneconomic, since the more volatile substances can be utilized in producing valuable commercial products, i.e., wood alcohol, acetic acid, acetone, creosote, and wood turpentine. Even the gases may be used as fuel during the process. For wood distillation either coniferous or deciduous trees are used; in the former wood turpentine is a distinctive product, but the yield of acid is less than with hard woods.

There is great similarity in the processes and apparatus, the main points being: the use of air-dried material; as low a temperature as is consistent with the changes involved; and the prompt removal of the products from the retorts as soon as formed; this is accomplished by keeping the retort under low vacuum conditions. The commonest form of retort is a wrought-iron cylinder set horizontally or vertically in brickwork. Retorts are usually arranged in pairs and connected with water-cooled copper condensers. When the tar yield is large a separator is interposed between the retort and condenser. A pipe leading back from the cool end of the condenser conducts the gas to the furnace, where it is burned under the retorts.

Where vertical retorts are used they are detached from the condensing system at the close of the operation, lifted out of the furnace by tackle and allowed to cool unopened, while a freshly charged retort is at once lifted into the furnace.

The retort charge consists of air-dried wood in cord lengths, piled endwise. The use of sawdust and mill waste requires a different type of furnace.

On application of heat residual moisture is driven off and the temperature rises slowly to 160° C. (290° F.), when decomposition sets in. Up to 275° C. (527° F.) the distillate is a thin watery liquid known as pyroligneous acid; this is collected in vats and further refined. Above 160° C. (290° F.) gases are evolved, and between 350° and 450° C. (662° and 810° F.) both liquid and solid hydrocarbons are produced and charcoal remains in the retort.

On the basis of dry wood the yield is about 30 per cent of crude acid and 10 per cent of tar. Pyroligneous acid contains 10 per cent of acetic acid, 1 per cent of methylalcohol, and 0.1 per cent of acetone.

Treatment of the Pyroligneous Acid. After settling to separate tar the acid may be combined with scrap iron in the form known as pyrolignite of iron, or black iron liquor, much used as a mordant in dyeing and calico printing.

The crude acid is usually distilled to remove tar, which remains behind in the still while the vapors are passed through milk of lime which holds the acid as acetate of lime. The alcohol and acetone passing on are condensed as crude wood alcohol. By filtering and evaporating the lime solution gray acetate of lime is produced; if the crude acid is neutralized before distillation, the retort residue contaminated with tar is known as brown acetate of lime.

Commercial acetic acids are prepared from gray or calcined brown acetate of lime by treatment in copper stills with strong hydrochloric acid, always keeping the acetate in excess. The distillate contains 50 per cent of anhydrous acid, and may be further purified with potassium bichromate and by filtration through fresh charcoal. With dilute hydrochloric acid the distillate contains 30 per cent of acetic acid and is ready for use without further treatment.

On neutralizing pyroligneous acid with soda ash and evaporating to dryness sodium acetate is formed; this is fused to destroy tarry matter, cooled and distilled with concentrated sulphuric acid, yielding glacial acetic acid crystallizing at 16.5° C. (62° F.), 99 per cent pure.

Among the acetates used in dyeing and colors are the mordants; aluminium acetate, or red liquor, chromium acetate, calcium acetate, ferrous and ferric acetates, and as pigment or color bases cupric and lead acetates.

Treatment of Wood Alcohol. On diluting the crude product with water the liquid becomes milky, owing to separation of hydrocarbons. On standing these settle into a distinct layer which is removed. The watery layer is then distilled over lime and filtered through charcoal to remove color and odor, but this treatment does not remove acetone.

The acetone free product is made by combining rectified wood alcohol with calcium chloride, yielding a solid product stable at 100° C. (212° F.). On heating this body carefully the acetone is vaporized and may be condensed, while the calcium alcohol compound can be decomposed with hot water under pressure and pure methyl alcohol (q.v.) recovered by distillation. Methyl alcohol calcium chloride has been put on the market under the name of solid alcohol and employed for heating purposes.

Acetone (q.v.) is prepared on a large scale by heating dry calcium acetate and condensing the volatile product—$(C_2H_3O_2)_2Ca = CaCO_3 + (CH_3)_2CO$.

Wood tar is usually washed with water to remove acid, gently heated to expel excess of water, and distilled in iron stills provided with stirrers.

Distillates caught below 150° C. (302° F.) are called light oils and used as a substitute for turpentine.

The distillate between 150°–250° C. (302°–482° F.) is known as heavy oil, this contains cresols, toluene, etc. Heavy oil is washed with caustic soda and boiled to oxidize various ingredients, by acidifying with sulphuric acid crude creosote (q.v.) separates. This is again treated with alkali and acid, and distilled. The distillate caught between 200°–220° C. (392°–428° F.) is the nonpoisonous wood-tar creosote, an excellent antiseptic used in food preparations.

If distillation of the crude tar is stopped at 250° C. (482° F.) the thick brown liquid residue is used in making axle grease, shoemaker's wax, lampblack, etc.

WOOD DOVE. A rather indefinite name applied to many pigeons, as the European turtle dove or the American mourning dove.

WOOD DUCK, or SUMMER DUCK. An American fresh-water duck (*Aix sponsa*). It is of medium size, and the male is exceedingly handsome. The back is greenish brown, the head green with purplish reflections and marked with considerable white, the breast purplish chestnut spotted with white, the sides yellowish, finely barred with black, and the belly white. The bill is pinkish and red, the feet orange. There is a crest on the head, and the upper tail coverts and some feathers of the back and sides are elongated to add to the beauty of his appearance. The female is more plainly attired, but is very handsome. In summer these ducks are scattered numerously all over the country, breeding along every stream or pond, and often a long distance from water. Unlike any other duck it nests in trees and walks about in the branches like ordinary perching birds. The nest is made in a hollow stump or tree, often more than 50 feet above the ground, and the young sometimes jump down, and sometimes are carried in the bills or on the backs of the mother. See Colored Plate of DUCKS.

WOOD ENGRAVING (XYLOGRAPHY). The most important form of engraving in relief, that is to say, with the lines, the figures, or the pattern left in projection, while the background is cut away or lowered. The ink by which the figure or pattern is printed off upon paper or other material is applied to these projecting lines and surfaces and taken thence by the paper; whereas in line engraving, etching, and the like the ink fills the incised lines and is cleared off from the polished surface, except as described in connection with the retroussage. (See DRY POINT; ENGRAVING; ETCHING; LINE ENGRAVING.) The process of engraving in relief is of peculiar importance in connection with printing from movable types, stereotype plates, and the like, because the ink is applied and transferred in exactly the same way. An engraved wood block, or the electrotype made from it, is of precisely the same character as a surface for the printer as is the surface of a page of type, or the stereotype or electrotype plate made from it. Woodcuts can be printed, therefore, with type, the whole page together; whereas when it is desired to print an impression from a line engraving or an etching on the same page with the letterpress, the sheet of paper must pass through two separate presses and undergo two operations.

Early Woodcuts. The origin of wood engraving is a matter of much controversy. Woodcuts, in various forms, were used to print or stamp in remotest antiquity: by the Babylonians and Egyptians to indent bricks; by the Romans to print letters and grotesques; during the Middle Ages to stamp monograms and to print color designs on linens, leathers, satins, and silks—a custom practiced in the Orient from time immemorial. But wood engraving, in the modern sense, postdates the introduction into Europe of paper during the twelfth century; for it was not practicable to print on papyrus, vellum, or the materials previously used. From most ancient times the Chinese printed both letters and illustrations from wooden blocks; but the hypothesis that wood engraving was introduced into Europe by the commerce of Venice with them lacks confirmation. In Europe it was of independent origin, having been probably practiced as early as the fourteenth century. At the beginning of the fifteenth prints from woodcuts were common in southern Germany, and perhaps in the Netherlands. They are the merest rude outlines, intended to be colored, and represent saints and similar subjects (whence the name *Helgen*), which were distributed by the clergy for purposes of religious instruction. The earliest dated ex-

ample is the well-known print of "Saint Christopher" (1423); the date assigned to the far finer "Madonna with the Child and Angels" (1413, Brussels Library) not being certain. Although playing cards were printed at this and even at an earlier date, there is not sufficient reason to find in them, as has been done, the origin of wood engraving.

Both *Helgen* and playing cards antedated considerably the "block books," in which illustrations, with an appropriate printed text, were cut upon the same block of wood, before the invention of movable type. The origin of block books is a matter of dispute, being variously assigned to the Netherlands and to Germany. Among the oldest surviving example the *Apocalypse* is of German origin, probably from Cologne. Other celebrated works are the *Canticum Canticorum*, the *Biblia Pauperum* (q.v.), which survives in the most numerous examples, and the *Ars Moriendi*—all from the Netherlands, where, indeed, the most beautiful block books were made.

The invention of printing from movable types, which was perfected in 1454, gave a new impetus to wood engraving. Illustrations were required for the books which now became common, and the printing press furnished a better means of taking an impression than the former process of rubbing or printing from a roller. The first printed book from movable types with woodcut illustrations was a book of fables, *Liber Similitudinis*, printed by Pfister at Bamberg in 1461; a very superior artistic stage is represented in illustrations of the *Speculum Humanæ Vitæ*, a Netherlandish work often erroneously considered a block book. The centres of the art shifted to the cities of Germany, where printing presses were established—like Cologne, Nuremberg, Augsburg, and Basel. Very widely circulated and imitated were the illustrations of the *Cologne Bible* (1475), remarkable for their vigor and realism, and of the *Augsburg Bible* (1475). Of great importance, too, were the different city chronicles, the best of which was Schedel's *Liber Chronicarum* (Nuremberg, 1493). Its illustrations, designed by Wohlgemuth and Pleydenwurff, the Nuremberg artists, were remarkable as being the first in which the mere outlines were replaced by a system of light and shade. From Basel and Nuremberg wood engraving was introduced into Lyons, where the first engravings date from 1476. Somewhat later it was practiced in Paris, which city soon became famous for the *Livres des heures* of its celebrated printers, executed with great elegance in imitation of the illuminated manuscripts of the day. The *manière criblée* (q.v.), in which we find a number of French fourteenth-century prints, was probably not a wood, but a metal process; a similar process of wood engraving is now used for astronomical illustrations.

Wood engraving was introduced into Italy by German printers, the earliest illustrated book being printed at Rome in 1467; but the centre of the art was Venice. Italian wood engraving speedily differentiated itself from the German, by a superior skill in the arts of design. Simplicity of line and idealism of form and conception are the chief characteristics; its spirit is manifest in such works as Æsop's *Fables* (Verona, 1481), and in the charming *Epistles of St. Jerome* (Ferrara, 1497). The delightful *Hypnerotomachia Poliphili* (Venice, 1499) embodies, as does no other illustrated work, the joyous youthful spirit of the Italian Renaissance. Though variously assigned to Bellini, Raphael, and others, it is probably the work of Benedetto Montagna.

During the fifteenth century woodcuts had been for the most part outline drawings, relying upon tinting for the final effect. They were cut with an instrument not unlike a penknife from the designs drawn upon blocks of apple or pear wood sawed lengthwise. In the very earliest engravings designer and engraver were usually the same person; but as the art progressed artists of importance designed for woodcuts. Wood engraving was an essentially democratic art. It occupied, in the early sixteenth century, a position analogous to that of the half-tone process in the nineteenth. For this reason its products are of highest interest as embodying the thoughts of the teachers and entertainers of the common people.

Sixteenth Century. The last years of the fifteenth and the first half of the sixteenth century saw wood engraving attain its highest development in Germany, where the motive for its practice, the need for popular religious instruction, was most intense. Albrecht Dürer, the greatest master of ancient woodcut, transformed the art. By the skillful introduction of light and dark he replaced the old outlines with some of the effect of color, putting an end to the need of tinting, while his narrative power and the grandeur of his design excelled anything hitherto done. According to the best research he did not himself use the knife; but he was intimately associated with a number of highly trained engravers, whose work he minutely directed, chief among whom was Hieronymus Andreæ. His *Apocalypse* (1498), *Life of the Virgin* (1504–05), *Greater Passion* (1510–11), and *Lesser Passion* (1509–10) were all epoch-making in the art. An important factor in the development of wood engraving was the commissions given by the Emperor Maximilian: the *Triumphal Arch*, nearly ten feet in height and breadth, composed of 93 plates by Dürer and his pupils; the *Triumphal Procession* and *Weisskunig*, by Hans Burckmair of Augsburg; and the *Adventures of Sir Thœuerdank* by Hans Schäuffelein. Second only to Dürer as a designer for woodcuts, Holbein reveals his mastery of woodcut in the celebrated *Dance of Death*, and to some extent in his *Bible*, both published at Lyons (1538), though designed earlier. He had the good fortune to have as an engraver Hans Lützelburger, whose work represents the highest possible effects with the knife. The third great representative German designer for woodcut, Lucas Cranach (1472–1553), though inferior to the others in design, is important as the chief champion of the Reformation. The "Little Masters," who followed Dürer, were so called because of the small size of their designs. Among the best were Albrecht Altdorfer (1488–1538) of Ratisbon, Hans Sebald Beham of Nuremberg, and Heinrich Aldegrever at Soest; and especially, Hans Baldung at Strassburg. During the latter half of the sixteenth century wood engraving declined in Germany, partly owing to the competition of line engraving, which caused disastrous changes in the art. It was lost in the general decay of the arts, resulting upon the Thirty Years' War.

Outside of Germany there was important activity in the Netherlands, where Lucas van Leyden did especially good work, in rivalry with

Dürer. The chief artists in the later sixteenth century were Hendrik Goltzius and Christopher Sichem, and in the seventeenth Christopher Jegher did some excellent work after Rubens. In France the chief masters of the sixteenth century were Jean Cousin, whose ascribed designs are in the true spirit of the Renaissance, and Bernard Salomon (c.1550), the leading designer of Lyons. In the seventeenth and eighteenth centuries the most important engravers belonged to the families Lesueur and Papillon. Jean Michel Papillon is an example of the careful minuteness of technique that characterized the declining art. He was the first to use the tougher boxwood in place of apple and pear, and wrote the first important *Treatise on Engraving* (1766). In Italy great masters of the Renaissance occasionally drew for woodcuts; as Titian, whose designs were engraved by Boldrini and others at Venice, and Leonardo, who illustrated Paccioli's *De Proportione Divina* (1509). But the art never became thoroughly acclimated, nor was there the same need for popular instruction by this means.

Chiaroscuro. A variety of wood engraving which achieved fine results was the so-called chiaroscuro, which is derived from two or more printings of identical blocks in different shades of the same grave color, such as sepia or a soft warm gray. It owes less to the engraver than to the printer, upon whose work it chiefly depends for its effects of light and shade and gradations of tint. The designing may be done with a pen or brush, and the effect resembles that of a wash drawing. Chiaroscuro engraving was probably invented at the beginning of the sixteenth century by Jost de Negker at Augsburg. Excellent work was done in Germany by Hans Baldung and other artists, and the art was introduced into Italy by Ugo da Carpi, who practiced at Venice, his first print being dated 1518. It was a favorite means for the reproduction of masterpieces in painting, and attained the highest proficiency in Italy. The chief master in the latter half of the sixteenth century was Andrea Andreani, whose masterpiece was Mantegna's "Triumph of Cæsar." The last good chiaroscurist in Italy was Coriolani in the seventeenth century. In France the art was practiced with success by Nicolas Lesueur (1691–1764), some of whose work is most admirable in delicacy of execution, and in England by John Baptist Jackson (1701–80), who did very effective work, especially after the great Venetian painters.

Modern Wood Engraving. The great difference between early and modern wood engravings is that the latter is done on the end of the grain on the wood, which is sawed crosswise, instead of the side of the wood sawed lengthwise. The surface being therefore much harder, it is done with a graver instead of a knife. Boxwood, the hardest variety of wood and most regular in grain, is generally used instead of the ancient pear or apple. It is not certain by whom these new methods were invented, but they were first used with greatest success in England by Thomas Bewick (1753–1828), who is the real founder of modern wood engraving. The most characteristic feature of his work, which is indeed the essential feature of modern engraving, is the uniform use of the white line—the design being formed of the part cut away from the block, instead of the part left standing, as formerly. This practice was made feasible by the substitution of the graver for the knife, and was not invented by Bewick, as is commonly supposed. He possessed, moreover, a very remarkable originality of design, and his works possess a pathetic intensity which renders them singularly attractive, quite aside from their high technical merit. His best productions are the illustrations to *British Quadrupeds* (1790), *British Birds* (1797), and a large engraving, the "Chillingham Bull." Contemporary with Bewick, William Blake produced an original and artistic set of illustrations, though defective in technique, for Thornton's edition of Vergil's *Pastorals* (1820).

In the hands of Bewick's pupils the woodcut became a serious rival of line engraving in the illustration of important literary works. Charlton Nesbit and Luke Clennell practiced it with great merit, the former excelling in line, the latter in artistic feeling. Robert Branston, on the other hand, founded a school which imitated copper engraving, relying upon the black line rather than the white. John Thompson engraved, though with independence, after the designs of the line engraver John Thurston, and in the works of Orrin Smith and William Harvey wood engraving lost its distinctive qualities. The illustrated newspapers and magazines, bringing the need of rapid production, caused a still further decline of the art. The engraver became a mere artisan. In vain did W. J. Linton endeavor to introduce the practice of rendering artists' drawings by lines conceived and arranged by the engraver himself. The influence of the American school (see below) failed to revive it, but finally led to a complete preference on the part of the public for the more accurate photographic processes.

The revival of wood engraving in Germany begins at the end of the eighteenth century with the two Ungers, father and son, professors in the Berlin Academy, whose work, however, was still done with the knife, and especially with their successors, Gubitz and Unzelmann. Of very great influence were the blocks designed by Adolf Menzel (1815–1905), illustrating different works on Frederick the Great, engraved by the brothers Vogel, Eduard Kretzschmar, and others. Other prominent wood engravers of the nineteenth century were Blasius Höfel in Vienna; Allgaier and Siegle, who engraved Kaulbach's *Reynard the Fox* (1863); Bürkner and Gabner, the engravers of Ludwig Richter's designs; and especially Max Klinkicht in Freiburg. German wood engraving is precise and careful in execution, but rather harsh in color. The colored prints from woodcuts so extensively produced in Germany were not an artistic success.

The founders of the modern French school were Charles Thompson, a pupil of John Thompson, and the Frenchmen Best and Brevière. During the reign of Louis Philippe important masters designed for woodcuts, such as Grandville, Gavarni, and Tony Johannot, and of very great influence upon its development was Gustave Doré (q.v.), whose illustrations occupied a number of engravers, among the best of whom were Pannemaker (fils), Ligny, and Tricon. Representative engravers were Lepère, Baude, Jonnard, and Jules Huyot, not to mention Florian (died 1900), who achieved remarkable effects of tone. The chief master was probably Stéphen Pannemaker, whose style is as brilliant as it is grand and robust. Artistic dash, intelligent use of the graver, and the achievement of tone are

in fact the strongest points of the French school, which enjoys a higher perfection than any other in Europe.

American School. The earliest American work consisted almost entirely in the reproduction of English book illustrations for American reprints. The first artist of importance was Alexander Anderson (1775–1870), who engraved blocks after Holbein's *Dance of Death*, Bewick's *British Quadrupeds*, and other English works. He adopted the manner of Bewick, and his original blocks were the best engraved at that time outside of his master's immediate circle. The best wood engraving of the first half of the nineteenth century was by Joseph Alexander Adams, whose original designs rank with the best English contemporaries. The Civil War interfered for a time with the new magazines which now offered chief employment to the engravers. The best work of the period before 1870 is to be found in the refined, delicate cuts of A. V. R. Anthony, the detailed, careful illustrations of Henry Marsh, as in Harris's *Insects Harmful to Vegetation* (1862), and, especially, in the engravings of William James Linton (q.v.). In his writings, as well as his masterly work, ranking with the best ever done, he was the champion of the methods of Bewick against the manipulative methods of the new school.

The last and most characteristic phase of the American development began in the years following 1870, in connection with the popular magazines, whose enormous circulation depended to a large extent upon their illustrations. The public demand being for the nearest possible reproduction of the originals, a school of engravers arose who accomplished this to a very remarkable extent—rendering the brush work and impasto of painting, the technical effects of etching, chalk drawing, and the like. This was rendered possible by photographing directly on the block the original, which was retained by the artist as a guide. The technical mastery acquired by the new school was soon employed in original work of a high order, especially in landscapes engraved from nature directly upon the block, and in portrait heads of great brilliancy and power. The perfection of photographic processes (see PHOTO-ENGRAVING) has, to some extent, removed the raison d'être of wood engraving of the new school, and the great American engravers have returned to a more legitimate practice of the art.

The head of the American school, and probably its most remarkable technician, was Timothy Cole. Other important exponents of modern methods were Henry Wolf (d.1916), and the late Frederick Juengling. Elbridge Kingsley is known for his fine landscapes directly from nature, while Gustav Kruell followed the methods of Linton. Other important names are W. B. Closson, who did good work from nature; F. S. King, Frank D. French, and Arthur Dow, known for his successful color printing.

The technical processes of wood engraving have in recent years been much improved both as regards the tools used in cutting the wood, such as the graver, chisels, etc., and the printing presses, the most perfect of which are in America. The process of electrotyping, by coating the woodcut with a thin film of metal, enables the printer to make an indefinite number of impressions, or by reproducing the block in metal to secure facsimiles for commercial purposes. For the important development of wood engraving and color printing in Japan, which lies outside of the sphere of the Western evolution, see JAPANESE ART.

Bibliography. The critical treatment of wood engraving began in the historical works of Heller (Bamberg, 1822); Ottley (London, 1846), and Chatto (ib., 1861). Among good modern histories are those of Delaborde (Paris, 1882); Woodbury (London, 1883); Wessely, in his *Geschichte der graphischen Künste* (Leipzig, 1890); H. M. Cundall (London, 1895); and especially W. J. Linton, *Masters of Wood Engraving* (New Haven, 1882). For the old German school, consult Von Lützow, *Geschichte des deutschen Kupferstichs und Holzschnitts* (Berlin, 1889); Muther, *Die deutsche Bücherillustration der Gothik und der Frührenaissance* (Munich, 1884); for the American school, Baker, *American Engravers and Their Work* (Philadelphia, 1875); Linton, *History of Wood Engraving in America* (ib., 1884); F. Weitenkampf, *American Graphic Art* (New York, 1912). Consult also Hering, *Anleitung zur Holzschneiderkunst* (Leipzig, 1873), and the treatises by Lippmann and Carrington and others cited in ENGRAVING.

WOODEN HORSE, THE. The treacherous device by which, according to the legend, the Greeks were introduced into Troy and captured the city.

WOOD'FALL, HENRY SAMPSON (1739–1805). An English journalist and printer, born in Little Britain, London, and educated at St. Paul's School. In 1758 he was made editor of the *Public Advertiser*, which the letters of Junius (q.v.), published in its columns between 1767 and 1772, brought into widespread notice. Woodfall declared that he had no personal acquaintance with the author of the letters and also, according to the statement of his son, that Sir Philip Francis was certainly not responsible for them. He published them in book form in 1772 and profited largely by their sale, although he was prosecuted by the crown for libel on account of them. In 1793 he sold the *Public Advertiser* and passed the rest of his days in Chelsea, where he died. His son, GEORGE (1767–1844), also a printer, was born in London and was trained by his father, whose partner he was till the latter's retirement. He then set up in business for himself, and in 1840 admitted his son, Henry Dick, as partner. He was regarded as one of the most eminent printers of his day, and published many works of great importance, the best known being the 1812 edition of *Junius's Letters*.

WOOD'FORD. A town in Essex, England, 8 miles northeast of St. Paul's, London (Map: London, C 9). It lies in the picturesque Epping Forest district. Pop., 1901, 13,806; 1911, 18,496.

WOODFORD, STEWART LYNDON (1835–1913). An American lawyer and diplomat, born in New York City. He graduated at Columbia College in 1854; was admitted to the bar in 1857; served in the Federal army from 1862 until 1865; was chief of staff for a time to Gen. Quincy A. Gillmore, in the Department of the South; and then was military commandant of Charleston and Savannah, and for his services received the brevet of brigadier general of volunteers. In 1868–70 he was Lieutenant Governor of New York; and in 1873–75 was a member of the National House of Representatives. From 1877 until 1883 he was United States District Attorney for the Southern District of New York; then engaged in private practice, and in 1897 was

sent as Minister to Spain. Upon the outbreak of the Spanish-American War (q.v.) in 1898 he returned to the United States and resumed law practice. In 1909 he was president of the commission that had in charge the Hudson-Fulton Celebration in New York.

WOOD GREEN. A municipal suburb of London, in Middlesex, 6½ miles north of St. Paul's Cathedral (Map: London, C 7). Pop., 1901, 34,183; 1911, 49,369.

WOOD GROUSE. See CAPERCAILLIE; GROUSE.

WOOD GUM. See GUMS.

WOOD HARE. See HARE.

WOOD'HEAD, GERMAN SIMS (1855–). An English pathologist, born at Huddersfield. He studied in Huddersfield College, Edinburgh University, and in Berlin and Vienna. In 1899 he was made professor of pathology in Cambridge University. At various times he was president of the Royal Medical Society, the Royal Microscopical Society, and temperance organizations. His works include: *Practical Pathology* (1883); *Pathological Mycology* (1885), with A. W. Hare; *Bacteria and Their Products* (1891); *Report to the Royal Commission on Tuberculosis* (1895).

WOOD HEN. The weka (q.v.).

WOOD HEWERS. See TREE CREEPERS.

WOOD'HOUSE, ROBERT (1773–1827). An English mathematician and astronomer, born at Norwich. He studied at Caius College, Cambridge, where he received a fellowship in 1798. He became Lucasian professor of mathematics in 1820, Plumian professor of astronomy and experimental philosophy in 1822, and director of the observatory in 1824. His chief service to mathematical teaching was in clarifying the Continental methods of the infinitesimal calculus, in advocating the use of its notation, and in showing its application to physical problems. Among his works are: *Plane and Spherical Trigonometry* (1809; 5th ed., 1827); *A Treatise on Isoperimetrical Problems and the Calculus of Variations* (1810); *A Treatise on Astronomy* (1812); *Physical Astronomy* (1818); and *Principles of Analytical Calculation* (1803).

WOODHULL, ALFRED ALEXANDER (1837–). An American army surgeon. Born in Princeton, N. J., he graduated from Princeton University in 1856 and, in medicine, from the University of Pennsylvania in 1859. He was commissioned a medical officer in the United States army in 1861 and served through the war, in 1864–65 being chief surgeon of the army of the James. With the rank of lieutenant colonel, he was chief surgeon of the Department of the Pacific (Philippines) in 1899. The next year he became colonel and assistant surgeon general, and in 1901 was retired. In 1885 he received the gold medal of the Military Service Institution and in 1907 the Seaman essay prize. Woodhull was the first to call to the attention of the service the necessity of coöperation between the medical staff and line officers in the promotion of military hygiene. From 1902 to 1907 he lectured at Princeton University on hygiene and sanitation. In 1904 he was promoted brigadier general retired.

WOODHULL, VICTORIA CLAFLIN. See MARTIN, VICTORIA C. W.

WOOD IBIS. See STORK.

WOODLAND. A city and the county seat of Yolo Co., Cal., 18 miles northwest of Sacramento, on the Southern Pacific Railroad (Map: California, D 4). The leading products are flour, dried fruit, wine, etc. The city has a Carnegie library, Woodland Sanitarium, and Holy Rosary Academy. Woodland has adopted the commission form of government. Pop., 1900, 2886; 1910, 3187.

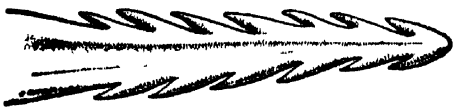
WOOD LARK. See SKYLARK.

WOOD LOUSE. An isopod crustacean of the family Oniscidæ. The abdomen is very short, but is composed of six segments. Wood lice are terrestrial, and the respiratory organs are completely infolded by perforated plates. They feed on decaying animal and vegetable matter. They roll themselves up into a ball, so as to exhibit only the plates of the back. Other popular names are pill bug, sow bug, and armadillo. See ISOPODA.

WOODMEN OF AMERICA, FRATERNITY OF MODERN. A fraternal and insurance order formed at Lyons, Iowa, in 1883, and chartered under the laws of Illinois in 1884. Divisions of branches are known as camps. The membership has increased from 600 in 1884 to 921,879 in 1915, and 14,112 camps. The total disbursements to beneficiaries of deceased members to Dec. 31, 1915, were over $142,000,000.

WOODMEN OF THE WORLD, THE. A fraternal and insurance order founded in 1890 at Omaha, Neb. The governing body is the Sovereign Camp of the World, the branches being known as local camps. White men alone are eligible. There is a Woman's Circle, which is in affiliation with the order, but of which Woodmen may become members. Women's circles are governed by the Supreme Forest. The Woodmen pay old-age benefits and erect a monument at the graves of deceased members. The order has one sovereign camp, three head camps, and 11,823 subordinate camps. The total membership in 1915 was about 735,000. The benefits disbursed since its organization amount to over $70,000,000.

WOODMOTE. See FOREST LAWS.



WOOD MOUSE. See RED-BACKED MOUSE.

WOOD NYMPH. Any of several small, beautiful noctuid moths of the genus *Euthisanotia* (or *Eudryas*), common in various parts of the United States, and noted as enemies of the grapevine. The wood nymph (*Euthisanotia grata*) has creamy-white front wings, with a glassy surface and with a wide brownish-purple stripe along the outer margin. The moth, which appears during midsummer, lays its eggs upon the leaves of grape and Virginia creeper, upon which evidently two broods of pale-bluish caterpillars, striped with orange and black lines, feed from May to September. The insects hibernate as naked chrysalises. The pearly wood nymph (*Euthisanotia unio*) much resembles the former species, but is smaller and the outer border of the front wings is paler and tawny. It forms a simple earthen cocoon, or frequently bores into a piece of old wood, and changes to a chrysalis, in which stage it passes the winter. (See Colored Plate of MOTHS.) A California species (*Euthisanotia brevipennis*) is similar to both of the above in color and habits. Spraying the vines with an arsenical solution is recommended as a preventive of damage by these insects.

WOOD OIL TREE. A name applied to several species of Aleurites, especially to *Aleurites fordii* of China and *Aleurites cordata* of Japan. These trees are of comparatively rapid growth, with light, soft wood. They bear numerous

fruits about the size of a small apple, each containing 2 to 8 large, oily seeds. The oil is secured by expressing the ground nuts. It is a rapidly drying oil, about 5,000,000 gallons of which is annually exported, nine-tenths of this amount being obtained from *Aleurites fordii*. It is largely used in varnish making and has been found valuable as a waterproof priming for cement. *Aleurites fordii* has been successfully introduced in the Southern States, withstanding temperatures of 14° F. See GURJUN BALSAM.

WOOD'PECK'ER. A forest bird of the family Picidæ, adapted to clinging to the trunks of trees and digging holes in the wood with its beak. The toes are in pairs, two before and two behind, armed with sharp strong claws; in *Picoides* and some other genera one of the two hind toes is wanting, and these forms are therefore called three-toed woodpeckers. The bill is rather long, straight, and wedge-shaped, with a hard tip, the end and sides compressed; the tail is usually lengthened and rigid, and the shafts of the feathers terminate in hard spines, which the birds press against the surface upon which they rest, and so aid in supporting their weight. The last of the caudal vertebræ is very large, with a long ridgelike spinous process; the whole structure adapting these birds to run and climb with the greatest facility on the stems and branches of trees, and to seek their food, which consists chiefly of insects and their larvæ, by digging into the bark and wood of trees with their bill. While woodpeckers bore into living trees for boring-insect larvæ, we notice their work on dead trees far more. Various bark and wood-boring beetles, weevils, cocoons of the codling moth, the woolly aphis and other injurious insects form the bulk of the food of these

TONGUE OF WOODPECKER.

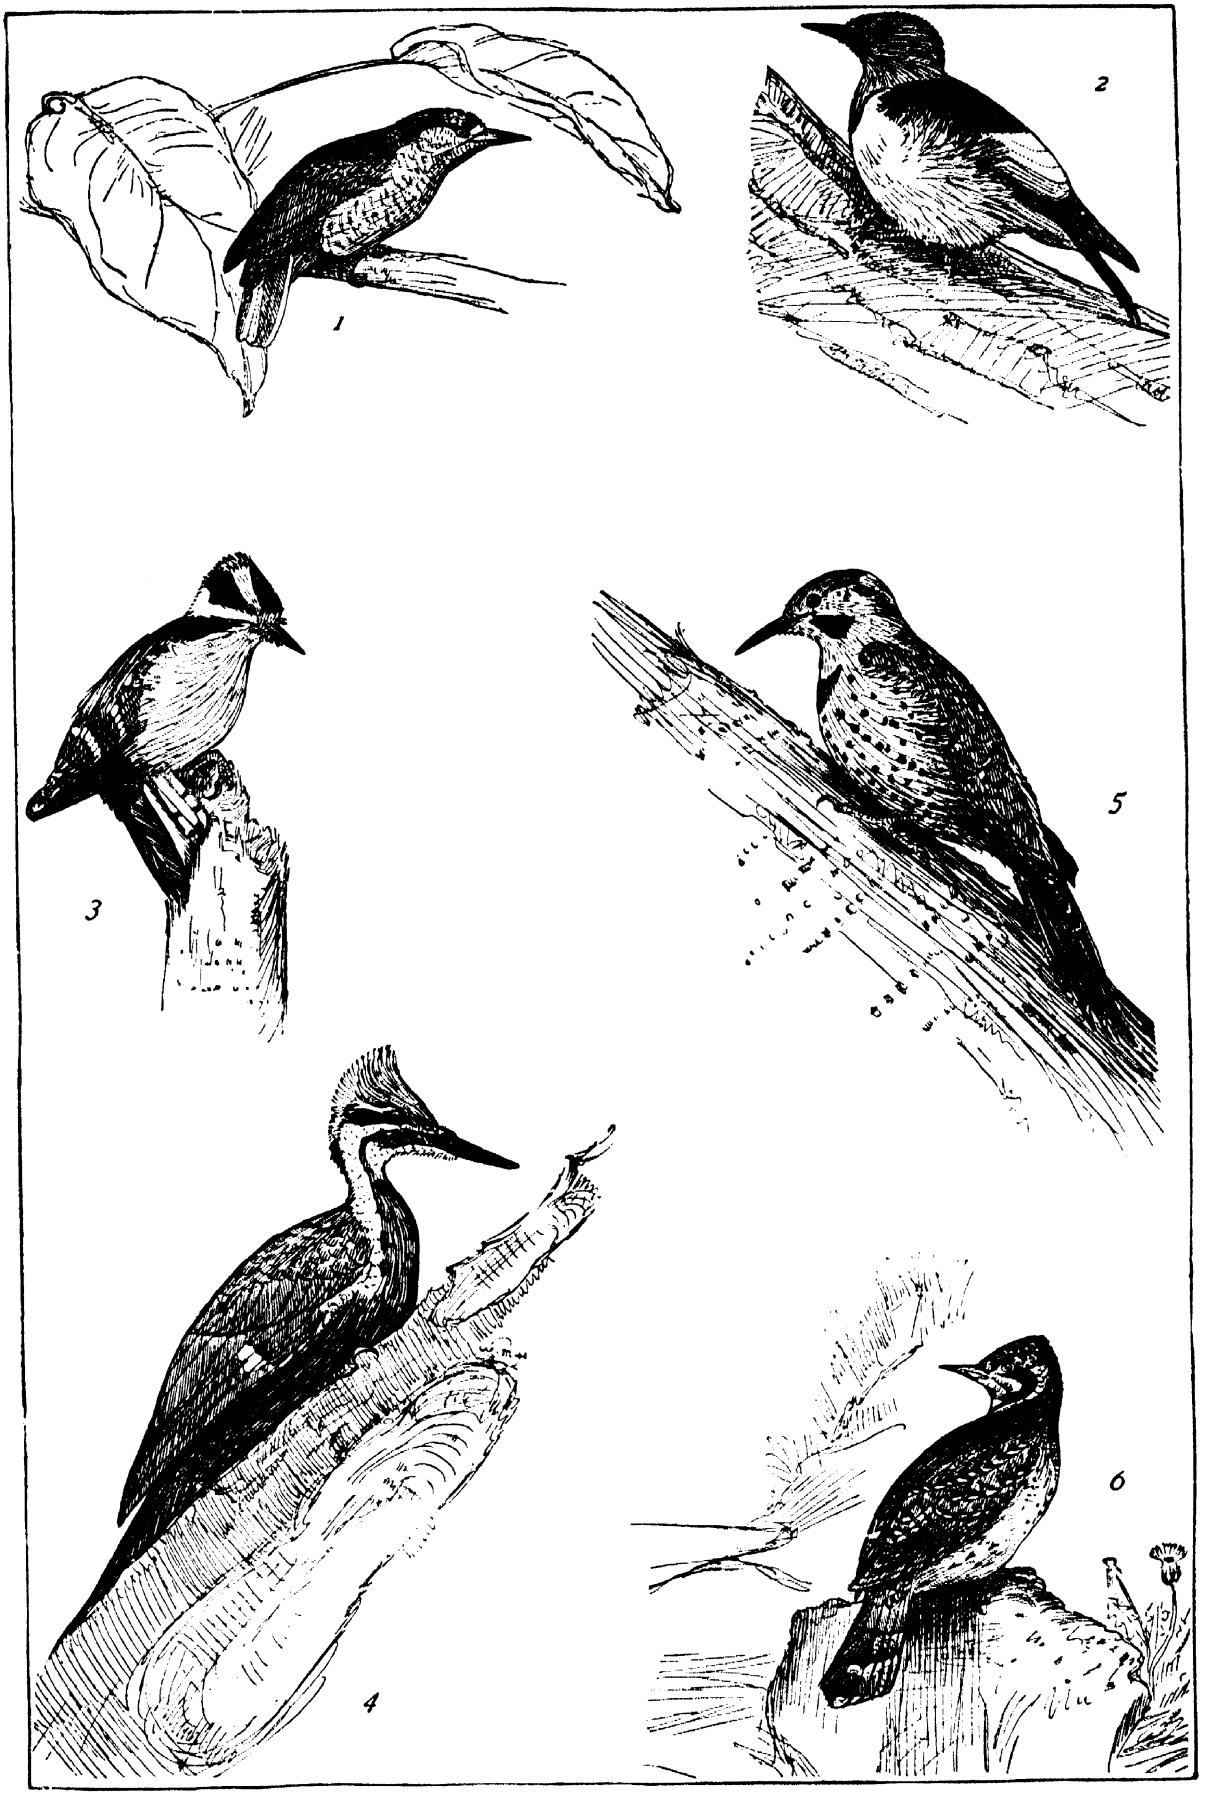
birds. The tongue is fitted to the work of removing the insects from the holes bored, as the branches of the hyoid bone are greatly elongated backward, and in front move as in a sheath; and muscles enable these birds to extend the tongue far beyond the bill. The tip of the tongue is horny and has barbed filaments, while its surface is covered with a glutinous saliva, secreted by two large glands. The keel of the breastbone is small, and the powers of flight are moderate.

Woodpeckers are diffused over almost all parts of the globe, but abound chiefly in warm countries. They are wanting in the Australian region and in Madagascar. The species are very numerous, probably 350 in all. They are mostly solitary in their habits, and live in forests. Some species feed in part on fruits and seeds, but much of their time is spent in pursuit of insects, and they may be heard at a long distance tapping the wood of trees with their bills, to discover the place where an insect is lodged, or getting at it when discovered by vigorous pickaxe-like strokes of the bill. They do more good by preventing the ravages of insects than harm by their pecking. They nest in a hole cut into the trunk of a tree for a short distance and then excavated downward six to 12 inches, according to the size of the bird, where it is somewhat enlarged. In the Southwest they often bore into cactus stems. No bedding is needed, the eggs, invariably glossy white, lying on the floor of the chamber. These holes are never used a second time, but old ones are frequently utilized by other birds.

The plumage of woodpeckers is generally of strongly contrasted colors, black and white, or green and yellow, with red marks about the head. There are several well-marked groups in the family, differing in form, plumage, habits, and geographic distribution.

The American species of woodpecker are numerous and well known. The finest of the race, the great ivory-bill (q.v.), is nearly extinct. Another very large species, the logcock (*Cocphlœus* or *Phlœotomus pileatus*) is about 17 inches long, greenish black, with stripes from the eyes along the neck and sides, and the top of the head red. It is widely distributed, but stays in forests and is nowhere numerous. Common and familiar in orchards and along roadsides is a small black and white species, the downy woodpecker (*Dryobates pubescens*); and a larger counterpart, the hairy (*Dryobates villosus*), is often seen. Both peck holes in the bark of apple trees, maples, and the like, but these scars most often mark the work of the sapsucker (q.v.). Various species belong to Canada or to the Pacific slope.

The red-headed woodpecker (*Melanerpes erythrocephalus*) is common in most parts of North America west of the Alleghanies, and feeds much upon fruits and upon young heads of Indian corn, so that it is not an unmixed blessing. But its superb coloration (head crimson, back, wings, and tail glossy blue-black, secondaries and rump pure white) makes it a handsome ornament and atones in some degree for the mischief it does. It is 10 inches long. An extraordinary species of California (*Melanerpes formicivorus*), related to the redhead, is remarkable for its habit of storing acorns, each hammered into a hole in a tree trunk dug to receive it. The Eastern redhead also stores acorns irregularly in bark crevices. Lastly, the golden-winged woodpecker or flicker (q.v.) should be mentioned.



Of the European woodpeckers, the great black species (*Dryocopus martius*), much like the American logcock, is rare. The greater spotted and lesser spotted are closely related and similar to the downy and hairy woodpeckers. The most distinctive and numerous of British species is the green woodpecker (*Picus viridis*), also common on the continent of Europe. It is about 13 inches in length, and is mostly of a dark green color, picturesquely ornamented about the head with black and scarlet.

One group of foreign woodpeckers demands a few words because of the peculiar tail, which is not at all woodpecker-like. This is the subfamily Picumninæ, of which about 25 species are known, sometimes called piculets (q.v.).

Consult: United States Department of Agriculture, *Farmers' Bulletins*, Nos. 54, 513 (Washington, 1897, 1913); F. H. Eckstorm, *The Woodpeckers* (Boston, 1901); F. E. L. Beal, *Food of Woodpeckers* (new ed., Washington, 1911); E. H. Forbush, *Useful Birds and their Protection*, published by Massachusetts Board of Agriculture (Boston, 1913); also general references under BIRDS. See Plate of WOODPECKERS.

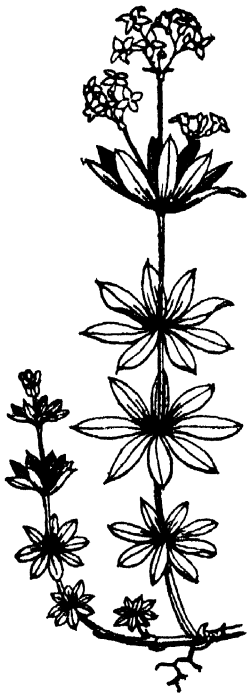
WOOD PEWEE. See PEWEE.

WOODPECKERS

1. BRAZILIAN PICULET (Picumnus lepidotus).
2. RED-HEADED WOODPECKER (Melanerpes erythrocephalus).
3. DOWNY WOODPECKER (Dryobates pubescens).
4. LOG-COCK (Phlœotomus pileatus).
5. FLICKER (Colaptes auratus).
6. WRYNECK (Jynx torquilla).

WOOD PRESERVING. Several processes have been employed for the purpose of preventing the decay of wood from dampness, atmospheric action, or the destructive operations of animals and parasitic plants. The principle in all has been the same, viz., the injection into the vessels of the wood of some antiseptic material, which, by combining with the woody tissue, prevents its decomposition, or gives it a poisonous character. The chief of the methods in use are: kyanizing with bichloride of mercury; creosoting, in which the preserving material is the creosote of coal tar; and burnettizing with zinc sulphate. While the tree is still growing the head of the tree is cut off, and the top of the bare stem is hollowed into the form of a bowl, which is then filled with the solution, which is afterward supplied as required. The liquid penetrates downward, killing the tree as it goes, but giving to the wood a most remarkable degree of durability. In creosoting the wood may be simply steeped in creosote oil. Melted naphthaline, too, has been employed as a preservative for timber.

WOOD-PULP YARN. A coarse yarn formed by twisting narrow strips of paper, made from wood pulp, in special machines. In this ingenious manner, cellulose fibres too short for ordinary spinning can be utilized. Wood-pulp yarns are used for twine or woven into various coarse fabrics suitable for floor and wall coverings, bagging and upholstery drapery. They are largely replacing jute on account of superior wearing qualities and lower cost, but have less tensile strength. When used with linen, cotton, jute, etc., a great variety of fabrics may be cheaply produced. Xylolin, textilose, silvalin, and licella yarn are trade names for wood-pulp yarns.



WOOD QUAIL. See ROULROUL.

WOOD RAT. A large American forest rat, several species of which form the group Neotominæ. Some have round, nearly naked tails, and others bushy tails. They are most numerous in the Southern and Western States, and are noted for the large houses they build of sticks, pieces of bark, leaves, etc., over the entrances of their extensive underground burrows. A well-known species is the bluish-gray *Neotoma floridana* of the South Atlantic and Gulf States. The yellowish brown bushy-tailed species widely distributed from Utah to the interior of British Columbia is *Neotoma cinerea*. Consult E. A. Goldman, "Revision of the Wood Rats of the genus Neotoma," in United States Bureau of Biological Survey, *North American Fauna, No. 31* (Washington, 1910).

WOOD RIVER. A river of Alaska, tributary to Nushugak Bay (q.v.). It is of importance to the United States government in connection with the adjacent spawning grounds for salmon. It was closed to commercial fishing by the Secretary of Commerce and Labor on Jan. 1, 1908.

WOOD ROBIN. A singing bird of forest-keeping habits. In the United States this name is sometimes applied to the wood thrush (q.v.); in Australia, to a warbler (*Erythrydryas rosea*), resembling the European robin redbreast.

WOODRUFF (AS. *wudurofe, wuderofe*, from *wudu, widu*, wood + **rofe*, of uncertain meaning, possibly ruff), *Asperula*. A genus of about 75 species of annual and perennial herbs of the family Rubiaceæ. The sweet woodruff (*Asperula odorata*) is common in shady woods in all parts of Europe. The plant when dried has an agreeable fragrance, similar to that of dried vernal grass. It forms an agreeable herb tea, and enters into the composition of the popular May drink of the Germans. Dyer's woodruff (*Asperula tinctoria*), a native of Europe and of Siberia is a perennial whose root is used in Dalmatia and elsewhere instead of madder, but is less productive. *Asperula galioides*, a European species, has been locally naturalized in the United States. See COUMARIN.

SWEET WOODRUFF.

WOODRUFF, CHARLES EDWARD (1860–1915). An American army surgeon and ethnologist, born in Philadelphia. He graduated (A.B.) from the Central High School of Philadelphia in 1879, then studied for four years at Annapolis, and graduated from Jefferson Medical College in 1886. In the latter year he joined the United States navy as assistant surgeon, and in 1887 was transferred to the army in the same capacity. He served in the Philippines in 1898, 1902–04, and 1909–10, rising to be lieutenant colonel and retiring in 1913. Afterward he served as chief health officer of New Rochelle. Besides helping to edit several medical journals, Woodruff wrote many monographs, and *The Effects of Tropical Light on White Men* (1905); *Expansion of Races* (1909); *Medical Ethnology* (1915). He advances the theory that blond persons can be of service to mankind and propagate only in cold and temperate zones, while brunets are fitted for life in tropical countries.

WOODRUFF, CLINTON ROGERS (1868–). An American municipal reformer, born in Philadelphia. He was educated at the University of Pennsylvania (Ph.B., 1889; LL.B., 1892). From 1891 to 1903 he served as counsel of the Philadelphia Municipal League, and in 1903–04 was special Indian commissioner to investigate charges of fraud. A member of the Pennsylvania Legislature for two terms, he was author of the "personal registration" amendment to the Pennsylvania Constitution, and after 1906 served as president of the Board of Personal Registration Commissioners for Philadelphia. Woodruff became secretary of the National Municipal League, and editor of the *National Municipal Review*. From 1894 to 1911 he edited the *Proceedings* of the National Conference for Good City Government. Besides contributions to reviews and various pamphlets, he published *City Government by Commission* (1911). In 1916, as editor in chief, he began the preparation of a new municipal encyclopædia.

WOODRUFF, WILFORD (1807–98). A president of the Mormon church. (See MORMONS.) He was born on March 1, 1807, in Avon, Hartford Co., Conn., joined the Mormon church in early manhood and was ordained a priest in 1833. He met the Prophet Joseph Smith, Jr., at Kirtland, Ohio, afterward removed to Clay Co., Mo., whence he made missionary trips to

the southwestern States, and later settled in Salt Lake City. In 1837 he became a member of the first quorum of Seventies and in 1839, one of the 12 apostles. In 1839, 1840, and 1844 he was a missionary in England, and in 1848 in the Eastern States. While at Nauvoo he asserted that he was opposed to the plural marriage system, but as one of the 12 apostles he refused to take the test oath against polygamy. In 1887, as newly elected president of the church, Woodruff issued a proclamation in which he said, in order to anticipate the provisions of the Cullom bill, "I publicly declare that my advice to the Latter Day Saints is to refrain from any marriage forbidden by the law of the land." He died Sept. 2, 1898.

WOOD RUSH. See LUZULA.

WOODS, ALBERT FRED (1866–). An American plant physiologist, born at Belvidere, Ill. In 1890 he graduated from the University of Nebraska, where he was an assistant botanist in 1890–93. In the United States Department of Agriculture he was connected with the Division of Vegetable Physiology and Pathology from 1893 to 1900, and served as pathologist and physiologist, and assistant chief of the Bureau of Plant Industry in 1900–10. In the latter year he became dean of the Minnesota State Agricultural College and director of the Minnesota Experiment Station. His publications consist largely of official reports and contributions to scientific journals.

WOODS, CHARLES ROBERT (1827–85). An American soldier, born at Newark, Ohio. He graduated at West Point in 1852, and became first lieutenant in the Ninth Infantry in October, 1855. Just before the Civil War began he commanded the troops on the steamer *Star of the West* in the unsuccessful attempt to reënforce Fort Sumter (q.v.). In October, 1861, he became colonel of the Seventy-sixth Ohio; fought under General Grant at Fort Donelson and Shiloh; commanded a brigade in the advance on Corinth, the land forces in the expedition to Milliken's Bend, a regiment in the Chickasaw Bluffs Expedition and the capture of Arkansas Post, and a brigade in the operations against Vicksburg; and was made a brigadier general of volunteers in August, 1863. He participated in the operations about Chattanooga; fought under Sherman in the advance on Atlanta and in the march to the sea; and in March, 1865, was brevetted major general of volunteers for services at the battle of Bentonville. He became lieutenant colonel of the Thirty-third Infantry in July, 1866; was promoted to be colonel of the Second Infantry in March, 1874; and retired in the following December.

WOODS, FREDERICK ADAMS (1873–). An American biologist, born in Boston and educated at the Massachusetts Institute of Technology and at Harvard Medical School (M.D., 1898), where for four years he taught histology and embryology. After 1903 he served as lecturer in biology at the Institute of Technology. He published, besides technical articles on heredity, *Mental and Moral Heredity in Royalty* (1906) and *The Influence of Monarchs* (1913).

WOODS, LEONARD (1774–1854). An American Congregational theologian. He was born at Princeton, Mass., graduated at Harvard College (1796), and became pastor at West Newbury, Mass. (1798). He was professor of theology at Andover from the opening of the seminary in 1808 till 1846, when he resigned, but continued to live in Andover till his death. He first came into notice by his controversial papers on the Hopkinsian side in the *Massachusetts Missionary Magazine* (see HOPKINS, SAMUEL), and later (1805) as joint editor of the *Panoplist*. He was prominent in the formation of the American Tract Society, American Education Society, American Temperance Society, and the American Board of Commissioners for Foreign Missions. His collected works appeared in five volumes (Boston, 1849–50), and his *History of Andover Seminary* in 1885. One of his most useful services was his *Life of Mrs. Harriet Newell* (1814), which profoundly influenced the foreign missionary cause. He also published: *Letters to Unitarians* (1820); *Letters to Rev. N. W. Taylor* (1830); *Lectures on Church Government* (1844); and *Theology of the Puritans* (1851). Consult Williston Walker, *Ten New England Leaders* (New York, 1901); F. H. Foster, *A Genetic History of New England Theology* (Chicago, 1907).

WOODS, LEONARD (1807–78). An American theologian and scholar, born in Newbury, Mass., the son of Leonard Woods (1774–1854). He graduated at Union College (1827) and at Andover Theological Seminary (1830) and edited in New York *The Literary and Theological Review* (1834–37). He was professor of sacred literature in Bangor Seminary (1836–39) and president of Bowdoin College (1839–66). His valuable investigations in the early history of Maine are contained in the *Proceedings* of the Maine Historical Society (1877). He translated, among other works, G. C. Knapp's *Christian Theology* (2 vols., 1831–33).

WOODS, MARGARET LOUISA (BRADLEY) (MRS. H. G. WOODS) (1856–). An English author, born at Rugby, a daughter of George Granville Bradley (q.v.). She was educated at home, and at school in Leamington. Among her publications are: *A Village Tragedy* (1887); *Lyrics and Ballads* (1889); *Esther Vanhomrigh* (1891); *The Vagabonds* (1894); *Wild Justice* (1896); *Sons of the Sword* (1901); *The King's Revoke* (1905); *Poems Old and New* (1907); *Pastels under the Southern Cross* (1911); *Collected Poems* (1914). Consult William Archer, *Poets of the Younger Generation* (New York, 1902).

WOODS, WILLIAM BURNHAM (1824–87). An American jurist and soldier, born in Newark, Licking Co., Ohio. He graduated at Yale in 1845 and was admitted to the Ohio bar in 1847; was Mayor of Newark in 1856–57; then was elected to the Legislature and chosen Speaker. In September, 1861, he became lieutenant colonel of the Seventy-sixth Ohio Regiment, and served throughout the war under General Grant and General Sherman. He commanded a division in Sherman's march to the sea. At the close of the war he was brevetted major general of volunteers. In 1869 he was appointed judge of the Fifth United States Circuit Court; and in 1880 associate justice of the United States Supreme Court.

WOOD SAGE. See GERMANDER.

WOODSFIELD. A village and the county seat of Monroe Co., Ohio, 42 miles southwest of Bellaire, on the Ohio River and Western Railroad (Map: Ohio, H 6). There are machine shops and some small manufactories. Pop., 1900, 1801; 1910, 2502.

WOOD'S HALFPENCE. The name given to the halfpence issued for Ireland by William

Wood, an English ironmaster, in 1723–25. According to a well-established custom, George I in 1722 gave the Duchess of Kendall, his favorite mistress, a patent for coining copper halfpence and farthings for Ireland to the value of £108,000. She in turn sold this to Wood for £10,000, and Wood proceeded to pour the coin down the throats of the people. All classes in Ireland united in a most vehement opposition, which became so formidable that the government revoked the patent in 1725 and granted Wood a compensation for his loss.

WOODS HOLE. See FALMOUTH.

WOOD SHRIKE. An Oriental shrike of the subfamily Prionopinæ.

WOOD SLAVE. A familiar and active little skinklike lizard (*Mabouia agilis*) of Jamaica.

WOOD'S METAL. See FUSIBLE METAL.

WOOD SNAKE, or SIPO. An arboreal colubrine snake (*Herpetodryas carinatus*) of the Amazon region, often seven feet long, and remarkable for its beautiful colors. The upper parts are bright verditer or olive green, and the under parts greenish or bright yellow.

WOOD SNIPE. See CURLEW.

WOOD SPIRIT, or WOOD ALCOHOL. See METHYL ALCOHOL.

WOODSTOCK. A town in Oxfordshire, England, 8 miles northwest of Oxford (Map: England, E 5). It is celebrated as the former seat of the manor of Woodstock, or Old Woodstock, a residence of the early English kings, granted to the great Duke of Marlborough, whose magnificent residence, Blenheim Palace, built for him by the nation, is in the immediate vicinity. Edward, the Black Prince, was born here; Elizabeth was here held prisoner by her sister Mary, and Chaucer resided in the place for some time. Woodstock is also famous in connection with Fair Rosamond, the celebrated mistress of Henry II. Pop., 1911, 1594. Consult Marshall, *Early History of Woodstock Manor* (1873–74).

WOODSTOCK. A port and capital of Oxford County, Ontario, Canada, on the Grand Trunk and the Canadian Pacific railroads, 30 miles east-northeast of London (Map: Ontario, D 7). It is the seat of Woodstock College, in affiliation with McMaster University (Baptist), Toronto. It also possesses a public library, and a hospital. Pop., 1901, 8833; 1911, 9320.

WOODSTOCK. A town, port of entry, and the county seat of Carleton County, New Brunswick, Canada, on the St. John River and on the Canadian Pacific and the St. John Valley railways (Map: New Brunswick, C 4). It possesses the Fisher Memorial School, an agricultural college, a school of domestic science and a public library. Pop., 1901, 3644; 1911, 3856.

WOODSTOCK. A city and the county seat of McHenry Co., Ill., 51 miles northwest of Chicago, on the Chicago and Northwestern Railroad (Map: Illinois, H 1). It has the Todd Seminary for Boys, the Chicago Industrial Home for Children, the Old Folks Rest Home, and a fine courthouse, city hall, and armory. There are two large typewriter factories, pickle works, feed and planing mills, a foundry and machine shops, and a cheese and butter factory. Pop., 1900, 2502; 1910, 4331.

WOODSTOCK. A village and the county seat of Windsor Co., Vt., 30 miles east of Rutland, on the Ottauquechee River, and on the Woodstock Railroad (Map: Vermont, D 6). It has a public library. Woodstock has some popularity as a place of resort, being situated in a picturesque region. There are lumber and flour interests. Pop., 1900, 2557; 1910, 2545.

WOODSTOCK. A novel by Walter Scott (1826). The scene of the story is laid in the royal lodge of Woodstock in 1651.

WOOD TAR. See NAVAL STORES; TAR.

WOOD THRUSH, WOOD ROBIN or SONG THRUSH. Names of one of the most familiar, beautiful, and melodious of North American thrushes (*Turdus mustelinus* or more correctly, *Hylocichla mustelina*). See THRUSH.

WOOD TIN. See CASSITERITE.

WOOD TORTOISE. An American terrestrial turtle (*Clemmys insculptus*) to be recognized by the concentric markings or striæ on each plate of the carapace. It occurs in the United States east of Ohio, and is common in many localities. See TURTLE.

WOOD TURPENTINE. See TURPENTINE.

WOODVILLE, RICHARD. See RIVERS.

WOOD WARBLER. A book name for the American warblers of the family Mniotiltidæ. See WARBLER.

WOODWARD. A city and the county seat of Woodward Co., Okla., 150 miles northwest of Oklahoma City, on the North Canadian River, and on the Atchison, Topeka, and Santa Fe and the Wichita Falls and Northwestern railroads (Map: Oklahoma, B 2). It has the Woodward Hospital, a government agricultural station, a Carnegie library, and fine school, courthouse and Federal buildings. Woodward carries on a large trade in wheat, corn, live-stock and poultry. Pop., 1900, 2018; 1910, 2696.

WOODWARD, wud'wĕrd, ARTHUR SMITH (1864–). An English paleontologist. He was born at Macclesfield, and studied at Owens College, Manchester. In 1882 he entered the British Museum, where he became assistant keeper, and later, keeper of geology. His researches deal mainly with extinct vertebrata, especially extinct fishes. He made trips to South America in 1896 and 1907, made excavations in Greece in 1901, and with Charles Dawson discovered and interpreted (1912–14) the Piltdown skull. (See MAN, SCIENCE OF, *Ancient Types.*) In 1901 he was elected a fellow of the Royal Society. He received the Wollaston grant in 1889 and the Lyell medal in 1896 from the Geological Society of London, and the Clarke medal from the Royal Society of New South Wales in 1914. Of the Geological Society he was president in 1914. Besides numerous memoirs and papers, his publications include: *Catalogue of Fossil Fishes in the British Museum* (4 vols., 1889–1901); *Outlines of Vertebrate Palæontology* (1898); *The Fossil Fishes of the English Chalk* (7 parts, 1902–12).

WOODWARD, CALVIN MILTON (1837–). An American technical educator, born at Fitchburg, Mass. He graduated from Harvard in 1860, and served as captain in the Forty-eighth Massachusetts Volunteers in 1862–63. At Washington University he was professor of descriptive geometry (1870–71) and of mathematics and applied mechanics (1871–1910), and dean of the School of Engineering (1871–96) and of the School of Engineering and Architecture (1901–10). Of the St. Louis Manual Training School, which he originated in 1879, he was thereafter director, and he served also as a member of the St. Louis Board of Education in 1877–79 and after 1897. Woodward held the presidency of the American Association for the Advancement of Science (1905–06), and of

the North Central Association of Colleges and Secondary Schools. He published: *History of St. Louis Bridge* (1881); *The Manual Training School* (1887); *Manual Training in Education* (1890); *Rational and Applied Mechanics* (1912).

WOODWARD, HENRY (1832–). An English geologist, born at Norwich, and educated at the Royal Agricultural College at Cirencester. Several other members of his family have been known as geologists—his father, Samuel Woodward (1790–1838), his brother, Samuel Pickworth Woodward (1821–65), and his nephew, Horace Bolingbroke Woodward (q.v.). His brother, Bernard Bolingbroke Woodward (1816–69), was librarian at Windsor Castle and a writer. He was keeper of the geological department of the British Museum from 1880 till 1901. He was president of the Palæontographical Society from 1896, was at various times president of the Royal Microscopical and Geological societies and of the Malacological Society and in 1906 received the Wollaston medal. His works include monographs on the *British Fossil Crustacea Belonging to the Merostomata* (1866–78); on the *Carboniferous Trilobites* (1883–84); on the *British Palæozoic Phyllopoda* (1888–99).

WOODWARD, HORACE BOLINGBROKE (1848–1914). An English geologist, nephew of Henry Woodward (q.v.). His father, Samuel Pickworth Woodward, had also been a geologist. He was born in London, became an assistant in the Library and Museum of the Geological Society in 1863, and in 1867 joined the Geological Survey of England and Wales, of which he later became assistant director. In 1893–94 Woodward was president of the Geologists' Association. He was elected a fellow of the Royal Society. His publications include: *Geology of England and Wales* (1876; 2d ed., 1887); *Jurassic Rocks* (1893–95); *Soils and Subsoils* (1897; 2d ed., 1906); *Geological Atlas of Great Britain* (1904; 3d ed., enl., 1913); *The History of the Geological Society of London* (1907); *The Geology of Water Supply* (1910); *History of Geology* (1911); *Geology of Soils and Substrata* (1912).

WOODWARD, JOHN (1665–1728). An English geologist, born in Derbyshire. He became professor of physic at Gresham College in 1692, was elected F.R.S. in 1693, and received the degree of M.D. from Cambridge in 1695. Much of his work was ahead of his time; indeed, he showed that the shells found in rock strata had originally lain in sea sand, and called attention to the strata themselves. He prepared a great *Catalogue* and published also: *An Essay towards a Natural History of the Earth* (1695; 3d ed., 1723); *Brief Instructions for Making Observations* (1696); *An Account of Some Roman Urns* (1713; 3d ed., 1723); *An Attempt towards a Natural History of the Fossils of England* (2 vols., 1728–29). His collection of English fossils formed the nucleus of the Woodwardian Museum at Cambridge, and his will provided for the Woodward professorship of geology.

WOODWARD, JOSEPH JANVIER (1833–84). An American surgeon, born in Philadelphia. He graduated from the medical school of the University of Pennsylvania in 1853, and practiced in Philadelphia and taught in the University of Pennsylvania until 1861. He then became assistant surgeon in the United States army, and served throughout the war, receiving the brevets of captain, major, and lieutenant colonel. In July, 1866, he was commissioned captain and assistant surgeon in the regular army, and in 1876 was promoted surgeon with the rank of major. He did much to develop medical microscopy. His inventions include an instrument for detecting myopia or other abnormal conditions of the eye. In 1882 he was president of the American Medical Association. He published works on photographic micrometry and *Outline of the Chief Camp Diseases of the United States Armies* (1863); but his great work was a collection of case histories, the two medical volumes (1870–79) of *The Medical and Surgical History of the War of the Rebellion*, of which G. A. Otis was co-author.

WOODWARD, ROBERT SIMPSON (1849–). An American physicist and mathematician, born at Rochester, Mich. He graduated C.E. at the University of Michigan in 1872 and was appointed assistant engineer on the United States Lake Survey. In 1882 he became assistant astronomer to the United States Transit of Venus Commission. In 1884 he became astronomer to the United States Geological Survey, serving until 1890, when he became assistant in the United States Coast and Geodetic Survey. In 1893 he was called to Columbia as professor of mechanics and subsequently became professor of mathematical physics as well. He was dean of the faculty of pure science at Columbia from 1895 to 1905, when he became president of the Carnegie Institution (q.v.) of Washington, whose reputation and usefulness as a means of furthering scientific research was widely extended under his direction. He was elected to the National Academy of Sciences in 1896. In 1898–1900 he was president of the American Mathematical Society, and in 1900 president of the American Association for the Advancement of Science. In 1915 he was appointed to the Naval Consulting Board. Woodward carried on researches and published papers in many departments of astronomy, geodesy, and mechanics. In the course of his work with the United States Coast and Geodetic Survey he devised and constructed the "iced bar and long tape base apparatus," which enables a base line to be measured with greater accuracy and with less expense than by methods previously employed. His work on the composition and structure of the earth and the variation of latitude found expression in a number of valuable papers. He published *Smithsonian Geographical Tables* (1897; 3d ed., 1906), and *Probability and Theory of Errors* (1906).

WOOD-WORKING MACHINERY. The various machines by means of which lumber as cut in the forest is reduced to standard dimensions and then made into pieces ready for immediate use, as boards, trim, doors, sashes, boxes, etc. As the lumber advances through consecutive operations the machinery becomes more and more specialized, and many ingenious and involved machines, as those for making barrels, wheels, chairs, etc., are required. A general division of wood-working tools may be made into those operating (*a*) by scission or cleaving, such as saws; (*b*) by paring, as the planers, surfacers, matchers; (*c*) by combining the two foregoing principles, as in the case of lathes, boring machines, mortisers, and gaining machines; (*d*) by abrading or grinding, as sandpapering and similar finishing machines.

The saws are discussed under that head, but may briefly be considered here. Rather than have the forest lumber cut by the log saws, it is preferable, for economy, to have it squared and then resawed at the mill. Vertical reciprocating saws, circular resaws, and band resaws are employed. The latter saws are finer than the log saws and consequently avoid unnecessary waste. They cut the lumber into large planks or boards. To reduce the lumber to the desired dimensions circular, ripping, and cross-cut saws are used. The former have fewer and larger teeth, which cut upon their front edges, while the latter cut upon their sides. In using the ripping saw the boards have to be fed to the saw, but with the cross-cut saw it is possible to move the saw to the work. Many forms of circular saws are devised by varying the arrangement of the carriage, and shingles, clapboards, etc., more or less irregular, can be prepared. For curved and scroll sawing a narrow bandsaw is employed, though there are reciprocating jig saws suitable for this purpose.

The wood must next be surfaced, or smoothed and planed, to the required dimensions. In the surfacer this is done by a series of revolving cutters, which pare off shavings, leaving the board or beam smooth. In many surfacers all four sides of the board are operated on at once, in some cases the tongue and groove being cut in the edges. The number of knives in each cutter may vary from three to nine, and the machines are fitted for handling various sizes of stock. Instead of plane surfacers machines may be devised for cutting curved surfaces to a given pattern, as in the case of moldings, while there are numerous cutting machines which carry cutting tools on a vertical spindle, for scrollwork, carving, paneling, etc. Of considerable importance are the dovetailing machines, which may consist of either a gang of chisels or of a cutter similar to that of the carving machine, which cuts out the tongues and spaces, automatically spacing them, assuring an exact fit.

Lathes are important and much-used tools. In them a piece of wood is rapidly revolved while a chisel or other tool is held against it, so that the wood is removed by a combined action which involves both the severing of the fibres and paring. Many forms of simple wood-turning lathe exist, and this, operated by a skillful mechanic, is capable of a wide range of work. By using various automatic attachments the output of the lathe can be greatly increased, especially where a number of similar pieces are to be constructed. In the simplest of these processes the cutting tool follows a pattern, which regulates the depth of cut and consequently the radius of the turned object. Then there are lathes where the blank and a pattern are revolved and rotary cutters carve out of the former an exact facsimile.

There are also tenoning machines to make tenon joints, and gaining machines, which cut grooves across the surface of timber, while to make mortises to receive the tenons there are machines, some of which have rotary cutters and others reciprocating chisels. Of boring machines there are numerous designs, arranged specifically for a given class of work. Abrasive machines include sandpapering machines, where an endless belt, on which sand or emery has been fixed, is in contact with the work, and drum machines, where the work is a large flat surface.

With such tools many varieties of work can be performed, and where a large number of pieces of a particular class of work are desired, a special machine is constructed which turns them out more or less automatically. It is in this direction that the greatest improvements in wood-working machines are being made. Their efficiency, as well as their capability for rapid work, is also being constantly augmented. See BORING TOOLS AND MACHINERY; BUILDING; SAW; SAW MILL.

WOODWORTH, wụd'wŭrth, ROBERT SESSIONS (1869–). An American psychologist and physiologist, born at Belchertown, Mass. He graduated at Amherst in 1891, and studied at Harvard (A.M., 1897), at Columbia (Ph.D., 1899), and at the universities of Edinburgh, Liverpool, and Bonn. He was an assistant in physiology at the Harvard Medical School (1897–98), an instructor in physiology at the University and Bellevue Hospital Medical College, New York (1899–1902), and demonstrator in physiology at the University of Liverpool (1902–03). Thenceforth a member of the faculty of Columbia University, he rose to be professor of psychology in 1909. In 1914 he was president of the American Psychological Association. Woodworth became editor of the *Archives of Psychology*. His publications include: *The Accuracy of Voluntary Movement* (1899); *Elements of Physiological Psychology* (1911), with G. T. Ladd; *The Care of the Body* (1912).

WOODWORTH, SAMUEL (1785–1842). An American journalist and poet, born at Scituate, Mass. After an apprenticeship in a printing office, he edited and printed a paper at New Haven, Conn., in 1807, and in 1809 removed to New York, where he conducted *The War* (1813–14), a weekly paper, during the War of 1812. He aided George P. Morris in 1823 in founding the New York *Mirror*. During his life he published a good deal of verse, as well as operettas and a curious romance of the War of 1812, *Champions of Freedom* (1816). His complete poetical works were edited (2 vols., 1861), by his son, with a *Memoir* by George P. Morris. He is remembered almost wholly for his song "The Old Oaken Bucket" (1817).

WOODY NIGHTSHADE. See BITTERSWEET.

WOOL (AS. *wull, wul,* Goth. *wulla,* OHG. *wolla,* Ger. *Wolle,* wool; connected with Lat. *villus, vellus,* OChurch Slav. *vlŭna,* Lith. *vilna,* Skt. *ūrnā,* wool, from *var,* to cover). The soft hairy covering of sheep and several allied animals; next to cotton the most extensively used of all fibres. Its history dates back to the earliest times of which we have any record, and as civilization has progressed its uses and applications have steadily increased.

Wool Production and Consumption. The chief wool-producing countries of the world are: Argentina, Uruguay, and other South American countries; Australia and New Zealand; the United States; Russia, Great Britain and Ireland, France, Spain, South Africa, and India. The world's clip for 1915 was estimated by the National Association of Wool Manufacturers at 2,872,000,000 pounds. The consumption of wool in the United States has always been relatively large. Prior to the beginning of the factory era it did not average more than three pounds per capita of population annually, and in the middle of the last century it amounted to four pounds, but as wealth increased and the uses of wool enlarged, the consumption increased to about eight

pounds per capita in 1900. In 1915 the wool clip of the United States was estimated at 290,192,000 pounds, the product of about 50,000,000 sheep. About two-thirds of the wool used by American mills is supplied by domestic flocks. The imported wools largely used for blankets and carpets are mostly of lower quality. The principal wool-producing States are Montana, Wyoming, New Mexico, Idaho, Oregon, Ohio, Utah, California, Texas, Colorado, and Michigan, in the order named.

Sheep raising has preceded civilization in nearly all parts of the world. Before agriculture was practiced to any extent, it was almost universal. With the progress of civilization, the use of wool for making cloth led to the improvement of the fleece by selection and breeding. The Romans greatly increased the fineness of the fleece, and after the Roman conquest of the Iberian Peninsula Roman sheep were introduced into Spain, where they so greatly improved the native flocks that even during Roman supremacy Spanish wool led in the world's markets, a prestige held for many centuries. Through judicious crossing of the fine-wooled Merino with high-grade long-wooled breeds, the highest type of wool fibre has been developed, combining suppleness, fineness, and other desirable qualities with lustre and length of staple. It is suitable for combing as well as carding.

Wool may be considered a product of cultivation, or domestication, as no wild animals are known which resemble the wool-bearing sheep; and few natural products have been more modified and diversified by man to meet his various needs. This is very strikingly shown by a comparison of the coarse heavy covering of the argali or musmon (the supposed progenitors of the sheep), with the fine wool of the Merino or the long, lustrous fleece of the Leicester. These animals in the natural state were covered with coarse hair or fur, among which close to the skin is a softer hair or wool. Under the influence of good care and feed, and protection from the inclemencies of the weather, the longer coarse hair largely disappeared, and only the softer, shorter hair or wool remained, a phenomenon said to be observed when the argali is brought under domestication.

Characteristics and Properties. Wool is a living appendage of the skin, produced by increased epidermal cells. The difference between wool and hair is one of degree rather than of kind, because all wool-bearing animals have the tendency when neglected to produce hair rather than wool, and because numerous intermediate structural stages exist between the two extremes. While wool is commonly characterized by its fine, soft, curly nature, the true distinction between it and hair lies in its covering of pointed scales or plates, attached to the filament at their bases and overlapping much like fish scales. This structure, which is readily seen with a microscope, is perceptible to the touch by its harsh, rough feeling when the fibre is drawn through the fingers from the tip to the root. The number of these scales bears a fairly direct relation to fineness of the fibre. The curliness of wool is due to a spiral structure of the filaments, and although all wool is not curly or wavy, curliness is one of its recognized and important characteristics. There also appears to be a relation between fineness and curliness. Owing to the relation which these three characteristics bear to each other, curliness, or the number of waves to the inch, which can be seen with the naked eye, is one of the factors noted in judging wool. The waviness and scaliness are utilized in making felt (q.v.) and also in thread making. A pound of the finest wool will yield nearly 100 miles of thread. In spinning, the filaments interlock by their scales, and the curl of the fibre prevents the threads untwisting and helps to hold them together. These valuable qualities vary greatly in different wools, some being adapted to carding for cloth, and others to combing for worsteds. It is upon minute points of difference that the value of various grades of wool chiefly depends. The lustre also differs greatly and to a certain extent is a breed characteristic, the wool of the Lincoln and the best Leicester sheep being much more lustrous than that of the shorter wools or the fine Merino fleece. The length of staple, which is made a basis of general classification, is largely a constitutional or breed characteristic, the staple being from 1 to 2 inches long in the finest Merinos, 8 inches or more in the Lincolns, and reaching 12 and even 15 inches in some combing wools, the length of staple suggesting the grouping of sheep into short-wools, middle-wools, and long-wools. The fine felting wools have a short staple, as a rule, and are used for carding or yarn purposes, while the longer, more lustrous, and less wavy ones are better suited to combing and worsteds.

Another valuable characteristic of wool is its elasticity, which gives it a softness to the touch which is retained in the manufactured goods. Closely related to this is the strength of fibre; a dead or inferior wool will break instead of stretching when strained. Delicate machines have been constructed for testing the strength and elasticity of fibre, for both practical and scientific purposes. Bowman found that wool fibre is fully one-fourth stronger than cotton, the strength being proportional to the diameter. Great variation, however, exists in the strength of fibres from different wools of the same class of sheep.

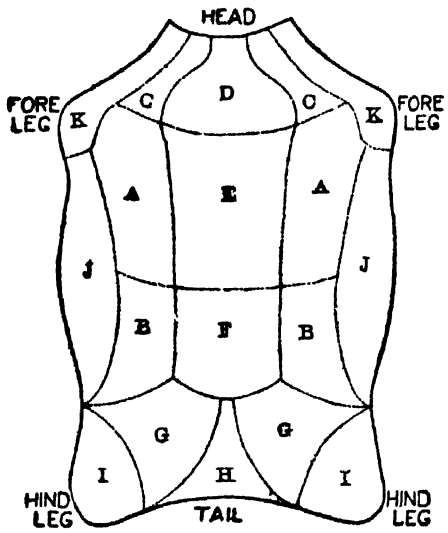
All wool in its natural state contains fatty or greasy matter called yolk or suint, secreted by the skin and covering the individual hairs. This serves to lubricate the fibres and prevent their matting together, and also protects the fleece from injury. It differs in quantity and exact character with various breeds and is believed to render the wool soft and pliable. The fats and the potash salts which the yolk contains form a sort of natural soap. In manufacturing wool, the yolk, which is partly soluble in water, must be removed so as to increase the felting tendency and the ability of the wool to take dye. White is the most common color of cleaned sheep wool and is generally preferred for manufacturing; but the black, fawn, cream, and gray shades produced by various breeds are utilized in their natural colors for certain kinds of clothing. Wool is soluble in a hot solution of caustic soda, while cotton is not. This fact is taken advantage of in testing woolen goods for adulteration with cotton, as when a sample of the goods is boiled with the reagent any cotton present will remain undissolved.

Variation in Properties. The wool from different parts of the same animal differs greatly in length of fibre, fineness, and structure. As a rule, the best is obtained from the shoulders and sides. That from the fore part is irregular and likely to be filled with burrs, while the loin wool is shorter and coarser, that on the hind

quarters still more, and that from the underside of the throat and the belly is likely to be short, worn, and dirty. As the wool is finer on the shoulders, it is likewise superior in soundness of fibre, softness, curl, and evenness of length. Purity of blood, good general management, and uniform feeding tend towards greater uniformity of the fibre grown on different parts of the body, whereas a period of insufficient feeding or of ill health leaves a weaker and less healthy fibre at the point represented by it. Such wool is usually noticeably deficient in yolk. The importance of breeding, climate, and feeding is evidenced by the changes which occur in the wool when sheep of a given breed are removed from one region or district to another quite different. Coleman states that wool in certain districts of Yorkshire brings a higher price than that of other localities, the advantage being probably due to favorable conditions of soil and climate. On the other hand, the ability of man to counteract unfavorable conditions of a particular section is testified to by Lastereye (as quoted by Darwin), who cites the preservation of the Spanish Merino sheep in their utmost purity under such varying conditions as are found at the Cape of Good Hope, in the marshes of Holland, and under the rigorous climate of Sweden, and contends that "fine-wool sheep may be kept wherever industrious men and intelligent breeders exist."

Kinds and Grades. The wool clipped from lambs, called in England "hog wool," differs from the wether wool, or subsequent clippings, in the staple being somewhat pointed, softer, and more wavy or curly. Lamb's wool is more valuable than wether's wool, and can be used for purposes to which the later clippings are not suited. Fleece wool, or that clipped from the live animals, is marketed as (1) unwashed, or in the grease, i.e., as shorn from the sheep with the yolk and dirt adhering to it; (2) washed, i.e., washed on the sheep in cold water, which removes a part of the yolk and dirt; and (3) scoured, or cleaned, ready for manufacture. By far the larger part of the wool produced in the United States, and especially west of the Mississippi River, is marketed unwashed, which is generally preferred by wool buyers. Skirted is a term applied to fleeces from which the head, belly, and breech wool (the inferior parts) have been removed. Pulled wool, also called skin wool, generally an inferior grade, comes from the pelts of sheep which have been slaughtered or have died from disease or exposure. The wool is loosened by application of a thin lime paste to the back of the skin, or by sweating the wet skins in piles. Shoddy is wool which has been previously manufactured, torn apart, and prepared for use again.

The value of wool and the use to which it is put is influenced by the length and the fineness of the fibre. The three main classes of wool on the basis of the staple are: (1) carding or clothing wools, or those of the Merino type, in which felting qualities are desired; (2) combing wools, in which length of staple is required and felting qualities not desired, used for hard-spun nonfelting worsteds; and (3) miscellaneous, sometimes called carpet or blanket wools, long, strong, coarse wools, used for carpets, blankets, and coarse clothing. The combing wools bring several cents a pound more than the carding or clothing wools. Wool is graded according to fineness, as judged by the feel, which is highly developed in the graders. The clothing wools are commonly classified as XX, X, the X quality being supposedly the wool from sheep containing three-fourths Merino blood. Formerly, two higher grades, Picklock and XXX, were recognized, derived from Silesian Merinos or their crosses. The combing wools, often called Delaines, were formerly derived from the English mutton breeds, but machinery has been adapted for combing the Merino carding or felting wools, which have been lengthened by breeding and selection. The clothing wool used in the United States, aside from home production, is derived mainly from Australia, South America, and South Africa. The imported combing wool comes mainly from Great Britain, although much comes from New Zealand, Argentina, and Canada. The coarse carpet wools are the product of neglected flocks and unskilled breeding throughout the world.



In judging wool on the sheep's back, account is taken of strength of fibre, fineness, curl, thickness, and closure of the fleece. When the yolk is deficient the fibres become dry and brittle, and the fleece is likely to be injured otherwise. The waves of the curl should be uniform and numerous throughout the length of the fibre. The thickness of the fleece, depending upon the closeness of the fibres upon the skin, varies greatly with the breed, and also with the individual to some extent. A fairly thick and well-closed fleece is desirable. The closure is caused by the matting together of the ends of the fibres by the yolk. This gathers dust and forms a dirty coating, rendering the fleece impervious to dust and dirt, which would be injurious.

As a result of the tendency towards combing wools, both fine and coarse, Merino and English worsted wools now largely predominate in the domestic supply. Since all the improved breeds of the world have been introduced and acclimated in the United States, the range of grades of wool which have been successfully produced is very great. Breeding, care, and feeding have more than doubled the average weight of the fleece, the present average for all classes being between six and seven pounds. Among well-tended flocks of mutton breeds, which produce a heavier fleece than the fine-wooled breeds, the yield amounts to 8, 10, and more pounds per head, in individual cases reaching 15 or even 20 pounds. In most parts of the United States shearing is done in the spring; in Texas, New Mexico, Arizona, and southern California, where climatic conditions interfere to prevent evenness of fibre, it is done twice, the winter fleece being stronger and of greater value than that grown in summer. Since these clips do not work well together, their mixture reduces both qualities to a low level.

Defects. The most common defect of wool is break, which is due to exposure, insufficient feeding, etc. In this the fibre contains weak spots which cause it to break when stretched. It destroys the value of wool for combing purposes. Stripy wool is inelastic, harsh, and lacking in curl, and is used only to make inferior goods. It affects the fleece in the most valuable part—the sides and shoulders. Toppiness is a sort of uneven felting of the fibres at the top of the fleece, so that the closure is not perfect. It is usually the result of uneven growth and causes waste in carding. Felted wool is deficient in yolk, and as a result becomes matted together in bunches, causing loss in combing and carding. It is attributed usually to poor health. Broad-topped wool is a serious defect, in which

the fibres split down from the top, interlace and mat so as to appear even on the surface, which is divided into broad masses called tops. These cannot be parted without tearing. Hemp, or kemp, consists of a mixture of short, coarse white hairs and wool fibres, occurring chiefly on the parts where the wool is lightest and shortest, but may occur all through the fleece if the sheep has a tendency to produce hemp. Since the hairs do not take dye and cannot be sorted out, they lessen the value of the fleece fully one-half for the manufacture of fine grades of goods. In cloudy wool the fibres adhere throughout their length, but not so much as to be felty. This injures the wool for combing, causing waste, but is not so objectionable in carding wools.

Wool Sorting. The differences in the quality of wool, and especially that from different parts of the fleece, render sorting a necessity. In shearing, the fleece from each sheep sticks together as a mat, and is tied up separately. In sorting, the different parts of the fleece representing separate qualities are torn off by hand. An idea of the location of the various qualities of wool is given by the accompanying diagram of a Leicester lamb's fleece, taken from Bowman's *Structure of the Wool Fibre*. The same relative positions hold good in all kinds of fleeces.

FLEECE OF LEICESTER WOOL.

The finest and most even growth of wool is found at *A*, on the shoulders. In some fleeces this quality extends farther up the back (*E*) and towards the tail (*B* and *F*) than in others, and the quality of the wool at *B* is not very much inferior, although rather shorter and coarser. These two qualities would be graded in the woolen trade as picklock and prime or choice, while the wool from the portion indicated by *C* is frequently finer but shorter than *A* or *B* and apt to contain more irregular or colored hairs. When free from these defects *C* is graded as super in quality. The portions *D* and *E* shade into those on each side of them, and as they form the top of the neck and shoulder, the fibre is not as deep or close as at *A* or *C*. The portion over the loin (*F*) resembles *B*, into which it shades, and for many purposes, especially for spinning down, *A*, *B*, *E*, and *F* are frequently used together as one quality. Back of *F*, on the flanks, the wool becomes long and coarse, the best being found in the portions marked *G*. The wool at *H* and *I* is the coarsest part of the fleece, growing in large locks with long coarse hairs. It is often termed breach wool and can only be used for very coarse yarns spinning low numbers. Beyond the extremities of *I* there is often a still lower quality called tail or cow-tail, which is coarse and hairy, and can only be used for the very lowest numbers. The differences in quality of fibre from the same fleece are so great that a large number of sortings can be made, depending upon the character of the fleece and the purposes for which the wool is to be used. The names applied to the different qualities of wool vary in different localities, and even among different manufacturers, and this lack of uniform nomenclature is a source of no little confusion.

ESTIMATE OF PRODUCTION OF WOOL IN THE UNITED STATES FOR 1915

(United States Department of Agriculture)

Weight given in thousands of pounds

Wyoming	29,040
Montana	28,682
New Mexico	18,620
Oregon	15,600
Idaho	15,286
Ohio	14,350
Utah	13,320
California	11,590
Texas	9,280
Michigan	8,073
Colorado	7,500
Missouri	7,035
Arizona	5,985
Nevada	5,890
Iowa	5,400
Indiana	4,920
Pennsylvania	4,030
Illinois	3,975
Wisconsin	3,960
Washington	3,818
Kentucky	3,552
South Dakota	3,500
New York	3,478
West Virginia	3,405
Other States	58,488
Total	288,777

Other Wools. Although the typical wool is produced by sheep, and it is from that animal that much the larger part of the wool supply is obtained, there are several other animals which produce so-called wool for industrial purposes. Among these are several species of goats whose hair can be greatly improved by breeding and management, furnishing a long, fine, silky material from which beautiful textile fabrics are made. No cultivation, however, has yet prevented the growth of the outer hair on goats, as has been done in the case of sheep, or changed the undergrowth of fine hair into true wool. The alpaca, closely related to or a variety of the llama of South America, yields a fibre known as alpaca (q.v.). The Angora goat (see GOAT), which yields mohair (q.v.), marks a distinct step towards true wool. The scales are less numerous than in the alpaca, but are more decided and exhibit a more definite edge. The fibres are very fine and wavy, lustrous, pure transparent white, and often 12 inches long, in some cases 18 or 20 inches. The diameter varies from $\frac{1}{850}$ to $\frac{1}{1500}$ of an inch. The annual product of mohair in the United States had reached nearly 4,000,000 pounds in 1910. Closely allied to mohair is the fine cashmere wool of India, which is the product of the Cashmere goat, common in the Himalayan mountains about Tibet. The hair is even longer than that of the Angora goat, but is not as curly. The surface of the fibres is not as brilliant as mohair, and the scales are more numerous but less distinct. Only the finest parts of the fleece are used, the yield from a single goat being

rarely more than 3 or 4 ounces. Cashmere wool is said to be the most costly of all the wools. The fine soft hair of the camel approximates true wool in its structure, and should be mentioned in this connection.

WOOL, JOHN ELLIS (1788–1869). An American soldier, born at Newburgh, N. Y. He began the study of law, but on the outbreak of the War of 1812 entered the United States Army, and in April, 1812, became captain in the Thirteenth United States Infantry. He was badly wounded in the battle of Queenstown Heights, and as a reward for his gallantry was in April, 1813, promoted major of the Twenty-ninth Infantry. At Plattsburgh in September, 1814, he again distinguished himself, and in December was promoted to the rank of lieutenant colonel. In 1821 he became inspector general of the army with the rank of colonel. In 1841 he became a brigadier general. When the Mexican War began he prepared troops for the field and sent thither about 12,000. He led the Army of the Centre into Chihuahua; then joined General Taylor, and at Buena Vista, as second in command, selected the American position. For his services he was brevetted major general. By his timely measures he secured Fortress Monroe, and as commander of the Department of Virginia, he occupied Norfolk and Portsmouth in May, 1862. In the same month he was made a major general in the Regular Army, and retired in August of the following year.

WOOL, MINERAL; MINERAL COTTON; SILICATE COTTON; or SLAG WOOL. A mechanical variation of slag. It was originally formed accidentally and, for a long time, as a by-product in smelting operations. Its value as a heat insulator, however, became apparent, and now means are taken to manufacture it on a large scale. It is essentially a fibrous form of blast-furnace slag, usually the product of iron-smelting operations. Its chemical composition is variable, according to the conditions under which the iron is melted, but is not important as affecting its qualities. It is said to have been first made in Wales in 1840, but its injurious effect upon workmen—cutting the lungs of those who breathed the fine particles—stopped its manufacture. Its manufacture was later taken up in Germany and other countries, but under safer conditions, by means of which the thread slag is not allowed to escape into the air, but is confined in long flues and settling chambers. As now manufactured, a jet of steam or hot air is turned upon the flowing slag, resulting in a scattering of the slag and a drawing out into threads or fibres. The material is caught in chambers especially prepared to settle it. The product may be white, or colored, depending on the composition of the slag. Its fire-resisting properties, together with its value as a heat and sound insulator, make it useful to architects in all kinds of buildings.

WOOL AND WORSTED MANUFACTURES. The development of the art of spinning and weaving took place so early in the history of civilization that no records of its beginning are preserved, and which of the textile fibres was used first for this purpose is unknown. But certainly the art of producing woven woolen fabrics was practiced by many different peoples at a very early period. At the time of Alexander's expedition to India the natives of that region wore shawls of great beauty. The Greeks learned many processes of woolen manufacture from the Egyptians; the Romans from the Greeks; and from the Romans the knowledge generally passed to the Occidental world. Among the ancients, the method of manufacture was, after thoroughly cleansing the wool, to sort, card, and spin the material by hand. The loom for the weaving was remarkably simple, even crude, but under the delicate manipulation of dexterous fingers, skilled operators produced fabrics that have never been excelled in fineness of texture or delicacy of construction, even at this later day. (See WEAVING and LOOM.) Woolen garments were worn by the Romans at a very early period. It is probable that the early lessons the ancient Britons received in the art were derived immediately after the Roman conquest, and woolen manufacture as carried on in England was at the outset but a repetition, and afterward an elaboration and improvement on the methods previously known. It is generally supposed that certain Flemish weavers went to England in the time of William the Conqueror, and obtaining the royal patronage, established the first manufactories of woolen goods. At various periods in the reigns of succeeding monarchs, other Flemish weavers were imported, and established at different points in the kingdom. Henry II established guilds of weavers in his reign, and the exclusive privilege of exporting woolen cloth was by him granted to the city of London. In the thirteenth century Spain produced her own cloth, and the beauty of her fabrics was celebrated far and wide. Italy followed, and for a time employed processes apparently superior to any others in use.

For many centuries the manufacture of wool was carried on as a household industry, although in occasional instances a large number of looms were gathered together under one roof and their products controlled by a single individual, as in the modern factory. The fulling of the woven fabrics was at an early date developed into a separate business, and here and there on convenient water powers fulling mills sprang up. The use of the teasel burr for raising the nap on the fulled fabric was of early origin. The distinction between ordinary woolen fabrics and worsteds made from combed wool is mentioned in the earliest records of European wool manufacture. The combing of the wool was done by hand till well into the nineteenth century and the wool combers formed an important industrial class, but it was not till the latter half of the nineteenth century that all the processes connected with the production of a woolen or worsted thread were grouped together in one establishment.

History of the Wool Industry in the

United States. In the United States, as in Europe, the development of the textile mill began with the introduction of the neighborhood fulling mill. Next came the public carding mill, where the wool was converted into rolls ready for the spinning wheel. Previous to its introduction carding had been done by a couple of hand cards, which were small, oblong boards, covered with leather filled with points of fine wire. By manipulating the wool between these teeth the fibre was opened up. (See CARDING.) The first wool-carding machine was put in operation in Pittsfield, Mass., in 1790. The same year, at Newbury, Mass., the first successful woolen mill was put in operation. By 1810 several woolen mills were in operation and the amount of homespun was appreciably lessening, and the value of woolen cloth annually produced as a household industry declined so rapidly that not enough cloth was produced in the factories to make up the deficiency, and large quantities were imported. The value of the factory output from 1820 to 1850 was as follows: In 1820, $4,413,068; in 1830, $14,528,166; in 1840, $20,696,999; in 1850, $49,636,881. The value of imported woolen goods was: In 1821, $7,238,954; in 1831, $13,197,364; in 1840, $10,808,485; in 1850, $19,620,619. By the close of the first half of the nineteenth century all the great improvements which had been invented in textile machinery had been adapted to the woolen industry, and during the last half of the century the development of the industry, except as disturbed by war or other political condition, was more steady and natural. The invention of the Crompton loom in 1837 and its successive improvements were of immense importance to the woolen industry. In 1873 the open shed fancy cassimere loom of L. J. Knowles enlarged still more the field of weaving possibilities and facilitated the manufacture of many refractory patterns. Since 1865 automatic wool-scouring machines have been introduced, taking the place of hand washing, and during the same period the carbonizing process of freeing wool from vegetable fibre, such as cotton, to procure a grade of shoddy, has come into use. The art of dyeing also advanced. In the United States the woolen industry has been subject to great fluctuations, due to political events, such as the Civil War, which suddenly created an enormous demand for a certain class of woolen goods, and to tariff legislation. Statistics showing the present status of the industry are given at the close of the article.

Structure of the Wool Fibre. The wool of the sheep differs from all other fibres, animal or vegetable, on account of its great felting power. (See WOOL.) This is due to its overlapping epidermal scales, which make the individual hairs, when brought in contact at an angle, tend to mat together. Another striking characteristic of wool is the curliness of the fibre. The transformation of wool into cloth is divided into two distinct branches: the manufacture of woolens and the manufacture of worsteds. In making woolen fabrics or cloths the natural characteristics of the fibre—its curliness and felting power—are developed by the manufacturing processes and produce a soft cloth with a nap and with the fibres so matted together that the weave is but slightly visible. In worsted manufacture the aim is to produce a smooth, wiry yarn, more like that of the other textile fibres, and to this end the fibres are straightened, twisted hard, and the shorter projecting ones which would form a nap combed out. This produces a cloth in which the weave is evident and great variety of design in weaving is possible.

After being sorted, the wool is subjected to a process of beating, not only for the purpose of eliminating the dust and other impurities, but the procedure has the effect of disposing the staple to open and thus render the material softer and less resisting when washed and worked over in the various machines. The wool must be thoroughly dry, else many difficulties will be encountered. If the beating process be well carried out, it will not only dispose of many impurities, but will invariably treble and quadruple the volume of the fibre.

Scouring. The washing received by the live sheep before the removal of the fleece is not enough for the purposes of the manufacturer. There is a subsequent cleansing which could by no possibility be given while the material was a part of the animal. The necessity of thorough scouring is due not only to the dirt adhering to the wool, but also to the natural secretion of the oil and sweat glands, called yolk or suint, which is in the wool. This oily substance is usually reclaimed from the wash water and sold under the commercial name of degras. From it lanolin and potassium salts are extracted. Soft water is required for washing, because the insoluble lime soap formed in dissolving soap in hard water is deposited on the wool fibre and becomes inextricably entangled. Wool washed with hard water is always harsh to the touch; it takes dyes unevenly and is not readily cleansed. Wool is scoured with a dilute soap solution, with or without soda or potash according to the kind of wool, and heated not above 120° F. The wool is passed by machinery from one tub to another, in each of which the cleansing operation is carried a step further until it emerges from the last tub, clean. It is dried in automatic driers, having been first dyed or bleached.

The wool having been dried is still found to retain many objectionable features that are not disposed of in the previous manipulations. These are bunches, matted locks, dust, sand, and other impurities, all of which must be removed before the article can go towards final manufacture. The process of removing these objectionable features is termed willowing or willeying (the latter term being given in honor of the inventor, Willey). It is accomplished by a machine consisting of a large drum and three small cylinders mounted on an inclosed frame. Powerful hooked teeth are geared on a drum which rotates with great rapidity, and the matted sections of wool, being fed into the drum, pass on to the spikes of the lesser cylinders; the matted locks are gently torn asunder, and the whole wool is delivered in a light, free, and disentangled condition. In various of the South American products there is a difficulty which requires additional care. There are little burrs and small adherent seeds which insist on remaining in the wool, no matter what the processes previously described may have accomplished. One method of eliminating them is chemical; another mechanical. In the chemical process, technically known as carbonization, the organic matter in the wool is decomposed by the use of chloride of aluminium, chloride of magnesium, weak sulphuric acid, or acid vapor, after which it is subjected to a baking process. The wool is now cooled and the carbon dusted out. Finally it is washed in a strong soda solution to remove the acids. This process is now

used not only to remove the vegetable matter from new wool, but also the cotton from the union shoddy. The operation of burring is sometimes performed by mechanical burr pickers, which crush the brittle burrs under powerful, closely set rollers, without injury to the more elastic and flexible wool. The pieces are then shaken out.

Mixing. This is an operation of great importance designed to secure uniform quality of yarn. It is accomplished by spreading the wool from different lots or from two or more qualities or colors into as many thin layers as possible, one on top of another. The greater the amount of wool mixed and the more thorough the mixing, the better will be the quality of the cloth produced. If other materials are to be added to the wool, as silk, cotton, or shoddy, the blending of these with the wool is performed at this stage.

Oiling. The wool having been thoroughly cleansed is more or less harsh and wiry to the touch, owing to the removal of its natural lubricant, the yolk. To restore its natural pliancy it is, while being mixed, slightly oiled, either by hand or machine. Oiling also imparts a certain adhesiveness to the fibres, useful in the subsequent operations. The lubricant usually employed is olive oil or emulsions of mineral oil.

Difference between Woolen and Worsted Process. The preliminary operations thus far described are common to both woolen and worsted manufacture. But at this point the two branches separate. In making woolen yarn the wool is simply carded and loosely spun; in making worsted thread the wool is combed and the thread is twisted until it becomes very hard. The aim in making a woolen thread is to criss-cross the fibres; in a worsted thread, to lay them parallel. In making woolen goods a short-stapled wool may be used and a fibre having good felting qualities is preferred. The opposite characteristics are sought in wool to be used in the manufacture of worsted. During the process of combing, described later on, the short fibres, known as *noils*, are pulled out and cast aside to be utilized in the woolen mill.

Returning to the process of woolen as distinguished from worsted manufacture, the wool, now oiled and thoroughly mixed, is next passed through a wool picker, the object of which is to loosen up the fibres. The wool is then passed through a series of carding machines similar to those used in the manufacture of cotton. See COTTON and SPINNING.

Carding. This process produces a thread whose fibres lie loosely projecting from the main thread in little ends which form the nap of the finished cloth. The condensing machine is attached to the cards, and its object, as the name implies, is to condense or reduce into compact slivers the sheet of fibres delivered by the last main cylinder of the carding engine. The condensed fibre is simultaneously wound on spools, and is ready to be passed on to the spinning department, where it is converted into a finished thread ready to be woven into cloth. See SPINNING.

Worsted Manufacture. In making a worsted thread, if a comparatively short or medium staple fibre is used, the wool is first carded as in woolen manufacture. But if a very long staple wool is used, having a fibre 5 inches or more long, the wool is not carded at all, because the fibre would be broken by the cylinder engaging it before it was released from the preceding cylinder. There is still a third class of worsted yarns, such as are required for carpet weaving, where a soft open thread is desired, which are not combed at all, but are carded, drawn, and spun. With the exception of this third class of worsted yarns, the first distinctive operation, after the wool has received the preliminary treatment already described, is gilling. The object of gilling is to level the fibres and make them parallel. The machine by which this is accomplished consists of a pair of rollers which catch the wool, and of a second pair of rollers, which draw it forward over heavy steel bars, called fallers, covered with projecting steel pins. The machines are generally used in sets, each successive machine having the pins on the rollers finer and more closely set than the preceding. The wool is fed to the rollers; it is caught by the rows of steel pins which rise in close and constant succession and penetrate the wool presented to them, traveling forward with it to the second pair of rollers, which in their turn catch the fibre and draw it away. The fallers are so called because when they accomplish their journey, they, through the agency of an endless screw mechanism, fall down, and by the action of other endless screws are returned to their original position. There is thus a continuous line of fallers traveling between the feed rollers and the back rollers, and there is a steady and constant drawing of wool away from the front rollers and through the teeth of the fallers. Five or six of these machines usually constitute a set. They are all constructed on the same principle, but with the pins finer and more closely studded as the fibre travels onward. In the first three machines it is usual to have the wool delivered in the form of a broad lap, but in the later machines, or gill boxes, as they are called, the product is condensed into a sliver and is received in large cylindrical cans. Six of these cans are brought to the front of the next gilling machine, and the six slivers are fed in, and passing through are drawn into and delivered as one. The operation is repeated three or four times, and the fibres are brought even with each other and a very level and uniform thread produced. It is usual to interpose a combing machine between the preparatory and the final gilling.

After the worsted has been gilled and combed it is put through drawing machines, much like those used in cotton spinning. It is then spun, the worsted thread being twisted much harder in spinning than woolen thread. The spun yarn is now reeled, warped, beamed, sized, and otherwise prepared for weaving.

For the process of weaving, the articles on WEAVING and LOOM should be consulted. The woven fabric requires several supplementary operations. The character and appearance of woolen fabrics are more altered by these finishing operations than any other material. Indeed, different fabrics may owe their distinctive peculiarities wholly to their finish, the processes of manipulation up to this point being exactly identical. In woolen goods, owing to the nap and its felting power, patterning is much less effective than in the weaving of worsted, but a greater variety of effects due to the character of the finish is possible. Among the principal varieties of finish of woolen goods are the dress-faced or doeskin finish, the velvet or erect pile finish, the Scotch or Melton finish, and the bare-faced finish. In the dress-face finish the nap

is raised and spread in one direction over the face of the cloth so as to hide completely the warp and weft threads. To this class belong broadcloths, beavers, and the other woolen fabrics having a nap. The velvet finish is another form of finish with a heavy nap. In overcoatings and similar materials the nap is formed in little curls on the outer surface of the goods. In other goods it is left standing out like velvet.

to give them solidity and strength. Tweeds have still less. The proper stage of beating or rolling having been reached, the soapsuds is gradually supplanted with pure water, tepid at first, but each new supply being cooler, until the fabric is finally worked in thoroughly pure and cold water.

On being taken from the machine the cloth is stretched uniformly in all directions by hooks

* Estimate of the National Association of Wool Manufacturers.

In the bare-face finish the nap is sheared off completely. While the process of finishing the woven fabric differs according to the character of the desired finish, the general method is the same. The first step is known as fulling or milling. The operation of fulling or milling is to saturate the cloth with hot soap and water, when it is worked either by the fulling stocks or the fulling machine, or pressed and rubbed between rollers in the more modern milling machine. The more the cloth is soaked and beaten, the more it will shrink, and the operation can

on a frame, that it may dry without wrinkle or curl. At this stage the operation of gigging or teasling is entered upon. This is the raising of the pile or nap by the agency of the cone-like spikehead of the teasel, a plant of the genus *Dipsacus*. The head is covered with imbricated scales which end in sharp recurved hooks of great elasticity, but stiff enough to do the work required. The work was formerly done by hand manipulation, but is now accomplished by the gigging machine, or gig mill, where the teasels are arranged on the face of revolving

* Given in the 1915 Bulletin of the National Association of Wool Manufacturers as the latest available figures.

be carried on till the cloth is reduced to half its original length and breadth. The degree of fulling is a distinctive feature of many varieties of goods. In broadcloths, and all kinds of nap-finished goods, the milling is carried on until the fibres become densely matted, and the appearance of weaving is entirely obliterated. Venetian cloths and diagonals, to which no pile finish is given, are fulled or milled only enough

cylinders before which the fabric is made to pass. By this operation the loose ends of the wool are drawn to the surface, thereby forming the nap. Wire teasels are sometimes used, but nature's creation of the vegetable teasel is regarded as having never been improved upon.

The pile is now trimmed to produce uniform surface. Formerly the work was done by hand with huge shears, but now a machine containing

a cylinder armed with a series of helical knives, and made to revolve with great rapidity, is employed. The machine was invented by Leonardo da Vinci, but not brought into practical use until 400 years later.

The final process is the brushing of the cloth, winding it tightly around a huge drum, and immersing it in hot water. It remains in that condition for three or four hours, when it is unwound, the ends reversed and rewound, and again the cloth is subjected to the hot-water process. The closing act in its manufacture is the pressing in a hydraulic press, during which time steam is forced through it, this last proceeding adding to the solidity and smoothness of the cloth, and developing the lustre characteristic of a well-finished fabric.

ing factories for hosiery and knit goods, shoddy mills, and wool-scouring establishments, the number of woolen mills in 1910 was 1397, as against 1675 in 1850. These figures, however, simply show to what extent the industry has been concentrated in large establishments, for the capital invested in the woolen industry and the carpet and rug industry combined in 1910 was $506,205,584, and in 1850 only $31,971,631, and the value of products in 1910 was $507,166,710, and in 1850 only $48,608,779.

The unit of calculation for the productive capacity of a woolen mill is the set of carding machines necessary to prepare the wool for spinning. The corresponding unit for a worsted mill is the combing machine, which, in its productive capacity, is taken to be equivalent to

† Returns of the United Kingdom are for the preceding year. ‡ Total for British Africa.

Utilization of Wastes. Shoddy is wool recovered from woolen fabrics that are not heavily felted or milled. Mungo is made from fragments of felted or milled cloth, and the fibre is therefore shorter. These two terms, however, are often used with different meanings and are sometimes interchangeable. (See SHODDY.) Extract wool is wool produced from goods which are part wool and part cotton, the wool being extracted by the process of carbonization already described. In 1900 71,496,508 pounds of shoddy were used in wool manufacture in the United States. In other words, of the total raw material 76.9 per cent was new wool and 23.1 per cent shoddy. These second-hand or recovered wools are reduced to fibre in grinding machines, from which they emerge in a flossy wool-like state.

Flocks are soft fluffy fibres which are cast out of the machines during the various processes of cloth manufacture. Noils are simply the shorter and more curly fibres which are pulled out during the process of wool combing for worsted manufacture. Both of these wastes are used in woolen manufactures.

Sophistication. The practice of weighting woolen and worsted fabrics prevails, as does the sophistication of silk. The goods are soaked in mineral salts, such as sulphates of alum, lead, zinc, and magnesium, which increases their weight from 15 per cent up.

Statistics. According to the Thirteenth Census of the United States there were in 1910 2887 establishments in the country devoted to various branches of wool manufacture, which put forth an annual product of $765,910,476. Of the 2887 establishments, 587 were woolen mills, 324 worsted mills, 139 carpet factories, 43 felt goods factories, 31 wool hat mills, 1374 hosiery and knit goods factories, 273 fur hat factories, 88 shoddy mills, 28 wool-scouring plants. Deduct-

2½ sets of cards for the same fineness and quality of work.

WOOL BLEACHING AND SCOURING. See BLEACHING.

WOOLD. See WELD.

WOOLLETT, wụl'ĕt, WILLIAM (1735–85). An English draftsman and line engraver. He was born at Maidstone, and studied under John Tinney at London and in St. Martin's Lane Academy. His earlier plates were topographical, but with his "Temple of Apollo" (1760), after Claude Lorraine, and his "Niobe," after Richard Wilson, he attained the rank of principal engraver in England. He engraved other landscapes after Wilson before attempting his most celebrated work, the "Death of General Wolfe" (1776), after Benjamin West, which brought him the title of "Historical Engraver to His Majesty"; it was followed by the "Battle of La Hogue" (1781), also after West, of almost equal celebrity. His plates aggregate about 100. In landscape he made great advance upon his predecessors in perspective, light, and atmosphere, and his figure subjects are especially good in line.

WOOLLEY, wụl'ĭ, JOHN GRANVILLE (1850–). An American prohibitionist. He was born at Collinsville, Ohio; graduated at Ohio Wesleyan University in 1871; was city attorney of Paris, Ill., in 1875, and was prosecuting attorney in Minneapolis in 1881. After about 1890 he devoted himself largely to writing

and lecturing, abroad as well as in the United States, against intemperance, to which he himself had formerly been addicted. In August, 1899, he became editor of *The New Voice*, and in 1900 was the candidate of the Prohibition party for President of the United States, receiving a popular vote of 208,914. Unlike some of his confrères, he worked in harmony with the Anti-Saloon League (q.v.). His writings include: *The Christian Citizen* (2 vols., 1897–98); *A Lion Hunter* (1900); *Temperance Progress in the Nineteenth Century* (1903); *South Sea Letters* (1905).

WOOLLEY, MARY EMMA (1863–). An American college president. Born at South Norwalk, Conn., she taught in Wheaton Seminary at Norton, Mass., from 1886 to 1891, graduated from Brown University in 1894, and from 1895 to 1900 taught biblical history at Wellesley College, for the last two years as professor. Thenceforth Miss Woolley was president of Mount Holyoke College, with the development of which her name became closely identified. Her interests, however, were many and varied. She served as a member of the executive board of the National Education Association, and of the national board of the Y. W. C. A., as vice president of the American Peace Society and honorary vice president of the National Consumers' League, as a senator of the United Chapters of Phi Beta Kappa, and in many other offices of responsibility. She received honorary degrees from Brown, Amherst, and Smith. In 1911 she edited a volume on *Education*.

WOOLLY APHIS, or PLANT LOUSE. The woolly root louse of the apple (*Schizoneura lanigera*), which, like many other aphides, secretes a greater or less quantity of wax in the form of wool-like fibres. This is a cosmopolitan species, probably of American origin, known in the English colonies as American blight and in Germany as Blutlaus. It is a small plant louse which has an abundant secretion of waxy fibres, and occurs both upon the roots of the apple under ground and upon the rough portions of the stems as well as about the young shoots and water sprouts coming from the lower part of the trunk. The attacks of the subterranean form on the roots produce galls or swellings, and in the cracks of these galls the insects occur in great numbers. The vitality of the plant is greatly reduced and young trees soon die. In general, the life history resembles that of other plant lice and the methods of control are similar. See APHID. Consult Marlatt, *The Woolly Aphis of the Apple* (United States Department of Agriculture, Washington, 1897).

WOOLLY BEAR CATERPILLAR. See HOP INSECTS.

WOOLMAN, wụl'man, JOHN (1720–72). A Quaker preacher and social reformer, born in Northampton, N. J. His early years were spent on a farm, as store clerk and as teacher of poor children. About 1741 he began to speak at meetings of the Friends. In 1746 he set out with a companion to visit Friends in the backwoods of Virginia, and afterward spent most of his life on similar journeys, supporting himself by work as a tailor. Woolman strongly influenced the Quakers of his time against the keeping of slaves, and one of his disciples, Benjamin Lundy, inspired William Lloyd Garrison to devote his life to the cause of abolition. He died at York, England. His writings include: a *Journal of John Woolman's Life and Travel in the Service of the Gospel* (1775; reëdited by John G. Whittier, 1871); *Some Considerations on the Keeping of Negroes* (1753–1762); *Considerations on Pure Wisdom and Human Policy, on Labor, on Schools, and on the Right Use of the Lord's Outward Gifts* (1768). *Serious Considerations with Some of His Dying Expressions* was published posthumously (1773), as were his *Works*, including some unpublished manuscripts, in 1774–75. His *Journal* still deserves to be read, and it ranks as a minor classic. Consult W. T. Shore, *John Woolman: His Life and Our Times* (New York, 1914).

WOOLNER, wụl'nẽr, THOMAS (1825–92). An English sculptor and poet. He was born at Hadleigh, Suffolk, and studied for four years in London with William Behnes and afterward at the Royal Academy. In 1843 he exhibited his first work, "Eleanor Sucking the Poison from the Arm of Prince Edward." From 1848 to 1852 he devoted himself to making portrait medallions; in 1848 he made the acquaintance of Rossetti; and in 1850 he was one of the "Pre-Raphaelite Brotherhood" which published the short-lived *Germ*, contributing the opening poem, "My Lady Beautiful." He became a member of the Royal Academy in 1874. From 1852 to 1854 he was in Australia. Woolner's statues are characterized by dignity, and his portrait busts and medallions are faithful likenesses. Among his important works are busts of Tennyson (1857 and 1873, Cambridge), Darwin, Newman, Maurice, Carlyle, Gladstone, Dickens, Kingsley, Temple, Huxley, Rajah Brooke, and Archdeacon Hare; statues of Lord Macaulay (1866), of Dr. Whewell (1873), of John Stuart Mill (1878, Thames Embankment), the colossal "Captain Cook" (Sydney, Australia); and "Bishop Fraser" (1888). His ideal figures, as "Guinevere" and "Godiva," display graceful and poetic feeling. He published several volumes of verse.

WOOLRYCH, wụl'rĭch, HUMPHRY WILLIAM (1795–1871). An English legal writer, born at Southgate, Middlesex. He was educated at Eton College, St. Edmund Hall, Oxford, and Lincoln's Inn, whence he was called to the bar in 1821. He wrote many legal volumes, the more important of which are: *Rights of Common* (1824); *Law of Certificates* (1826); *Law of Ways* (1829); *Commercial and Mercantile Law of England* (1829); *Law of Waters and Sewers* (1830); and *Treatise on Misdemeanours* (1842)

WOOLSACK. The name given to the seat of the Lord Chancellor of England in the House of Lords. It is composed of a large square bag of wool without either back or arms, and covered with red cloth. The woolsack was introduced in the House of Lords as the Chancellor's seat during the reign of Queen Elizabeth, as a memento of an act which was passed against the exportation of wool, then one of the main sources of the national wealth of England.

WOOLSEY, wụl'sĭ, SARAH CHAUNCEY (1835–1905). An American writer for young people, known by her pseudonym, Susan Coolidge. She was born in Cleveland, Ohio, and subsequently lived in Newport, R. I. Her books include: *The New Year's Bargain* (1871); *What Katy Did* (1872), the beginning of a series of stories for young girls; *Verses* (1880); *A Guernsey Lily* (1881); *A Little Country Girl* (1885); *Clover* (1888); *Curly Locks* (1899); and many other juvenile tales; and *A Short History of the City of Philadelphia* (1887). She edited *The*

Autobiography and Correspondence of Mrs. Delaney (1879), and *The Diary and Letters of Frances Burney* (1880).

WOOLSEY, THEODORE DWIGHT (1801–89). An American scholar and educator, nephew of Timothy Dwight. He was born in New York City, graduated at Yale in 1820, and spent a year in legal study at Philadelphia, and two years in theological study at Princeton. Returning to New Haven he afterward became a tutor in Yale, and went abroad to pursue the study of Greek in Leipzig, Bonn, and Berlin. From 1831 to 1846 he was professor of Greek at Yale, of which college he was chosen president in 1846, and, in accordance with precedent, was ordained to the Congregational ministry. Leaving Greek to younger men, he devoted himself to instruction in history, political economy, and political science, and especially international law. He was a frequent preacher in the college pulpit, and an influential, though not a conspicuous, leader of public opinion during the stirring events which led up to the Civil War. In 1871 he resigned the presidency, continuing for a time to lecture on international law. During his administration Yale advanced in wealth and influence and two new departments, the Scientific School and the School of the Fine Arts, were begun. Woolsey was one of the founders of the *New Englander*, and a frequent contributor to its pages, chairman of the American commission for the revision of the Authorized Version of the Bible, president of the World's Evangelical Alliance at its international meeting in New York, a lifelong member and at one time president of the American Oriental Society, and a regent of the Smithsonian Institution. Woolsey Hall at Yale is named in his memory. His principal publications include: Editions of the *Alcestis* of Euripides (1834), of the *Antigone* of Sophocles (1835), of the *Prometheus* of Æschylus (1837), of the *Electra* of Sophocles (1837), and of the *Gorgias* of Plato (1843); an edition of Lieber's *Civil Liberty and Self Government* (1871), and *Manual of Political Ethics* (1871); an *Introduction to the Study of International Law* (1860; many times republished); *Essays on Divorce and Divorce Legislation* (1869); *Religion of the Present and Future*, a collection of sermons (1871); *Political Science* (1877); *Communism and Socialism* (1880); and *Helpful Thoughts for Young Men* (1882).

WOOLSEY, THEODORE SALISBURY (1852–). An American legal scholar, born at New Haven, Conn., son of Theodore Dwight Woolsey. He graduated at Yale (1872) and at Yale Law School (1876), and after traveling in Europe was instructor in public law at Yale, and from 1878 to 1911 professor of international law. He was one of the founders of the *Yale Review* and a frequent contributor. He wrote several essays which were collected under the title *America's Foreign Policy* (1898), and he edited *Woolsey's International Law* and *Pomeroy's International Law*.

WOOLSON, wụl'sŭn, CONSTANCE FENIMORE (1848–94). An American novelist, born in Claremont, N. H. She was a grandniece of James Fenimore Cooper. She was educated in Cleveland, Ohio, and at a French school in New York City. She lived first at Cleveland, then (1873–79) in Florida and the neighboring States, and thereafter chiefly in England, and in Italy, at Rome, Venice, and Florence. Her first literary work appeared in *Harper's Monthly* in 1870, and here much of her subsequent writing was published. Her volumes were: *The Old Stone House* (1873); *Castle Nowhere: Lake-Country Sketches* (1875); *Two Women: A Poem* (1877); *Rodman the Keeper: Southern Sketches* (1880); *Anne* (1882); *For the Major* (1883); *East Angels* (1886); *Jupiter Lights* (1889); *Horace Chase* (1894), which may be regarded as her best piece of work; and *The Front Yard, and Other Italian Stories* (1895). "No Woman," says Mr. Stedman, "of rarer personal qualities, or with more decided gifts as a novelist, figured in her own generation of American writers." Miss Woolson depicted American types skillfully.

WOOL-SORTER'S DISEASE. See ANTHRAX; MALIGNANT PUSTULE; OCCUPATIONAL DISEASES.

WOOLSOWER (wụl'sō'ẽr) **GALL.** See OAK INSECTS.

WOOLWA, wo͞ol'wȧ. A Central American tribe. See ULUA.

WOOL WAX. See WAXES.

WOOLWICH, wo͞ol'ĭch *or* -ĭj. A metropolitan borough of London, England, on the Thames, 9 miles east of St. Paul's Cathedral (Map: London, E 9). The royal arsenal, the largest in Britain, contains war stores and establishments for manufacturing them. The arsenal covers 593 acres and employs over 14,000 men. On the common, south of the town, is the Royal Military Academy, colloquially called "The Shop," for the education of cadets for the artillery and engineers. Pop., 1901, 117,178; 1911, 121,376.

WOOLWORTH, FRANK W. (1852–). An American merchant, born at Rodman, N. Y. In 1879 he started a "5-cent" store at Utica, N. Y., removed in that year to Lancaster, Pa., where he continued in the same business, and gradually expanded his interests until he had a chain of about 700 "5 and 10-cent" stores in the United States and Canada, as president of the F. W. Woolworth Company. He built a famous skyscraper in New York, the Woolworth Building, of which Cass Gilbert (q.v.) was the architect. See ARCHITECTURE, *Recent Architecture*.

WOONSOCK'ET. A city in Providence Co., R. I., 16 miles north by west of the city of Providence, on the Blackstone River, here spanned by a fine bridge, and on the New York, New Haven, and Hartford Railroad and its leased lines (Map: Rhode Island, C 1). It has the Sacred Heart College and the Harris Institute Library. There are three public parks, and a soldiers' monument. Woonsocket is primarily an industrial city, being especially known for the manufacture of cotton and worsted goods. Other important manufactures include foundry and machine-shop products, wringing machines, knit goods, hosiery, rubber boots and shoes, etc. Pop., 1900, 28,204; 1910, 38,125; 1915 (State census), 40,075. Woonsocket was settled about 1666; in 1867 it was incorporated as a town and in 1888 was chartered as a city. Its area was enlarged in 1871 by the annexation of a portion of Smithfield. Consult Richardson, *History of Woonsocket* (Woonsocket, 1876).

WOORALI, wo͞o-rä'lĭ, or WOORARI, wo͞o-rä'rĭ. A South American vegetable poison. See CURARI.

WOOS'TER. A city and the county seat of Wayne, Co., Ohio, 52 miles south by west of Cleveland, on the Pennsylvania and the Baltimore and Ohio railroads (Map: Ohio, G 4). It

is the seat of the University of Wooster (Presbyterian), opened in 1870, and has a Carnegie library, and the Ohio Agricultural Experiment Station, which possesses fine buildings and grounds. The principal manufactures include boilers, pumps, aluminium ware, brushes, buggies, bricks, engines, farm implements, flour, lumber products, pianos, glass, etc. Pop., 1900, 6063; 1910, 6136.

WOOSTER, DAVID (1711–77). An American soldier. He was born in Stratford, Conn., graduated at Yale in 1738, and, entering the provincial army in 1739, served throughout King George's War (q.v.), acting as captain in the Louisburg expedition of 1745, and commanding for a time the sloop of war *Connecticut*. He became colonel of a Connecticut regiment in 1755, and served throughout the French and Indian War, during which he rose to the rank of brigadier general. He was appointed collector of customs at New Haven, but resigned on the approach of the Revolutionary War, and was one of the eight brigadier generals appointed by Congress in June, 1775. After serving in Canada, where for a time, owing to the death of General Montgomery, he held the chief command, he resigned to become major general of Connecticut militia, and was mortally wounded (April 26, 1777) near Danbury, while defending that place against the attack of General Tryon.

WORCESTER, wus'tĕr. The capital of Worcestershire, England, in the centre of the Severn valley, on the eastern bank of the river, 27 miles southwest of Birmingham (Map: England, D 4). The most important public buildings are the cathedral, the shire hall, the guildhall, the county prison, the city library, the Worcester museum, the corn exchange, the music hall, and a city grammar school, founded by Queen Elizabeth. A cathedral, dedicated to St. Peter, was founded as early as the seventh century. In 1084 Bishop Wulfstan laid the foundation of a new cathedral, which was not completed till 1216. Restored since 1855, it is now distinguished by the simplicity, if not plainness, of the exterior, which is amply compensated for by a fine perspective, the lofty roof, and generally charming effect of the interior. The tombs of King John, of Arthur, Prince of Wales (eldest son of Henry VII), and of Bishop Gauden (q.v.), are the chief ancient monuments in the building. Glove making, leather dressing and staining, porcelain factories, for which the city is specially famous, ironworks, locomotive-engine factories, tanning and currying, horse-hair weaving, vinegar, wine and sauce making, coach building, and the manufacture of chemical manures and agricultural implements are the chief industries. The frequent discovery of ancient remains proves that Worcester was a Roman station. It became a city under the kings of Mercia, and holds charters from Richard I and subsequent monarchs. Here Cromwell overthrew a Scotch army under Charles II, Sept. 3, 1651. Pop., 1901, 46,623; 1911, 47,987. Consult Brassington, *Historic Worcestershire* (Birmingham, 1894–95).

WORCESTER. The second city of Massachusetts, and one of the two county seats of Worcester Co.; 44 miles west-southwest of Boston, on the Blackstone River (Map: Massachusetts, D 3). It has one union railroad station, occupied by the Boston and Albany, the New York, New Haven, and Hartford, and the Boston and Maine. The street railway system reaches every part of the city and extends into nearly all the neighboring towns.

Worcester is mainly situated in a valley, surrounded by hills of moderate elevation, and is about 500 feet above sea level. There are 17 public parks, comprising 1092 acres. The largest are Green Hill Park, 500 acres; Boynton Park, 113 acres; Lake Park, 110 acres; and Elm Park, 86 acres. Among the important edifices of a public or semipublic character are the city hall, courthouse, art museum, public library, which contains 212,000 volumes, the post office, State armory, State lunatic asylums, five hospitals, and the buildings of the Woman's Club, the Boys' Club, the American Antiquarian Society, the Worcester Society of Antiquity, the Young Men's Christian Association, the Young Women's Christian Association, and the State Mutual Life Assurance Company. The public-school system includes four high schools. Worcester is the seat of Clark University (q.v.), Clark College (q.v.), the College of the Holy Cross (see HOLY CROSS, COLLEGE OF THE), the Worcester Polytechnic institute (q.v.), a State normal school, and the Worcester Academy.

Worcester is preëminently a manufacturing city. The largest establishment in the city employs more than 6000 men in the making of every kind of wire. Other important industries are manufactures of looms, emery wheels, elevators, envelopes, corsets, carpet, firearms, and cars. Besides these there are many smaller establishments for the manufacture of skates, wrenches, wall paper, boots and shoes, clothing, leather, machinery, machinists' tools, woven-wire goods, and woolens.

The government is vested in a mayor, elected annually, a board of 11 aldermen, one elected at large, and one from each ward; and a board of councilmen, three from each of the 10 wards. These two boards constitute the City Council, and elect the heads of departments and have power to confirm or reject nominations made by the mayor to either board. The amounts paid for the support of the principal departments in 1915 were: for schools, $990,000; for the fire department, $288,000; for the police department, $281,000; for streets, $474,000; for the public library, $61,000; for the support of the poor, $99,000. The net funded debt was $7,574,000; and the valuation of taxable property $179,199,000. The water works are owned by the city and have cost $7,150,000. The sewerage system now includes 234 miles of sewers. It has cost $7,079,000.

Pop., 1800, 2411; 1850, 17,049; 1870, 41,405; 1880, 58,291; 1890, 84,655; 1900, 118,421; 1910, 145,986; 1915 (State census), 162,697. More than one-third the population in 1910 was of foreign parentage, principally Irish, Swedish, and Canadian. More than 40 different nationalities were represented.

A settlement called Quansigamog Plantations was made here in 1673, but on the outbreak of King Philip's War in 1675, it was abandoned. In 1684 the place was resettled and called Worcester (from Worcester, England), but was again virtually abandoned on account of difficulties with the Indians in 1702. The permanent settlement dates from 1713. In 1722 Worcester was incorporated as a town, and in 1848 it was chartered as a city. In 1775 Isaiah Thomas (q.v.), the publisher, removed hither from Boston, and from 1790 to 1800 Worcester was one of the most important publishing centres in the

United States. Consult Hurd, *History of Worcester County* (Philadelphia, 1889), and Rice (ed.), *Worcester in 1898* (Worcester, 1899).

WORCESTER, wŭs'tĕr, DEAN CONANT (1866–). An American zoölogist, public official, and authority on the Philippines. He was born at Thetford, Vt., and was educated at the University of Michigan (A.B., 1889). While an undergraduate he had visited the Philippines as a member of the Steere scientific expedition (1887–88), and in 1890, as one of the leaders of the Menage expedition, he returned to the islands. For three years he studied their fauna, topography, history, and inhabitants. In 1893 he became instructor in morphology at the University of Michigan, and in 1895 assistant professor of zoölogy and curator of the zoological museum. From 1899 to 1901 he was a member of the United States Philippine Commission; thenceforth until 1913 served as secretary of the interior for the Philippine Insular Government. His publications include, besides various papers: *The Philippine Islands and Their People* (1898); *The Non-Christian Tribes of Northern Luzon* (1906); *The Philippines Past and Present* (2 vols., 1913; new ed., 1914).

WORCESTER, EDWARD SOMERSET, second MARQUIS OF (1601–67). An English nobleman and inventor, the son of the first Marquis of Worcester. In early life he devoted himself to mathematical and mechanical researches. In 1641 he entered the service of Charles I, who, in 1645, sent him to treat secretly with the Irish Catholics and to raise troops for service in England. The secret was discovered, Worcester was imprisoned on the charge of treason, and Charles I disowned him. After his release Worcester spent four years in voluntary exile, and upon his return to England in 1652, was imprisoned in the Tower until 1654. Worcester wrote *A Century of the Names and Scantlings of Such Inventions as at Present I Can Call to Mind to have Tried and Perfected* (1663), in which he described a steam engine as an admirable and most forcible machine for "driving up water by fire." Though he is known to have erected great water works at Vauxhall, there is no proof that he constructed the engine described above. Consult Henry Dircks, *The Life, Times, and Scientific Labors of the Second Marquis of Worcester*, with an annotated reprint of his *Century of Inventions* (London, 1865).

WORCESTER, ELWOOD (1863–). An American Protestant Episcopal clergyman and author. Born at Massillon, Ohio, he graduated from Columbia in 1886, and from Leipzig, (Ph.D.) in 1889. He served as professor of philosophy and psychology and chaplain at Lehigh University (1890–96), as acting rector of St. John's, Dresden, Germany (1894–95), and as rector of St. Stephen's Church, Philadelphia (1896–1904), and thenceforth of Emmanuel Church, Boston. Shortly after assuming this last charge, Dr. Worcester organized in connection with his church a class for the treatment of nervous disorders. About 1906 the outcome of this attempt became known as the Emmanuel Movement, more properly described as a movement for the moral treatment of nervous disorders, in coöperation, when necessary, with medical practitioners. With Dr. Worcester was associated another clergyman, Dr. Samuel McComb. The treatment, which also had a psychological side, involved helpful suggestion to the afflicted and in exceptional cases hypnosis, always with the consent of the patient, and under the supervision of a physician. Cases of organic disease also were sometimes admitted, with the coöperation of a physician. Dr. Worcester's publications include: *Religious Opinions of John Locke* (1889); *The Book of Genesis in the Light of Modern Knowledge* (1901); *Religion and Medicine* (1907); *The Living Word* (1908); *The Christian Religion as a Healing Power* (1909); *Religion and Life* (1914); *The Issues of Life* (1915).

WORCESTER, FLORENCE OF. See FLORENCE OF WORCESTER.

WORCESTER, JOSEPH EMERSON (1784–1865). An American lexicographer and philologist, born at Bedford, N. H. A graduate of Yale (1811), he taught at Salem, and after a brief stay at Andover moved to Cambridge (1819), where he devoted himself to study and writing till his death. He began his work in lexicography in 1828 by an edition of Johnson's *Dictionary* and an abridgment of *Webster's American Dictionary* (1829). In 1830 he published a *Comprehensive Pronouncing and Explanatory English Dictionary*. From 1831 to 1843 he edited *The American Almanac*. In 1846 he issued *A Universal and Critical Dictionary of the English Language*, and after a suspension of his labors, owing to failure of his eyes (1847–49), repeatedly enlarged this until it became the great quarto *Dictionary of the English Language* (1860), the first illustrated dictionary in English. Worcester's various dictionaries were the first in America to take an objective rather than a didactic position towards the language. In contrast especially to the work of Webster, they sought to represent the language as it was rather than to mold it in special forms.

WORCESTER, NOAH (1758–1837). A New England theologian, born at Hollis, N. H. He served in the Continental Army during the War of Independence; in the New Hampshire Legislature; was licensed as Congregational preacher in 1786; ordained pastor at Thornton in 1787; and in 1802 was employed as State missionary. From 1810 to 1813 he had a ministerial charge at Salisbury, N. H., and then moved to Brighton, Mass., where he began a prolific literary career as editor of *The Christian Disciple* (1813–18), followed by *The Friend of Peace* (1819–29). He was active in founding the American Peace Society (1815). Among his more noteworthy publications are *Respectful Address to the Trinitarian Clergy* (1812); *The Atoning Sacrifice: A Display of Love, not of Wrath* (1829), and *Last Thoughts on Important Subjects* (1833). Consult Henry Ware, *Memoirs of Noah Worcester, D.D.* (Boston, (1844).

WORCESTER COLLEGE. A college at Oxford, England. It was founded about 1698 by bequest of Sir Thomas Cookes, Bart., of Bentley Pauncefoot, Worcestershire, for a provost, six fellows, and six scholars. Worcester, though far from the largest or most splendid, is one of the most attractive of Oxford colleges, both in the variety of its buildings, dating from the old monastic houses to the newly decorated chapel, and in the beauty and extent of its gardens, which are of remarkable size and charm. According to the revised statutes of 1882 there were a provost, eight fellows, several honorary fellows and lecturers, 15 scholars, and 15 exhibitioners. The number of undergraduates is

about 100. The college presents to 10 livings. Consult Daniel and Barker, *Worcester College* (London, 1900).

WORCESTER MUSICAL FESTIVAL. One of the most important annual music festivals in the United States, held at Worcester, Mass. It originated from the annual conventions held by various choirs in the vicinity of Worcester for the purpose of discussing and studying church music. The first festival was held in September, 1858, under the direction of Benjamin F. Baker of Boston, when one concert of anthems and selected choruses from oratorios was given. An entire oratorio was not attempted until 1866 when Karl Zerrahn (q.v.) became conductor. In 1863 the choirs of 20 towns were incorporated under the name Worcester County Musical Convention, and the present title Worcester County Musical Association, was adopted in 1871. At first the accompaniment was played on a piano, after 1864 on the organ in Mechanics' Hall. In 1868 an orchestra of 10 players participated, and as the orchestra increased, instrumental numbers were included. To-day the festival consists of four concerts, one or two of which are devoted to some large oratorio or choral work. Zerrahn was conductor till 1897. His successors were George W. Chadwick (1898–1901), Wallace Goodrich (1902–07); Arthur Mees (1908–) (qq.v.). For the Festival at Worcester, England, see THREE CHOIRS FESTIVAL.

WORCESTER POLYTECHNIC INSTITUTE. A college of engineering founded at Worcester, Massachusetts, in 1865 by John Boynton of Templeton. It was opened for students in 1868. The institution offers five courses of study—mechanical, civil, and electrical engineering, chemistry, and general science—each covering four years, and all identical in the freshman year. It includes the Salisbury laboratories, appropriated to work in physics and chemistry; the mechanical engineering and power laboratories; the Alden laboratory, for hydraulic testing; the Washburn shops, for industrial management; Boynton Hall, containing offices and lecture rooms; and electrical engineering laboratories. The degree of Bachelor of Science is conferred in regular course, and the advanced degrees of Master and Doctor of Science, and Mechanical, Civil, and Electrical Engineer are given after the completion of graduate courses. In 1915–16 the total enrollment was 543 students and there were 29 professors and 25 instructors. The library contains 14,544 volumes. The president in 1916 was Ira M. Hollis, A.M.

WORCESTERSHIRE, wụs'tẽr-shĭr. A western inland county of England, bounded by Stafford, Warwick, Gloucester, Hereford, and Shropshire (Map: England, D 4). Area, 751 square miles. Its surface is in general hilly and picturesque; it is watered by the Severn and Avon rivers. Orchards and pastures are the most important and extensive portions of the improved lands, the grain crops being small. Manufactures, especially of machinery, are also important, and the mineral products include large amounts of salt, clay, coal, and some iron. Pop., 1901, 357,402; 1911, 427,064. County town, Worcester.

WORDE, wôrd, WYNKIN DE (?–c.1534). A famous English printer and typographer. He was born, probably, in Lorraine, and went to England in 1477, as an assistant to Caxton. He superintended Caxton's famous printing office till the latter's death, and afterward succeeded him. He made great improvements in the art of printing, and especially in that of type cutting, which then formed a branch of the profession. He is said to have first introduced Roman letters into England, using them as italics are now used. He also made extensive use of engravings, which, however, appear to have been mostly obtained from the Continent. The books printed by him are distinguished by their neatness and elegance, and number 408 distinct works, against 99 by Caxton.

WORDEN, wụr'dĕn, JOHN LORIMER (1818–97). An American naval officer, born in Westchester Co., N. Y. He joined the navy as midshipman in 1835, and was commissioned a lieutenant in 1846. On March 9, 1862, he commanded the *Monitor* in her celebrated battle with the *Merrimac* or *Virginia* in Hampton Roads. During the action he was partially blinded by a shell, which struck the lookout hole of the pilot house just opposite his eyes. After this engagement he was commissioned commander and placed in command of the ironclad *Montauk*. He twice bombarded Fort McAllister, in January and February, 1863; on February 3 was commissioned captain; on the 28th destroyed the *Nashville* under the guns of Fort McAllister; and on April 7 assisted Admiral Du Pont in the attack on the defenses of Charleston. He was on special duty in New York in 1864–66; was head of the Naval Academy in 1870–74; was commissioned commodore in 1868, and rear admiral in 1872; and retired in 1886.

WORDSWORTH, wûrdz'wŭrth, CHARLES (1806–92). An Anglican bishop. He was born at Lambeth, London, and graduated with honors at Oxford (1830); was private tutor at Cambridge (1830–33); second master of Winchester College (1835–46); and warden of Trinity College, Glenalmond, Perthshire (1847–54), contributing largely to its establishment, and building the chapel largely at his own expense. He was consecrated Bishop of St. Andrews, Dunkeld, and Dunblane. He was a member of the New Testament revision committee. His publications were numerous and varied. Of them may be mentioned *Shakespeare's Knowledge and Use of the Bible* (1865); a *Life* of Bishop Joseph Hall (1872); commentary on Ecclesiasticus (1881); *Public Appeals on Behalf of Christian Unity*, a collection of writings on this subject from 1854 to 1885 (1886); *Primary Witness to the Gospel* (1892). He was noted for his translations into Latin in prose and verse. His *Greek Primer for Beginners* reached its 83d thousand in 1896. Consult: his *Annals of My Early Life (1806–46)* (London, 1891); *Annals of My Life (1847–56)* (ib., 1893); John Wordsworth, *The Episcopate of Charles Wordsworth* (ib., 1899, with full bibliography).

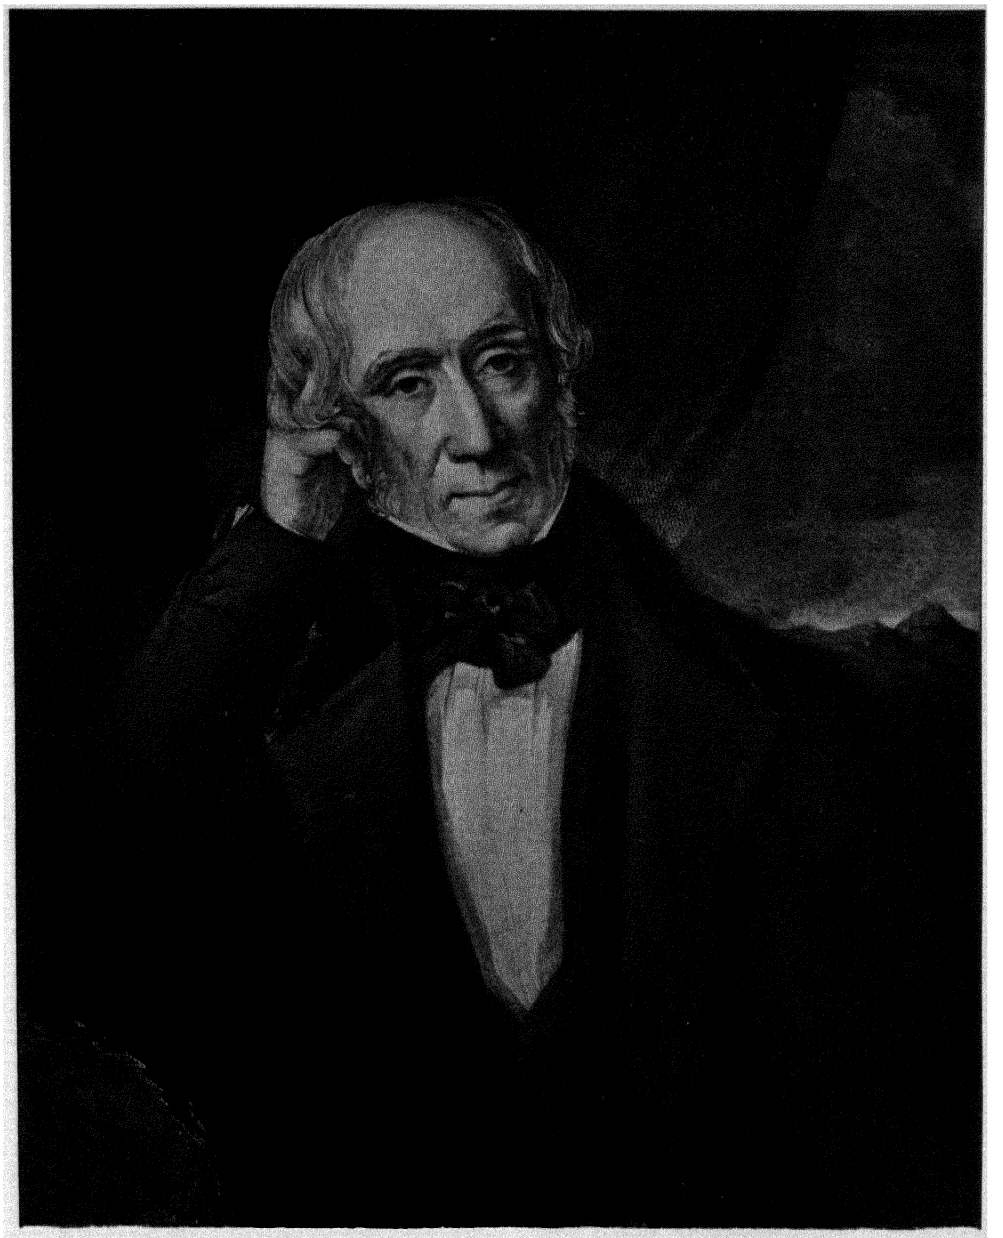
WORDSWORTH, CHRISTOPHER (1774–1846). An English divine, the youngest brother of William Wordsworth. He was born at Cockermouth, in Cumberland, and was educated at Trinity College, Cambridge. He became rector of Ashby in Norfolk (1804), domestic chaplain to the Archbishop of Canterbury (1805), rector of Woodchurch in Kent (1806), dean and rector of Bocking in Essex (1808), rector of St. Mary's, Lambeth, and of Sundridge in Kent (1816), and in 1817 chaplain of the House of Commons. From 1820 to 1841 he was master of Trinity and in 1820–21 and 1826–27 vice chancellor of the university. Among his publications are:

Ecclesiastical Biography (6 vols., 1810); *Christian Institutes* (1836); and *Who Wrote Icon Basilike?* (1824).

WORDSWORTH, CHRISTOPHER (1807–85). An English divine and scholar, born at Cockermouth, in Cumberland, the youngest son of Christopher Wordsworth (1774–1846). He was educated at Winchester School, and at Trinity College, Cambridge, graduating in 1830. Elected fellow of his college in the year just named, he was soon appointed tutor. In 1832–33 he visited Greece. He was master of Harrow (1836–44), canon of Westminster (1844), archdeacon of Westminster (1865), and Bishop of Lincoln (1868). His great work was a commentary on the Bible: *The New Testament* (1856–60) and *The Old Testament* (1864–70). Late in life he published a *Church History to A.D. 451* (1881–83). He early gained a considerable reputation in classical scholarship with *Athens and Attica* (1836); *Pompeian Inscriptions* (1837); *Greece, Pictorial and Descriptive* (1839; new ed. with 600 engravings, 1858; revised by Tozer, 1882); and *Theocritus* (1844). Consult the *Life* (London, 1888) by J. H. Overton and Wordsworth's daughter, Elizabeth Wordsworth, who for a time was principal of Lady Margaret Hall, Oxford; A. C. Benson, *The Leaves of the Tree* (New York, 1911).

WORDSWORTH, DOROTHY (1771–1855). See WORDSWORTH, WILLIAM.

WORDSWORTH, JOHN (1843–1911). An English bishop, born at Harrow, son of the Bishop of Lincoln and grandnephew of William Wordsworth. He was educated at Winchester and Oxford (New College), and became assistant master of Wellington College in 1866. In 1870 he was appointed prebendary of Lincoln. From 1883 to 1885 he was Oriel professor of Scripture interpretation at Oxford, fellow of Oriel, and canon of Rochester. In 1885 he was made Bishop of Salisbury. He wrote: *Fragments and Specimens of Early Latin* (1874); *Bampton Lectures* (1881; 2d ed., 1887); *Old Latin Biblical Texts* (vol. i, 1883); vol. ii, with Sanday and White (1886); *Novum Testamentum Latine, Secundum Editionem S. Hieronymi* (1898); *Bishop Serapion's Prayer Book* (1899); *Teaching of the Church of England for the Information of Eastern Christians*, with Greek by Dr. John Gennadius (1900); *The Ministry of Grace* (2d ed., 1904); *Education Question* (1906); *The Invocation of Saints and the Twenty-Second Article* (1908); *The Law of the Church as to the Marriage of a Man with his Deceased Wife's Sister* (1908); *Ordination Problems* (1909); *Unity and Fellowship* (1910). Consult E. W. Watson, *Life of Bishop John Wordsworth* (London, 1916).



WORDSWORTH, WILLIAM (1770–1850). An English poet, born at Cockermouth, in Cumberland, April 7, 1770. He came from a family that had long been settled in the north country. William was the second son. His sister Dorothy (1771–1855), a remarkable woman, was the poet's companion through mature life. William was sent to the schools at Cockermouth and Penrith, and, after the death of his mother (1778), he was transferred to the grammar school at Hawkshead, a picturesque village by Esthwaite Water, where he remained till 1787. His father had died in 1783. The years passed at Hawkshead were the seedtime of his soul. He read widely, joined in the society of the country folk, took long solitary strolls, and had mystic visions in which nature seemed to palpitate with life. Wordsworth studied at St. John's College, Cambridge, graduating in 1791. In 1790 he interrupted his studies to take a tour through France and Switzerland with Robert Jones, a college friend, afterward fellow of St. John's. Unsettled in his plans, after a three-months' stay in London, he again went to France, staying a full year (November, 1791, to December, 1792). He embraced the principles of the Revolution, and in spite of its excesses, his republicanism was not wholly dissipated till the French invasion of Switzerland (1798). Later he became a stanch Conservative, if not a Tory. For this change, sincere and natural, he was severely criticized by many of his republican contemporaries, e.g., by Byron; and in *The Lost Leader*, Browning, while not intending it directly for Wordsworth, yet used him as a subject in describing the effect upon ardent young Liberals of the defection of an admired leader. Returning to England, Wordsworth made his first appearance as poet in *An Evening Walk* (1793), and *Descriptive Sketches taken during a Pedestrian Tour among the Alps* (1793). The poet's masters were then Pope, Goldsmith, and Cowper. These two poems, composed in the heroic couplet, contain many refined and delightful sketches taken from nature at first hand. Coleridge saw in the second volume "the emergence of an original poetical genius." In 1795 Wordsworth settled with his sister at Racedown, near Crewkerne, moving (1797) to Alfoxden, 3 miles from Nether Stowey, where Coleridge was then living. At Racedown Wordsworth wrote several poems, in which the heroic couplet was abandoned. Among them were *Guilt and Sorrow* in the Spenserian stanza, and a tragedy in blank verse, devoid of dramatic power, called *The Borderers*. But the main outcome of the period was a joint publication of the two poets entitled *Lyrical Ballads* (1798), a memorable volume, which, though severely criticized by reviewers and neglected by the public, marks an epoch in the history of English poetry. Coleridge contributed *The Ancient Mariner* and three other poems. Wordsworth's poems, *Simon Lee*, *We Are Seven*, *Expostulation and Reply*, "were written" (so runs the advertisement) "with a view to ascertain how far the language of conversation in the middle and lower classes of society is adapted to the purposes of poetic pleasure." The volume closed with the beautiful *Lines on Tintern Abbey*, commemorating a tour with Dorothy up the Wye valley. The volume *Lyrical Ballads* was republished in 1800, with the addition of the famous and epoch-making preface. In this *Preface* Wordsworth elaborated the thesis that there is no "essential difference between the language of prose and metrical composition." The thesis was ably criticized by Coleridge in his *Biographia Literaria* (1817), and is now generally regarded as an extreme position. To it Wordsworth always held in theory, but, to his good fortune, he often forgot it in practice. The *Preface*, though needing qualification, was most salutary. It put an end to the conventional poetic diction of the eighteenth century; the publication of the little book is generally taken to mark the definite beginning of the Romantic movement in England, and of the glories of nineteenth-century English poetry.

Meanwhile Wordsworth and his sister, having been supplied with funds by the Wedgwoods,

had accompanied Coleridge to Germany (1798–99). Coleridge went to Göttingen to study philosophy; the Wordsworths settled down in Goslar for the winter. The poet hardly knew a word of German, but his genius throve at Goslar. There he began his *Prelude* and his first song of "Lucy." Returning to England, William and his sister settled in Dove Cottage at Grasmere, the loveliest spot among the English Lakes (1799), and they finally made their home at Rydal Mount (1813). In 1802 the Earl of Lonsdale died, and his successor paid over to the Wordsworths a debt of £8500 and afterward further helped them. Having thus a competency, Wordsworth married (Oct. 4, 1802) Miss Mary Hutchinson (born Aug. 16, 1770), a friend from youth, portrayed in "She was a phantom of delight." For nearly 50 years Wordsworth's life flowed on tranquilly, a noble illustration of "plain living and high thinking." Coleridge for a time lived near him and with him, but the poets became estranged, never to be wholly reconciled. Friends and admirers gathered around Wordsworth—John Wilson, De Quincey, Henry Crabb Robinson, and Sir George Beaumont, the landscape painter. Southey, too, lived near at Keswick. In London Wordsworth associated with Rogers, Haydon, Hunt, Keats, and others. He made many tours, of which those into Scotland, to the Highlands, furnished him with exquisite poetic material. In 1813 Wordsworth was appointed distributor of stamps for Westmoreland, a post that brought him £400 a year. In 1820 he spent four months in Switzerland and in Italy, visited Belgium in 1823 and 1828, and made his last Continental tour in 1837. In 1842 he received a government pension of £300 a year; and in 1843 he succeeded Southey in the laureateship. He died at Rydal Mount, April 23, 1850, and was buried in the Grasmere churchyard. Dorothy survived her brother till Jan. 25, 1855. Mrs. Wordsworth died Jan. 17, 1859. A favorite child, Dorothy, who had married Edward Quillinan (q.v.), died in 1847. Two sons survived.

Wordsworth consecrated his life to poetry, issuing volume after volume, and for a long time meeting with little favor. The attitude of the orthodox critics was summed up in Jeffrey's "This will never do!" (*Edinburgh Review*, November, 1814). Wordsworth nevertheless had defenders in Wilson, De Quincey, Lamb, Coleridge, and the younger generation; and his serene belief in himself was justified by full recognition. *Poems* (2 vols., 1807) contained much of his finest verse, as "To a Highland Girl," "The Solitary Reaper," "I wandered lonely as a cloud," and the odes to duty and on immortality. In 1814 appeared *The Excursion*, a didactic epic in blank verse, ridiculed by Byron, but now regarded as the best of Wordsworth's longer poems. In 1815 Wordsworth republished his poems in two volumes, arranging them on philosophical principles. Later he published *The White Doe of Rylstone* (1815); *Thanksgiving Ode* (1816); *Peter Bell* (1819); *The Waggoner*, with Sonnets (1819); *The River Duddon* (1820), a series of noble sonnets, the best since Milton; *Ecclesiastical Sketches* (1822), an unfortunate attempt to shape the history of the Church in Britain to a sonnet sequence; *Yarrow Revisited, and Other Poems* (1835); *Poems*, chiefly of early and late years (1842); *The Prelude*, a highly interesting autobiographical poem (posthumous, 1850); and *The Recluse*, a fragment (1888). Wordsworth also issued collected editions of his work, containing revisions and additions, in 1820, 1827, 1832, 1836–37, 1843, 1846, and 1849–50. It was Wordsworth's aim to depict the elemental passions in unaffected language, and in his best work he succeeded—though his simplicity sometimes became tedious. In his inspired moments, "Nature herself," said Matthew Arnold, "seemed to take the pen out of his hand, and to write for him with her own bare, sheer, penetrating power." Wordsworth's passion for nature and his insistence on the brotherhood of man passed into the thought of the nineteenth century. Though Burns and Cowper and Crabbe had described nature before him, it was his to take up what Arnold has called the office of modern poetry, the moral interpretation of nature. He held a sort of Neo-Platonic, almost pantheistic, view of the existence of a soul, something conscious and all but divine, in nature. He also vindicated the possibility of treating the lives and emotions of the humblest classes in a strain of deep poetry.

Bibliography. The principal editions of Wordsworth's works are as follows: *Poetical Works*, ed. by W. A. Knight (8 vols., Edinburgh, 1882–86), full bibliography in vol. viii; *The Complete Poetical Works*, Aldine ed. by Edward Dowden (7 vols., London, 1892–93); *Poetical and Prose Works, together with Dorothy Wordsworth's Journal*, ed. by W. A. Knight (16 vols., ib., 1896; 2d ed. of the *Journals*, 2 vols., ib., 1904); *Complete Poetical Works*, Oxford ed. by Thomas Hutchinson (ib., 1904); *Complete Poetical Works*, Cambridge ed. (Boston, 1904); *Complete Poetical Works*, Globe ed. by John Morley (New York, 1909), a chronologic arrangement; *The Patriotic Poetry of William Wordsworth*, ed. by A. H. D. Acland (Oxford, 1915); *Prose Works*, ed. by A. B. Grosart (6 vols., London, 1876); *Guide to the Lakes* (5th ed., ib., 1835; new ed., with introduction by Ernest de Sélincourt, ib., 1906); *A Description of the Wordsworth and Coleridge Manuscripts in the Possession of T. N. Longman*, ed. by W. Hale White (New York, 1897); also Dorothy Wordsworth, *Recollections of a Tour in Scotland*, ed. by J. C. Shairp (London, 1874). WORK (AS. *weorc*, OHG. *werah*, *werc*, Ger. *Werk*, work). Whenever there is a displacement of a body upon which a force is acting, work is done if the displacement is in the line of action of the force, or has a component in that direction. Thus, if one raises a body from the floor to a table, work is done against the force of gravity. If the body falls, work is done by the force of gravity. The work done is given the numerical value equal to the product of the force by the component of the displacement of the body in the line of action of the force. In angular motion it is the product of the angular displacement and the moment of the force acting. Work is done whenever energy is transferred from one body to another. (See MECHANICS and ENERGETICS.) The unit of work on the C. G. S. system is the erg, or a force of one dyne acting through a distance of one centimeter. A more practical unit is the joule, which is 10^7 ergs. On the foot-pound system, the unit of work is that required to raise one pound one foot vertically against the force of gravity at sea level at latitude 45°; this unit is called a foot pound. It equals 1.383 joules, approximately.

WORK, HENRY CLAY (1832–84). An American song writer and inventor, born at Middletown, Conn. In boyhood he was taken to Illinois by his father. Returning to Connecticut, Work was apprenticed to a printer, studied harmony, and achieved universal popularity during the Civil War by his songs, among which the most popular were "Kingdom Coming," "Marching Through Georgia" (1865), "Babylon is Fallen." He wrote also temperance songs, the best known of which is "Father, Dear Father, Come Home with Me Now," and sentimental melodies, as "My Grandfather's Clock" and "Lilly Dale." He was an inventor and, among other things, patented a knitting machine, a walking doll, and a rotary engine.

WORKHOUSE. A name given in England to establishments for the segregation and maintenance of paupers; sometimes in the United States to institutions in which vagrants, drunkards, and other minor offenders are detained on short sentences and at labor, but which are usually and rightly known as houses of correction. The institutions established in London and Westminster during the reign of Charles II, which are commonly referred to as the first English workhouses, were in reality houses of correction to which vagabonds and other petty offenders were committed. William III, in creating the Board of Trade, instructed its members to "consider the proper methods of setting on work and employing the poor, and making them useful." The idea was in the air that a workhouse, in the literal sense of the word, could be made an effective discouragement of unnecessary pauperism. In 1676 John Cary, a merchant of Bristol, brought about the building and opening of a workhouse in that city. The experiment was so successful that it was followed by the cities of Plymouth, Worcester, Hull, and Exeter. John Locke about this time, writing the first report of the Board of Trade, made a strong plea for the technical instruction as well as the compulsory industry of the dependent elements of society, but the public was well enough satisfied with a scheme of segregation and hard work so long as it diminished the burden of the support of the poor. And so remarkable in fact was the suppression of vagrancy and the lowering of the poor rate by the workhouse experiments which have been mentioned, that in 1722 a general Act of Parliament authorized parishes, singly or in unions, to build workhouses and to refuse relief to all who would not enter them. For nearly 50 years the dread of the workhouse stimulated the poor to provide for themselves, but this wholesome condition was completely changed by a period of sentimentalism wherein the famous statute 22 George III, c. 83, in 1783, known as Gilbert's Act, practically broke down the workhouse principle. From this time began those abuses of outdoor relief which resulted in the appointment of the Poor Law Commission of 1832 and the Poor Law Amendment Act of 1834. See PAUPERISM.

The workhouse or house of correction in the United States is not a feature of the poor-law system of a commonwealth, but of its system of penology. It is usually a developed or modified county jail. The nearest American approach to such a test of aid-deserving poverty as the English workhouse is intended to be is found in the woodyards and laundries maintained by charity organization societies.

WORKINGMEN'S ASSOCIATION, INTERNATIONAL. See INTERNATIONAL WORKINGMEN'S ASSOCIATION.

WORKINGMEN'S CLUBS. Organizations of workingmen for various purposes, but partaking nothing of the character of trade unions or friendly societies. Such clubs are practically unknown in the United States, but are common in England and on the Continent. A large proportion of the London clubs of this kind were gambling or drinking associations. There are a large number of philanthropic clubs, connected as a rule with some church organization. The political clubs, about one-fourth of the total number, are generally Socialistic in tone. A small number are organized for educational purposes or social purposes of an educational nature. On the Continent the clubs comprise athletic organizations, Socialist clubs, and church societies.

WORKINGMEN'S COMPENSATION. Under the employers' liability laws the injured worker was required to bring suit at law and break down the employers' defenses before he could secure damages for his injury. These defenses required the worker to prove that he was not himself responsible, that no fellow worker was responsible, and that the accident to which injury was due was not a normal risk of the industry. The result was that only a small proportion of injuries were ever requited and much unmerited hardship was forced upon the working class. In consequence the system of compensation for accidents has been introduced. This

removes the employers' defenses, obviates the necessity of a lawsuit, and provides definite scales of compensation for accidental injuries incurred during working hours regardless of who is responsible therefor. Since workmen's compensation laws are usually accompanied by laws requiring the reporting of all accidents to a public board charged with the determination of the amounts of compensation, the injured worker, or, in case of death, his family, receives payment very quickly without expense.

Legislation of the compensation type began with the compulsory accident insurance law of Germany in 1884, followed by the British workmen's compensation act of 1897. (See SOCIAL INSURANCE for full statement.) In the United States the Federal government, 31 States and 2 Territories, had enacted compensation laws by the close of 1915. Aside from 10 southeastern States, the only States lacking such laws were: Arkansas, Idaho, Missouri, New Mexico, North and South Dakota, and Utah. Nearly all of these laws apply to public as well as private employees. As a rule they provide specific benefits in case of death, of total disability, and of partial disability due to specific injuries or continuing during specified periods. While they all introduced the principle of compensation, they vary much in scope, in the degree of compulsion, and in the prominence given to insurance by employers. Elective compensation laws have been enacted by the following: Alaska, Colorado, Connecticut, Illinois, Indiana, Iowa, Kansas, Louisiana, Maine, Michigan, Minnesota, Montana, Nebraska, New Hampshire, New Jersey, Pennsylvania, Rhode Island, Vermont, and Wisconsin. Compulsory compensation is provided by: Arizona, California, Canal Zone, Hawaii, Maryland, New York, Oklahoma, and the United States. Elective insurance in funds under State control or supervision is provided for by laws of Massachusetts, Nevada, Oregon, Texas, and West Virginia; and compulsory insurance in State funds is required in Ohio, Washington, and Wyoming. See SOCIAL INSURANCE; EMPLOYERS' LIABILITY; INSURANCE, *Employers' Liability Insurance;* and ACCIDENTS, INDUSTRIAL.

WORKINGMEN'S INSURANCE. The insuring of workingmen against accident, sickness, unemployment, or old age, carried on solely by the government or by the government in conjunction with employers and employees. The system has attained its fullest development in Germany, Austria, Great Britain, Denmark, and Australia, and is making fairly rapid progress throughout Western nations. See OLD AGE PENSIONS; SOCIAL INSURANCE.

WORK'INGTON. A seaport in Cumberland, England, at the mouth of the Derwent, on the Solway Firth, 7 miles north of Whitehaven (Map: England, C 2). Its importance is due to the neighboring coal mines, the extensive iron, steel, and other factories, a thriving salmon fishery, and an export trade in industrial products. Pop., 1901, 26,141; 1911, 25,092.

WORKINGWOMEN'S CLUBS. Organizations of workingwomen for social and educational purposes. They are as a rule self-governing and self-supporting, the fees, however, being very moderate. The primary aim of such clubs is to bring within the reach of the woman in factory, shop, or store the advantages of wholesome lodgings and pleasant surroundings, dancing, books, music, etc., but a common feature is the instruction given in the various branches of domestic science as well as in stenography, typewriting, bookkeeping, etc. In a number of cases vacation homes are maintained. The movement began in Boston about 1890 and has made rapid progress. There are now several State organizations of women's clubs and many independent organizations. See WOMEN'S CLUBS.

WORK'MAN, FANNY BULLOCK (?–). An American alpinist, born at Worcester, Mass. Educated in New York, France, and Germany, she was married in 1881 to W. Hunter Workman (q.v.), whom she accompanied on extensive travels in North Africa, Asia Minor, and the Far East. In 1899 she made record first ascents for women in the Himalaya, including: Mount Bullock Workman, 19,450 feet; Mount D 41, 20,700 feet; Mount Koser Gunge, 21,000 feet. Her first ascent of one of the Nun Kun peaks in the Himalaya to the height of 23,300 feet in 1906 gave her the world record for mountaineering for women. Mrs. Workman explored and mapped seven glaciers of the Hushe and Kindus systems in 1911, and in 1912 surveyed the 50-mile Rose Glacier and discovered the water parting between the Indus and Chinese-Turkestan regions. She became a fellow of the Royal Geographical Society, lectured before learned societies and alpine clubs, and received various decorations. In collaboration with her husband she wrote books cited in the article on him.

WORKMAN, GEORGE COULSON (1848–). A Canadian biblical critic. He was born at Grafton, Ontario, graduated at Victoria University in 1875, and at Leipzig (Ph.D.) in 1889. He was assistant editor of *The Christian Guardian* in 1876–78, and for some years held Methodist pastorates. At Victoria University, Coburg, he was professor of Old Testament exegesis and literature (1884–88) and of Oriental languages and literature (1889–91). In 1904–08 he occupied the chair of Old Testament exegesis and literature in the Wesleyan Theological College, Montreal. He studied abroad on leave, and after returning to Canada his theological writings were the first important embodiment and defense of the higher criticism in that country. He published: *The Text of Jeremiah* (1889); *The Old Testament Vindicated* (1897); *The Messianic Prophecy Vindicated* (1899); *How to Study the Bible* (1902); *The Servant of Jeremiah* (1907); *At Onement or Reconciliation with God* (1911).

WORKMAN, HERBERT BROOK (1862–). An English Wesleyan Methodist clergyman and educator, born at Peckham. Graduating from Owens College, Manchester, and later from Didsbury College, he entered the ministry in 1885. From 1903 he was principal of Westminster Training College. In 1908 he was elected to the Legal Hundred of his church, and he held various offices, educational and denominational. Besides serving as an editor of *A New History of Methodism* (2 vols., 1909) and contributing to Hastings's *Encyclopædia of Religion and Ethics*, he wrote: *The Church of the West in the Middle Ages* (2 vols., 1898); *The Dawn of the Reformation* (1900); *The Letters of John Hus* (1904); *Persecution in the Early Church*, the Fernley lecture for 1906; *Christian Thought from the first Century to the Reformation* (1911); *Methodism* (1912); *The Evolution of the Monastic Ideal* (1913); *The Martyrs of the Early Church* (1913).

WORKMAN, W(ILLIAM) HUNTER (1847–). An American alpinist, born at Worcester, Mass. He graduated from Yale in 1869, and from Harvard (M.D.) in 1872, and studied also at Vienna, Heidelberg, and Munich. From 1874 to 1889 he practiced medicine at Worcester. In 1892–96, by bicycle, he traveled extensively with his wife, Fanny Bullock Workman (q.v.), in Europe and Algeria, and in 1897–99 in Ceylon, Java, and India. He made an expedition to the Great Biafo Glacier in 1899, and made pioneer ascents of three snow peaks of 18,600, 19,450, and 21,000 feet respectively. In the ascents of Mount Chogo and Mount Lungma in 1903 he was accompanied by his wife, but in addition made an ascent of a snow peak of 23,394 feet. With his wife he explored the Nun Kun group in 1906 and the Hispar Glacier in 1908. The Workmans made their seventh Himalayan expedition in 1911 and their eighth in 1912. In collaboration with Mrs. Workman he wrote: *Algerian Memories* (1895); *Sketches A-wheel in Modern Iberia* (1896); *In the Ice-world of Himálaya* (1900); *Through Town and Jungle* (1904); *Ice-bound Heights of Mustagh* (1908); *Peaks and Glaciers of Nun Kun* (1909); *The Call of the Snowy Hispar* (1910).

WORKMEN'S COMPENSATION. See WORKINGMEN'S COMPENSATION.

WORKS, JOHN DOWNEY (1847–). An American lawyer, jurist, and legislator, born in Ohio Co., Ind. He served in the United States Volunteers during the Civil War, was admitted to the bar in 1868, and practiced law at Vevay, Ind., until 1883, when he took up practice at Los Angeles, Cal. A Republican in politics, he was a member of the Indiana House of Representatives in 1879, judge of the superior court of San Diego, Cal., in 1886–87, and justice, by appointment and election, of the Supreme Court of California in 1888–91. Afterward he resumed practice and identified himself with efforts to secure irrigation. A leader in the clean-up campaign in Los Angeles and in the elimination of race-track gambling in the State, a bitter opponent of the Southern Pacific Railroad and of machine politics, and an advocate of social justice, he was known as an independent and progressive Republican and was indorsed in the primary election of 1910 for the United States Senate over Senator Flint, taking his seat in 1911. As Senator he often coöperated with the Democrats. He was the author, in 1912, of the Senate resolution providing that the President's term be six years and that he be ineligible for re-election. He published *Courts and Their Jurisdiction* (1894), and *Practice, Pleading, and Forms* (3 vols., 1882–86; 4th ed., rev., 1906); *Irrigation* (1900); and numerous periodical articles.

WORKS OF SUPEREROGATION. See SUPEREROGATION, WORKS OF.

WORKSOP, wûrk'sŭp. A town in Nottinghamshire, England, 16 miles southeast of Sheffield, on the Ryton (Map: England, E 3). It has a fine old Norman church, with two lofty towers, a relic of an Augustinian monastery, founded in 1103, and other interesting remains. Malting is the staple industry and there are agricultural implement works, iron and brass foundries, saw mills, and chemical works. Windsor chairs are a specialty of the town. Pop., 1901, 16,112; 1911, 20,387.

WORLD CONFERENCE ON CHRISTIAN UNITY. See CHRISTIAN UNITY, WORLD CONFERENCE ON.

WORLDLY WISEMAN, MR. A character in Bunyan's *Pilgrim's Progress.*

WORLD PEACE MOVEMENT. The dream of the abolition of war is many centuries old, but only in recent decades has any movement for its accomplishment acquired anything like world-wide proportions. The growth of international trade, commerce, and investments has given rise to enormous economic interests dependent on the continuance of peace. The growth of communication and travel has tended to allay national suspicions and arouse national friendliness. Moreover the cost of maintaining the ever-expanding and ever more expensive military equipments necessitated a burden of taxation that impeded the development of economic resources and checked the improvement of social conditions. There have resulted numerous national and international organizations seeking to put an end to war and to preparations for war. For an historical account see ARBITRATION, INTERNATIONAL; CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE; PEACE MOVEMENT; WAR; WAR IN EUROPE.

Bibliography. In addition to publications mentioned under PEACE MOVEMENT, consult: *Les Etats Unis d'Europe* (Bern); *Le Courrier Européen* (Paris); *The International Peace Year Book* (London, 1915); Felix Adler, *World Crisis and its Meaning* (New York, 1915); A. O. Crozier, *Nations of Nations: The Way to Permanent Peace* (ib., 1915); J. T. Hibbon, *Higher Patriotism* (ib., 1915); H. R. Marshall, *War and the Ideal of Peace* (ib., 1915); J. A. Hobson, *Towards International Government* (London, 1916); J. H. Holmes, *New Wars for Old* (New York, 1916); W. I. Hull, *Preparedness* (ib., 1916); P. W. Mackaye, *Substitute for War* (ib., 1916).

WORLD'S COLUMBIAN EXPOSITION. An international exposition held in Chicago, Ill., from May 1 to Oct. 30, 1893, to celebrate the four hundredth anniversary of the landing of Columbus. On April 25, 1890, a bill passed by Congress was approved, providing for the celebration of "the Four Hundredth Anniversary of the Discovery of America by Christopher Columbus by holding an International Exhibition of Arts, Industries, Manufactures, and the Products of the soil, mines, and sea, in the City of Chicago." A World's Columbian Commission was authorized, of which Thomas W. Palmer became president, by whom George R. Davis was appointed director general. The funds for the Exposition consisted of $10,000,000 raised by the city of Chicago, a loan of $2,500,000 from Congress, debenture bonds for $5,000,000 issued by the Exposition authorities, together with miscellaneous contributions from various sources of about $3,000,000, making a total fund of about $20,000,000 that was available for use before the opening day. A site was chosen in Jackson Park in the southeastern part of Chicago, on the shore of Lake Michigan, covering an area of 666 acres, where 150 different buildings were erected.

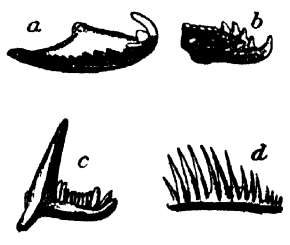
The work of designing and construction was placed under the charge of a Bureau of Construction, of which Daniel H. Burnham was made chief. The principal buildings were constructed of a composition called staff, consisting of a mixture of plaster of Paris, with a little cement, glycerin, and dextrin, in water, which

at a short distance gave the effect of marble. This appearance led to the name of White City, by which the Exposition subsequently became generally known. The following were the larger buildings: Administration Building, in the style of the French Renaissance, surmounted by a gilded dome which formed one of the many conspicuous objects on the ground; Agricultural Building, in the classic Renaissance style; Electrical Building, in the Corinthian style; Fine Arts Building, in the Greek-Ionic order and a pure type of the most refined classical architecture; Forestry Building, in the rustic style, with a veranda, supporting the roof of which was a colonnade consisting of a series of columns composed of tree trunks in their natural state with bark undisturbed; Fisheries Building, in the Spanish style, consisting of a large central structure with two small polygonal buildings connected with it on either end by arcades; Government Building, in the classical style constructed of iron and glass, with an imposing central dome 120 feet in diameter and 150 feet high; Horticultural Building, embracing a central pavilion with two end pavilions, each connected with the central one by a front and rear curtain forming two interior courts. The centre of the pavilions was roofed by a crystal dome, under which were exhibited the tallest palms, bamboos, and tree ferns that could be procured. Machinery Hall was in the best type of the Spanish Renaissance. At the first story a covered loggia furnished a promenade which encircled the entire building. The building was spanned by three arched trusses, and the interior presented the appearance of three railway train houses side by side. Manufactures and Liberal Arts Building, in the Corinthian style, was the largest exposition building ever constructed up to that time. The principal thoroughfare of the building extended longitudinally and was 50 feet wide, while an avenue of like width crossed it at right angles at the centre. The main roof was of iron and glass, and arched an area 1400 feet long by 385 feet wide. Mines and Mining Building, in the early Italian Renaissance style, had columns and arches overhanging the principal entrances, which were richly decorated with sculptured groups and other embellishments emblematic of mining and its allied industries. Transportation Building, in the Romanesque style, had its interior treated similarly to a Roman basilica, with broad naves and aisles. The main entrance consisted of an immense single arch enriched with carvings, bas-reliefs, and mural paintings coated with gold leaf, whence its name of the Golden Doorway. Woman's Building, by Miss Sophia Hayden, in the Italian Renaissance style, was two stories in height, with an open rotunda 70 by 65 feet, which reached through the height of the building and was protected by a richly ornamented skylight. The rotunda was surrounded by a two-story open arcade producing an effect similar to that of the Indian courtyard.

In addition to the foregoing there were numerous State buildings, of which that of California was in the style of the old Missions; that of Florida, a miniature of Fort Marion; that of Massachusetts, a copy of the John Hancock House; and that of Virginia, a suggestion of Mount Vernon. The foreign buildings were in many instances characteristic. Scattered through the grounds were numerous groups of sculpture, of which the most famous was the Columbian Fountain by MacMonnies, facing which was a colossal statue of the Republic by French, and over the peristyle still beyond was a quadriga representing the Triumph of Columbus, while the figures and animals by Kemeys and Proctor were especially noteworthy. The amusement features were collected in a strip of land west of Jackson Park, to which the name of Midway Plaisance was given. During the Exposition a series of international congresses, grouped under 20 departments and 224 general divisions, were held in Memorial Art Palace. The total attendance at the Exposition was 27,539,041, of which 21,479,661 were paid. There were 65,422 exhibitors representing over 250,000 separate exhibits; these were examined by an international jury of awards consisting of 852 judges, about one-half of whom were foreigners. The award, consisting of a bronze medal and diploma, was given to 27,757 exhibitors, or 36 per cent of the whole number catalogued, exclusive of those from France and Norway, whose exhibits were withdrawn from examination. At the close of the Exposition the total receipts from all sources were $33,290,065, while the total disbursements were $31,117,353. An official account of the Exposition is given in a *History of the World's Columbian Exposition Held in Chicago in 1893*, edited by Rossiter Johnson (4 vols., New York, 1897–98).

WORLD SOUL. See ANIMISM.

WORLD'S WOMAN'S CHRISTIAN TEMPERANCE UNION. An international association organized through the instrumentality of Miss Frances E. Willard (q.v.) in November, 1883. Mrs. Margaret Bright Lucas, at that time president of the British Woman's Temperance Association, was the first president. She was succeeded by Miss Willard, who held the position until her death in 1898, when Lady Henry Somerset of England became president. She was succeeded by the Countess of Carlisle of York, England, in 1906. The first world's convention was held in Faneuil Hall, Boston, in 1891, being the first international woman's convention of any kind ever held. Conventions have since been held in Chicago (1893), London (1895), Toronto, Canada (1897), Edinburgh (1900), Geneva (1903), Boston (1906), Glasgow (1910), and Brooklyn (1913). Fifty-eight countries are affiliated with the organization and the presidents of the national societies are ex-officio vice presidents of the World's Union, which has an aggregate membership of about 500,000.



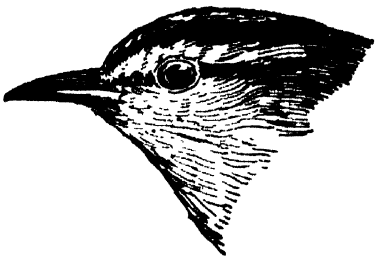
The work of the World's Union is carried on under six main departments. That of organization is in charge of the general officers and has two branches, the young woman's and the Loyal Temperance Legion. The preventive and educational departments have the following bureaus: Sunday school work, moral education, promotion of purity in art and literature, little white ribboners, antinarcotics, antiopium, antigambling, schools of methods, press, literature, medal contest, mercy, school savings, medical temperance, food reform, and labor. The evangelistic department carries on a crusade among penal and charitable institutions, railway men, soldiers and sailors, miners and lumbermen, raises the world's missionary fund, and encourages systematic giving. The social department conducts parlor meetings, counter attractions to the saloon, exhibits, and flower missions. The legal department has bureaus devoted to petitions and legislative work, the protection of native races,

peace and international arbitration, and the franchise. Through the missionary fund World's White Ribbon missionaries are sent out under five-year engagements to aid organization in newer countries. There were 10 such in 1916. Such work had been begun by eight round-the-world missionaries sent out by the National Woman's Christian Temperance Union of the United States. The World Union publishes a *Bulletin* and numerous pamphlets. Besides the numerous publications in the United States there are official papers in England, Scotland, Australia, Canada, India, Burma, New Zealand, Norway, Sweden, Denmark, Finland, and Japan.

The most important special work undertaken by the World's Woman's Christian Temperance Union has been the polyglot petition against legalizing the sale of opium and alcohol, addressed "To the Governments of the World." This petition, written by Miss Willard, has been circulated throughout the world during many years in every important nation. It has received over 7,000,000 signatures and attestations. The petition has been presented to the governments of the United States, Great Britain, and Canada, and eventually will be presented to rulers in all leading countries.

WORM (AS. *wyrm*, Goth. *waúrms*, OHG. *wurm*, Ger. *Wurm*, worm, snake, dragon; connected with Lat. *vermis*, ORuss. *vermie*, worm, Gk. *ῥόμος*, *rhomos*, wood worm). A popular term for a great variety of animals, variously classified. All are of low organization, and generally of elongated form and with very short legs or none at all. Many caterpillars, moreover, maggots, grubs, and other larval forms of insects are popularly, but unscientifically, called worms. See CLASSIFICATION OF ANIMALS; ANNULATA; ASCARIS; CESTODA; EARTHWORM; ENTOZOA; FLATWORM; GORDIUS; LEECH; NEMATHELMINTHES; NEMERTINEA; PALOLO; ROUNDWORM; SCOLECIDA; SERPULA; THREADWORMS; TRICHINA; VERMES; and similar titles.

Fossil Worms. Fossil worms are known from geological formations of all ages. The tube-dwelling worms are represented by *Serpula*, which is common from the Jurassic upward and which is very abundant in some beds of Lower Cretaceous age in Germany, known on that account as the Serpulitenkalk and Serpulitensand. *Spirorbis*, also a recent genus, is common in the Upper Paleozoic formations, where its small spiral tubes are often found on fragments of shell and on the leaves and roots of Devonian and Carboniferous plants. Other Paleozoic genera are *Autodetus*, *Cornulites*, *Conchicolites*, *Ortonia;* and perhaps also *Tentaculites* (q.v.) may be included here. Burrows and trails are common in all beach and sandy shallow-water formations, but the form of the worms that made them can seldom be determined. *Scolithus*, *Arthrophycus*, *Planolites*, *Scolecoderma*, and many other generic terms have been applied to the different forms. Impressions of the bodies of worms and also their excrements are common in the Mesozoic rocks (*Eunicites* and *Lumbricaria*), and have been found also in the Paleozoic; *Nereites* in the Cambrian, and *Planolites* and *Gyrichnites* in the Devonian. Conodonts (q.v.) are found in most formations from Ordovician to Carboniferous age. Consult K. A. Von Zittel, *Textbook of Paleontology*, Eng. trans. by C. R. Eastman (2 vols., New York, 1903; 2d ed., vol. i, London, 1913).



FOSSIL JAWS OF ANNELID WORMS.

a, *Lumbriconereites basalis; b*, *Œnonites rostratus; c*, conodont of *Prioniodus elegans; d*, conodont of *Polygnathus dubius.*

WORM. See ENDLESS SCREW.

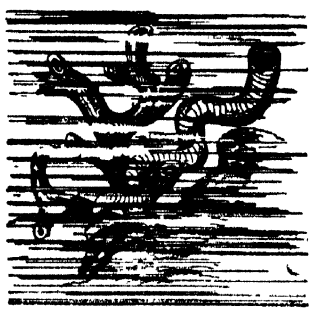
WORM-EATING WARBLER. One of the most interesting and widely distributed of American warblers (q.v.). It is olive-green, yellow on the under surface, with darker stripes on its crown. It makes its nest in a well-hidden hollow of the ground in the woods, and breeds plentifully northward to Illinois and southern New England. Its scientific name is *Helmintheros vermivorus*.

WORM-EATING WARBLER.

WORMELEY, wûrm'lĭ, KATHARINE PRESCOTT (1830–1908). An American translator and author, born in Ipswich, England. The daughter of a British admiral, she came to the United States in girlhood and first gained distinction by her active interest in the relief of Union soldiers during the Civil War. In this connection she published: *The United States Sanitary Commission* (1863); *Letters from Headquarters During the Peninsular Campaign* (1862); and *The Other Side of War* (1888). She translated the works of Balzac (36 vols., 1883–97), Molière (6 vols., 1892), *Versailles Historical Memoirs* (20 vols., 1898–1901), and other works from the French, and wrote a *Memoir of Balzac* (1892).

WORM GEAR (WORM DRIVE or WORM AND WHEEL). See ENDLESS SCREW; GEARING.

WORM GRASS. See SPIGELIA.



WORMS, vôrms. A town of the Grand Duchy of Hesse, Germany, on the left bank of the Rhine, 22 miles north of Heidelberg (Map: Germany, C 4). Its chief structure is the cathedral, dating from the eleventh century, with a richly ornate Gothic portal of the fifteenth century. Second only in interest to the cathedral is the church of St. Paul, now used as a museum. The church of St. Martin (restored in 1888), the Gothic Liebfrauen-Kirche, and the town library, with early historical records and mementos of Luther, are other notable buildings. The town possesses a Luther monument in which numerous statues of his contemporaries are included. An interesting object is the mediæval Jewish synagogue. The town has manufactures of leather, cloth, machinery, shoddy, worsted yarn, chicory, chemicals, slate, and flour. In the vicinity is produced the famous wine known as *Liebfraumilch*. The town has a considerable river and canal trade. Pop., 1910, 46,891. Worms is the Roman *Borbetomagus*. From very early times the town was the seat of a bishop. It became the capital of the Burgundians, and later was occasionally the residence of the Frankish kings. It gradually emancipated itself from the rule of its bishops and became a free Imperial city. In 1122 the famous Concordat (q.v.), which settled the dispute regarding investitures, was concluded here. The most celebrated event in the history of Worms was the holding of the

Imperial Diet of 1521, before which Luther made his sturdy defense. The town suffered greatly in the Thirty Years' War, and in 1689 was almost entirely destroyed by the French, a blow from which it never wholly recovered. In 1801 it was joined to France, and in 1815 to Hesse-Darmstadt.

WORMS. The larger number of entozoa for which the human body is the host are developed in the intestines. The list of wormlike parasites preying upon man is rapidly extending with our increasing knowledge of tropical diseases. For a classification of the parasites attacking man, see article PARASITIC DISEASES and references there given; see also HOOKWORM DISEASE. The intestinal worms of frequent occurrence are *Ascaris lumbricoides*, the lumbricoid or roundworm; *Oxyuris vermicularis*, the threadworm or seat worm; and the *tænia* or tapeworm (q.v.). The lumbricoid is treated under ASCARIS, with regard to its appearance in animals, and under LUMBRICOID in its relations to the human being. The *Oxyuris*, known also as the thread, seat, or pin worm, inhabits the large intestine, and especially the rectum. It is from 2 to 5 lines in length, and is frequently found in large numbers, agglutinated by mucus into a ball. While more frequent in young children, they occur at any period of life. They cause pain in the rectum, itching, and straining, all symptoms being worse at night, interfering with sleep. In girls the entozoa may migrate into the vagina and occasion pruritus vulvæ and leucorrhœa. The treatment is simple. An enema of cold water, salt and water, or infusion of quassia given twice a day for about two weeks eliminates the parasite. Vinegar, camphor, and creosote have also been used.

WORMS. See BORMIO.

WORMS, vôrN, RENÉ (1869–). A French sociologist, born at Rennes and educated there and at the University of Paris. He lectured upon philosophy and social subjects, practiced law as well, and filled several important posts in the administrative service. He was active in founding the Parisian Société de Sociologie and the Institut International de Sociologie, of both of which he became secretary. He edited the *Revue internationale de sociologie*. In Worms's best-known work, *Organisme et société* (1896), he presents human society as a real organism, carrying the analogy much further than Herbert Spencer. His other publications include: *De la volonté unilatérale considérée comme source de l'obligation* (1891); *Précis de philosophie* (1891; 3d ed., 1905); *Eléments de philosophie scientifique et de philosophie morale* (1891); *La morale de Spinoza* (1892); *Philosophie des sciences sociales* (3 vols., 1903–07; 2d ed., 1913); *Les principes biologiques de l'évolution sociale* (1910); *La sexualité dans les naissances françaises* (1912).

A WORMSHELL.

WORMSEED. See CHENOPODIUM.

WORMSEED MUSTARD. See ERYSIMUM.

WORMSHELL. A mollusk of the family Vermetidæ, allied to the fresh-water Melaniidæ, whose body is slender and annelid-like, and whose small uncoiled shells resemble the twisted tubes of some annelids. These mollusks are free and spiral in early life, but soon settle down and become stationary, when the further growth of the shell is uncoiled. Most species are found in Eastern seas. A well-known species is *Vermetus lumbricalis*, which is illustrated herewith.

WORMWOOD (from AS. *wermod*, Ger. *Wermuth;* etymology uncertain). A perennial herb, *Artemisia absinthium*, native in Europe and Asiatic Russia and found also in gardens and by roadsides in the United States and Canada. It has an erect somewhat shrubby stem from 2 to 4 feet high. The plant is aromatic, tonic, and bitter, and was used by the ancients for its medicinal properties. In Europe it is still used as an aid to weak digestion. Its principal use now is in the manufacture of absinthe. The name "wormwood" is sometimes extended to the entire genus *Artemisia*. See ABSINTHE; ARTEMISIA.

WORSAAE, vôrs'ą, JENS JACOB ASMUSSEN (1821–85). A Danish historian and archæologist, born at Veile, in Jutland. He was appointed assistant in the Copenhagen Museum of Northern Antiquities in 1838. In 1847 he was appointed inspector of antiquities in Denmark, and two years later received a commission to arrange and preserve the archæological remains of the country. In 1854 he became professor at Copenhagen University. He later became titular director of Danish antiquities, director of the Museum of Northern Antiquities at Copenhagen (1866), and of the Ethnographical Museum. In 1874–75 he was Minister of Public Instruction and Ecclesiastical Affairs. Among his works may be mentioned: *Danmarks Oldtid oplyst ved Oldsager* (1843; Eng. trans., *The Primeval Antiquities of Denmark*, 1849); *Blekingske Mindesmærker fra Hedenold* (1846); *Minder om de Danske og Nordmændene i England, Skotland og Irland* (1851; Eng. trans., *Memorials of the Danes and Norwegians in England*, 1852); *Den Danske Erobring af England og Normandiet* (1863); *Nordens Forhistorie* (1881; Eng. trans., *Prehistory of the North*, 1886).

WORSHIP (AS. *weor scipe*, honor, from *weor, wur*, worthy, honorable + *-scipe*, abstract suffix, Eng. -ship). The expression of any form of the reverence which man feels for a superior being, and especially for spirits and gods, in any stage of the growth of religion. In primitive religion sacrifice (q.v.) is the central element of worship, and is offered alike to objects of nature worship and to the spirits of the dead. Prayer and other parts of the ritual were originally, for the most part, the accompaniments of sacrifice. Dances and music, used first to arouse or express emotion, early became elements of worship, used in honor of a god. In Judaism worship was especially the sacrifices in the temple. Christianity borrowed its form of worship, not from the temple, but from the synagogue with its prayer, praise, and instruction. The church later drew a sharp distinction between the worship of God (*latria*) and the adoration of the saints (*dulia*), for which properly the term "worship" should not be used. Worship was originally the act of the tribe or community, since the god was a tribal god. When individual religion arose, worship also became individual, and might be offered in private. The value of social worship, however, is so great that individual religions, like Christianity, re-

tain and emphasize it. See LITURGY; PRAYER; RITE; RITUAL.

WORSLEY, wûrz'lĭ. A coal-mining and cotton-manufacturing town in Lancashire, England, 5 miles west-northwest of Manchester. Pop., 1901, 12,448; 1911, 13,906.

WORSLEY, wûrz'lĭ, PHILIP STANHOPE (1835–66). An English poet, born at Greenwich, in Kent. He was educated at the Cholmeley Grammar School, Highgate, and at Corpus Christi College, Oxford, where he won the Newdigate prize for English verse in 1857, and graduated in 1861. His original poems appeared in 1863 under the title, *Poems and Translations* (reprint with additions, 1875). Though they are graceful, Worsley's fame rests on his translations of the *Odyssey* and of the first 12 books of the *Iliad* in Spenserian stanzas. The *Odyssey* was published in 1861 and the *Iliad* in 1865. The *Iliad* was completed by John Conington in 1868. Consult Matthew Arnold's essay *On Translating Homer*.

WORSTED, wŭs'tĕd. See WOOL AND WORSTED MANUFACTURES.

WORT. See BREWING.

WÖRTH, vērt. A village of Alsace-Lorraine, situated on the Sauer, about 10 miles southwest of Weissenburg (Map: Germany, B 4). Here, on Aug. 6, 1870, subsequent to their defeat at Weissenburg, the French under MacMahon were defeated with great loss by the Germans commanded by the Crown Prince of Prussia. The fiercest fighting of the day occurred in the village of Fröschweiler, which was taken by storm after a desperate struggle in the streets. The French lost 8325 men in dead and wounded and 9000 prisoners. The German loss was 9270 men in dead and wounded. French historians refer to it as the battle of Reichshofen. Pop., about 1100.

WORTH, wûrth, CHARLES FREDERICK (1825–95). An Anglo-French dressmaker, born at Bourne, Lincolnshire. In 1846 he went to Paris, and for 12 years was in the employ of Gagelin, a silk weaver. He began to design articles of dress and in 1858 went into business as a lady's tailor. He came to the notice of the Empress Eugénie, and became famous as a designer. The house established by him continued to be one of the best known of its kind.

WORTH, WILLIAM JENKINS (1794–1849). An American soldier, born in Hudson, N. Y. He entered the Twenty-third Infantry as a first lieutenant in March, 1813; served as an aid to General Scott; and was brevetted captain for gallantry at Chippewa, and major for gallantry at Lundy's Lane, where he was severely wounded. In 1838 he was made colonel of the Eighth Regiment of Infantry, and on April 19, 1842, defeated the Seminole Indians at Palaklaklaha. During the Mexican War he served under General Taylor, and for services in the attack on the Bishop's palace at Monterey was brevetted major general. He then served under General Scott in the Southern campaign; greatly distinguished himself at Cerro Gordo, Churubusco, Molino del Rey, and Chapultepec; and on Sept. 13, 1848, received from the authorities of the city of Mexico the overtures for a surrender. After the war until his death he commanded the Department of Texas. A monument to his memory was erected at the intersection of Broadway and Fifth Avenue, New York, in 1858.

WORTHEN, wûr'THen, WILLIAM EZRA (1819–97). An American civil engineer, born at Amesbury, Mass. He graduated from Harvard in 1838, and immediately became engaged in hydraulic work at Lowell and Boston, part of the time under James B. Francis (q.v.). He continued in hydraulic, railway, and mill work in Massachusetts until 1850, when he moved to New York. There he designed many large buildings and the water works of several cities. Worthen was for a time engineer of the New York and New Haven Railroad, and vice president of that road until 1854. He built the dam across the Mohawk River at Cohoes, N. Y., and was sanitary engineer of the Metropolitan Board of Health (New York, Brooklyn, and vicinity) throughout the existence of that board in the late sixties. In 1887 he was president of the American Society of Civil Engineers. He published: *Cyclopædia of Drawing* (1857); *First Lessons in Mechanics* (1862); *Rudimentary Drawing for Schools* (1863).

WORTHIES OF ENGLAND, THE. The greatest work of Thomas Fuller, a voluminous collection of national biographies, published in 1662.

WORTHING, wûr'THĭng. A fashionable watering place on the Sussex coast, England, 10 miles west of Brighton (Map: England, F 6). Its importance began with the nineteenth century. Early fruits are grown under glass here, an industry to which many acres of land are devoted. Pop., 1901, 20,006; 1911, 30,305.

WORTHINGTON, wûr'THĭng-ton, HENRY ROSSITER (1817–80). An American inventor and hydraulic engineer, born at Tarrytown, N. Y. He early devoted himself to the study of steam machinery; invented the independent feed pump, and in 1849 patented the direct-acting steam pump. Five years later he built the first direct-acting compound condensing engine, and soon afterwards he invented the duplex pump. See PUMPS AND PUMPING MACHINERY.

WORTHINGTON, JOHN. See CAMBRIDGE PLATONISTS.

WOTHERSPOON, wŏTH'ẽr-spo͞on, WILLIAM WALLACE (1850–). An American soldier and public official, born in Washington, D. C. He was appointed second lieutenant of the Twelfth United States Infantry in 1873, served with the rank of captain at the time of the Spanish-American War, and in 1905 graduated from the Army War College, of which he was president in 1907–09 and 1910–12. He served on the general staff in 1905–09, was promoted to brigadier general in 1907 and major general in 1912, was assistant to the chief of staff in 1909–10 and 1912–14, and in the latter year served as chief of staff of the United States Army from April to November. Retiring from the United States army, he was appointed by Governor Whitman New York State Superintendent of Public Works in 1915.

WOTTON, wŏt'ŭn, SIR HENRY (1568–1639). An English diplomat and poet. He was born at Boughton Malherbe, in Kent, and educated at Winchester School and at New and Queen's Colleges, Oxford. He traveled for nearly seven years on the Continent. In 1595, after his return to England, he entered the service of Robert Devereux, Earl of Essex, and made a number of foreign journeys in his behalf. Being implicated, through this connection, in the condemnation falling upon Essex for conspiracy (1601), Wotton remained out of England during the remainder of Elizabeth's reign, though once he journeyed from Italy to Scotland, disguised

as an Italian, to warn James VI (afterward James I of England) of a conspiracy against his life. Upon the accession of James I he was recalled to England and appointed Ambassador to Venice in 1604. With two intermissions he retained the post until 1624. In 1624 he became provost of Eton and held the post until his death. Wotton is the author of two poems included in nearly every collection of English verse, "The Character of a Happy Life," and "On His Mistress, the Queen of Bohemia," and a posthumous publication, *Reliquiæ Wottonianæ, or a Collection of Lives, Letters, Poems, with Characters of Sundry Personages and Other Incomparable Pieces of Language and Art* (1651). This volume contained the memoir by Izaak Walton. Consult also P. E. More, *Shelburne Essays*, Fifth Series (New York, 1908).

WOTTON, WILLIAM (1666–1726). An English scholar, born at Wrentham, in Suffolk. His father, trained in the classics by Méric Casaubon, began to teach the boy Latin and Greek at the age of four, and Hebrew at the age of five. In his tenth year William entered Catharine Hall, Cambridge, and the master, John Eachard, recorded that in these languages he was second neither to Hammond nor to Grotius. After graduating B.A. in 1679, Wotton was elected fellow of St. John's College, Cambridge, took orders, and held various livings, eventually becoming a prebendary in Salisbury Cathedral (1705). His scholarship was recognized by an election to the Royal Society (1687). Wotton, one of the most precocious of scholars, is best known as the author of *Reflections upon Ancient and Modern Learning* (1694), written on the side of the moderns in the famous controversy of the time. Among his other works were a *History of Rome* (1701) and *Traditions and Usages of the Scribes and Pharisees* (1718). Wotton also studied Welsh. After his death appeared *Leges Walliœ* (1730), a translation of the laws of Hywel Dda. For the principles on which Wotton was educated, consult Henry Wotton's *Essay on the Education of Children* (London, 1753).

WOUND, wōōnd (AS. *wund*, OHG. *wunta*, Ger. *Wunde*, wound). An injury attended with a division of tissue produced by sudden mechanical force. The skin may be broken, as in an open wound; or it may be unbroken, and deep structures attacked, as in a subcutaneous wound. Wounds are termed penetrating, when they enter a cavity without emerging; perforating, when they enter and emerge from a cavity. All wounds are accompanied by some death of tissue. If great areas are contused or lacerated, death and destruction are great, and graver conditions arise. Wounds may be classified as aseptic, when they are not contaminated by poisonous infection; and as septic, when bacterial or other fermentative agents have been admitted, in which case suppuration and sloughing ensue.

Among the local symptoms of wounds are impairment of function, pain, bleeding, and shock. Severing of muscles may be the result of a wound, leaving a limb powerless. Pain results from laceration of nerves, and may vary in character from a sharp twinge to a dull ache. The amount of hæmorrhage depends upon the nature and size of the wound, and the number and size of blood vessels injured. For shock, see that title. This condition occurs when fat globules gain access to the blood and are carried in the circulation to lodge in some organs and produce death.

Repair is the process by which the cells of the part replace lost tissue. The most economical method is by primary adhesion or first intention. This occurs when parts can be brought together in close coaptation and the wound is aseptic. There may be few or no symptoms of inflammation. Pressure, suturing, or position may secure the coaptation necessary. If this be impossible and the edges must be left apart or there is a large amount of tissue missing, healing by secondary intention or granulation occurs. That is, new tissue grows up in the deepest part of the wound, appearing like a heap of granules, gradually filling the gap, and finally the skin grows across when the granulations reach the surface. After surfaces of a wound have begun to granulate, they may be brought together so that the granulations fuse and the gap is closed. This is called healing by third intention. Subcutaneous wounds heal similarly, the exudations being absorbed, and if there be no bacterial infection the process is rapid. Healing under a blood clot or by scabbing is nature's method of closing small superficial wounds. In the case of a fracture or wound of bone, a callus (or provisional deposit of new bone) occurs, covering the ends of the fragments and cementing them together. Gradually part of this callus disappears after healing is complete.

In treatment the surgeon must first stop the hæmorrhage by ligature, pressure, torsion of arteries, or the application of heat. The wound must then be cleansed and disinfected, all dead or dying tissue, blood, and foreign bodies being removed. The lips of the wound must then be brought together as far as possible, and kept in place by suture (q.v.), or by bandages. Drainage must be secured by the use of a tube, a piece of gauze, or other device, if the wound cannot be closed, or is known to be infected. An aseptic dressing must then be applied. This may be of wool, cotton, gauze, jute, etc., carbolized, sublimated, or treated with boric acid, thymol, iodoform, or other disinfectant. Dressings must be changed and removed, according to indications.

Poisoned wounds may be the results of the microbial infection of glanders, anthrax, rabies, actinomycosis, etc. (qq.v.), or may be due to chemical agents. Dissection wounds are septic wounds generally of great virulence, contracted during post-mortem examinations or the dissection of dead bodies. They are due to microbic poisoning. In many poisoned wounds amputation is necessary, or free incisions to favor suppuration and sloughing off of the attacked tissue. Meanwhile internal supportive treatment is administered. See GUNSHOT WOUND.

Consult G. E. Brewer, *A Textbook of Surgery* (New York, 1915).

WOUNDWORT, wōōnd'wûrt. See STACHYS.

WOUWERMAN, wou'wĕr-măn, PHILIPS (1619–68). A Dutch animal, genre, and landscape painter. He was born at Haarlem, the son of a painter, and probably studied with Frans Hals, and afterward certainly under Pieter Verbeeck, a painter of horses. In 1638, in order to marry a Catholic, he went to Hamburg, where he worked with Evert Decker. On his return he came under the influence of Pieter de Laer. In 1640 he is recorded as a member of the painters' guild, in 1645 as its commissaire. He seems to have acquired much wealth by his art, as for the marriage of his daughter in 1672 he provided a dowry of 20,000 florins. From the foreign scenes in his landscapes, the country houses of

WOUWERMAN

THE SMITHY," FROM THE PAINTING IN THE ROYAL GALLERY, DRESDEN

French aristocracy, a first-hand knowledge of the Alps, and echoes of Italy in the antique, it is assumed that he traveled extensively. He died May 19, 1668. Wouwerman's art shows its greatest originality in the combination of figures and landscape. Both are treated with equal mastery, neither being subordinate, yet without loss of the harmony of the picture. He was, above all else, the painter of the horse, which he portrayed engaged in all of its services to mankind; in battle and hunting scenes, the pampered riding or carriage horse of the rich, the overworked cart horse of the poor. A feature of his pictures is usually a white or gray horse, upon which the high light is concentrated. Wouwerman is a facile draftsman, and his compositions show fertile imagination and poetic feeling. His landscapes are especially good in aërial perspective. The color scheme, at first a warm brownish one, gradually became a silvery gray, giving play to a harmonious coloring with fine discrimination of values. In later life his paintings became careless in execution, too dark, and often inharmonious in color. The most prolific of the Little Masters, he executed over 1000 paintings, of which above seven hundred survive, besides the many figures he painted for the landscapes of others. The Dresden Gallery and the Hermitage, St. Petersburg, each possess fifty, the Cassel and Munich galleries twenty, and he is well represented in the Louvre and various English collections.

His younger brother PIETER (1623–82) developed under Philips's influence, and painted similar subjects, though his work is far inferior to that of his more gifted brother. Many of the works ascribed to Philips are probably by his brother. The works of JAN (1629–66), the youngest member of the family, represent moonlight scenes and sand dunes, and are extremely rare. Consult: Wurzbach, in Dohme, *Kunst und Künstler Deutschlands und der Niederlande* (Leipzig, 1878); Kämmerer, *Ueber die Composition in Wouwermans Gemälden* (ib., 1879); Wilhelm Bode, *Great Masters of Dutch and Flemish Painting* (New York, 1909).

WOVO'KA (Cutter), or JACK WILSON (c.1856–). A Piute Indian prophet of Nevada, the originator of the Messiah or Ghost Dance religion, born in Mason Valley, west of Walker Lake, Nevada. On his father's death, about 1870, the boy was taken into the family of David Wilson, a ranchman from whom he got his "white" name. In 1888–89, while in delirium from fever, Wovoka thought he saw the God of the Indians and all the Indians who had died engaged in their old-time sports and occupations, as before the white man came. He was given a revelation and a dance which he was commanded to communicate to his people, with the promise that by strictly observing the doctrines and ceremonial they would be enabled to rejoin their departed friends in a new Indian earth which was rapidly approaching from the west, stocked with game and everything of the old Indian life, and which would slide over the present earth, driving the whites before it. In the same connection he was to preach the brotherhood of the Indian race, and the abolition of tribal warfare, the war dance, and all that savored of war; to forbid laceration, destruction of property, and excessive grief at funerals, and to permit the equality of women in ceremonial affairs. On his return from the spirit world he at once began to preach the new doctrine, which, in spite of its prohibition of their cherished war and funeral customs, appealed strongly to the Indians for the hope it held out of a happy future. The songs and dances of the ceremonial, popularly known as the Ghost Dance, soon became general among the Piute (q.v.), and the report spread to other tribes across the mountains, which sent delegations to interview and receive instructions from the Messiah until the Ghost Dance had spread to nearly all the Indian tribes from the Sierras to the Missouri River, and from the Canadian frontier almost to the Mexican border. Among the Sioux (q.v.) the religious ferment intensified a feeling of dissatisfaction over certain treaty grievances, resulting in the war of 1890–91. The dance reached its highest point about a year later, after which the excitement rapidly subsided, owing to the failure of the prophecies at the appointed time. It exists now only as a semisocial affair. Consult James Mooney, *The Ghost Dance Religion* (Washington, 1896).

WOYRSCH, voirsh, FELIX (1860–). A German composer, born at Troppau (Silesia). Although he studied for a short time with H. Chevallier in Hamburg, he was practically self-taught. In 1895 he became conductor of the Singakademie at Altona, and in 1903 conductor of the municipal symphony and popular concerts. His compositions include a symphonic prologue to Dante's *Divina Commedia;* two symphonies (C minor and C major), an overture to *Hamlet;* the large choral works with orchestra: *Die Geburt Jesu, Sapphische Ode an Aphrodite, Totentanz, Deutscher Heerbann, Der Vandalen Auszug;* a Passion Oratorio; and the operas *Der Pfarrer von Meudon* (1886), *Der Weiberkrieg* (1890), *Wikingerfahrt* (1896).

WRANGEL, vräng'el, FRIEDRICH HEINRICH ERNST, COUNT (1784–1877). A Prussian general. He was born at Stettin; entered the Prussian army as ensign, 1796; fought in the campaigns against Napoleon, rising to the rank of colonel, and was made major general in 1823 and lieutenant general in 1838. He was given command of the allied forces against Denmark in 1848, but in September he was summoned home, and in November suppressed a popular uprising in Berlin, for which service he was made general of cavalry. He was created a field marshal in 1856, upon the sixtieth anniversary of his entrance into the military service. He commanded the allied Austrian and Prussian forces against Denmark in 1864, but soon after the opening of the war retired from the command.

WRANGEL, or **WRANGELL**, vräng'ĕl, FERDINAND, BARON (c.1794–1870). A Russian explorer and naval officer. He was born in Livonia, and after graduating at the Imperial Naval Academy at St. Petersburg entered the Russian navy. He sailed twice around the world and took part in several scientific expeditions. In 1820 he was placed in command of an expedition planned to explore the Polar regions north of Asiatic Russia. He advanced on sledges to lat. 72° 2′ N., from which point he sighted the open sea beyond. The land known as Wrangel Land was not discovered by him, but was named after him. It was first definitely known by the cruise of an American whaler, T. Long, who sailed along its southern shores in 1867. Wrangel was chief director of the Alaskan colonies from 1831 to 1836. During his administration an observatory was established at Sitka, extensive areas of the territory explored, and

new colonies planted. He was influential in exposing the abuses of the Russian American Company, which prevented an extension of its charter in 1862. In 1849 he became a vice admiral, and from 1853 to 1858 he held the post of Minister of Marine. He opposed the sale of Alaska to the United States. Among Wrangel's works was *Statistische und ethnographische Nachrichten über die russischen Besitzungen, an der Nordwestlichen Kuste von Amerika* (1839). His own complete account of his Polar expedition was published in Russian (St. Petersburg, 1844). A briefer account, being extracts from his diaries, was published in German by Engelhardt (Berlin, 1839), and an English translation, made by Mrs. Sabine and edited by Major Sabine, was entitled *Narrative of an Expedition to the Polar Sea in 1820–23* (London, 1840).

WRANGEL, vräng'ĕl, KARL GUSTAF, COUNT (1613–76). A Swedish commander, born at Skokloster, near Upsala. He entered the military service in 1627, under Gustavus Adolphus. After the death of the King (1632) he served with Bernhard of Saxe-Weimar and Banér. At the death of Banér in 1641, though the command of the army was his by right, he consented to serve under Torstensson. In 1644 he took command of the Swedish fleet and defeated the Danes near the island of Fehmarn. At the close of the Danish war in 1645 he was made Count, and in the following year took command of the Swedish army in Germany. With Turenne he forced Maximilian of Bavaria to an armistice in 1647. He served against the Poles in 1655–56, and against the Danes in 1657–59, with much distinction. In 1674 he led the Swedish army against the Elector of Brandenburg, but was compelled by failing health to leave it, and returned to Sweden.

WRANGELL, răn'gel. A town in the southern district of Alaska, 150 miles southeast of Juneau, on Wrangell Island, at the mouth of the Stikine River (Map: Alaska, N 7). It is in direct steamship communication with Seattle, Wash., and has salmon canneries, a hatchery, and a saw mill. There are also a government school for natives, a wireless station, and a weekly paper. The first independent Indian church of Alaska was organized here in 1876, and in 1877 the first American mission by the Presbyterians. Wrangell was settled by Russians in 1833, and was of considerable importance as a distributing centre at the time of exploitation of the Cassier gold fields. Pop., 1900, 868; 1910, 743.

WRANGEL (răn'gel) **LAND.** An island in the Arctic Ocean, in lat. 71° 32′ N., long. 178° W., about 400 miles northwest of Bering Strait (Map: Arctic Regions, C 5). It is about 70 miles long and 35 miles broad, and consists chiefly of naked granite rocks over 2000 feet high. The island was first reported by natives of the Siberian coast early in the nineteenth century, and the Russian explorer Wrangel, after whom it was named, went in search of it in 1821. It was first sighted, probably by Kellett, in 1849. An American whaler, Thomas Long, coasted along its southern shores in 1867, and it was explored in 1881 by Hooper, who took possession of it for the United States and called it New Columbia. Consult Hooper, Rosse, Muir, and Nelson, *Cruise of the Corwin* (Washington, 1883).

WRANGELL MOUNTAINS. A group of very lofty volcanic mountains situated east of Copper River, Alaska (Map: Alaska, K 4). They have been inactive since 1819. The highest peaks are Castle, 10,314 feet; Drum, 12,002; Jarvis, 12,230; Regal, 13,400; Wrangell, 14,005; and Blackburn, 17,140.

WRANGLER. A term formerly applied to one who attained a first class in the mathematical tripos examination in the University of Cambridge. The word owes its origin to the public disputations formerly held as part of the examinations. The honor men, or those reaching a certain rank, were divided into three classes according to merit, wranglers, senior optimes, and junior optimes, the highest of the first class being known as senior wrangler. The term and the system disappeared after 1909, when the practice of publishing the results of the examination in these classes was introduced with the names in each class arranged in alphabetical order.

WRASSE, răs (from Welsh *gwrachen*). A spiny-rayed marine fish of the family Labridæ. The form is somewhat perchlike, but the back is straighter. There is a single long dorsal fin, the spines of the anterior portion of which are surmounted by short membranous filaments, the posterior portion having short and split rays. The mouth is protrusible, with thick fleshy lips, folded so as to appear double. The colors are generally very brilliant, especially in the Oriental genus *Julus* (for an example, see Colored Plate of PHILIPPINE FISHES). They chiefly frequent rocky shores, and are generally seen in small shoals, often hiding under seaweeds, where they feed on crustaceans, mollusks, and marine worms. They are often caught by bait intended for other fish, but their flesh is not esteemed. No North American fish is popularly called a wrasse, but the family is represented by cunners, tautogs, ladyfishes, doncellas (qq.v.), and similar forms.

WRATH, CAPE. See CAPE WRATH.

WRATISLAW, ALBERT HENRY (1822–92). An English Slavonic scholar. He was born at Rugby of a Czechic family which had settled in England. He was educated at Rugby and at Cambridge, and in 1850 was appointed head master of Felsted School. In 1855 he became the head of King Edward VI's school at Bury St. Edmund's, where he remained till 1879, when he was given the living of Manorbier, Pembrokeshire. In 1889 he retired. His more important works are *Lyra Czecho Slovanska* (1849); *Life, Legend, and Canonization of St. John Nepomuk* (1873); *The Native Literature of Bohemia in the Fourteenth Century* (1878); and *Sixty Folk-Tales from Exclusively Slavonic Sources* (1889).

WRAXALL, răks'ąl, SIR FREDERICK CHARLES LASCELLES (1828–65). An English writer, born in Bristol; a grandson of Sir Nathaniel William Wraxall (q.v.). He lived mostly on the Continent, and served for nine months as assistant commissary in the Crimean War. Among his books are: *Armies of the Great Powers* (1859); *Camp Life* (1860); and *Life and Times of Caroline Matilda, Queen of Denmark and Norway* (1864), a substantial work. He also wrote several novels.

WRAXALL, SIR NATHANIEL WILLIAM (1751–1831). An English historical writer. He was born at Bristol and was educated there. He lived for several years as an author and would-be man of fashion, partly in England and partly on the Continent. In 1780 he entered Parliament, where for 14 years he pursued a somewhat

tortuous and noisy career. After his retirement he devoted himself largely to compiling his historical memoirs and was often involved in quarrels as a result of his publications. Wraxall must be regarded as a fairly accurate raconteur, though his veracity has been often impeached, and his pictures of political life have some historical value. His publications include: *Memoirs of the Kings of France of the Race of Valois* (1777); *Memoirs of the Courts of Berlin, Dresden, Warsaw, and Vienna* (1779); *Historical Memoirs* (1815); and *Posthumous Memoirs* (1836). The last two were republished with additions by H. B. Wheatley in 1884.

WRAY'BURN, EUGENE. A kindly, indolent young barrister in Dickens's *Our Mutual Friend.*

WRECK (AS. *wræc*, exile, misery, from AS. *wrecan*, Icel. *reka*, Goth. *wrikan*, to persecute, Ger. *rachen*, to revenge). A vessel which has been stranded or so badly injured as to be helpless. The number of wrecks which occur annually is very large, amounting to about 4 per cent of all ships in actual use. This has led to the development of a special form of industry called wrecking. The means of raising sunken vessels and removing stranded ones are various. They may be lifted with chains; by submerging hollow caissons, lashing them to the hull and then pumping them out; by closing all openings in the vessel's hull and pumping the water out; by inserting air bags in the hull and inflating them; or by a combination of these methods or of similar ones. Stranded wrecks have been removed in many different ways: by digging a canal to them from deep water; by building launching ways underneath; by cutting them in two (where caught on the rocks) and removing the parts separately and reconnecting them; and of course by hauling them into deep water by means of lines leading to tugs or anchors.

In law, wreck is defined as parts of vessels or their cargoes cast upon the land by the sea. By the common law, fragments of vessels or other property floating upon the sea do not come under this classification; they are known as derelict property, and belong to the jurisdiction of the admiralty courts. By the British statute of 17 and 18 Victoria all jetsam, flotsam, and ligan, which were formerly classed as derelict property, were included under the head of wreck. Under the ancient English law all wreck belonged to the crown, but by the statute above referred to the owner may claim his property upon the payment of the proper salvage. In the United States the disposition of wrecks belongs to the several States. The owner of a wrecked vessel may abandon his property and is not obliged to remove it, even though it obstruct navigable waters, nor is he liable for damage occasioned thereby. Federal statutes provide that stealing from wrecks, obstructing the escape of a crew from a wrecked vessel, extinguishing lights or setting up misleading lights in order to cause wrecks, shall be punished as felony. In the law of marine insurance a vessel becomes a wreck and may be abandoned to the insurers when she becomes so disabled as to be unnavigable. See SAFETY AT SEA; SALVAGE; SHIPWRECK.

WRECKFISH. One of the great deep-water sea bass of the genus *Polyprion*, closely related to the jewfish (*Stereolepis*). It is usually to be seen about floating timber and wrecks. Two species are known—one in the South Pacific, and the other (*Polyprion cernium*), the stone bass of English and cernier of French fishermen. The latter reaches a weight of 86 pounds, and its flesh is excellent. Consult W. Yarrell, *History of British Fishes* (London, 1862).

WREDE, vrā'de, KARL PHILIPP, PRINCE (1767–1838). A Bavarian field marshal, born at Heidelberg. He studied at the university in his native city. In 1799 he led a body of Bavarian volunteers to join the Archduke Charles of Austria in the struggle against the French, and for his conduct in that campaign he was made a major general. After the peace of 1801 he devoted time and labor to the organization of the Bavarian army. He held important commands in the French campaigns against the Austrians, Prussians, and Russians till 1813, when Bavaria joined the allies. He was defeated by Napoleon at Hanau. Soon after he was chosen to command the Fifth Corps of Schwarzenberg's army, and fought in the battles of La Rothière, Bar-sur-Aube, and Arcis-sur-Aube in the campaign of 1814. His services were rewarded by the dignities of field marshal and prince, and by the gift of the domain of Ellingen.

WREN (AS. *wrenna*, *wrænna*, wren; perhaps connected with AS. *wræne*, wanton). A subfamily of birds (Troglodytinæ) of the family Troglodytidæ, the other members of which are the mocking birds and thrashers (qq.v.). The wrens have a slender, slightly curved, and pointed bill, the edge of the mandibles entire; the wings very short and rounded; the tail short and often carried erect; the legs slender and rather long. Their plumage is generally dull. There are about 150 species, natives chiefly of the Northern Hemisphere, and most of them are American. They live near the ground, seeking food among low bushes, etc. About 98 per cent of the food of wrens is composed of grasshoppers, beetles, caterpillars, bugs, and spiders. Perhaps the best-known species, and a good example of the group is the European wren (*Troglodytes troglodytes* or *vulgaris*). It is only about 4 inches long, reddish brown above, with narrow transverse streaks of dark brown, yellowish white below, the greater wing coverts with three or four small beadlike spots of white. It frequents gardens, hedges, and thickets, flitting here and there. The male has a loud, sweet song. The nest is large for the size of the bird, oval, domed above, with an opening on the side, and is composed of hay or moss, lined with feathers.

No other true wren is found in Europe, but the United States has a dozen or more species, several of which agree very closely in color and habits with the European type. Such a one is the familiar house wren (*Troglodytes aëdon*), abundant in the eastern parts of the United States. It is less shy than the European wren, and often builds its nest near houses, and in boxes prepared for it. The nests are made to fill the boxes; and to effect this a large mass of heterogeneous materials is sometimes collected. The song of the house wren is simple but sweet. The male is a very bold, pugnacious bird. In the southern half of the United States another very similar species, Bewick's wren (*Thryomanes bewicki*), is prevalent. It has a much longer tail than the house wren but behaves in the same way, and its nest and eggs (see Plate of EGGS OF SONG BIRDS) are of the typical pattern. The winter wren (*Nannus hiemalis*) is similar to the European wren. It is common throughout North America, but is migratory, breeding in Canada and wintering in the Southern States. It is noted for the surprising loud-

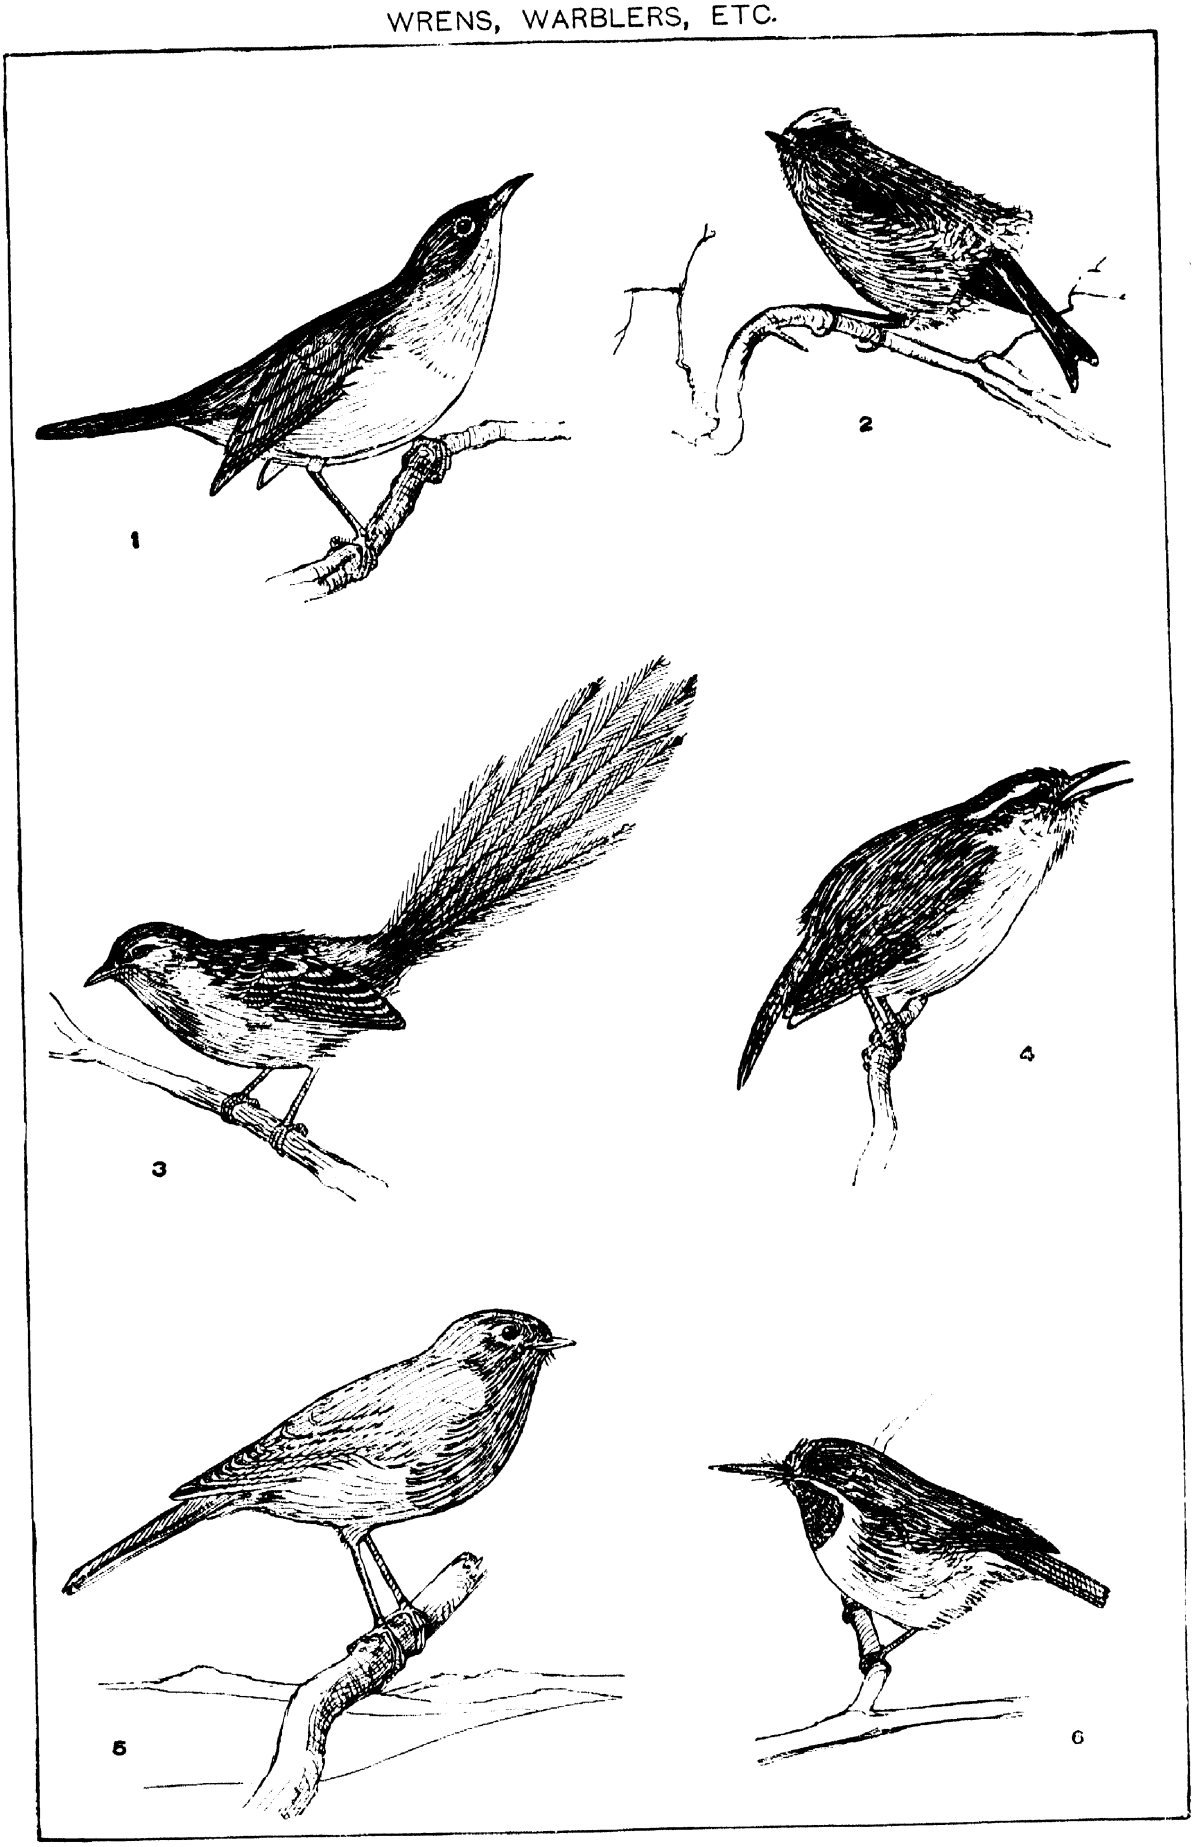
ness as well as the musical quality of its spring song.

The other wrens of the United States belong to still different genera. Among the best known is the Carolina wren (*Thryothorus ludovicianus*), a rather southerly species breeding as far north as Connecticut and wintering from Maryland southward. It is a large species, 5½ inches long, with considerable white in the plumage. This bird is one of the most varied and cheerful vocalists in America; it sings a sweet and gleeful medley of notes, some of which seem culled from other bird songs, so that this fine species is popularly called the mocking wren. (See Plate of WRENS, WARBLERS, ETC.) Other wrens, except marsh wrens (q.v.), are mainly denizens of the West and Southwest. The cactus wrens of the genus *Heleodytes* (large brownish birds frequenting the arid, cactus-growing plains of the Mexican border), and the cañon wrens of the genus *Catherpes*, inhabiting the rocky defiles of the southern Rocky Mountain region and noted for their brilliant singing, are conspicuous Western species; also the rock wren (q.v.).

Consult: Elliott Coues, *Birds of the Colorado Valley* (Washington, 1878); E. H. Forbush, *Useful Birds and their Protection*, published by Massachusetts Board of Agriculture (Boston, 1913); *Bulletin 30, United States Biological Survey;* and references given under BIRD.

WREN, SIR CHRISTOPHER (1632–1723). One of the greatest of English architects, born at Knowle, Wiltshire. He was a graduate of Wadham College, Oxford, fellow of All Souls' in 1653, and Savilian professor of astronomy in 1660. He was one of the founders of the Royal Society and its president in 1681. As a scientist and mathematician of wide reputation he was in 1663 appointed one of the commissioners for the repair of old St. Paul's Cathedral (q.v.), London. There were at this time few trained architects in England, and Wren, finding himself gradually drawn, by frequent consultations on building matters, into a profession which he had not originally intended to follow, devoted himself to its study with increasing enthusiasm. In 1665 he began the Sheldonian Theatre at Oxford and the Library of Trinity College, Cambridge.

The great fire of London in 1666 gave the real opportunity for the manifestation of his genius; from that time on for forty years there was hardly an important building in or near London planned without his aid. Winchester Palace, an extensive addition to Hampton Court, Chelsea Hospital, Marlborough and Buckingham Houses, the old Royal Exchange, Greenwich Hospital (in part), and a series of fifty-three parish churches in London, are among the works. He employed assistants and deputies to carry out his plans, but impressed the stamp of his individual style on everything that was in his charge. He showed extraordinary ability in producing monumental effects with slender financial resources; and was the originator of the modern Renaissance type of steeple. For his great masterpiece, see ST. PAUL'S CATHEDRAL.



Working in an age when his art had declined in England, he raised the standard of taste by his refinement and propriety of design. His work exerted strong influence on the nascent architecture of the American colonies, especially that of churches, though it is doubtful whether he designed any American buildings. He is buried in St. Paul's, his tablet bearing the well-known epitaph, "Si monumentum requiris circumspice" (If thou seek his monument, look about thee). Consult his biography by Elmes (London, 1852) and by Phillimore (ib., 1883); Clayton, *Churches of Sir Christopher Wren* (ib., 1848); Loftie, *Inigo Jones and Wren* (New York, 1893); and the authorities referred to under ST. PAUL'S CATHEDRAL.

WREN TIT, or GROUND TIT. A small, long-tailed, brown, wrenlike bird (*Chamæa fasciata*) of the coast region of southern California, which keeps close to the ground, searching for its insect food, and uttering a low, trilling, titmouse-like call. It nests in low bushes and lays light-blue, unspotted eggs. It is set apart in a family (Chamæidæ) by itself, and is regarded as intermediate between the gnatcatchers and the titmice.

WRESTLING (from *wrestle*, AS. *wræstlian*, *wraxlian*, to wrestle, frequentative of *wræstan*, Icel. *reista*, to twist, probably from AS. *wriþan*, Icel. *riþa*, OHG. *rîdan*, to turn, twist, wrest). A sport in which one person tries to throw another to the ground. The rule with the Greek wrestlers was to secure three throws before the victory was decided. The wrestlers were accustomed to rub their bodies with oil in the belief that they secured a greater pliancy of limb, and doubtless also to check excessive perspiration. In order to obviate the difficulty of grasping each other with firmness owing to the coating of oil, the wrestlers were required either to roll in the dust of the stadium or to be sprinkled with the fine sand kept for that purpose at Olympia. Should one in a match fall and drag his adversary with him, the combat was continued on the ground. The Greek method of wrestling subsequently passed to the Romans, and by them was introduced throughout Europe. Græco-Roman wrestling of to-day must not be confused with the ancient Greek method of wrestling, for it is neither a variation of the ancient Greek or Roman, nor even a compound of the two. The Græco-Roman style was adopted in France about the middle of the nineteenth century and is now the only recognized mode in that country. It was introduced into England in 1869 and 1870. In America it has become popular. The style proper does not begin until both men are on the ground.

"Tripping," the essence of the English game, is barred in the Græco-Roman. Of the distinctive English style of wrestling, the following points are important. In the Cornwall and Devon style the wrestler is required fairly to throw his opponent flat on his back before a decision can be won. In order to secure the throw, two shoulders and one hip must be on the ground, or two hips and one shoulder. This is called three points down. The various artifices used in this style of wrestling are called trips or chips. They include the flying mare, the inside lock forward, the inside lock backward, the double lock, the forehand play, the after play, inside and outside clamp, the pull under, and the cross heave. In the Lancashire style, or catch-as-catch-can, unlimited action is permitted. It is the roughest of English methods but one which most appeals to the athlete. Throttling is forbidden by the rules, but it is almost invariably resorted to. Tripping and catching hold of the legs are permitted, and in the floor work the style comes nearer the French or Græco-Roman than any other method. The most important trips are the double Nelson, the half and three-quarter Nelson, the lock, ham and

6. JAMAICAN GREEN TODY (Todus viridis).

leg, the flying mare, heave and leg holding. The cleanest style, with the most simple rules, is the Cumberland and Westmoreland style, in which the wrestlers on taking hold stand up chest to chest, each combatant placing his chin on his opponent's right shoulder, at the same time grasping him around the body, one man placing his left arm above the right of his antagonist. When both men have secured their hold and are reckoned as fairly on their guard, the struggle begins. If one of them breaks hold (loses his grip), if yet on the ground and his opponent retains his hold, the one who has lost his grip is declared loser. Similarly if either man touches the ground with one knee or any other part of the body, though he may still retain his hold, he is not permitted to recover himself and is declared loser. The Irish, or collar-and-elbow, style is interesting and peculiar. The contestants seize each other by the neck with one hand and by the elbow with the other, and when one of them touches the ground with his hand, knee, back, or side the fall is won. In Burma and throughout the East Indies wrestling has reached a high degree of development. The wrestlers are nude, and skill rather than strength is made to count.

Japanese Wrestling (JUJUTSU or JIUJITSU). A method of self-defense without weapons; the modern form of the old samurai weaponless combat. It first became popular in Japan in the sixteenth century, its origin being traced to Akiyama, a learned physician, who at that period lived at Nagasaki. He is said to have brought it back from China. Before he died, Akiyama had elaborated the Chinese system to the extent of discovering 303 methods of seizing and throwing an opponent, or otherwise disabling him. Jujutsu, owing to its semisecret character, is usually taught in night sessions, and although most pupils gain considerable skill in the system, only a few acquire complete mastery. It is difficult to penetrate the secrets of the higher playing, owing to the close guard of its professors. The rank and file of the police departments of Tokyo, Kobé, and Yokohama are compelled to attain a certain degree of efficiency, although no pupil receives a lesson before taking oath not to reveal the methods. When it is realized that the master of this science can by a slight, swift movement benumb a victim's brain, dislocate his hip or shoulder, burst or twist a tendon, or break an ankle, there is reason for the Japanese system of confining the proficiency in the higher degrees of the art only to men of perfect self-command and good moral character. The Japanese wrestler does not meet his opponent by a sustained counter effort as does a boxer, but instead makes a shirking of physical contact and the avoidance of effort an important part of his play. An aggressive combatant has to be careful that his agressiveness and impetuosity are not deftly deflected so that by the exercise of some little trick he himself is made to dislocate his shoulder or break a limb without expenditure of the slightest effort by his opponent. At the beginning of the twentieth century there were many important kinds of jujutsu throughout Japan, which, although they differed slightly from one another in methods and practice, were practically a unit in teaching the idea of Akiyama. There were 40 different schools in Tokyo alone. Consult: H. I. Hancock, *Jiu-jitsu Combat Tricks* (New York, 1904); W. E. Cann, *Manual of Wrestling* (Battle Creek, Mich., 1912).

WREXHAM, rĕks'am. A municipal borough in Denbighshire, North Wales (Map: Wales, C 3). It stands 12 miles southwest of Chester, on an affluent of the Dee. The town is well built, and St. Giles Church, a handsome edifice in Perpendicular, dating from 1470, with a tower 135 feet in height, is styled "one of the seven wonders of Wales." The churchyard contains the tomb and quaint epitaph of Elihu Yale (1648–1721), founder of Yale College. It is also the seat of the Roman Catholic Bishop of Menevia, whose diocese includes most of Wales. In the vicinity are collieries and lead mines, and the town has ironworks, paper mills, breweries, and important markets and fairs. Pop., 1901, 14,966; 1911, 18,377.

WRIGHT, ADAM HENRY (1846–). A Canadian physician. He was born at Brampton, Ontario, graduated at Toronto University in arts in 1866, in medicine in 1873, and later studied abroad. He was connected with the Toronto School of Medicine (1879–87), the Toronto General Hospital, the Women's Medical College, and, as professor of obstetrics, with Toronto University (from 1887). In 1900 he was elected president of the Ontario Medical Association and in 1909 president of the Canada Medical Association. He published *Lectures on Obstetrics* (1905).

WRIGHT, SIR ALMROTH (EDWARD) (1861–). A British physician. He was educated at Dublin University, and at Leipzig, Strassburg, and Marburg, was a demonstrator of pathology at Cambridge in 1887 and of physiology at Sydney University (Australia) in 1889, and held the chair of pathology in the Army Medical School at Netley from 1892 to 1902. He was also a member of the Indian Plague Commission from 1898 to 1900. In 1906 he was knighted. During the European War he served in 1914–15 as consultant physician in France, where he did a great work in reducing the dangers of wound infection. In 1900 Wright, with others, developed the opsonin (q.v.) theory, a method of measuring the protective substances in human blood. This discovery led to therapeutic inoculation with dead cultures for bacterial infections (see VACCINE THERAPY), and especially to antityphoid inoculation (see TYPHOID FEVER), in which he did pioneer work. His publications include: *Treatise on Anti-Typhoid Inoculation* (1904); *Principles of Microscopy* (1906); *Studies in Immunisation* (1909); *Technique of the Teat and Capillary Glass Tube* (1912); *The Unexpurgated Case against Woman Suffrage* (1913); *Wound Infections* (1915).

WRIGHT, ARTHUR WILLIAMS (1836–1915). An American physicist, born at Lebanon, Conn. He graduated at Yale in 1859, and was an instructor in the Sheffield Scientific School in 1867–68. He studied in Heidelberg and Berlin in 1868–69; was professor of physics and chemistry in Williams College in 1869–72; and at Yale served as professor of molecular physics and chemistry in 1871–87, and thenceforth until his retirement in 1906 as professor of experimental physics. He contributed numerous scientific papers, chiefly on astronomical and electrical subjects, to various publications, and became a fellow of the Royal Astronomical Society of Great Britain and a member of the National Academy of Sciences. He did much to make the X-ray of practical use.

WRIGHT, CARROLL DAVIDSON (1840–1909). An American economist and statistician, born in

Dunbarton, N. H. He began to study law in 1860, but his course was interrupted by the Civil War, in which he served first as a private and finally as a colonel in the Union army. He was admitted to the bar in 1865; served two years (1871–72) in the Massachusetts Senate; and from 1873 to 1885 did distinguished service as chief of the Massachusetts Bureau of Labor Statistics. In this position he superintended the State censuses of 1875 and 1885 and was in charge of the Tenth United States Census in his State. In 1885 he became the first chief of the United States Bureau of Labor and was continued in this position irrespective of the party in power until 1902. He then resigned to become president of Clark College, Worcester, Mass. He had charge of the completion of the census of 1890; made various investigations for Congress; was a member of the Anthracite Coal Commission in 1902; and served on many other boards of conciliation. Wright served as president of the American Statistical Association, the American Social Science Association, the American Unitarian Association, and the American Association for the Advancement of Science. From 1895 to 1903 he had an honorary chair of political science in the Catholic University in Washington. He lectured at Harvard, Johns Hopkins, Michigan, and Northwestern universities at various times; was an original trustee of the Carnegie Institution and in charge of its section on the economic history of the United States; was corresponding member of learned societies in England, Russia, France, and Germany; and was decorated with the Cross of the Legion of Honor of France. His writings include: *The Industrial Evolution of the United States* (1895); *Outlines of Practical Sociology* (1899); *Some Ethical Phases of the Labor Question* (1902); *Battles of Labor* (1906); *The Apprenticeship System in its Relation to Industrial Education* (1908). Consult H. G. Wadlin, *Carroll Davidson Wright, a Memorial* (Boston, 1911).

WRIGHT, CHARLES HENRY HAMILTON (1836–1909). An Anglican clergyman and scholar, born in Dublin, Ireland, and educated at Trinity College, Dublin. Besides holding various charges, he was Bampton lecturer (1878), Donnellan lecturer (1880), and Grinfield lecturer on the Septuagint at Oxford (1893–97); examiner in Hebrew at the University of London (1897–99), at Victoria University, Manchester (1897–99), and at the University of Wales (1897–1901), and from 1898 to 1907 clerical superintendent of the Protestant Reform Society. His publications include: *Grammar of Modern Irish* (1855; 2d ed., 1860); *Book of Genesis in Hebrew* (1859); *Bunyan's Works with Notes* (1866); *Biblical Essays* (1885); *An Introduction to the Old Testament* (1890; 4th ed., 1898); *Roman Catholicism* (1896; 4th ed., 1909); *Genuine Writings of St. Patrick, with Life* (1902); *Daniel and his Prophecies* (1906).

WRIGHT, CHAUNCEY (1830–75). An American physicist and philosophical writer, born in Northampton, Mass. He graduated at Harvard in 1852, and became a computer for the *American Ephemeris and Nautical Almanac*, then just established. By frequent contributions to scientific periodicals he won a reputation as a physicist and mathematician. He was corresponding editor of the American Academy of Arts and Sciences from 1863 to 1870, delivered a course of university lectures at Harvard on the principles of psychology, and was an instructor at Harvard in mathematical physics in 1874–75. He published at intervals between 1864 and 1875 a notable series of articles in the *North American Review*, on topics suggested by the works of John Stuart Mill, Charles Darwin, Herbert Spencer, and Alexander Bain. He was also a frequent contributor to the *Nation*, and in 1871 published two papers on the "Genesis of Species" in reply to St. George Mivart's attack on the theory of natural selection, which were republished in England at Darwin's instance. A collection of his writings with a biographical sketch by Charles Eliot Norton was published under the title *Philosophical Discussions* (1877). Consult a chapter in John Fiske, *Darwinism and Other Essays* (Boston, 1885).

WRIGHT, ELIZUR (1804–85). An American journalist and Abolitionist, born in South Canaan, Conn. He graduated at Yale in 1826, and was professor of mathematics and natural philosophy at Western Reserve College, 1829–33. Then he settled in New York, where he was for five years secretary of the Antislavery Society, editing within that time two antislavery periodicals, *Human Rights* and the *Quarterly Anti-Slavery Magazine*. In 1839 he went to Boston and edited the *Massachusetts Abolitionist*, the *Chronotype*, and its successor, in 1850, the *Commonwealth*. He was State insurance commissioner of Massachusetts in 1858–66, and he wrote frequently on insurance and political topics.

WRIGHT, FANNY (MADAME FRANCES D'ARNSMONT) (1795–1852). A Scottish-American philanthropist and reformer, born at Dundee, Scotland. In 1818 she visited the United States, and after her return to Great Britain in 1820 she wrote a volume of *Views of Society and Manners in America*, which was published in London the following year and in Paris in 1822. Five years later she again visited the United States, and, becoming interested in the slavery question, she purchased land and founded a colony of free negroes at Neshoba, now Memphis, Tenn. The colony proved a failure, however, and the colonists were finally settled in Haiti. During 1833–36 she attracted considerable attention as a fearless and radical lecturer on social problems. She then, for a time, edited the *Gazette*, and later the *Free Enquirer* at the Owen community of New Harmony, Ind. During a visit to France in 1838 she married a M. D'Arnsmont, but soon afterward separated from him, and, returning to the United States, made her home in Cincinnati. Her published works include: *Altdorf*, a tragedy (1817); *A Few Days in Athens*, a defense of the philosophy of Epicurus (1822); and *A Course of Popular Lectures on Free Inquiry, Religion, Morals, Opinions, etc.* (1829; 6th ed., 1836). Consult Amos Gilbert, *Memoir of Fanny Wright, the Pioneer Woman in the Cause of Women's Rights* (Cincinnati, 1855).

WRIGHT, GEORGE FREDERICK (1838–). An American theologian and geologist, born at Whitehall, N. Y., and educated at Oberlin College and Theological Seminary. After holding Congregational pastorates, he was professor of New Testament language and literature at Oberlin Seminary from 1881 to 1892, and then professor of the harmony of science and religion until 1907, when he became president of the Ohio Historical and Archæological Society. He served on the United States Geological Survey in 1884–92. His publications include: *Studies in Science and Religion* (1882); *Glacial Bound-*

ary in Ohio, Kentucky, and Indiana (1889; 5th ed., enl. and rev., 1911); *The Ice Age in North America* (1889; 5th ed., 1911); *Man and the Glacial Period* (1892; 2d ed., 1896); *Greenland Icefields and Life in the North Atlantic* (1896); *Scientific Aspects of Christian Evidences* (1898); *Asiatic Russia* (2 vols., 1902); *Scientific Confirmations of Old Testament History* (1906); *Origin and Antiquity of Man* (1912); *See Ohio First* (1915).

WRIGHT, HAROLD BELL (1872–). An American novelist. He was born at Rome, N. Y. He was employed as a painter and decorator in 1887–92, and as a landscape painter in 1892–97. Entering the ministry of the Christian (Disciples) Church, he held various Western pastorates between 1897 and 1908. His books, some of which were very popular and circulated widely, include: *That Printer of Udell's* (1903); *The Shepherd of the Hills* (1907); *The Calling of Dan Matthews* (1909); *The Uncrowned King* (1910); *The Winning of Barbara Worth* (1911); *Their Yesterdays* (1912); *The Eyes of the World* (1914); *Hidden Things* (1915).

WRIGHT, HORATIO GOUVERNEUR (1820–99). An American soldier, born at Clinton, Conn. He graduated at West Point in 1841, entered the corps of engineers, for about six years was engaged in important engineering work for the government, and in 1855 was promoted to be captain. In April, 1861, he went as chief engineer on the expedition sent to destroy the Norfolk Navy Yard. He was chief engineer of General Heintzelman's division at the first battle of Bull Run and he held the same position in the Port Royal expedition, during which he also commanded a brigade. He became brigadier general of volunteers in September, 1861, and in 1862 commanded the land forces which captured Fernandina, Jacksonville, and St. Augustine. In 1864 he was promoted to be major general of volunteers, and brevetted colonel in the regular army for gallantry at Spottsylvania, where he had been wounded. When General Early threatened Washington in July, 1864, Grant sent Wright with the Sixth Corps to defend the national capital. After driving the Confederates as far south as Winchester, Wright took part in the Shenandoah campaign, was again wounded at Cedar Creek, and later rejoined Grant before Petersburg, where he led his troops in the assault on April 2, which broke the Confederate line and ended the siege. For this he was brevetted major general in the regular army. He was commissioned lieutenant colonel of engineers on Nov. 23, 1865. After the close of the Civil War he was a member of various important commissions, and in June, 1879, was promoted to the rank of brigadier general and was made chief of engineers. He retired in 1884.

WRIGHT, SIR JAMES (1716–85). A British Colonial Governor, born in Bloomsbury, London. He entered Gray's Inn, London, in 1741, was called to the bar, and practiced in Charleston, S. C. He became agent of that Colony, and on May 13, 1760, was appointed Lieutenant Governor of Georgia, and in 1762 Governor. The attempt of South Carolina to extend her jurisdiction over parts of Georgia was defeated and the territory of the latter Colony was enlarged through treaties with the Indians. Wright was able to cause a limited use of the stamps provided under the Stamp Act, for which use Georgia was much blamed by the other Colonies. In 1771–73 he visited England and was created a baronet for his services. On his return he was unable to prevent the appointment of a committee of correspondence, but did cause Georgia to be unrepresented in the First Continental Congress in 1774. The Liberty Boys seized the magazine in Savannah in 1775 and took charge of the port. On June 18, 1776, Wright was arrested, but escaped to a man-of-war in the harbor and remained until after an unsuccessful attempt to take the city, when he returned to England. On the recapture of Savannah by the British, Dec. 29, 1778, he returned and attempted to institute severe measures against the Revolutionary party. Wright abandoned the province July 11, 1782, and was active in endeavoring to secure compensation for the American Loyalists. In return for his efforts and his own losses he received a pension of £500. Consult Georgia Historical Society *Collections* (1873).

WRIGHT, JOHN HENRY (1852–1908). An American classical scholar, born at Urumiah, Persia. He graduated in 1873 at Dartmouth College, to which, after two years (1876–78) at Leipzig, he returned to be associate professor of Greek. In 1886 he was appointed professor of classical philology and dean of the Collegiate Board in Johns Hopkins, and a year later was called to be professor of Greek at Harvard, where in 1895 he was made dean of the Graduate School. In 1894 he was president of the American Philological Association. He edited Collignon's *Manual of Greek Archæology* (Eng. trans., 1886) and *A History of All Nations* (24 vols., 1902). He was associate editor (1888–1906) of the *Classical Review*, editor in chief (1897–1906) of the *American Journal of Archæology*, and associate editor (1907–08) of the *Classical Quarterly*.

WRIGHT, JOSEPH (1756–93). An American portrait painter. He was born at Bordentown, N. J., the son of Patience Wright, a noted modeler of miniature heads in wax. In 1772 he went to London, where he studied designing, but devoted himself particularly to portrait painting. In 1782 he went to Paris, where he had the patronage of Benjamin Franklin, and the following year he returned to the United States. He painted a three-quarter length portrait of General Washington (1783), then a portrait of General Washington and his wife, and he also executed a miniature profile of Washington from life. Other portraits include those of John Jay (1786, Historical Society, New York) and James Madison. In 1792 President Washington appointed him draftsman and die sinker of the newly established mint at Philadelphia, and he designed the earliest coins and medals issued by the government.

WRIGHT, JOSEPH (1855–). An English philologist. In 1891 he was appointed deputy professor, and in 1901 professor, of comparative philology at Oxford. In 1899 he was granted a civil-list pension of £200 a year to help him in completing his valuable *English Dialect Dictionary* (6 vols., 1896–1905). His works include primers of *Old High German* (1888; 2d ed., 1906), *Middle High German* (1888; 2d ed., 1899), and *Gothic* (1892; 2d ed., 1899); *Grammar of the Dialect of Windhill* (1892); *English Dialect Grammar* (1905); *Historical German Grammar*, vol. i (1907); *Old English Grammar* (1908; 2d ed., 1914); *Grammar of the Gothic Language* (1910); *Comparative Grammar of the Greek Language* (1912). He was responsible (1888) for vol. i of an Eng-

lish translation of Brugmann's *Grundriss der vergleichenden Grammatik der indogermanischen Sprachen.*

WRIGHT, LUKE E. (1846–). An American lawyer, administrator, and cabinet officer. He was born at Memphis, Tenn., where he was admitted to the bar. He took an active part in the relief work during the yellow fever epidemic of 1878. From 1880 to 1888 he was Attorney-General of the State. In 1896 he supported Palmer and Buckner, the Gold Democratic candidates for the presidency and vice presidency. A member of the Philippine Commission in 1900–04, he was president of the Commission in 1903–04, and served as Governor of the Philippines in 1904–06. In 1906–07 Wright was Ambassador to Japan, and in 1908–09, Secretary of War in President Roosevelt's cabinet.

WRIGHT, MABEL OSGOOD (1851–). An American author, born in New York City. In 1884 she was married to James Osborne Wright, an Englishman. She became president of the Audubon Society of the State of Connecticut on its organization in 1898. Beginning as a writer about children, nature, and outdoor life, she received a cordial reception from the public, but concealed her identity as the author of later books, novels, until they had won recognition independently. Much of the material to which she gave attractive literary expression she found in the large garden at her home in Fairfield, Conn. Her writings include: *The Friendship of Nature* (1894); *Birdcraft* (1895); *Four-footed Americans* (1899); *Flowers and Ferns in their Haunts* (1901); *The Garden of a Commuter's Wife* (1901), under the pseudonym of Barbara; *Dogtown* (1902); *The People of the Whirlpool* (1902); *The Garden, You, and I* (1906); *The Open Window* (1908); *Poppea of the Post Office* (1909); *The Love that Lives* (1911); *The Stranger at the Gate* (1913).

WRIGHT, MARCUS JOSEPH (1831–). An American soldier and author, born at Purdy, Tenn. He was admitted to the bar, and practiced at Memphis. During the Civil War he was military governor of Columbus, Ky., from February, 1862, until its evacuation, and with his regiment was present at Belmont and Shiloh. After serving on the staff of Gen. B. F. Cheatham, he became brigadier general, Dec. 13, 1862, and fought at Chickamauga and Missionary Ridge. In 1863–64 he was in charge of the district of Atlanta. After the evacuation of the city he commanded at Macon, and then in northern Mississippi and western Tennessee. After 1878 he was agent of the United States War Department for collection of military records. He published *Life of Gov. William Blount* (1884); *Life of General Scott* (1894); *Analytical Reference* (1904); *Tennessee in the War* (1908); *General Officers of the Confederate Army* (1911); *The Social Evolution of Woman* (1912).

WRIGHT, ORVILLE (1871–). An American aviator and designer of aëroplanes. He was born at Dayton, Ohio. With his brother, Wilbur Wright (q.v.), he devoted his attention after 1903 to the perfecting of a biplane of their own make. Orville Wright made numerous flights in the United States and abroad, and in 1909 was awarded a gold medal by the French Academy of Sciences. He received an honorary B.S. from Earlham College, Ind., LL.D. from Oberlin, and Sc.D. from Trinity. In 1915 he sold out his interest in the Wright Aëroplane Company at Dayton, but remained with the company as consulting engineer. In the same year he was appointed to the United States Naval Consulting Board. See AËRONAUTICS, *Aviation.*

WRIGHT, ROBERT RAMSAY (1852–). A Canadian biologist and educator. He was born at Alloa, Scotland, graduated at Edinburgh University in 1873, went to Canada in 1874, and the same year was appointed professor of natural history in University College, Toronto. In 1887–1912 he was professor of biology in the University of Toronto, where he was also vice president of the university and dean of the faculty of arts from 1901. In 1901, also, he was appointed assistant director of the biological station of Canada. Wright was president of the Canadian Institute, the American Association of Anatomists, and the Royal Society of Canada. He contributed many papers to scientific periodicals.

WRIGHT, SILAS (1795–1847). An American political leader, born at Amherst, Mass., May 24, 1795. He graduated at Middlebury College, Vt., in 1815, was admitted to the bar in 1819, and began the practice of his profession at Canton, N. Y. From 1823 to 1827 he was a member of the State Senate, acting with the Bucktail faction in opposition to the policy of De Witt Clinton. He rendered conspicuous service in the State militia, of which he became brigadier general in 1827. In 1827–29 he was a Democratic member of Congress, but voted for the tariff Act of 1828. He was then Comptroller of the State of New York until 1833, when he was chosen to succeed William L. Marcy in the United States Senate. As a senator he supported the administration of President Jackson, advocated the establishment of the subtreasury system, and voted for the annexation of Texas. On the slavery question he maintained the right of petition and the sovereignty of Congress in the Territories, although he favored the exclusion from the mails of Abolition literature calculated to excite the prejudices of the Southern States. In 1844 he was elected Governor of New York, chiefly on account of the factional fight between the Hunkers and Barnburners, led by Marcy and Van Buren respectively, but was defeated for reëlection. He opposed the calling of the constitutional convention of 1846, vetoed a bill for canal improvements, and took strong measures against the antirent disturbances. Upon the expiration of his term in 1847 he retired to his farm. He died at Canton, N. Y., Aug. 27, 1847. Consult the *Lives* by Gillet (Albany, 1874), Hammond (Syracuse, 1848), and Jenkins (Auburn, 1847).

WRIGHT, THOMAS (1809–84). A British paleontologist, born at Paisley, Renfrewshire, Scotland, and educated at the Royal College of Surgeons, Dublin, and at St. Andrews. He practiced as a physician, but it was as a geologist that he became chiefly distinguished. His collection of Jurassic Echinodermata and Cephalopoda was unsurpassed. In 1878 he won the Wollaston medal. He wrote: *British Fossil Echinodermata of the Oölitic Formations* (1860–61); *The Cretaceous Echinodermata* (1864); and *Lias Ammonites* (1878–84).

WRIGHT, THOMAS (1810–77). An English antiquary, born at Tenbury in Shropshire and educated at Trinity College, Cambridge. In 1836 he went to London and in 1837 he was elected a fellow of the Society of Antiquaries. He was one of the founders of the Camden So-

ciety (1838), of the Percy Society (1841), of the Shakespeare Society (1841), and of the British Archæological Association (1843). Wright published nearly a hundred works, including translations and books edited for various learned societies. He was careless and inaccurate to an astonishing degree, and yet he deserves much credit for opening the way to better equipped scholars. The range of his researches is indicated by the following partial list of his works: *Early English Poetry*, an anthology in black letter (4 vols., 1836); *The Latin Poems Commonly Attributed to Walter Mapes* (1841); *Specimens of Old Christmas Carols* (1841); an edition of the *Canterbury Tales* (1847–51); *Popular Treatises on Science, Written During the Middle Ages* (1841); *The Chester Plays* (1843–47); *Reliquiæ Antiquæ: Scraps from Ancient Manuscripts, Illustrating Early English Literature and the English Language* (1839–43); *Queen Elizabeth and her Times* (1838); *St. Patrick's Purgatory* (1844); *Wanderings of an Antiquary, Chiefly upon the Traces of the Romans in Britain* (1854); *Essays on Archæological Subjects* (1861); *A History of Domestic Manners and Sentiments in England During the Middle Ages* (1862); *Political Poems and Songs Relating to English History* (1859–61); and *Feudal Manuals of English History* (1872).

WRIGHT, THOMAS (1859–). An English author. He was born at Olney, in Buckinghamshire, and was educated at Buxton College, Forest Gate. At Olney he became principal of the Cowper School. His writings comprise: *The Town of Cowper* (1886); the standard *Life of William Cowper* (1892); lives of Defoe (1894), Edward Fitzgerald (1904), Sir Richard Burton (1905), Walter Pater (1907), Col. Fred Burnaby (1908), William Huntington (1909), Isaac Watts (1914), and others. In several of his biographies he did valuable work, notably in the case of his *Cowper* and *Burton;* but he often fails in taste, sympathy, and insight, as his *Pater* only too clearly proves. His *Correspondence of William Cowper* (4 vols., 1902) should also be mentioned. Wright wrote, too, some verse and some fiction.

WRIGHT, WILBUR (1867–1912). An American pioneer in aviation. He was born near Millville, Ind. With his brother, Orville Wright (q.v.), he became interested in aëronautical experiments with kites and gliding machines at Dayton, Ohio. In 1903 they began fruitful experiments at Kittyhawk, N. C. The Wright brothers built a number of biplanes in 1906 and in 1908 went to France, where Wilbur Wright won the Michelin prize on September 21 of that year. During the Hudson-Fulton celebration in New York City in 1909 he flew from Governor's Island up the Hudson River as far as Grant's Tomb and returned. The French patent rights of the Wright machine were disposed of for $100,000, and the machine was adopted by the United States army. Further experiments were made at Kittyhawk by the brothers with a motorless glider in 1911. Wilbur Wright received a gold medal from the French Academy of Sciences in 1909. See AËRONAUTICS, *Aviation.*

WRIGHT, WILLIAM (1830–89). An English Orientalist, born at Mallai on the Nepal frontier, India. He studied at St. Andrews, Edinburgh, at Halle, and at Leyden, gaining a wide knowledge of Syriac and Arabic under such teachers as Rödiger and Dozy, and adding an acquaintance with Sanskrit. He was professor at University College, London (1855–56), and at Trinity College, Dublin (1856–61). From 1861 to 1870 he was engaged in cataloguing the Syriac manuscripts in the British Museum (published 1871). In 1870 he became professor of Arabic at Cambridge. He assisted in preparing the Syriac lexicon of Payne Smith and the Arabic lexicon of Dozy, and published: in Arabic, the *Travels of Ibn Jubair* (1852); *Opuscula Arabica* (1859); *Kamil of Al Mubarrad* (1864–82); and an Arabic grammar, based on *Caspari,* but in the later editions practically an independent work (1859–62; 3d ed., by de Goeje, 1896–98); in Syriac the *Homilies of Aphraates* (1869); *Apocryphal Acts of the Apostles* (1871); *Chronicle of Joshua the Stylite* (1882); and *Book of Kalilah and Dimnah* (1883). His *Lectures on the Comparative Grammar of the Semitic Languages* was published posthumously (1890), edited by his successor at Cambridge, Robertson Smith.

WRIGHT, WILLIAM ALDIS (1836–1914). An English scholar. He was educated at Trinity College, Cambridge, of which college he was vice master from 1888 to 1912. With William George Clark (q.v.) he collaborated on the Cambridge Shakespeare (9 vols., 1863–66; 2d ed., 1891–93), the Globe Shakespeare (1864), and the Clarendon Press series of single Shakespearean plays (1868–97). With J. Eastwood he edited *The Bible Word Book* (1866; rev. ed., 1884). He also contributed largely to Smith's *Dictionary of the Bible* (1860–66). Among the works edited independently are Bacon's *Advancement of Learning* (1869); the *Chronicle of Robert of Gloucester* (1887); *Letters and Literary Remains of Edward FitzGerald* (1889); *Letters of FitzGerald to Fanny Kemble* (1895); *Facsimile of the Milton MS. in the Library of Trinity College, Cambridge* (1899); *FitzGerald's Miscellanies* (1900); *More Letters of FitzGerald* (1901); *Works of FitzGerald* (7 vols., 1903); *English Works of Roger Ascham* (1904); *The Hexaplar Psalter* (1911).

WRIGHTIA, rīt'ī-ȧ (Neo-Lat., named in honor of William Wright, a Jamaica physician and botanist of the eighteenth century). A genus of plants of the family Apocynaceæ, containing some of the greatest twining shrubs of the East Indies. Attaching themselves to trees for support, they finally attain a treelike thickness and height, and kill the supporting trees by their choking embrace. The timber of some species, as *Wrightia tomentosa* and *Wrightia coccinea,* is valuable. The latter species is a large tree, the other treelike species being comparatively small. *Wrightia zeylanica,* a native of Ceylon, yields Conessi bark, which was formerly a popular medicine. *Wrightia tinctoria,* common in many parts of India, yields an inferior indigo.

WRIOTHESLEY, rī'ŭths-lĭ *or* rŏts'lĭ, HENRY. See SOUTHAMPTON, EARL OF.

WRIST DROP. See LEAD; NEURITIS; OCCUPATIONAL DISEASES.

WRIT (from AS. *wrītan,* to write, OHG. *rīzan,* Ger. *reissen,* to tear). A mandatory precept issued by a court in the name of the State for the purpose of compelling a designated person to do some act specified therein. Under the common-law system of practice all actions were begun by original writs or by bill. The dates of the origin of the older writs are not certain, but they provide only for the redress of certain

flagrant wrongs which recurred most frequently. These writs were issued by the chancellor or by the clerks of the Court of Chancery in the name of the King. There was a long period during which no new writs were devised and justice was often denied because the circumstances of a case were not similar to those alleged in any existing writ. This hardship led to the enactment of the Statute Westminster II (13 Edw. I, ch. 24), by which it was provided that where there was an injury or wrong which was similar (*in consimili casu*) to a recognized wrong, for which there was a remedy under an existing writ, the Court of Chancery should frame a writ to cover the new facts. The statute was not at first liberally construed, but it resulted in several additions to the original writs and was ultimately responsible for the legal development of practically all the modern law of torts and contracts. The forms of the original writs were preserved in a court record known as *The Register of Writs.*

An original writ contained a short statement of the facts complained of, and directed the sheriff to command the defendant to satisfy the claim; and if he failed to do so, to summon him to appear in court and answer the complaint. As each writ could be used to begin an action upon any state of facts practically similar to those alleged in it, the complaint in a writ was usually a fiction, and the plaintiff was permitted to prove the actual facts upon which he based his claim. This use of fictions became the distinctive feature of common-law pleading and continues where that system prevails. Among the more important writs for the beginning of real and mixed actions are: The writ of right, for the recovery of real property; formedon, for the recovery of lands; dower for the enforcement of a widow's right of dower; quare impedit, to ascertain the right of presentation to a benefice or to try title to an advowson; writ of entry, to try title to land. The most important writs for the beginning of personal actions are: debt, for recovery of a sum of money due; covenant, to recover for breach of a promise under seal; detinue, for the specific recovery of goods unlawfully detained; trespass on the case, for any wrong which could not be redressed by the remedies of covenant or trespass, and out of this writ sprang the actions of trover and assumpsit. If the defendant did not appear in response to an original writ he was arrested under a judicial writ known as a capias ad respondendum. Other writs were the writ of subpœna, of error, and of certiorari for the review of judicial decisions.

Habeas Corpus. This most important writ, sometimes known as the bulwark of English liberty, is treated at length under its own title, which see.

A writ may be issued and served on Sunday in most States, but usually cannot be made returnable on that day. Statutes relating to this remedy usually prescribe a penalty against a judge who refuses to grant the writ in the proper cases.

Other modern writs are those of prohibition, mandamus, etc.

Consult: Pollock and Maitland, *History of the English Law* (2d ed., Cambridge, Boston, 1899); Hurd, *On the Right of Personal Liberty* and on *The Writ of Habeas Corpus* (2d ed., Albany, 1876); Hallam, *Constitutional History* (New York, 1872); Blackstone, *Commentaries on the Laws of England;* and the writings of Story, Rawle, and Pomeroy on the United States Constitution; also see FORMS OF ACTION.

WRITER. A term vaguely applied in Scotland to a law practitioner or his clerk; in provincial towns more definitely to a law agent practicing before the sheriff, and acting as factor in the management of private affairs.

WRITERS' CRAMP. See NEUROSIS; OCCUPATIONAL DISEASES.

WRITERS TO THE SIGNET. An incorporated Scottish law society of great antiquity. The signet is the royal seal employed for authenticating writs or warrants connected with the administration of justice, and it is probable that the phrase "writers to the signet" was originally employed to describe the clerks in the office of the Secretary of State upon whom the duty devolved of issuing such writs. However this may be, we find this important duty, from an early period of Scottish history, exercised and monopolized by an exclusive society of legal practitioners, who, though performing a public function, were not subject to public appointment, but regulated admissions to their own ranks by rules of their own framing. Besides possessing this exclusive right to issue such writs as required authentication by the signet, which gave them a certain monopoly of litigation, writers to the signet thus came, in the course of time, to assume very much the place and to perform the functions of the Inns of Court in England, that, viz., of regulating admissions to the bar. While, however, they still retain a certain preëminence at the Scottish bar, not unlike that formerly enjoyed by serjeants at law in the sister country, their monopoly of litigation has been destroyed by modern legislation (36 and 37 Vict., ch. 63). See BARRISTER; LAWYER; SOLICITOR.

WRITING. The art of fixing thoughts in a visible and lasting shape, so as to make them intelligible and capable of preservation. The ways in general fall into two classes: picture writing, where the picture or symbol denotes the object or idea as a whole, and phonetic writing, where the characters employed denote the spoken word or its elements, either syllables, or single sounds, such as vowels and consonants. The phonetic signs are believed to have been developed from the primitive pictographic methods. In a wide sense various mnemonic systems might be described as writing, but commonly the term is restricted to markings upon some more or less durable surface. It is, however, rather to the picture that we must look for the origin of the complicated systems which lie at the basis of human progress into a higher civilization. In its most primitive form picture writing is a representation of an object or group of objects, which of necessity tells its own story. Even here it is not long before a certain degree of symbolism or at any rate conventionality is introduced, and it becomes somewhat difficult for the stranger to interpret the series of pictures. Interesting examples of the conventionalized forms are to be found among the Indians and also in Polynesia. Such pictures are, however, at best limited in scope, and are usually but condensed means of expression. The pictures tend more and more to become ideograms, i.e., symbols with a conventionalized meaning, as when an arrow stands for an enemy. Here we have a form of writing intelligible only to the instructed. The pictures also tend to

become conventional rather than natural, and this transformation becomes rapid when in place of carving on stone incision with a stylus in soft clay or writing with a brush or pen becomes common. Many Chinese characters are good examples of ancient pictures modified by a cursive script. Even the ideogram, however, does not suffice, and we advance to the further step where the picture or character derived from it suggests a sound rather than an object; thus the picture of an eye would denote I, etc. In a monosyllabic language, like Chinese, the same sound may have many meanings, as the sound eye in English in the example above, and therefore to the phonogram may be joined an ideogram to indicate the sense in which the sound is used.

Passing now to the methods of writing in vogue in the great civilizations of the ancient world, we find in Egypt the elaborate pictorial system known as hieroglyphics (q.v.). This system might almost serve alone as an example of the various ways in which characters might be used. The signs are all pictures, more or less conventionalized, but these only occasionally indicate the actual object represented. Sometimes they are symbolic, as when an arm holding a whip denotes the abstract idea of power. Again, they are real phonograms, where two or more pictures together denote another object whose Egyptian name is a combination of the names of the pictures, as in the modern pictorial rebus. From this use it is but a step to the selection of a limited number of these signs to denote uniformly syllables, or again of a still more limited number to be used as single letters. All of these steps the Egyptians had taken at a very early date. They discovered, indeed, the principle of expressing a consonantal, and possibly also a vowel, sound by a single sign, but did not follow it logically to the abandonment of ideograms and complements, so that they never gained the advantages to be derived from the use of a few alphabetic signs, though it must be admitted that they retained a system well adapted for the decorative effects which Egyptian inscriptions frequently seem designed to produce. The cuneiform system of writing, invented by the Sumerians and adopted by Akkadians, Assyrians, Mitannins, Hittites, Chaldians, Elamites, Persians, and others, likewise originated in pictographs. This is most obvious in the earliest linear inscriptions, but may also be seen in the grouping of the wedges after the script had been fully developed. It presents a mixture of ideograms and syllabic signs; determinations indicating the class to which an object belongs are freely used. In Susiana a definite syllabic system was developed; while the Persians in the Achæmenian period used what is practically a cuneiform alphabet of 36 characters. (See CUNEIFORM INSCRIPTIONS.) In the eastern Mediterranean, and perhaps further west, other systems were also in use, most of which still defy interpretation. The Hittite monuments bear inscriptions in strange pictorial characters which have not yet been deciphered. (See HITTITES.) In Cyprus there was in use by the Greeks a peculiar syllabary, first read by the aid of bilingual inscriptions. Crete was the home during the third and second millenniums B.C. of two systems, one apparently hieroglyphic or pictorial, though the pictures finally became decidedly conventional in some cases; the other, described as linear or geometric, apparently syllabic, as the number of signs is more limited. Still another type is found on the disk of Phæstus (q.v.). Many of these signs bear a close resemblance to the Cypriote syllabary, and others suggest the early Greek and Semitic alphabets. The origin of the north and south Semitic alphabets, from which the Greek, the Latin, the later Persian, the Indian, and the modern alphabets are derived, is still obscure. But while it is not capable of strict proof, many scholars deem it probable that they were developed under the influence of the system of writing the Philistines (q.v.) are likely to have brought with them from their original home, Crete. The subjects touched upon in this article and the later history of writing are treated more fully in ALPHABET; CUNEIFORM INSCRIPTIONS; HIEROGLYPHICS; INSCRIPTIONS; PALEOGRAPHY; and the articles on the separate letters.

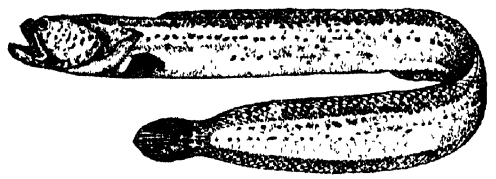
WRIT OF INQUIRY. See INQUIRY, WRIT OF.

WROBLEWSKI, vrō-blĕf'skĭ *or* -blĕs'kĭ, ZYGMUNT FLORENTY (1845–88). A Polish physicist. He was born at Grodno, Russia, and when a student at Kiev was banished to Siberia for taking part in the Polish insurrection of 1863. Pardoned in 1869 he resumed his studies, and after working at the universities of Berlin, Heidelberg, and Munich, he took his doctor's degree at the last-named place in 1874 and became an assistant in the physical laboratory. He then served as assistant or lecturer at Strassburg, Paris, London, Oxford, and Cambridge, and in 1882 he was appointed professor of physics at the University of Cracow. Wroblewski is best known for his work on the liquefaction of gases which he carried on after 1883. (See LIQUEFACTION OF GASES.) His first work of importance was *Ueber die Diffusion der Gase durch absorbirende Substanzen* (1874). While working in Paris in the laboratory of Sainte-Claire-Deville, he investigated the properties of liquids and gases under heavy pressures and discovered the hydrate of carbonic oxide. With Olszewski he was able to liquefy oxygen, nitrogen, and carbon monoxide and to solidify alcohol and bisulphide of carbon.

WRONSKI, vrŏn'skĭ, JOSEPH MARIE (1778–1853). A Polish philosopher and mathematician, whose real name was Hoëne, born in Posen. He studied mathematics and philosophy in Germany and France, and at first was an enthusiastic follower of Kant, but later advocated a system of his own, *Messianism*, which seeks to prove that the world is governed by reason. He also applied his philosophy to mathematics (analysis, theory of numbers, and theory of probabilities), and contributed to celestial mechanics and various branches of physics. He wrote *Philosophie critique découverte par Kant et fondée définitivement sur le principe absolu du savoir* (1803); *Introduction à la philosophie des mathématiques* (1811); *Prospectus du Messianisme* (1831); *Réfutation de la théorie des fonctions analytiques de Lagrange* (1812); *Critique de la théorie des fonctions générales de M. Laplace* (1819); *Messianisme, union finale de la philosophie et de la religion* (1831–39); and *Nouveau système des*

machines à vapeur (1835). Consult: Bobynin, *Hoene-Wronski*, in Russian (Moscow, 1894).

WRYBILL. A New Zealand plover (*Anarhynchus frontalis*), allied to the killdeers, which is unique in having the end of its bill bent to the right. It seeks its food on the seashore, feeding upon small crustaceans and insects which hide



THE WRYBILL.
Head from above, showing normal bend in the beak.

under stones; and gets it by running around these stones, always from left to right, and reaching far under them with its bent bill. Consult Buller, *Birds of New Zealand* (London, 1888).

WRY-LEGGED TERRIER. See HOUND, *Turnspit*.

WRYMOUTH. Any one of the large blennies of the family Cryptacanthodidæ. They are slender, lathlike fishes, from two to three feet long, with large oblique mouths, very heavy lower jaws, and the dorsal fins of strong spines hidden

WRYMOUTH (*Cryptacanthodes maculatus*).

in skin. The Eastern species (*Cryptacanthodes maculatus*) is brownish, with dark spots; but an albino form is so frequently seen as to be well known under the name "ghostfish." A closely related form (*Delolepis virgatus*) inhabits Puget Sound and northward.

WRYNECK, or TORTICOLLIS. A disease characterized by a spasm of the muscles of the neck, which results in tilting the head to one side and raising the chin, the point of which is directed towards the sound side. Spasmodic wryneck is a disease of the nervous system. It may be congenital. The symptoms are pain in the neck and spasm, at first clonic and intermittent, later tonic and fairly persistent. The sterno-mastoid and the upper fibres of the trapezius are the muscles affected. In a rare form both sides are affected and the head is drawn backward. The neurosis involves the bulbar and lower cerebral centres. The disease is rarely cured. A great number of drugs are suggested, including opium, atropine, conium, zinc, asafœtida, chloral, bromides, cocaine, gelsemium. The galvanic and faradaic currents are useful, as also massage and systematic exercise. Partial or complete cutting of the tendon of the sterno-mastoid muscle near its sterno-clavicular attachment has been the resort in some cases, with a few cures resulting. Acquired wryneck may be due to many diverse causes, all of which should be investigated before treatment is instituted. Thus rheumatism, inflammation of the lymphatic glands, caries of the vertebræ, or exposure to cold may be a cause.

WRYNECK. A genus of small birds of the woodpecker family, having a short, straight, conical beak; the feet with two toes in front and two behind; and a short, rounded tail of soft feathers, utterly unlike the tail of a woodpecker. There are several species, one of which, the common wryneck (*Iynx torquilla*), is a summer visitant of Great Britain and the North of Europe. It is seven inches long, of a rusty ash color, irregularly spotted with brown and black. It feeds on caterpillars and insects, and is often seen on the ground near ant hills, feeding on ants and their eggs. The construction of its tongue resembles that of woodpeckers. The wryneck does not chisel out a nest, but deposits its eggs on fragments of decayed wood in a cavity in a tree. The name "wryneck" is derived from the bird's habit of writhing its head and neck quickly with an undulating snakelike motion, often accompanied by a hissing noise. See Plate of WOODPECKERS.

WRY TOE. See HALLUX VALGUS.

WUCHANG, wōō'chäng'. A *fu* or departmental city of China, capital of the Province of Hupeh, and the seat of the Governor-General of the combined provinces of Hunan and Hupeh. It stands on the right bank of the Yang-tse River, opposite Hanyang, and diagonally opposite Hankow (Map: China, K 5). Its lofty walls inclose considerable space, and it is a place of much importance, having a college, a government mint, cotton mills, an ore-crushing mill and other industries, and it has electric lights. Its north gate is surmounted by an imposing tower. The city is included in the port and customs district of Hankow. Wuchang has very good sanitation and is known as a centre of learning. Industrially it is progressing rapidly. The three cities of Wuchang, Hankow, and Hanyang are frequently spoken of as the Wuhan towns. The Chinese revolution of 1911 broke out at Wuchang on October 10. Pop., with its suburbs, 500,000 to 600,000.

WUCHOW, or **WUCHAU,** wōō'chou'. A *fu* or departmental city of the Province of Kwangsi, China, on the left bank of the Si-kiang or West River, about 200 miles west of Canton (Map: China, K 7). It was opened as a treaty port in 1898, and forms an admirable distributing point for the provinces of Yunnan, Kweichow, and Kwangsi. It lies in a highly cultivated and picturesque region, but is subject to inundations in summer. Its exports include star aniseed, pearl barley, native coal, firewood, glue, raw hemp, hides, indigo, leather, medicines, tin, sugar, poultry, tea, wood, and aniseed and other oils. The principal imports are kerosene, matches, betelnuts, woolen and cotton goods, aniline dyes, fish, flour, gypsum, and lamps. Pop., 59,000.

WUHU, wōō'hōō'. A *hien* or district city of the Province of Nganhwei (or Anhui), China, which gives its name to a river port on the Yang-tse opened as a treaty port in 1877. It lies about a mile from the right bank of the river, from which it is reached by a wide creek. It is about 125 miles below Anking (Ngankingfu), the capital of the province, and 60 miles above Nanking (Map: China, L 5). It is walled, is connected by several canals and creeks with productive districts in the interior, and is thus well adapted for foreign trade. Its native industries are represented by its cutlery, and its red cord, for which it is noted. The city suffered greatly during the Taiping rebellion, but under the influence of foreign trade is now reviving and prosperous. Pop., 137,000. A foreign settlement was opened at Wuhu in 1905. In 1912 the total trade of the port amounted to 29,506,289 Haikwan Taels (Hk. Tael = $0.74).

WULFENITE, wụl'fen-īt (named in honor of *Wülfen, Wülffen,* an Austrian mineralogist of the eighteenth century). A mineral lead molybdate crystallized in the tetragonal system. It has a resinous lustre, and is yellow to orange and red in color, sometimes passing into olive green. It occurs in veins with various ores of lead, and is found at various localities in Austria, Hungary, Siberia, Saxony, France, Colombia, Mexico, and in the United States. A variety containing chromium has been found, to which the name *chromowulfenite* has been given. See MOLYBDENUM.

WULFILA. wụl'fī-là. A bishop of the Goths. See ULFILAS.

WULFSTAN, wụlf'stăn, **WULSTAN,** or **WOLSTAN,** wụl'stăn. The name of three Anglo-Saxon prelates and authors. (1) A monk of Winchester who flourished about 980 A.D. He is the reputed author of a Latin poem on the miracles of St. Swithin. For a study of his life and work consult Clemens Blume, *Wolstan von Winchester und Vital von Saint-Evroult,* in the "Proceedings of the Imperial Academy of Sciences of Vienna" (vol. 146, 1903); and P. M. Huber, *S. Swithunus, Miracula Metrica* (Metten, 1906). (2) An archbishop of York from 1003 until his death in 1023, and the author of two pastoral letters and several sermons in Anglo-Saxon. His homilies were edited by A. S. Napier (Berlin, 1883). Consult also the same author's *Ueber die Werke des altenglischen Erzbischofs Wulfstan* (Weimar, 1882); Kinard, *Study of Wulfstan's Homilies* (Baltimore, 1897); L. H. Dodd's *Glossary of Wulfstan's Homilies* (New York, 1908); R. Becher, *Wulfstans Homilien* (Leipzig, 1910); and A. Brandl in Paul's *Grundriss der germanischen Philologie,* vol. ii (revised ed., Strassburg, 1901–09). (3) A bishop of Worcester (c.1007–95) and a saint of the English calendar. He was born at Icentum, in Warwickshire, and was educated at Evesham and Peterborough. He became a priest and afterward a monk. He was made prior of the monastery of Worcester, and in 1062 bishop of that see. He lived through the troubles of the Norman Conquest, and enjoyed the favor not only of the Conqueror, but of William Rufus. He rebuilt the cathedral of Worcester, and was canonized by Pope Innocent III in 1203. He is regarded by some as the author of that portion of the Anglo-Saxon Chronicle which extends from 1034 to the death of the Conqueror. Consult the lives of St. Wulfstan by Hemming and Florence of Worcester in H. Wharton, *Anglia Sacra* (2 vols., London, 1691), and E. A. Freeman, *Norman Conquest* (6 vols., ib., 1867–79).

WÜLKER, vụl'kĕr, RICHARD PAUL (1845–1910). A German philologist, born at Frankfort-on-the-Main. He was educated at the universities of Berlin, Leipzig, and Marburg. In 1875 he was appointed professor of English at Leipzig. He published: *Das Evangelium Nikodemi* (1872); *Altenglisches Lesebuch* (2 vols., 1874–80); *Kleinere angelsächsische Dichtungen* (1882); *Grundriss zur Geschichte der angelsächsischen Litteratur* (1885); *Codex Vercellensis* (1894); *Geschichte der englischen Litteratur* (1896; 2d ed., 2 vols., 1906–07).

WULLENWEBER, vụl'len-vā'bĕr, JÜRGEN (1492–1537). A Hanseatic statesman, born at Hamburg. Having removed to Lübeck he acquired great influence there during the party conflicts attendant upon the establishment of the Reformation, and, becoming the leader of the democratic-Protestant faction, was elected one of the four burgomasters in 1533. In this position he made it his chief aim to restore the political hegemony of Lübeck on the Baltic Sea by the subjection of Denmark and Sweden and the propagation of Protestantism, but was thwarted by the unlucky turn which the campaign against Denmark took and the return to power of the aristocratic party at Lübeck. When, moreover, a writ of execution from the Imperial Chamber at Speyer, issued in June, 1535, threatened the city with the ban of the Empire if the old aristocratic constitution were not restored within 45 days, Wullenweber resigned his office. On a journey to Hadeln soon after, he was arrested by the Archbishop of Bremen and delivered to that prelate's brother, Duke Henry of Brunswick, a sworn enemy of Lutheranism, who imprisoned him. Put to the rack the most inconsistent self-accusations were extorted from him, whereupon he was condemned to death and executed in September, 1537. Consult G. Waitz, *Lübeck unter Jürgen Wullenweber und die europäische Politik* (3 vols., Berlin, 1855–56).

WÜLLERSTORF-URBAIR, vụl'lĕrs-tôrf-ụr'bâr', BERNHARD, BARON VON (1816–83). An Austrian admiral, born at Triest. He entered the navy in 1833, and after a special course in astronomy at Vienna in 1837–39, was appointed director of the naval observatory and professor at the naval academy in Venice. In 1848 he was intrusted with the reorganization of the latter institution at Triest and made its commandant. In 1857, having in the meanwhile attained the rank of commodore, he was put in command of the Novara Expedition around the world, and after its return in 1859 superintended the publication of its reports. Sent to the North Sea with a squadron, during the Schleswig-Holstein campaign of 1864, he wrested from Denmark the North Frisian islands. In 1865–67 he was Minister of Commerce, and after his retirement was made a life member of the House of Lords. His publications include: *Ueber das Verhalten und die Verteilung der Winde auf der Oberfläche der Erde* (1860); *Ueber die Wichtigkeit des Adriatischen Meers für Oesterreich* (1861); *Bemerkungen über die physikalischen Verhältnisse des Adriatischen Meers* (1863). His *Vermischte Schriften* were published by his widow (1889).

WÜLLNER, vụl'nĕr, ADOLF (1835–1908). A German physicist, born in Düsseldorf. He studied in Bonn, Munich, and Berlin, and became docent in Marburg, 1858. In 1862 he was appointed director of the technological school at Aix-la-Chapelle, in 1865 professor of physics in the agricultural school at Poppelsdorf, and was also at the same time assistant professor of physics in the University of Bonn (1867–69). In 1869 he became professor of physics in the Polytechnic Institute at Aix-la-Chapelle. He carried on important investigations in all branches of physics and wrote: *Lehrbuch der Experimentalphysik* (2 vols., 1862–65; 6th ed., 1907); *Einleitung in die Dioptrik des Auges* (1866); *Kompendium der Physik* (2 vols., 1879).

WÜLLNER, FRANZ (1832–1902). A German composer, born at Münster, Westphalia. He studied in his native place, and at Frankfort, Berlin, Brussels, and Munich. In 1856 he was appointed instructor in pianoforte at the Munich conservatory. He held the position of town

musical director at Aix-la-Chapelle from 1858 to 1864. In 1867 he became director of the choral classes in the reorganized School of Music at Munich and wrote for them *Chorübungen der Münchener Musikschule*. In 1869 he succeeded Bülow as conductor of the Court Opera and the Academy Concerts. Here he conducted the first performances of *Rheingold* and *Walküre* (1869, 1870) before the production of the entire Ring cycle at the first Bayreuth Festival of 1876. He became court kapellmeister at Dresden and artistic director of the conservatory in 1877, and director of the Cologne conservatory and conductor of the Gürzenich concerts in 1884. After 1864 he appeared frequently as conductor of the Lower Rhenish Musical Festival (q.v.). He died at Braunfels. Among his works are: *Heinrich der Finkler*, a cantata for solo, male chorus, and orchestra; additional recitatives to Weber's *Oberon*, accepted by many of Germany's principal theatres; *Psalm 125*, for chorus and orchestra; *Miserere* for double choir; and *Stabat Mater* for double choir; besides masses, motets, songs, chamber music, and pianoforte pieces.

WÜLLNER, Ludwig (1858–). A famous German lieder singer (baritone), born at Münster, Westphalia. He studied Germanic philology, receiving the degree of Ph.D at Strassburg in 1884. In 1887 he entered the Cologne conservatory, of which his father, Franz (q.v.), was director. In 1889 he joined the famous Meiningen company as an actor and won great success. The success of a tour as a reader in 1895 induced him to enter the field of the lieder singer, and since 1896 his tours (including two to the United States in 1908–09 and 1909–10) have been a succession of veritable triumphs. Although the quality of his voice is but mediocre, his extraordinary power of interpretation, coupled with the rare art of his assisting artist at the piano, Coenraad Bos, holds his audiences spellbound.

WULSTAN. See Wulfstan.

WUNDERLICH, vụn'dĕr-lĭk, Karl August (1815–77). A German physician, born at Sulz-am-Neckar. He was educated at Stuttgart, Tübingen, and Paris. In 1846 he was appointed professor in the University of Tübingen and director of its clinic, and in 1850 he accepted a call to Leipzig, where he carried on his important investigations of temperatures. The *Archiv für physiologische Heilkunde*, founded by him in 1841, became the organ of the most advanced medical thought. Wunderlich published *Nosologie des Typhus* (1839); *Versuch einer pathologischen Physiologie des Blutes* (1844); *Handbuch der Pathologie und Therapie* (1846–54); *Grundriss der speziellen Pathologie und Therapie* (1858); *Geschichte der Medizin* (1859); and *Das Verhalten der Eigenwärme in Krankheiten* (1868).

WUNDT, vụnt, Wilhelm (1832–). A German physiologist, psychologist, and philosopher, born Aug. 16, 1832, at Neckarau, in Baden. He studied from 1851 to 1856 at Tübingen, Heidelberg, and Berlin, specializing in medicine. In 1857 he qualified as privatdocent in physiology at Heidelberg, where he became assistant professor in 1864. After serving one year as professor of philosophy at Zurich, he was called in 1875 to a similar position at Leipzig, where he was also rector of the university in 1889–90. In 1902 he was made an *Ehrenbürger* of Leipzig, and in 1907 of Mannheim. In 1905 he was given the degree of Doctor of Jurisprudence, *honoris causa*, by the University of Göttingen, and later he received the order *Pour la Mérite*. He published the following works: *Die Lehre von der Muskelbewegung* (1858); *Beiträge zur Theorie der Sinneswahrnehmung* (1862); *Vorlesungen über die Menschen- und Tierseele* (1863; 5th ed., 1911; Eng. trans., *Lectures on Human and Animal Psychology*, 3d ed., 1901); *Lehrbuch der Physiologie des Menschen* (1865; 4th ed., 1878); *Die physikalischen Axiome und ihre Beziehung zum Kausalprincip* (1866); *Handbuch der medizinischen Physik* (1867); *Untersuchungen zur Mechanik der Nerven und Nervencentren* (1871–76); *Grundzüge der physiologischen Psychologie* (1874; 6th ed., 1908–11; Eng. trans., *Principles of Physiological Psychology*, i, 1904); *Der Spiritismus, eine sogenannte wissenschaftliche Frage* (1879); *Logik, eine Untersuchung der Principien der Erkenntnis und der Methode wissenschaftlicher Forschung* (1880–83; 3d ed., 1906–08); *Essays* (1885; 2d ed., 1906); *Ethik, eine Untersuchung der Thatsachen und Gesetze des sittlichen Lebens* (1886; 4th ed., 1912; Eng. trans., *Ethics: An Investigation of the Facts and Laws of the Moral Life*, 1897–1901); *Zur Moral der literarischen Kritik* (1887); *System der Philosophie* (1889; 3d ed., 1907); *Hypnotismus und Suggestion* (1892); *Grundriss der Psychologie* (1896; 12th ed., 1914; Eng. trans., *Outlines of Psychology*, 3d ed., 1907); *Völkerpsychologie, eine Untersuchung der Entwicklungsgesetze von Sprache, Mythus, und Sitte*, i (1900; 3d ed., 1911); ii (1905–06; 3d ed., 1912–14); *Einleitung in die Philosophie* (1901; 6th ed., 1914); *Sprachgeschichte und Sprachpsychologie* (1901); *Festrede zur fünfhundert jährigen Jubelfeier der Universität Leipzig* (1909); *Principien der mechanischen Naturlehre* (1910); *Kleine Schriften* (1910); *Probleme der Völkerpsychologie* (1911); *Einführung in die Psychologie* (1911; Eng. trans., *Introduction to Psychology*, 1912); *Elemente der Völkerpsychologie* (1st and 2d eds., 1912); *Reden und Aufsätze* (1913); *Psychologie im Kampf ums Dasein* (1913); *Anfänge der Philosophie und die Philosophie der primitiven Völker* (1913); *Sinnliche und übersinnliche Welt* (1914); *Ueber den wahrhaften Krieg* (1914); *Deutschland im Lichte des neutralen und des feindlichen Auslandes* (1915); *Die Nationen und ihre Philosophie* (1st and 2d eds., 1915). In 1881 Wundt instituted a periodical, the *Philosophische Studien*, for the purpose of publishing the work of the psychological laboratory at Leipzig. The *Studien* was followed in 1905 by the *Psychologische Studien*.

From the foundation of the Leipzig laboratory and of the *Studien* came the effective impulse which has led to the institution of many if not all of the other laboratories for the systematic investigation of experimental psychology in both Europe and America. Wundt is thus not only the leading German representative of what is ordinarily termed modern psychology, but, in a certain sense, its creator. He alone treated it in all its area; he alone had sufficient breadth of outlook, sufficient training, and sufficient sympathy to unite in one science the work of Herbart, Weber, Fechner, and Lotze. In his *Vorlesungen*, but more especially in his classical *Grundzüge*, the standard textbook of the science, he effected the union of the various disjointed movements then existing, the mathematical, the experimental, the psychophysical, and the physiological. Wundt defines psychology as the

"science of immediate experience"; the natural sciences are abstractions from experience. Nevertheless, his psychology starts from physiological facts, and seeks by variation of external condition to discover the elementary psychical facts which are correlated with them; it works from without inward. But the end is to construct psychology. Physiology, however valuable it may be as an avenue of exploration or as a basis for explanation, is held to be but a means towards this end. Consult: T. Ribot, *German Psychology of To-Day* (Eng. trans., New York, 1886); E. König, *Wundt, seine Philosophie und Psychologie* (Stuttgart, 1901); R. Eisler, *W. Wundt's Philosophie und Psychologie* (Leipzig, 1902); G. S. Hall, *Founders of Modern Psychology* (New York, 1912). See PSYCHOLOGY; PSYCHOLOGY, ETHNIC; SOCIAL PSYCHOLOGY.

WÜNSCHE, vŭn'shĕ, KARL AUGUST (1838–). A German theologian and Hebraist, born at Hainewalde, near Zittau. From 1869 to 1905 he was head master of the girls' high school at Dresden. During this period he published important works on biblical and Talmudic literature, among them: *Der Prophet Hosea übersetzt und erklärt* (1868); *Die Leiden des Messias in ihrer Uebereinstimmung mit den Lehren des Alten Testaments* (1870); *Jesus in seiner Stellung zu den Frauen* (1872); *Die Weissagungen des Propheten Joel übersetzt und erklärt* (1874); *Der lebensfreudige Christus der synoptischen Evangelien im Gegensatz zum leidenen Messias der Kirche* (1876); *Neue Beiträge zur Erläuterung der Evangelien aus Talmud und Midrasch* (1878); *Der Babylonische Talmud in seinen haggadischen Bestandteilen* (5 parts, 1886–89); *Der Midrasch Tehillim* (2 vols., 1892–93); *Aus Israels Lehrhallen* (2 vols., 1907–08); *Der Kuss in Bibel, Talmud, und Midrasch* (1911).

WURMSER, vŭrm'zĕr, DAGOBERT SIEGMUND, COUNT VON (1724–97). An Austrian field marshal, born at Strassburg. He entered the French service in 1741, and distinguished himself during the Seven Years' War. In 1762 he entered the Austrian army as colonel. At the outbreak of the wars of the French Revolution he was given command of the forces beyond the Rhine and prevented the French from relieving Mainz (1793). He took Mannheim (1795), and in the summer of 1796 became field marshal and succeeded Beaulieu in Italy. While attempting to relieve Mantua, which was besieged by the French, the two divisions of his army were successively routed by Napoleon and Wurmser himself was forced to take refuge in the beleaguered city. It fell in 1797 (February 2) after a siege of nine months, but Wurmser was permitted to go free.

WURTS, ALEXANDER JAY (1862–). An American electrical engineer, born at Carbondale, Pa. He graduated from Sheffield Scientific School (Yale) in 1883, and from Stevens Institute of Technology (M.E.) in 1884, and studied also, for two years, in the Polytechnikum at Hanover, Germany. From 1887 to 1898 he served on the technical staff of the Westinghouse Electric and Manufacturing Company, of which company he was general engineer in 1904–05. In the meantime he was manager of the Nernst Company (1898–1904). After 1905 he held the chair of applied electricity and was head of the electrical department of the Carnegie Technical Schools, Pittsburgh. For his invention of lightning arresters he was awarded the John Scott medal by the Franklin Institute in 1894. Wurts was the discoverer of the five non-arcing metals.

WÜRTTEMBERG, vŭrt'tĕm-bĕrk. A kingdom of the German Empire in southwestern Germany, lying between Baden and Bavaria. In the south Hohenzollern penetrates the country as an irregular tongue and Lake Constance separates it from Switzerland (Map: Germany, C 4). Württemberg has small enclaves in Baden and Hohenzollern, and incloses three enclaves of Hesse. The area is 7534 square miles.

Württemberg is in general a region of hills and mountains. It is a western part of the south German upland. A portion of the Black Forest borders the west, where the loftiest point of the kingdom is found at its extreme western point—3820 feet. The Swabian Jura or Rauhe Alb crosses the kingdom north of the Danube. Its highest elevation is 3327 feet. The Danube crosses the southern part of the country, flowing in a northeast direction and leaving it at Ulm. South of the Danube the upland gradually merges into the Alpine foreland. In the north of the kingdom is a fertile lowland country—hills, level valleys, and dales—descending gradually to the north with the Neckar and its numerous tributaries coursing through to the northwest, where the altitude falls as low as 500 feet. About one-quarter of the country is level land. The climate is moderate and agreeable, with a yearly mean of 40° in the mountains and 50°, or a little less, in the Neckar valley. There are nearly 75 mineral springs.

The mining output is not large. Salt and iron are obtained. Württemberg is essentially an agricultural country and about one-half of the population is connected with agriculture. Of the area, 64 per cent is tilled, and 31 per cent is in forest (conifers and beech), the forests being thoroughly exploited and forming a prominent part of the wealth. Most of the farms are between 2½ and 25 acres in size. The largest acreages are, in their order, hay, spelt, oats, clover, barley, and potatoes. Fruit raising and the live-stock interests are prominent. Co-operative dairying is extensively carried on. The manufactures have in recent years rapidly developed. There is a large output of sugar, iron, and textiles. Other products are gold and silver work, musical and scientific instruments, bells, chemicals, paper, and wood carving, and the products of celebrated machine shops at Esslingen. The kingdom leads in book publishing in southern Germany. Commerce is lively and is being actively fostered and developed. The transit traffic is important. Grain, cattle, wood, salt, fruit, and manufactured articles of many kinds are exported. The Neckar is navigable by steamboats to Heilbronn, and Ulm stands at the head of navigation on the Danube.

Württemberg is a constitutional monarchy. The constitution dates from 1819, but was extensively altered in 1906. The Landstände, or Parliament, consists of two Houses (estates), which assemble at least every three years. The members of the higher chamber, or House of Standesherren, are the royal princes, persons named by the King, and the representatives of 20 mediatized houses. Its president is appointed by the King. The deputies of the lower chamber consist of 13 nobles, 6 Evangelical and 3 Catholic dignitaries, the head of Tübingen University, 7 representatives from towns, and 63 from rural

districts. The deputies are chosen for six years without property qualification. Citizens voting must be above 25. The Ministry of State comprises six departments—Justice, War, Finance, Interior, Religion and Education, Foreign Affairs and the Royal House. There is a privy or advisory council, composed of the ministries and councilors. Administratively the kingdom is divided into four circles—Neckar, Black Forest (Schwarzwald), Jagst, and Danube. It sends 4 members to the national Bundesrat and 17 to the Reichstag. The budget of the kingdom for 1914–15 nearly balanced at $30,476,785. The chief items of expenditure were Imperial contributions, national debt, and religion and education; the chief sources of income were Imperial receipts, railway revenues, direct taxes, and forests, farms, and mines. The public debt amounted in 1914 to about $159,853,000. However, the debt, with the exception of a small fraction, is for railways, and is accordingly offset by the railroad property of the kingdom. At the end of 1914 there were 1134 miles of railway in Württemberg, 1094 of which were owned by the government. Stuttgart is the capital.

The population in 1900 was 2,169,480; in 1910, 2,437,574, giving density per square mile of 323.2. Württemberg ranks fourth in population among the German states. The people are mostly Swabians. About 70 per cent of the population is Protestant. The King is, under the constitution, the guardian and director of the Evangelical church. It is administered by a consistorium composed of a president, nine councilors, and six superintendents. The Catholics are under a bishop, who, however, can only act together with a Catholic council named by the government. The Jews are under a council appointed by the King. In educational matters Württemberg holds high rank. Instruction is compulsory. Practically every person above 10 can read and write. The University of Tübingen stands at the head of the educational system. Among other institutions there are the great Polytechnic Institute at Stuttgart, a famous conservatory of music at the same place, and agricultural, industrial, and special schools of every variety, including a school of viticulture at Weinsberg. There are numerous scientific, art, and literary organizations.

History. The greater part of modern Württemberg was included in the mediæval Duchy of Swabia. About the beginning of the twelfth century history first speaks of a Count of Württemberg. An uninterrupted line of counts may be traced back to the middle of the thirteenth century, when they ruled a district in the valleys of the Neckar and its affluent, the Rems. The dominions of the house were steadily extended. Count Eberhard IV (1417–19), through his marriage with the heiress of Montbéliard, united that county with Württemberg. Count Eberhard im Bart (q.v.), an able ruler, who founded the University of Tübingen, was raised by the Emperor Maximilian in 1495 to the rank of Duke, with the title of Eberhard I. In 1519 Duke Ulrich, in consequence of arbitrary acts of oppression exercised upon the free Imperial city of Reutlingen, was forcibly ejected from Württemberg by the Swabian League and did not recover his throne till 1534. He became Lutheran and established the Reformed faith in his dominions. Duke Frederick, having taken part in the war against the French Republic, was compelled to cede part of his territory to France, but later, owing to his support of Napoleon, it was restored to him. In 1803 this ruler received large accessions of territory, including Heilbronn, Reutlingen, and other free cities, and was raised to the dignity of Imperial Elector. He reluctantly joined Napoleon in the war against Austria in 1805, and at the Peace of Pressburg (Dec. 26, 1805) Württemberg was further enlarged and erected into a kingdom. On Jan. 1, 1806, Frederick I assumed the royal title. He joined the Confederation of the Rhine in the same year and received additional territory, and as an ally of Napoleon in the French-Austrian War of 1809 was rewarded with new possessions, including Ulm. Württemberg was required to furnish a quota of 16,000 men for Napoleon's Russian campaign. On Nov. 2, 1813, the King abandoned the cause of Napoleon, and joined the other German princes in their rising against the French power. King Frederick died Oct. 30, 1816, and was succeeded by his son, William I (1816–64). William reduced the public expenditure, and in 1819 promulgated a constitution. In the revolutionary movement which swept over Germany in 1848 William yielded at first to the demand of his subjects for political reforms, but ultimately the hopes of the Liberals were disappointed. William died on June 25, 1864, and was succeeded by his son Charles, who sided with Austria in the Seven Weeks' War. The troops of Württemberg were beaten and a war indemnity of $4,000,000 was levied by Prussia upon the kingdom. In 1867 Württemberg formed an alliance with the North German Confederation. She supported Prussia against France in 1870, and in 1871 became part of the new German Empire. King Charles died on Oct. 6, 1891, and was succeeded by his nephew, William II.

WÜRTTEMBERG, vụr'tem-bĕrk, DUKE OF. See EUGEN.

WURTZ, vụrts, CHARLES ADOLPHE (1817–84). A French chemist. He was born in Strassburg, and studied chemistry there and at Giessen. In 1845 he went to Paris as tutor of organic chemistry at the Sorbonne. Afterwards he became professor in the Agronomic Institute of Versailles (1851), professor of organic chemistry at the Sorbonne (1852), and professor of toxicology in the School of Medicine (1853). He was dean of the Sorbonne medical faculty from 1866 to 1875. Among Wurtz's principal discoveries were those on the compound ammonias (1849), on glycol (1856), on aldol ($C_8H_8O_4$), and the so-called process of "aldolization." His most important work, however, was on the theoretic side of chemistry in distinguishing the atomic relations of organic compounds. His publications include: *Mémoire sur les ammoniaquee composées* (1850); *Traité élémentaire de chimie médicale* (2 vols., 1864–65); *Dictionnaire de chimie pure*

et appliquée (3 vols., 1868–78; supplement, 1880–86; 2d supplement by Friedel, 7 vols., 1892–1908); *Progrès de l'industrie des matières colorantes artificielles* (1876); *Théorie atomique* (1880; Eng. trans., *The Atomic Theory*, 1894); and the important *Traité de chimie biologique* (1884).

WURTZITE, wûrts'īt (named in honor of Charles Adolphe *Wurtz*). A mineral zinc sulphide crystallized in the hexagonal system. It has a resinous lustre, and is brownish black in color. It occurs in crystals or in massive fibrous varieties. It is found in Portugal, Bolivia, Peru, and in the United States, with sphalerite and quartz, at Butte, Mont. This mineral has been made artificially by fusing equal parts of zinc sulphate with calcium fluoride and barium sulphide.

WURZBACH, vụrts'bäk, ALFRED, KNIGHT VON TANNENBERG (1846–). An Austrian art historian. He was born at Lemberg, son of Constant Wurzbach. He studied jurisprudence in Vienna and entered the civil service, but resigned in 1876, and after extensive travel devoted himself to the study of art history. In 1881–86 he was art critic for the *Wiener Allgemeine Zeitung*. Among his chief works are: *Martin Schongauer* (1881); *Geschichte der holländischen Malerei* (1885); and, most important of all, *Niederländisches Künstlerlexicon* (2 vols., 1904–11). He edited several editions de luxe and translated Houbraken's *Groote schouburgh der nederlandsche konstschilders* (1879). He became known as one of the foremost authorities on Dutch painting.

WURZBACH, CONSTANT, VON TANNENBERG (1818–93). An Austrian poet and biographer, born at Laibach. After studying jurisprudence at Graz, he served in the army from 1836 to 1844, when he obtained a position in the university library at Lemberg. In 1849 he was appointed librarian in the Ministry of the Interior at Vienna, and afterward Secretary in the Ministry of State. His writings include: *Die Volkslieder der Polen und Ruthenen* (1846); *Die Sprichworter der Polen* (1852); *Die Kirchen der Stadt Krakau* (1853); *Joseph Haydn und sein Bruder Michael* (1861); *Glimpf und Schimpf in Spruch und Wort* (1864); *Historische Wörter, Sprichwörter und Redensarten* (1866); *Franz Grillparzer* (1871); *Ein Madonnenmaler unserer Zeit: E. Steinle* (1879); *Feldmarschall Erzherzog Karl* (1880). He also published several volumes of epic poetry. He is, however, best known for the *Bibliographisch-statistische Uebersicht der Litteratur des österreichischen Kaiserstaates* (1856), and his valuable *Biographisches Lexikon des Kaisertums Oesterreich* (60 vols., 1855–91), a unique publication on a gigantic scale, containing about 25,000 critical biographies of notable personages in every walk of life and from all parts of the Austro-Hungarian monarchy.

WÜRZBURG, vụrts'bo͝orĸ. The capital of Lower Franconia, Bavaria, 81 miles by rail northwest of Nuremberg (Map: Germany, D 4). It is situated almost wholly on the right bank of the navigable Main, which is here crossed by three bridges (1474–1607, 1887, and 1894). The old, or inner, city is separated from the modern and handsome suburbs by broad and agreeable promenades, into which the beautiful Hofgarten blends on the east.

The Hofgarten dates from 1729. The handsome law courts rise a short distance away on the south. The rococo palace (1720–44), formerly the episcopal residence, a splendid edifice, situated in the Hofgarten, is the centre of interest to the visitor. Here are the Residenzplatz, and the elaborate modern Luitpold fountain. West of the palace is the uninteresting cathedral, a Romanesque basilica, tracing its origin back to 862; the four towns date from 1240, the rococo façade from 1711–19, and the dome from 1731. The exterior was restored in 1882–83. Adjacent to the cathedral is the rococo Neumünster Church, with a red façade belonging to the eighteenth century. It has a tablet to Walther von der Vogelweide, who was buried in the ancient cloisters here. Near by on the west is the old market place with the beautiful Chapel of Mary. This graceful Gothic structure dates from 1377–1441, and was restored in 1856.

To the south, beyond the mediæval town hall, rise in the modern quarter the new buildings of the university. (See WÜRZBURG, UNIVERSITY OF.) The University Church, with Gothic features, belongs to the later sixteenth century, and the Seminary Church to the latter part of the eighteenth century. In the northern part of the city are the Ludwigshalle, where expositions are held, and the large Julius Hospital, founded in 1576. In the northwest corner of Würzburg, near the river, are the anatomical, physical, pathological, and other institutes belonging to the university.

The fine old Main bridge (1474) leads from the central part of the city to the town on the left bank, where the Romanesque St. Burkard Church (1033–42), with its towers, and the Marienberg fortress command the attention. The Marienberg, which was an episcopal residence from 1261 to 1720, and is now used as a barracks, stands on the Leistenberg, a hill over 400 feet above the river. There are a royal music school, and schools of agriculture, horticulture, etc. Würzburg is an active industrial town. Machinery, railway cars, pianos, scientific and musical instruments, and tobacco are among the principal manufactures. Famous brands of beer are produced in the city. The wine, fruit, coal, and timber trade is important. Pop., 1900, 75,497; 1910, 84,496.

Würzburg became an episcopal see in the middle of the eighth century. It early grew wealthy and important. The bishops of Würzburg were prominent in their capacity as temporal princes, their domain finally having an area of about 1900 square miles. They bore the title of Duke of Franconia. The bishopric was secularized in 1801 and assigned in 1803 to Bavaria. By the Peace of Pressburg, in 1805, the principality was transferred to Ferdinand III, the dispossessed Grand Duke of Tuscany. In pursuance of the acts of the Congress of Vienna (1814–15), it passed again to Bavaria. The Prussians entered the town on Aug. 2, 1866.

WÜRZBURG, vụrts'bụrĸ, KONRAD VON. See KONRAD VON WÜRZBURG.

WÜRZBURG, UNIVERSITY OF. A German university, founded in 1402 by Bishop Johann von Egloffstein and confirmed by a bull of Pope Boniface IX in the same year. The institution was reorganized in 1582 by Prince Bishop Julius Echter von Mespelbrunn on the mediæval pattern, as a Catholic university. It soon became the Mecca for Catholic students not only of Germany, but of other European countries. The care of the faculties of theology and philosophy was left to the Jesuits, who carried on the in-

struction until the suppression of the Order in 1773. The faculty of law was reorganized in 1776 and that of medicine in 1807. With the union of Würzburg to Bavaria began a new era for the institution. It soon rose to an eminent position among German universities. Its medical faculty particularly stands high. It consists of the faculties of theology, law, and political science, medicine, and philosophy. It had in 1913 an attendance of 1456. The library, founded by Karl von Dalberg, which includes the original collections, contains over 39,000 volumes.

WURZEN, vo͝orts'en. A town of the Kingdom of Saxony, 15½ miles northeast of Leipzig, picturesquely situated on the Mulde, here spanned by two bridges (Map: Germany, E 3). Its industries include iron casting, bleaching, weaving, and the manufacture of machinery, paper, wall paper, carpet, furniture, and hosiery. Pop., 1900, 16,614; 1910, 18,582.

WÜSTENFELD, vu̇s'ten-fĕlt, HEINRICH FERDINAND (1808–99). A German Arabic scholar. He was born at Münden, Hanover, studied at Göttingen and Berlin and was librarian (1838–89) and professor (1842–90) at Göttingen. He published many important Arabic texts and valuable works on Arabic history and literature, including *Geschichte der arabischen Aerzte und Naturforscher* (1840); *Genealogische Tabellen der arabischen Stämme und Familien* (1852); *Vergleichungstabellen der mohammedanischen und christlichen Zeitrechnung* (1854; continuation by Mahler, 1887; later continuations, 1899); *Die Statthalter von Aegypten* (1875–76); *Geschichte der Fatimiden-Chalifen* (1881); *Die Geschichtschreiber der Araber* (1882); *Der Iman el Schâfi'i, seine Schüler und Anhanger* (1890–91).

WUSTMANN, vu̇st'mȧn, GUSTAV (1844–1911). A German philologist and historian, born in Dresden, where he frequented the Kreuzschule, before studying philology at Leipzig in 1862–66. He then taught at the Nikolai Gymnasium in Leipzig until 1881, when appointed director of the municipal archives and city librarian. From 1879 he was also associate editor of the *Grenzbòten* and in 1897 received the title of professor. He published *Apelles' Leben und Werke* (1870) and the valuable contributions to the history of Leipzig: *Der leipziger Baumeister Hieronymus Lotter* (1875), *Beiträge zur Geschichte der Malerei in Leipzig vom 51. bis 17. Jahrhundert* (1879), *Aus Leipzigs Vergangenheit* (1885), *Quellen zur Geschichte Leipzigs* (1889–95), *Leipzig durch drei Jahrhunderte* (1890), *Der Wirt von Auerbachs Keller, Dr. Heinrich Stromer von Auerbach* (1902). Much opposition was aroused by his publication *Allerhand Sprachdummheiten, Kleine deutsche Grammatik des Zweifelhaften, des Falschen und des Häslichen* (1891; 4th ed., 1908). Besides a collection of poems, entitled *Als der Grossvater die Grossmutter nahm* (1886; 4th ed., 1905), he edited a new adaptation of Borchardt's *Die sprichwörtlichen Redensarten im deutschen Volksmund, nach Sinn und Ursprung erläutert* (5th ed., 1895).

WUTHERING (wŭTH'ĕr-ing) **HEIGHTS.** A novel by Emily Brontë, published in 1847 under the nom de plume of "Ellis Bell."

WU TING-FANG, wo͞o'tĭng'fäng' (1842–). A Chinese lawyer, diplomatic agent, and statesman, born at Singapore. At 13 he entered St. Paul's College in Hongkong, where he remained for seven years, when he entered the service of the colonial government as interpreter in the law courts. In 1874 he went to London to study law, entered at Lincoln's Inn, and was called to the bar in 1877. Returning to Hongkong, he practiced as a barrister. In 1882 he came under the notice of the Chinese government at Peking, was called north, and joined the official staff of Li Hung Chang, then Governor-General of Chih-li and the Grand Chancellor of the Empire. He was a member of the peace embassy at the head of which was Li Hung Chang, and assisted in negotiating the Treaty of Shimonoseki. On his return to Peking he was successively appointed vice president of the Imperial Clan Court, a senior vice president of the Board of War, and superintendent of Imperial railways; and in the following year (1896) was appointed Minister to the United States. He opposed the reënactment of the Chinese Exclusion Act without some modification, but was unsuccessful. In 1902 he was recalled to act as one of the commissioners engaged in negotiating commercial treaties with the United States and other foreign nations, and in 1903 was appointed vice president of the Board of Commerce, a new government department then established. He became a member of the permanent Court of Arbitration at The Hague.

WUTTKE, vu̇t'ke, HEINRICH (1818–76). A German historian, born at Brieg in Silesia, and educated at the universities of Breslau, Berlin, and Leipzig. He became privatdocent in history at Leipzig in 1841, and was made full professor in 1848. In that year he was a member of the National Assembly at Frankfort, and one of the founders of the Greater-Germany party. His works include: *Polen und Deutsche* (1847); *Erdkunde und Karten des Mittelalters* (1854); *Die Völkerschlacht bei Leipzig* (1863); *Die deutschen Zeitschriften und die Entstehung der öffentlichen Meinung* (3d ed., 1875); and an unfinished but very valuable *Geschichte der Schrift und des Schrifttums* (1872).

WY'ANDOT (properly *Wandót*, or *Wendát*, of uncertain etymology), or HURON. An important tribe or confederacy of Iroquoian stock (q.v.). The original Wyandot were known to the French as Huron; this tribe was made up of the Wyandot proper or Huron and the neighboring and cognate Tionontati, who probably outnumbered the Wyandot when the two tribes united in 1650 and abandoned their country to escape the Iroquois. When first known to the French, about 1615, the Huron occupied a narrow territory between Georgian Bay and Lake Simcoe, Ontario, Canada. They had about 20 villages and a population conservatively estimated at 10,000. Their numbers, however, were greatly reduced about 1625 by smallpox and other pestilence. Adjoining them on the southwest were their kinsmen and allies, the Tionontati. On the invitation of the Huron, the French missionaries entered their country in 1623 and within a few years the Jesuit missions among the Huron became the most important in New France. The Iroquois had long been at war with the Huron and were equally hostile to the French. In 1648 began the final war, and within a year the Huron were compelled to abandon their country and seek shelter in different directions. Most of them fled to the Tionontati, who in turn were immediately attacked by the Iroquois in 1649, and after a short struggle the two tribes abandoned their country and fled to-

gether, first to Manitoulin Island in Lake Huron, then to Mackinaw and Green Bay, and finally to the Mississippi. Driven back by the Sioux (q.v.), they halted for a time near the western end of Lake Superior and then returned to Mackinaw, where in 1677 they numbered about 500. In 1702 they removed to Detroit, in Lower Michigan, and were followed by the missionaries. In 1723 they were formally admitted to the friendship of the Iroquois. In 1751 they built a new village at the present Sandusky, Ohio, and under the name of Wyandot soon acquired a new prominence in the Ohio country. They took an active part with the French in the Colonial wars and with the English against the Americans in the Revolution and War of 1812. At the treaty of peace in 1815 they were confirmed in possession of a large tract in Ohio and Michigan, most of which they sold three years later, reserving only two small pieces, near upper Sandusky, Ohio, and on the Huron River in Michigan. In 1842 they removed to Kansas and in 1867 were again removed to a small reservation in the northeastern corner of Oklahoma, where in 1910 they resided to the number of 320. Consult Barbeau, *Wyandot Myths* (Ottawa, 1916).

WY'ANDOTTE. A city in Wayne Co., Mich., 12 miles south-southwest of Detroit, on the Detroit River, and on the Michigan Central, the Lake Shore and Michigan Southern, the Grand Trunk, and the Detroit, Toledo, and Ironton railroads (Map: Michigan, F 6). It has a public library and the Eilbert Memorial Hospital. Manufacturing is the leading industry, the most important establishments being chemical works, salt blocks, iron works, a steel shipbuilding plant, a trunk factory, breweries, and manufactories of fur coats, robes, sashes, doors, blinds, wagons, wheelbarrows, gasoline engines, automobiles and accessories, etc. Wyandotte has adopted the commission form of government. Pop., 1900, 5183; 1910, 8287; 1915 (U. S. est.), 9396.

WY'ANDOTTE (from the North American Indian tribal name *Wyandot*). A breed of domestic fowls in high repute for general excellence. It originated about 1875 from a mixture of dark Brahma, silver-spangled Hamburg, and French bred fowls, and possesses the good qualities of the Plymouth Rock breed, with a trifle less weight. Five varieties are recognized, differing in plumage. The silver-laced has a silvery-white plumage, with regularly marked white lacing on the breast and a generous distribution of white and black throughout the entire body. The cock has a silver-white head, rose comb, silver hackle, with a black stripe down the centre of each feather; back silvery white; breast black with white centre; tail black; wings black, edged with white, showing a bar when folded; shanks and toes unfeathered and yellow. The golden is golden-bay and black instead of white. The white is white throughout, and the most practical variety. The buff is uniformly deep, clear buff in color, with a coppery bronze tail; and the black variety is wholly black with a greenish sheen. See FOWL; consult books mentioned thereunder; and see Colored Plate of DOMESTIC FOWLS with article POULTRY.

WYANDOTTE, or THE HULLED KNOLL. A novel by James Fenimore Cooper (1843).

WYANDOTTE CAVE. A remarkable natural formation in Crawford Co., Indiana, five miles northeast of Leavenworth. It is second in size to Mammoth Cave, being about 23 miles long, and consists mainly of a series of galleries and large chambers, whose greatest height is about 250 feet and greatest width about 300 feet. It is remarkable for the number and beauty of its crystals, exceeding, it is said, even Mammoth Cave in that respect. Among the most notable features are the Pillared Palace, with clusters of stalactites, and the Monument Mountain, 175 feet high, with three massive stalagmites at its top, standing on the floor of the Mammoth Hall, 350 feet long and 245 feet high. Consult H. C. Hovey, *Celebrated American Caves* (Cincinnati, 1896).

WYANT, wī'ant, ALEXANDER H. (1836–92). An American landscape painter. He was born at Port Washington, Ohio, and was self-taught. After practicing portrait painting in Cincinnati, in 1856, he went for a short stay to New York, where he came under the influence of Inness. In 1864 he returned to New York and in 1865 he went abroad, studying for some time under Hans Gude at Düsseldorf, but was more influenced by the works of Turner and Constable in London. Returning to America he settled in New York, was elected to the National Academy in 1869, and was one of the founders of the American Water-Color Society. His landscapes, usually representing a sunny rolling country seen through a foreground of tall trees, are treated in a subjective manner, with soft, shimmering atmospheric effects, and refinement and delicacy of presentation. Among his paintings are a "View on Lake George" (1875); a "Scene in the Adirondacks" (1882); "An October Day." The Metropolitan Museum in New York possesses seven good examples of his work, including "Broad Silent Valley," "Forenoon in the Adirondacks," and "Landscape in the Adirondacks."

WY'ATT (**WYATE, WYAT,** or **WYET**), SIR FRANCIS (c.1575–1644). A Colonial Deputy Governor of Virginia, born in England. In 1621 he was chosen by the Virginia Company to succeed Deputy Governor Sir George Yeardley, and in October of that year arrived at Jamestown with a fleet of nine ships. With him he brought a written constitution, memorable as the first instrument of the kind ever in use in America. With the first year of Wyatt's governorship 21 vessels bearing more than 1300 settlers arrived, but in 1622 occurred the great disaster of an Indian uprising. (See VIRGINIA.) When the charter was annulled in 1624, Wyatt remained Deputy Governor under a royal commission, but in 1625 he returned home. He was again sent out in 1639, but after a stormy administration of about 18 months was succeeded by Sir William Berkeley. Consult E. D. Neill, *Virginia Governors under the London Company* (London, 1889).

WYATT, JAMES (1746–1813). An English architect. He was born at Burton Constable, Staffordshire, and at 14 accompanied Lord Bagot to Rome. He remained there for three or four years, and during the two following years studied with Antonio Vicentini at Venice. About 1766 he returned to England. After rebuilding the old Pantheon in Oxford Street in 1772, he was constantly employed on important buildings, using first the Italian style, but after his appointment as surveyor to Westminster Abbey in 1776, the Gothic. He was commissioned to restore Salisbury, Lincoln, Lichfield, and Hereford cathedrals; built Fonthill Abbey for Beckford

in 1795; and was employed by George III at Windsor Castle. In 1785 he became a Royal Academician. He was the only man of his time who practiced in the Gothic style, which he sought with indifferent success to popularize. But he wholly failed to master its fundamental principles either of construction or design; and his ruthless demolition of mediæval work in the course of his restorations fastened upon him the sobriquet of "The Destroyer."

WYATT, Sir Matthew Digby (1820–77). An English architect and writer on art. After his apprenticeship and his study for some time at the Royal Academy, he went in 1844 to the Continent and studied the architecture of Italy, France, and Germany, making an especial study of decorative art in its various applications. He returned to England in 1846, and in 1848 published *Geometrical Mosaics of the Middle Ages.* As secretary to the Royal Commissioners he took an important part in the arrangements of the 1851 exhibition. In 1856 he was appointed architect to the East India Company. In 1866 he received the royal gold medal of the Royal Institute of British Architects, and in 1869 he was chosen Slade professor of fine arts at Cambridge. His chief publications are: *Metal Work and Its Artistic Design* (1852); *Industrial Arts of the Nineteenth Century* (1853); *Art Treasures of the United Kingdom* (1857); *Fine Art* (1870); and *Architect's Notebook in Spain* (1872).

WYATT, or **WYAT,** Sir Thomas (c.1503–42). An English poet and diplomatist, born on his father's estate of Allington, near Maidstone in Kent. His father, Sir Henry Wyatt, of a family originally of Yorkshire, stood high in favor with both Henry VII and Henry VIII. The younger Wyatt studied at St. John's College, Cambridge, from 1515 to 1520. In that year he married Elizabeth Brooke, daughter of Lord Cobham, but already he had been the lover of Anne Boleyn (q.v.), and for long after his marriage was still regarded as such. His boyish intimacy was ended only by her death. Through his father's influence and his own personality a career at court was open to him. In this sphere, as one of the most accomplished men of his day, of noble presence and fine manners, of honor and integrity, and skillful in the management of affairs, he was thoroughly qualified to succeed. Wyatt visited Venice, Ferrara, Bologna, Florence, and Rome. In 1529 and 1530 he was high marshal at Calais. The favors of Anne Boleyn having now been sought by the King, Wyatt, it is said, confessed his relations and tried to dissuade the King on the ground that her character was not beyond reproach. In 1536 the scandal aroused by Anne Boleyn's adulteries threatened to overwhelm Wyatt. In May he was committed to the Tower, but after Anne's death he went free, was endowed with more honors, was made sheriff of Kent, and was sent on an embassy to Spain (1537–39). He was sent to Flanders in 1539. On the fall of his patron at court, Thomas Cromwell, Wyatt was sent to the Tower, accused of treason, but after explanation and confession, he regained the King's confidence and enjoyed it to a greater degree even than before the accusation. Granted lands at Lambeth by Henry VIII, named high steward of the King's manor of Maidstone, elected to Parliament for Kent, all in 1542, death overtook him in the same year.

Wyatt shares with Surrey the honor of introducing the sonnet into English verse; as he was the elder by some years, and a student of Petrarch, while Surrey was a mere child, the evidence seems to give him the preference. Wyatt also tried his hand at the terza rima. He wrote (besides sonnets) rondeaux and miscellaneous verse forms, and satires and a version of the penitential psalms. Love is the theme of most of his lyrics and Anne Boleyn is the mistress of his song. In his sacred poems Wyatt shows the influence of Dante and of Alamanni. More vigorous in thought and more robust in sentiment than Surrey, he was a ruder artist than his associate. His poems, together with those of Surrey, who was his poetical pupil, were published in London, 1557, in *Songes and Sonnettes* (*Tottel's Miscellany*). A more elaborate edition prepared by G. F. Nott, in two volumes, was issued in 1815–16 in London. This latter edition contained also the works of Surrey, and included an elaborate memoir. Consult: W. E. Simonds, *Sir Thomas Wyatt and His Poems* (Boston, 1889); F. M. Padelford, *Early XVIth Century Lyrics* (London, 1907); A. K. Foxwell, *Study of Sir Thomas Wyatt's Poems* (New York, 1912).

WYATT, Sir Thomas (?1521–54). An English soldier, son of Sir Thomas Wyatt, the poet, surnamed "the Younger." He did good service at the siege of Boulogne (1544), displaying considerable military talent; and continued in honorable service on the Continent till 1550. In 1554, when the marriage between Queen Mary and Philip of Spain was under consideration, Wyatt conspired to prevent it, and led the Kentish men to Southwark, after gaining considerable success over the royalists. He, however, failed to capture Ludgate, and, becoming separated from the main body of his followers, was taken prisoner, and soon afterward executed.

WYCHERLEY, wĭch'ẽr-lĭ, William (?1640–1716). An English dramatist, a founder of the school of artificial comedy, which reached complete development in the work of Congreve and his associates and later of Sheridan. Wycherley was born at Clive, in Shropshire, the son of a well-to-do cavalier squire, who sent him at 15 to be educated in France. On returning to England he was entered at the Inner Temple in 1659, but literature proved more attractive than law. His first comedy, *Love in a Wood, or St. James's Park,* was acted with great applause, and soon published, probably in 1672. *The Gentleman Dancing-master,* which appeared in 1673, was less successful, but two other comedies, *The Country Wife* (1675), and *The Plain Dealer* (1677), are his strongest works, though he is indebted to Molière for them. About 1680 Wycherley married a rich widow, the Countess of Drogheda. She soon died and left him her fortune; but his succession was disputed and a lawsuit ensued, the costs of which fairly broke him down. He was committed to the debtors' prison and languished there neglected for seven years. He was partly relieved by the bounty of James II, and upon his father's death he succeeded to the patrimonial estate in Shropshire. This, however, was heavily mortgaged and strictly entailed. He was on bad terms with the heir-at-law, his nephew; and to injure this relative, he married, at the age of 75, a young girl, on whom he settled a jointure. Eleven days afterward he died. Besides his comedies, Wycherley published a volume of wretched *Miscellany Poems* in 1704, and after

his death another volume, *The Posthumous Works of William Wycherley, Esq., in Prose and Verse*, appeared in 1728. His comedies reflect the literary taste, the manners, and the vices of his time. They are grossly immoral, but their dramatic construction is excellent, the language is clear and forcible, the dialogues are often witty, some of the characters are vigorously drawn, and the scenes are expressed in a terse, sententious style. Consult: The memoir published with the *Posthumous Works* (London, 1728); Lord Lansdowne, *Memoirs of the Life of William Wycherley, Esq.; with a Character of His Writings* (ib., 1718); W. C. Ward, ed., *Best Plays of William Wycherley, with an Introduction and Notes* (ib., 1888); and William Hazlitt, *Lectures on the English Comic Writers* (ib., 1819; new ed. in "Everyman's Library," New York, 1910).

WYCHE'S (wĭch'ĕz) **LAND.** An island east of Spitzbergen, in about 79° N. lat., discovered and named by Edge in 1617. Its identity has been much discussed, without positive results, but it is probably part of King Charles Land.

WYCH (wĭch) **STREET.** A street in London, famous as the resort of thieves and loose characters during the seventeenth and eighteenth centuries. Jack Sheppard's special haunt, the White Lion, has long been demolished. In 1554, Bishop Hooper spent the night before his execution at another of its inns, the Angel. Wych Street leads from the Strand, near Clement's Inn, to Drury Lane, and contains the Olympic Theatre and an entrance to New Inn.

WYCKOFF, wĭ'kŏf, WALTER AUGUSTUS (1865–1908). An American sociologist, born in Mainpuri, India, where his father was a missionary. He graduated at Princeton in 1888, and studied in Europe (1889–90). For 18 months after July, 1891, he worked as a day laborer, making his way from Connecticut to California, in order to study the character and manner of life of the wage-earning class in America. The results of his studies appeared in three volumes: *The Workers—the East* (1897); *The Workers—the West* (1898); and *A Day with a Tramp and Other Days* (1901). These attracted widespread attention and show sympathetic insight and acuteness of observation. Wyckoff traveled twice around the world as a private tutor, in 1893–94; and at Princeton became lecturer on sociology in 1895 and was assistant professor of political economy from 1898 until his death.

WYCLIFFE. See WICLIF.

WYCOMBE, wĭk'ŭm, HIGH WYCOMBE, or CHIPPING WYCOMBE. A municipal borough in Buckinghamshire, England, surrounded by beech-clad hills, 28 miles west-northwest of London, on the Wye, a small affluent of the Thames (Map: England, F 5). It is famous for its Roman and Saxon antiquities. The church of All Saints, in the Norman and early English style, is a large and handsome edifice, dating from 1273. There are flour and paper mills, and manufactures of lace and furniture, beechwood chairs being a specialty. Pop., 1911, 20,390.

WYE, wī. A river of Wales and England. It rises on the south slope of Plinlimmon in Wales near the source of the Severn, and flows southeast into Herefordshire, England, then southward, in a deep trench emptying into the estuary of the Severn on the boundary between Monmouth and Gloucester (Map: Wales, D 5). It is 130 miles long, navigable for large vessels to Chepstow, near its mouth, and for small craft 70 miles to Hereford, whence a canal connects it with the Severn at Gloucester. At its mouth the tide rises sometimes 46 feet, a height exceeded in few places on the globe. The lower course of the Wye is celebrated for its beauty, and here on its banks lie the ruins of Tintern Abbey.

WYET, SIR FRANCIS. See WYATT.

WY'ETH, JOHN ALLAN (1845–). An American surgeon, born in Marshall Co., Ala. He studied for a year at La Grange Military Academy, La Grange, Ala., and during the Civil War served as a private and was a prisoner for 15 months at Camp Morton, Indianapolis. He graduated in medicine at the University of Louisville (Ky.), in 1869, and at Bellevue Medical College (New York) in 1873. From 1880 to 1897 he was surgeon to Mount Sinai Hospital, New York. In 1882 he founded the New York Polyclinic, an important post-graduate school with hospital, and after occupying the chair of surgery in that institution for several years became, in addition, president of the faculty in 1893. He was president of the American Medical Association in 1902. His publications include: *A Text-Book on Surgery* (1888); *Bloodless Amputation at the Hip Joint* (1890); *Osteo-Plastic Operation for Correction of Deformities of the Nose and Palate* (1892); and a *Life of General Nathan Bedford Forrest* (1899). *With Sabre and Scalpel* (1915) is autobiographical.

WYKEHAM, WILLIAM OF. See WILLIAM OF WYKEHAM.

WYLIE, wī'lĭ, ALEXANDER (1815–87). An English missionary and sinologist, born in London. He was educated partly in Scotland and partly in London. With Premare's *Notitia Linguæ Sinicæ* and with a New Testament he learned to read Chinese fairly well. In 1847 he went to Shanghai as superintendent of the Mission Press of the London Missionary Society, and there, besides mastering Chinese, he carried through the press the new Delegates' Version of the Bible. In 1860 he became agent in China of the British and Foreign Bible Society. In the prosecution of his new work he traversed 17 of the 18 provinces of China, and naturally had less time for writing, but when in 1877 he retired, worn out with manifold labors and half blind, the list of his writings was a long one. In a year or two he became totally blind, but with the assistance of his daughter he continued his translation of the Han Dynasty history and the preparation of the catalogue of his library, which went to the Bodleian at Oxford. He died in London. His industry was enormous and his learning deep and wide. He published in Chinese, *A Compendium of Arithmetic*, with tables of logarithms, etc.; Euclid's *Elements*, books vii to xv, reprinted by Tsêng Kwoh-fan (in 1865); *A Popular Treatise on Mechanics* (1858); De Morgan's *Treatise on Algebra* (1859); Loomis's *Elements of Analytical Geometry* and his *Differential and Integral Calculus* (1859); and Herschel's *Astronomy*, with the original steel plate illustrations (1859). In 1855 he brought out an English version of a Chinese-Manchu *Grammar*, and in 1859 edited and published the Gospels of *Matthew* and *Mark* in Manchu and Chinese. His best known work in English is *Notes on Chinese Literature* (1867).

WYLIE, JAMES AITKEN (1808–90). A Scot-

tish theological writer, born at Kirriemuir, Forfarshire. He was educated at Marischal College, Aberdeen, at the University of St. Andrews, and at the Original Secession Divinity Hall, Edinburgh. In 1846 he became subeditor of the Edinburgh *Witness* and in 1852 (having joined the Free Church of Scotland) editor of the *Free Church Record*. In 1860 he was appointed lecturer on Roman Catholic and Protestant theology at the Protestant Institute, Edinburgh, and he held this position till his death. All his life he was a zealous upholder of Protestantism and wrote copiously on this topic and other religious subjects. His more important works were: *The Modern Judea* (1841); *Ruins of Bible Lands* (1845); *The Great Exodus* (1863); *The History of Protestantism* (1874–77); *The Jesuits* (1881); *Over the Holy Land* (1883); *History of the Scottish Nation* (1886–90).

WYMAN, wī'man, JEFFRIES (1814–74). An American naturalist and anatomist, born at Chelmsford, Mass. He graduated at Harvard College in 1833 and at Harvard Medical School in 1837, and in 1840 was made curator of Lowell Institute, Boston. After studying in Europe, he was elected in 1843 professor of anatomy and physiology at Hampden-Sidney College, Richmond, Va. In 1847 he became professor of anatomy at Harvard, where he remained till his death. He made extensive and valuable collections in comparative anatomy and archæology, and he published nearly 70 scientific papers. His work as a comparative anatomist, a student of American Indian antiquities, and an early champion of evolution was of the first importance. Consult B. G. Wilder in *Leading American Men of Science*, ed. by D. S. Jordan (New York, 1910).

WYMAN, WALTER (1848–1911). An American surgeon and sanitarian. Born and educated at St. Louis (M.D., St. Louis Medical College, 1873), he joined the Marine Hospital Service in 1867, becoming surgeon general of the United States Public Health and Marine Hospital Service in 1902. He drafted several laws designed to result in improving the physical condition of sailors, furthered national quarantine, and was instrumental in the establishment of governmental laboratories for the manufactory of serums, toxins, and virus. He published many articles on public health and hygiene.

WYMORE. A city in Gage Co., Neb., 52 miles south of Lincoln, on the Blue River and on the Chicago, Burlington, and Quincy Railroad (Map: Nebraska, H 4). It has railroad machine shops and roundhouse. Grain and live stock are shipped in large quantities. Pop., 1900, 2626; 1910, 2613.

WYNANTS, or **WIJNANTS**, wī'nants, JAN (c.1605–c.1679). A Dutch landscape painter. He was born at Haarlem, and lived there and at Amsterdam. He was one of the earliest landscape painters in Holland, and is intrinsically interesting for his color, though his choice of subjects was poor. Wouwerman painted figures in his landscapes while he lived at Haarlem, and Van der Velde, Lingelbach, and others after he removed to Amsterdam. His work is well represented in many of the European galleries, especially in those of Amsterdam, The Hague, Munich, St. Petersburg, and the National Gallery and Wallace collection, London.

WYNDHAM, win'dam, SIR CHARLES (1837–). An English actor and manager. Educated as a physician, he came to America during the Civil War and was for a time a surgeon in the Union army. While in America, too, he made his appearance upon the stage; and after his return to England appeared in London (1868), where he soon became very popular in light comedy. His Charles Surface was much admired and another of his successes was made in an adaptation of Bronson Howard's *Saratoga*, called *Brighton*, in 1874, which he afterward played in German at Berlin. In 1876 he became connected with the Criterion Theatre, of which he assumed control in 1879. Among his productions were many of the best-known plays of Sir Arthur Pinero and Henry Arthur Jones. He made frequent visits to the United States, where he appeared in all his best rôles. In 1899 he opened the splendid Wyndham's Theatre in London, and in 1903 the New Theatre. In 1916 he married Miss Mary Moore (widow of James Albeny), who for 30 years had been his leading lady, and had also been associated with him as a manager. He was knighted in 1902. Consult Florence T. Shore, *Sir Charles Wyndham* (New York, 1908).

WYNDHAM, GEORGE (1863–1913). An English statesman. He was born in London, and was educated at Eton and at the Royal Military College at Sandhurst, where he graduated in 1882. In 1883 he entered the Coldstream Guards and served through the Suakim campaign, and in Cyprus (1885), when he resigned from the army. From 1887 to 1892 he was private secretary to A. J. Balfour. In 1889 he entered Parliament as a Conservative member from Dover, and in 1898 became Undersecretary of State for War. In 1900 he was advanced to the position of Chief Secretary for Ireland, and in 1902 was made a member of the cabinet. He first became a figure of international interest when, on March 25, 1903, he introduced the most important of Irish land purchase bills. (See IRISH LAND LAWS.) His conciliatory attitude rendered the passage of the bill possible. He resigned in March, 1905, owing to the criticism directed by the Orange Unionists against his conciliatory policy in Ireland. He edited *North's Plutarch* (1894), and *Shakespeare's Poems* (1898), and in 1906 published *Ronsard and La Pléiade*.

WYNDHAM, WILLIAM. See GRENVILLE, LORD.

WYNDHAM-QUIN, WINDHAM THOMAS. See DUNRAVEN, EARL OF.

WYNKIN DE WORDE. See WORDE, WYNKIN DE.

WYNTOUN, win'tūn, ANDREW OF (?1350–?1420). A Scottish chronicler, about whom very little is known except that he was a canon regular of St. Andrew's and was elected about 1395 prior of St. Serf's Inch in Loch Leven. His *Oryginale Cronykil of Scotland*, in verse, possesses great linguistic interest as a specimen of early English written in the North. Like Barbour's *Bruce*, the poem is composed in octosyllabic verse. The work was edited by David Laing for the "Series of Scottish Historians" (3 vols., Edinburgh, 1872–79). A new edition from the Wemyss manuscript prepared for the Scottish Text Society and issued in 1906 is incomparably the best.

WYOMING, wī-ō'ming *or* wī'ō-ming (named after Wyoming valley, Penn., q.v. for derivation). One of the Rocky Mountain States, lying between lat. 41° and 45° N. and long. 104° 3′ and 111° 3′ W. Its boundaries are straight lines

running along meridians and parallels. The length of the southern boundary line is 369 miles; the width of the State north and south is 276 miles, and the area is 97,914 square miles, making it eighth in size among the States of the Union.

Topography. The Rocky Mountain system crosses Wyoming from southeast to northwest in two chains of connecting ranges. While the general altitude is great, the relief is in many places so great that the general altitude is forgotten. Only a few small valleys lie below 4000 feet elevation; vast plateaus, between the ranges, lie between 6000 and 7000 feet, and many of the mountain peaks reach nearly 14,000 feet above sea level.

The more easterly of these chains enters the State a little west of the southeast corner, under the name of the Front Range or the Laramie Range, extends north some hundred miles to Laramie Peak, bends to the west and after flattening out and lowering to less than 7000 feet, turns sharply to the north, again increases in altitude, and extends to and into Montana as the mighty Big Horn Range. The second chain enters the State at the eastern third point of the southern boundary as the Medicine Bow and Sierra Madre ranges, being separated by the North Platte valley. They merge and swing to the west under the name of the Ferris, and farther west the Green Mountains, and again swinging to the north, rise as the great Wind River Range which joins with the Absaroka and Owl Creek mountains and becomes the great elevated plateau known as Yellowstone Park. The waters from the eastern slope of the Wind River Range flow north, then east towards the Mississippi and the Gulf of Mexico, those from the southern slope to the Gulf of California, and those from the northwestern slope go to the Columbia and thence to the Pacific.

Hydrography. Wyoming has six large rivers. The Green River and its tributaries drain the southwestern quarter. Its headwaters come from under the glacier on the north side of Fremont Peak in the Wind River Range. It leaves the State through the beautiful Ladore Cañon. The Snake River rises in Yellowstone Park, flows through Jackson Lake, receives tributaries from the Teton, Wind River, Gros Ventre, and Wyoming ranges in the famous Jackson Hole and flows into Idaho to become the Columbia.

All the other rivers are tributaries of the Missouri. The North Platte (q.v.) has the largest drainage area of the State. The Powder River has but few tributaries from the mountains. It flows northeasterly across a vast area of plains country, leaving the State near its northeast corner. The Big Horn River is formed by the union of several rivers which drain the eastern slope of the Wind River Range and the south slope of the Owl Creek Mountains and join under the name of Big Wind River, which, after roaring through the magnificent cañon of the Owl Creek Mountains, enters the Big Horn basin, and is then known as the Big Horn River.

Geology. Wyoming has rocks of every geological age. The mountain cores are Archean granites and Pre-Cambrian schists. Upon the flanks of the ranges lie the Cambrian, Paleozoic, and Mesozoic series, while the Tertiary and Quaternary appear far from the mountains in what were the old sea and lake beds, when these bodies of water were entrapped by the uprearing of the mountain ranges. In the sedimentary rocks are vast deposits of coal, petroleum, iron, phosphates, gypsum, and soda. Building stones are unlimited in quantity and extremely varied in quality. The coal-producing area of the State is estimated at 30,000 square miles, and some 4000 square miles of phosphate-bearing area has been surveyed. In the igneous rocks are found the various precious metals.

Climate and Soil. The climate is arid, the annual precipitation in some parts being as low as 6 inches. The high timber-covered mountains receive some 20 feet of snow during the winter months. This melts during the summer months, feeding the thousands of streams which are diverted to irrigation ditches in the foothill and plain parts of their courses. The dryness of the air results in a healthful climate. The soils vary from the gravelly, sandy loams of the glacial-drift areas, to the heavy clay (adobe) of the shale and limestone districts. Much of the State has a thin sandy grass-covered soil overlying a heavy blue-clay subsoil. This condition seems to be very favorable for irrigation, as the water does not escape as it does where the subsoil is sand and gravel.

Mineral Products. Wyoming in 1914 ranked thirtieth among the mineral-producing States. The most important minerals in order of importance are coal, petroleum, iron ore, and gypsum. The value of the coal produced in 1914 constituted about five-sixths of the total value of mineral products. The production of powder-mined coal was 2,204,762 tons. The machine-mined production amounted to 2,734,151 tons, the hand-mined coal amounted to 1,532,987 tons. The total production of coal in that year amounted to 6,475,293 short tons valued at $10,033,747. Remotely situated, the oil fields have been developed slowly, largely in response to the demand of certain railroads for liquid fuel. The petroleum comes largely from the Salt Creek and Shannon fields both in Natrona County. The production of petroleum in that year amounted to 3,560,375 barrels valued at $1,679,192. The State also produced gypsum in that same year valued at $86,196, clay products with a value of $64,942, and stone valued at $62,331. Other minerals produced are gold, sand and gravel, silver and mineral waters. The gross value of all mineral products in 1914 was $12,417,752.

Agriculture. Of a total land area of approximately 62,460,160 acres only 8,543,010 acres were in farms in 1910 and of which 1,256,160 acres were improved land. The total number of farms in that year was 10,987, and the average number of acres per farm was 777.6. The average value of farm land per acre was $10.41. The total value of all farm property including land, buildings, implements and machinery, domestic animals, poultry, and bees, was $167,189,081. Of the total number of farms in 1910 10,090 were operated by owners and managers and 897 were operated by tenants. The native white farmers numbered 9019, the foreign-born farmers 1903, the negro and other nonwhite 65. Of the foreign-born farmers 324 were born in England, 321 in Germany, and 252 in Sweden. Among the nonwhite farmers were 44 Indians and 19 negroes. The following table gives the acreage, production, and value of some of the leading crops as estimated by the United States Department of Agriculture in 1915.

CROPS	Acreage	Prod. in bu.	Value
Corn	25,000	625,000	$419,000
Wheat	125,000	3,315,000	2,586,000
Flaxseed	2,000	26,000	38,000
Oats	227,000	9,534,000	4,100,000
Rye	9,000	180,000	162,000
Potatoes	16,000	2,400,000	1,440,000
Hay	550,000	*1,210,000	9,438,000
Barley	17,000	612,000	337,000

* Tons.

While the State still takes high rank as a grazing State, large areas are now being irrigated and cultivated with great success. The gross value of all crops in 1909 was $10,022,961. The leading crops are hay and forage, oats, wheat, and potatoes. According to the thirteenth census the acreage of hay and forage was 585,386, and the production 853,515 tons valued at $6,077,354; the acreage of oats 124,035 and the production 3,361,425 bushels valued at $1,828,711; the acreage of wheat 41,968, the production 738,698 bushels valued at $664,251; the acreage of potatoes 8333 and the production 932,162 bushels valued at $524,489. The acreage of vegetables (other than potatoes) was 2933 and their value $332,000. To small fruits were devoted 106 acres from which the yield was 96,883 quarts valued at $13,984. Most important among the small fruits were currants and strawberries. The production of orchard fruits was 18,586 barrels valued at $39,774. By far the most important of the orchard fruits is the apple. The production of sugar beets amounted to 13,418 tons valued at $61,398.

Live Stock and Dairy Products.—The gross value of all live stock on the farms in 1909 was $65,384,559. According to the estimates of the United States Department of Agriculture there were on the farms on Jan. 1, 1916, horses, 180,000 valued at $14,760,000; mules, 2000 valued at $198,000; milch cows, 50,000 valued at $4,025,000; cattle, other than milch cows, 703,000 valued at $37,048,000; sheep 4,338,000 valued at $24,293,000; swine 70,000 valued at $658,000. The total value of milk, cream, and butter fat sold, and butter and cheese made was $539,423. The milk sold amounted to 1,377,607 gallons valued at $155,882, the butter made amounted to 1,192,122 pounds valued at $331,021. The total number of fowls of all kinds on the farms was 341,050 and their value $194,078.

Irrigation. Irrigation was reported from every county in 1909. There are three counties, Park, Bighorn, and Carbon, with more than 90 per cent of the farms irrigated, and two others, Uinta and Sheridan, with more than 75 per cent irrigated. The number of farms irrigated in 1909 was 6297, the number of acres irrigated 1,133,302, and the number of acres existing enterprises were capable of irrigating 1,639,510. The acreage included in projects now under way is 2,224,298. The total cost of existing irrigation enterprises amounted to $17,700,980 and the estimated final cost of existing enterprises aggregated $20,425,890. The most important farm crops are almost altogether grown on irrigated land. Most important among such crops is alfalfa, of which the output from irrigated land in 1909 was valued at $2,526,657. Second in importance were the wild salt or prairie grasses with an irrigated crop valued at $1,384,269. Next came oats with an irrigated crop valued at $1,302,033.

Forest Products. The lumber industry is the second in importance within the State. The rough lumber sawed in 1909 amounted to 28,602 M feet B. M., the lath to 1224 thousands, the shingles 960 thousands. The rough lumber sawed in that year consisted almost altogether of soft woods, chiefly western pine and lodgepole pine. In addition to the figures cited above there were produced on the farms forest products valued at $104,259.

Manufactures. The manufacturing industries in Wyoming are not of great importance. The value of products per capita in 1909 was $42.81.

The following table gives the most important figures relative to the manufactures in the State.

SUMMARY OF MANUFACTURES FOR 1914, 1909, AND 1904

THE STATE — FIVE LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY: Total	PERSONS ENGAGED IN INDUSTRY: Wage earners (average number)	Capital	Wages	Value of products	Value added by manufacture
					Expressed in thousands			
All industries	1914	337	3,696	2,989	$20,270	$2,312	$11,223	$5,664
	1909	268	3,393	2,867	6,195	2,081	6,249	3,641
	1904	169	2,163	1,834	2,696	1,261	3,523	2,222
Butter, cheese, and condensed milk	1909	4	27	20	115	17	269	58
	1904	5	17	11	38	7	114	19
Cars and general shop construction and repairs by steam-railroad companies	1909	9	1,806	1,690	2,046	1,309	2,337	1,629
	1904	9	1,288	1,212	901	884	1,640	1,107
Flour-mill and gristmill products	1909	13	45	29	440	21	746	163
	1904	11	31	16	222	11	284	65
Lumber and timber products	1909	63	766	648	1,075	314	751	553
	1904	32	370	305	345	151	465	401
Printing and publishing	1909	65	275	162	437	141	490	400
	1904	47	186	119	206	84	313	261

The average number of wage earners in 1909 was 2867, of whom only 45 were female. The wage earners under 16 years of age numbered only 12. For the great majority of wage earners the prevailing hours of labor were from 60 to 72 per week, only 16.9 per cent having hours less than 60 per week.

The only city with a population of 10,000 or more, Cheyenne, gave employement to 29.8 per cent of the total number of wage earners and produced 25.2 per cent of the total value of output, the respective figures being 853 and $1,577,023. Outside of the car repair shops the only industries are those necessary to meet local needs.

Transportation. There is no water transpor-

tation, Wyoming having no navigable streams. The rugged character of the terrain does not permit of extensive railway construction, and in 1914 the total mileage was 1821. The principal lines and the mileage in that year are the Union Pacific (617), the Chicago, Burlington, and Quincy (692), and the Chicago and Northwestern (279).

Banks. The condition of the various banks in 1915 as reported by the United States Comptroller of the Currency is as follows:

	National banks	State banks	Savings banks
Number	33	66	4
Capital	$1,900,000	$1,546,259	$210,000
Surplus	1,116,000	431,425	12,500
Cash, etc	853,000	373,061	23,667
Deposits	14,198,000	6,497,509	1,161,992
Loans	13,135,000	6,524,841	1,205,438

Government. The present constitution was adopted by the people on Nov. 5, 1889. Amendments may be proposed by either branch of the legislature, and if agreed to by two-thirds of the members of each of the two houses they are submitted to the electors of the State at the next general election, and if ratified become a part of the constitution. On recommendation of two-thirds of the members of each branch of the legislature the question of constitutional convention may be submitted to the people.

Legislative.—The legislative power is vested in the Senate and House of Representatives. Senators are elected for a term of four and representatives for a term of two years. Senators must be at least 25, and representatives at least 21 years of age. Sessions of the legislature begin on the second Tuesday of January, biennially in odd years.

Executive.—The executive power is vested in the Governor, who holds office for four years. Other executive officers are Secretary of State, Auditor, Treasurer, and Superintendent of Public Instruction. They also hold office for four years. The Attorney-General, State Engineer, State Examiner, and other officers are appointed by the Governor.

Judiciary.—The judicial power is vested in a Supreme Court, district courts, justices of the peace, and such other courts as may be established by law. The Supreme Court consists of three justices, who are elected for a term of eight years. In each county is appointed one or more court commissioners who have authority to perform legal business in the absence of the district judges from the county. There are seven district judges. The State is divided into seven judicial districts, and a judge is elected in each district for a term of six years.

Suffrage and Elections.—Any citizen, male or female, of the United States of the age of 21 years and over, who has resided in the State for one year and in the county for 60 days preceding the election, is entitled to vote. All general elections are held on the Tuesday following the first Monday in November of each even year. Nominations for offices are made through primary elections.

Local and Municipal Government.—The county is the unit of local government. The towns are incorporated under a general law. Municipalities having a population of more than 4000 are cities of the first class, and may adopt the commission form of government.

Miscellaneous Statutory and Constitutional Provisions.—There is a workmen's compensation law. In regulation of the liquor traffic, Wyoming is under license and municipal council option in the incorporated towns and villages, while unincorporated sections of the State are under prohibition. The Yellowstone National Park, which is under the control of the Federal government, is also under prohibition. The initiative and referendum are in force among cities of the first class.

Finance. A bonded debt of $320,000, chiefly to meet expenditures for the capitol and other buildings, was incurred when Wyoming entered the Union in 1890. This amount had been reduced by Sept. 30, 1914, to $111,000, of which $90,000 was public bonds. The report of the State Treasurer for the biennial period 1913–14 shows a cash balance on Oct. 1, 1912, of $1,179,672. The receipts for the period were $2,643,268, while the disbursements amounted to $2,331,459, leaving a cash balance on hand Sept. 30, 1914, of $1,491,482.

Population. The population of the State at each of the Federal censuses was as follows: 1870, 9118; 1880, 20,789; 1890, 62,555; 1900, 92,531; 1910, 145,965; 1915 (State census), 141,705. The number of persons to the square mile in 1910 was 1.5. The urban population—i.e., that in places of 2500 or more—was 43,221. The native whites of native parentage numbered 80,696, the native whites of foreign or mixed parentage 32,504, the foreign-born whites 27,118, the negroes 2235. Of the foreign born Austria furnished 14.6 per cent, England 11 per cent, Germany 9.7 per cent, and Sweden 9.2 per cent. Of the native whites 27.2 per cent was born in the State, 9.1 per cent in Iowa, 7.3 per cent in Nebraska, 6.3 per cent in Illinois, and 6.2 per cent in Missouri. By sex the population was divided into 91,670 males and 54,295 females. The males of voting age in 1910 numbered 63,201. There are three cities with a population of 8000 or more. These with their population in 1910 and 1915 (State census) follow: Cheyenne, 11,320 and 9661; Sheridan, 8408 and 8906; Laramie, 8237 and 4962.

Militia. The males of militia age in 1910 numbered 54,654. The organized militia in 1915 included 598 men and 34 officers. It comprised two battalions and a separate company of infantry, and a detachment of sanitary troops.

Education. The percentage of illiteracy in 1910 was 3.3. The percentage of illiterates among the native born of native parentage was 0.3, among foreign-born whites 9.7. The total school population in 1910 according to the thirteenth census was 32,334. Of these 24,584 or 76 per cent attended school in that year. The total enrollment in the schools in 1914 according to the reports of the State Superintendent of Schools was 29,301. Of these 29,155 were white and 146 were colored. The total number of schoolhouses was 879. There were 245 graded and 714 ungraded schools. The total number of teachers was 1488, of whom 1300 were women and 188 men. The average monthly salary of men teachers was $85.92, and of women $58.43. There were 44 high schools, in which there were enrolled 2697 pupils. The total disbursement for educational purposes in 1914 was $1,758,930.

Provision has been made for the teaching of agriculture in the State course of study. It is the duty of the State Superintendent of Edu-

cation to prepare a course of study for the elementary schools. All teachers are obliged to attend the annual county teachers' institute, and must hold a valid Wyoming State certificate covering a period of services in public schools. Each county has a county superintendent.

Most of the schools are of course rural schools. The Legislature of 1915 amended the compulsory education law. Children from the ages of seven to 14 inclusive are obliged to attend school during the entire term. There is one State normal school in Wyoming. The only institution of collegiate rank is the University of Wyoming at Laramie (see WYOMING, UNIVERSITY OF), which is part of the educational system of the State. It is coeducational.

Charities and Corrections. The charities and corrections under the control of the State Board of Charities and Reform include the State Hospital for the Insane at Evanston, Wyoming State Penitentiary at Rawlins, Wyoming Soldiers and Sailors Home at Buffalo, Big Horn Hot Springs Reserve at Thermopolis, Wyoming General Hospitals at Sheridan, Rock Springs, and Casper, and Wyoming School for Defectives at Lander.

Religion. The combined membership of all religious bodies comprises a little more than one-fourth of the total population. The Roman Catholics outnumber the Protestants, who are followed by the Mormons. The leading Protestant denominations are the Episcopalian, Methodist, Baptist, and Congregationalist.

History. The territory included within the present State was a part of the Louisiana Purchase of 1803 with the exception of the southwest corner, which was a part of the Mexican cession of 1848. The Territory of Wyoming was directly created by Congress July 25, 1868, from Dakota, Utah, and Idaho. The stories of Spanish exploration have no foundation. The first white explorers were Sieur de la Verendrye and his sons, who passed through while looking out for situations for trading posts in 1734–44. White hunters visited the Yellowstone in 1804, and in 1807 fur-trading posts were established in Montana and the trappers began to range the country. The first permanent fort was built on the Laramie Fort of the Platte in 1834. It was sold to the American Fur Company in 1835, rebuilt by that corporation in 1836, and sold to the United States in 1842, and in the same year Fort Bridger was built on the Black Fork of the Green River, but was abandoned in 1835 on account of Mormon opposition. The streams of immigration both to California and Oregon passed through the Territory, but few or none of the immigrants settled permanently. A chain of forts was built by the Federal government to protect the travelers, however, from the Sioux and other Indians, who declared war against the military and the trappers in 1854. In 1867 the discovery of gold led to the founding of South Pass City, and the same year Cheyenne was laid out by the Union Pacific Railroad Company. The surrounding country, which was without government of any sort, was formed into Laramie Co., Dak., and a vigilance committee kept order. The Territorial government was organized in 1869, and the same year woman's suffrage was adopted and has been maintained to the present time. The Indians in 1866 refused to grant a right of way through their lands, and until after they had been punished for the massacre of Gen. George A. Custer (q.v.) in Dakota in 1876 they were constantly making trouble. The State was admitted to the Union July 10, 1890, as the constitution adopted in November, 1889, had been approved by Congress. Fraudulent entries for public lands, especially the coal lands, made by the collusion of railroad and United States Land Office agents, led, 1903–06, to numerous convictions in the State. In national politics the State voted first in 1892 for the Republican candidates. The free-silver agitation in 1896 carried it into the Democratic column, but in 1900, 1904, and 1908 the Republican electors were chosen. In the presidential election of 1908 Taft received 20,846 votes, and Bryan 14,918. In 1910, as the result of the division in the Republican party, the Democrats elected their candidate for Governor, Joseph M. Carey, an insurgent Republican. In the presidential election of November, 1912, Wilson received 15,210 votes, Taft 14,560, and Roosevelt 9232. In the State election held in 1914 the Democrats elected John B. Kendrick, Governor.

GOVERNORS OF WYOMING

TERRITORIAL

John A. Campbell	1869–75
John M. Thayer	1875–78
John W. Hoyt	1878–82
William Hale	1882–85
Francis E. Warren	1885–86
George W. Baxter	1886
Thomas Moonlight	1886–89
Francis E. Warren	1889–90

STATE

Francis E. Warren	Republican	1890
Amos W. Barber (acting)		1890–92
John E. Osborne	Democratic Populist	1892–95
William A. Richards	Republican	1895–99
DeForest Richards	"	1899–1903
Fenimore Chatterton	"	1903–05
Bryant B. Brooks	"	1905–11
Joseph M. Carey	Democrat	1911–15
John B. Kendrick	"	1915–

Bibliography. Wyoming Territory, Department of State, *Resources of Wyoming* (Cheyenne, 1889); H. H. Bancroft, *History of Nevada, Colorado, and Wyoming, 1540 to 1888* (San Francisco, 1890); G. R. Hebard, *Government of Wyoming* (3d ed., ib., 1907); and Census of the State of Wyoming (Cheyenne, 1915), and United States Geological and Geographical Survey of the Territories, *Reports* (Washington, 1877 et seq.).

WYOMING. A borough in Luzerne Co., Pa., 5 miles north of Wilkes-Barre, on the Susquehanna River, and on the Delaware, Lackawanna, and Western, and the Lehigh Valley railroads (Map: Pennsylvania, K 4). Coal mining is the chief industry. Pop., 1900, 1909; 1910, 3010.

WYOMING, UNIVERSITY OF. A State institution for higher education founded at Laramie, Wyoming, in 1886. The university includes the following departments: the college of liberal arts, college of agriculture, college of engineering, and college of education. There are also departments of commerce, home economics, music, university extension, a teachers' training high school, a department of secondary education, and a summer school. With the university is included the State normal school. There is maintained in connection with the agricultural education the Wyoming Agricultural Experiment Station. In 1914 the graduate school of the university was discontinued. In the same year the college of education was created embracing a State normal school. In

1913 the legislature appropriated $5000 for agricultural extension work. The total enrollment in all departments in 1915–16 was about 450, and the faculty numbers about 70. The library contains approximately 35,000 volumes. The productive funds amount to about $60,000, and the annual income to about $200,000. The university is supported chiefly by State appropriations. The president in 1916 was Clyde Augustus Duniway, Ph.D., LL.D.

WYOMING VALLEY. A beautiful and fertile valley in Luzerne Co., Pa., along the north branch of the Susquehanna. It is about 21 miles long by 3 wide and is supposed to have derived its name from the Delaware Indian word *Maughwauwama*—large plains. Though early claimed by both Connecticut and Pennsylvania, in virtue of their charters of 1662 and 1681 respectively, it remained unsettled by the whites until 1763, when the Susquehanna Company of Connecticut, which had been formed in 1753, and had purchased the land from the Indians in 1754, sent out a number of settlers. In 1768 Pennsylvania also bought the tract from the Indians and established a settlement (1769) through two lessees, Ogden and Stewart. Almost simultaneously another party from Connecticut arrived, and there was an almost continual conflict, until in 1771, Connecticut's claim having been confirmed by the King, the Susquehanna Company was left in control. In 1773 the valley was erected by Connecticut into a chartered town under the name Westmoreland. In 1775 the militia of Northumberland Co., Pa., made an abortive attack on a small settlement along the west branch of the Susquehanna, and in the same year, the Revolutionary War having broken out, the settlers expelled a few of their number, who were Tories. The expelled Tories, assisted by an additional white force and 700 Indians—the total force numbering about 1100—marched against the isolated settlements in the summer of 1778. They were commanded by John Butler (q.v.), but his son Walter, who later directed the Cherry valley (q.v.) massacre, was partly responsible for the acts done there. The settlers, warned, took refuge in Forty Fort, near the present Wilkes-Barre, but on July 3, 400 of them—nearly all the males—attacked the invaders and were completely defeated, two-thirds of their number being killed or captured and the rest taking refuge in the fort. Many of the prisoners were tortured and killed, partly by the Indian squaws (among them Esther Montour, q.v.), and on the following day the fort surrendered. More lives were taken, but the settlements were thoroughly devastated, and the inhabitants, endeavoring to reach the nearest settlements, suffered terrible hardships, a hundred women perishing of fatigue and starvation. The settlers returned in small numbers, but after the war the old controversy between Connecticut and Pennsylvania was renewed. In 1782 Congress decided in favor of Pennsylvania, but conflicts continued among the settlers until 1788, when the Pennsylvania Legislature confirmed their various titles. The long conflict between Connecticut and Pennsylvania is sometimes called the Pennamite-Yankee War (or wars). A granite obelisk opposite Wilkes-Barre marks the site of the battle of July 3, 1778. Consult: Smith, *Story of Wyoming Valley* (Kingston, Pa., 1906).

WYSE, N. B. See PANAMA CANAL.

WYSS, vēs, JOHANN RUDOLF (1781–1830). A Swiss professor of philosophy and librarian at Bern, where he was born and died. Wyss is remembered chiefly if not solely as the author of *Der schweizerische Robinson* (*The Swiss Family Robinson*, 1813), a juvenile classic, still popular in many languages, the sole survivor of numerous imitations of Defoe's *Robinson Crusoe;* also of the Swiss national hymn "Rufst du, mein Vaterland?" Wyss wrote also *Idyllen, Volkssagen, Legenden und Erzählungen aus der Schweiz* (1815–22); *Reise im Berner Oberland* (1808); and *Vorlesungen über das höchste Gut* (1811).

WYTHE, WITH, GEORGE (1726–1806). An American patriot and jurist; a signer of the Declaration of Independence. He was born near Hampton, Va., was educated at William and Mary College, and was admitted to the Virginia bar. He was chosen to represent William and Mary College in the Virginia House of Burgesses, and drew up its remonstrance to the British Parliament against the proposed Stamp Act (q.v.) in 1764. In August, 1775, he was chosen a delegate to the Continental Congress. In the following year he was appointed on a committee with Thomas Jefferson, Edmund Pendleton, and others to revise the laws of Virginia. In 1777 he was Speaker of the Virginia House of Delegates, and shortly afterward was appointed a judge of the High Court of Chancery. From 1786 until his death he was Chancellor. He was professor of law at William and Mary College from 1779 to 1789, and in 1787 was a member of the convention which framed the Federal Constitution. Subsequently, as a member of the Virginia convention, he aided in securing its ratification by his native State. He published *Decisions in Virginia by the High Court of Chancery* (1795; 2d ed., with *Memoir*, 1852).

WYTHEVILLE, with'vil. A town and the county seat of Wythe Co., Va., 131 miles southwest of Lynchburg, on the Norfolk and Western Railroad (Map: Virginia, C 5). Knit goods, woolen goods, flour, and iron and lumber products are the principal manufactures. Pop., 1900, 3003; 1910, 3054.

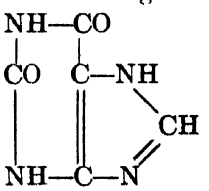
WYTTENBACH, vit'ten-bäk, DANIEL ALBERT (1746–1820). A Dutch classical scholar, born at Bern, Switzerland. After studying at Marburg, Göttingen, and Leyden, he became professor of Greek at Amsterdam in 1771, and in 1799 professor of rhetoric at Leyden. Wyttenbach died of apoplexy in 1820. In addition to his chief work, a critical edition of Plutarch's *Moralia*, with copious notes, and an *Index Græcitatis in Plutarchi Opera* (1795–1830), he published: *Epistola Critica* (1769); *Præcepta Philosophiæ Logicæ* (1782; new ed., 1821); *Eclogæ seu Selecta Principum Historicorum Capita* (1793 and 1829); *Vita Ruhnkenii* (1800), a masterly biography of his former teacher, ed. by Frotscher, 1846; and an edition of Plato's *Phædo* (1810; new ed., 1825). Posthumously appeared *Opuscula Varii Argumenti* (1821). Consult Mahne, *Vita D. Wyttenbachii* (Ghent, 1823, ed. by Frotscher, Freiburg, 1846); also J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).—His wife, JOHANNA (died 1830), born at Hanau, was a woman of scientific education and author of *Théagène* (1815); *Das Gastmahl der Leontis* (1821); and of the novel *Alexis* (1823).

WYVERN, wī'vērn. See HERALDRY.

X

X The twenty-fourth letter and nineteenth consonant in the English alphabet. This form (X) had two different values in the alphabets of eastern and western Greece. It is from the western Greek alphabet that the Latin form and value (*ks*) were derived. In native Latin words *x* never occurred initially, but it was employed internally as a representative of *cs, gs*, e.g., *pax, pacis, rexi, regere.*

Sound and Philological Value. As a composite sound *x* has usually the value of *ks*, e.g., in *fixture, Styx, excellent.* Between vowels, the second of which is accented, *x* becomes voiced (= *gz*), as in *exalt, exhilarate, exotic.* In *anxious, luxurious, x* is pronounced *ksh, gzh.* Initially, where it usually indicates a word of Greek origin, its sound is *z*, as in *Xantippe, Xerxes, xylophone.* As a philological derivative, English *x* represents Indo-Germanic *ks* (Germanic *hs*), as in Sanskrit *uksan*, German *Ochse*, English *ox;* Greek ἕξ, Latin *sex*, German *sechs*, English *six.* X occurs in loan words from: (1) Latin, *exact, mix, noxious;* (2) from Greek *onyx, calyx, lynx.*



As a Symbol and Abbreviation. As a Roman numeral X = 10; ⋈ = 1000; $\overline{X}$ = 10,000; $\boxed{X}$ = 1,000,000. In algebra *x* represents an unknown variable quantity; in analytical geometry *x* indicates the abscissa or rectilinear point coördinate. Consult: Victor Gardthausen, *Griechische Paläographie* (Leipzig, 1879; 2d ed., 1911); Philippe Berger, *Histoire de l'écriture dans l'antiquité* (Paris, 1892); Maurice Prou, *Manuel de paléographie latine et française* (2d ed., ib., 1910); Sir E. M. Thompson, *Introduction to Greek and Latin Paleography* (London, 1912).

XALAPA, hä-lä'pä. Another spelling for Jalapa (q.v.), a city of Mexico.

XALISCO, hä-lės'kō. Another spelling for Jalisco (q.v.), a state of Mexico.

XANTHI, zän'tē. A town of Bulgaria, situated near an inlet of the Ægean Sea, 28 miles northeast of Kavala. It is chiefly important for its trade in a celebrated brand of tobacco. In the partition of European Turkey (1913) following the Balkan War (q.v.) the town was allotted to Bulgaria. Pop., about 14,000.

XANTHINE, zăn'thĭn (from Gk. ξανθός, *xanthos*, yellow), $C_5H_4N_4O_2$. An organic substance found in small quantities in urine and in the substance of the muscles, the liver, the spleen, the brain, etc. It is also found in urinary calculi, in certain vegetable tissues (i.e., in tea), and in the soil. Somewhat large quantities of it are found in meat extract. It is usually prepared from guanine, a nitrogenous substance allied to xanthine and obtained from guano; as shown by Fischer in 1910, guanine is converted into xanthine by boiling with a 25 per cent aqueous solution of hydrochloric acid for 32 hours. Pure xanthine is a colorless substance, soluble in alkalies, sparingly soluble in water, and acting as a feeble base. By the action of methyl iodide on its lead salt, theobromine—a substance closely allied to xanthine—is obtained. The chemical constitution of xanthine has been shown by Fischer to be represented by the following structural formula:

When oxidized, xanthine yields urea and alloxan, which are also among the oxidation products of uric acid (q.v.). Xanthine may be identified by the Weidel-Kossel test, a reaction similar to the murexid test for uric acid: a little nitric acid is added and a gentle heat applied till a dry residue is obtained; if a drop of caustic soda is added to the latter and heat applied, a permanent reddish-violet coloration is produced, while in the case of uric acid the coloration disappears on warming.

Xanthine is in most cases accompanied by hypoxanthine, a similar substance, from which it may be separated by means of silver nitrate and nitric acid, xanthine silver nitrate ($C_5H_4N_4O_2$. $AgNO_3$) being more readily soluble in hot nitric acid than the analogous compound of hypoxanthine.

XANTHIPPE, zăn-thĭp'pē (Lat., from Gk. Ξανθίππη). The wife of the Athenian philosopher Socrates (q.v.). Her name has become proverbial for a typical termagant, and many stories have come down to us illustrative of her shrewish temper. Several of these, however, may be of later invention, and, in judging her character, some allowance should perhaps be made for the unpractical and unconventional ways of Socrates, which could hardly have been other than exasperating. Her grief and solicitude at the time of Socrates's imprisonment were, it is recorded, great. Consult E. Zeller, "Zur Ehrenrettung der Xanthippe," in his *Vorträge und Abhandlungen*, vol. i (1875).

XANTHIUM, zăn'thĭ-ŭm. See COCKLEBUR.

XANTHOPHYLL, zăn'thō-fĭl (from Gk. *ξανθός*, *xanthos*, yellow + *φύλλον*, *phyllon*, leaf). The term is applied to a yellow pigment accompanying carotin and chlorophyll in the chloroplast and carotin in the etiolated plastid. It is an oxidation product of carotin (q.v.) and has the empirical formula $C_{40}H_{56}O_2$. Late work indicates that both xanthophyll and carotin acting with chlorophyll play an important rôle in photosynthesis. Xanthophyll, like carotin, has an absorption band in the violet and two broad bands in the blue and indigo blue.

XANTHOPSIA, zăn-thŏp'sĭ-ȧ. See SIGHT, DEFECTS OF.

XANTHORRHŒA, zăn'thō-rē'ȧ. See GRASS TREE.

XANTHOXYLUM, zăn-thŏk'sĭ-lŭm. A genus of plants. See ZANTHOXYLUM.

XANTHUS, zăn'thŭs (Lat., from Gk. *Ξάνθος*). The capital of ancient Lycia (q.v.), situated on the river of the same name, about eight miles from its mouth. Its site is near the modern village of Gunik. When the Persians under Harpagus invaded Lycia, after the conquest of Crœsus (q.v.) and the Lydians, the inhabitants resisted with desperation, and finally burned their city and fell themselves in a last sally, only 80 families surviving the catastrophe (546 B.C. Consult *Herodotus*, i, 176). Though their country was reduced to a Persian satrapy, the Xanthians seem to have remained under their own princes, until the city was captured by Alexander the Great (q.v.) and shared the fate of Lycia during the wars of his successors and under the Romans. In 43 B.C. the city resisted Brutus, and few survived. It suffered severely by an earthquake in the reign of Tiberius. The site is now occupied only by a few wretched huts. The ancient ruins were first fully described by Sir Charles Fellows (q.v.), and later English excavations resulted in the transfer of an interesting series of sculptures to the British Museum. One is the Harpy Tomb, so called from figures which were once interpreted as the Harpies with the daughters of Pandarus. It is now recognized that they represent the carrying away of souls to the other world. The other reliefs seem to represent offerings either to the heroized dead or to the powers of the lower world. The sculptures, evidently Greek in origin, are good examples of Ionian art of the sixth century B.C. The other striking monument belongs to a later date. It was a tomb in the form of a lofty pedestal, on which was a cella, surrounded by an Ionic colonnade, with four columns in front and six on the sides. Around the base ran two friezes, another decorated the cella, and a fourth was carved on the architrave of the peristyle. The pediments also contained sculptures, and in the intercolumniations stood the statues of so-called Nereids, which have given the monument its name. The friezes represent battles, the storming of a city, sports, and banquets. It has been supposed that the monument was the tomb of Pericles and that the sculptures refer to his wars and especially the capture of Telmessus. It was formerly commonly held that the art of this monument belonged to the early part of the fourth century B.C., but recent opinion inclines to a date not many years after 425 B.C. The other sculptures in London as well as the remains in situ are chiefly connected with tombs; but there are a fairly well-preserved theatre, now much overgrown, remains of the Roman gate, and Acropolis walls of various dates. Of importance for the Lycian language is the inscription on the Harpagus stele, sometimes called the Columna Xanthiaca, which seems to relate to the exploits of a native ruler in the fifth century B.C. Consult Benndorf and Niemann, *Reisen in Lykien und Karien* (Vienna, 1884), and Smith, *Catalogue of the Sculptures of the British Museum*, vol. i (London, 1892).

XÁTIVA, hä'tē-vȧ. A city in Spain. See JÁTIVA.

XAVIER, zăv'ĭ-ēr, *Sp. pron.* hä'vē-ăr', SAINT FRANCIS. See FRANCIS XAVIER, SAINT.

XEBEC, zē'bĕk (Sp. *jabeque*, It. *sciabecco*, *zambecco*, xebec, from Turk. *sumbeki*, sort of small ship). An armed vessel of great speed, formerly used by the Algerine corsairs. It carried three masts, on which square or lateen sails could be set. The bow and stern were remarkable for the small angle they made with the water. The sides were low, and the upper deck of great convexity, that the water might readily flow off through the scuppers.

XENIA, zē'nĭ-*a*. A city and the county seat of Greene Co., Ohio, 55 miles southwest of Columbus, on the Cincinnati, Hamilton, and Dayton, the Pennsylvania, and the Pittsburgh, Cincinnati, Chicago, and St. Louis railroads (Map: Ohio, C 6). It is the seat of the Zenia Theological Seminary (United Presbyterian), founded in 1794, and opened in Xenia in 1855, and of the Ohio Soldiers' and Sailors' Orphans' Home. Noteworthy also are the city hall and county courthouse. The public library occupies a handsome building, the gift of Andrew Carnegie. Xenia is especially known for the manufacture of twine and cordage, and has saw and planing mills, marble and granite works, and manufactories of furniture, ice, shoes, dairy products, machinery, canned goods, candy, powder, and fuses. Pop., 1900, 8696; 1910, 8706; 1915 (U. S. est.), 8711.

XENIA, zē'nĭ-ȧ. See XENY.

XENIEN, ksā'nĭ-en (from Gk. *xenia*, gifts for guests; used as a title for book 13 of Martial's epigrams). The name given, at Goethe's suggestion, to a series of epigrams by himself and Schiller, directed against the self-complacent mediocrity and perverse manifestations in contemporaneous German literature. They were published in Schiller's *Musenalmanach* for 1797, exciting much animosity and calling forth a torrent of rejoinders, but exercising a wholesome purifying influence upon letters. So completely were these couplets the production of a mental alliance, that in many cases the authors themselves were unable completely to determine their own part in the composition. The best edition with excellent commentary is that by E. Schmidt and B. Suphan, *Xenien 1796* (Weimar, 1893); this contains also many epigrams not in the *Musenalmanach*. An edition, with notes by Adolf Stern, entitled "Goethe-Schillers Xenien," was published in Reclam's *Universalbibliothek* (2d ed., 1895). Consult Boas, *Schiller und Goethe im Xenienkampf* (Stuttgart, 1851).

XENOCRATES, zē-nŏk'rȧ-tēz (Lat., from Gk. *Ξενοκράτης*) (396–314 B.C.). A Greek, born at Chalcedon. At an early age he attached himself to Plato. On the death of Speusippus he succeeded to the presidency of the Academy (339 B.C.). He is said to have been the first to distinguish the three parts of philosophy—dialectic, physics, and ethics; he also recognized three classes of essences, the sensible, the

intelligible, and the intermediate, which can be grasped by the intellect and perceived by the senses. The sensible, he taught, was within the heavens, while that which was intelligible lay beyond. The intermediate or heavenly essence was identical with the heavens themselves, for it was possible to perceive these and to contemplate them scientifically. The soul, he held, was self-moving number, and happiness consisted in the possession of that virtue which is proper to the individual. He introduced into the teachings of the Academy the mystic Pythagorean doctrine of numbers more fully than it had been employed before, and combined these numbers with the Platonic ideas. In person he was of irreproachable character, well balanced, and temperate in all things. His integrity was so universally known that an anecdote says that he was absolved from the necessity of taking oath when obliged to give evidence, and that Philip of Macedon said that Xenocrates was the only ambassador who had ever come to him whose friendship he was not able to purchase. Famous also were his resistance to the charms of Laïs, the celebrated Athenian hetæra, and his success in converting the young roué Polemo into an earnest and virtuous man. Consult E. Zeller, *Philosophie der Griechen* (4th ed., vol. i, Leipzig, 1901), and Ritter and Preller, *Historia Philosophiæ Græcæ* (9th ed., Gotha, 1913).

XENOGAMY, zē-nŏg'ă-mĭ. See POLLINATION.

XENON, zĕn'ŏn *or* zē'nŏn (Gk. *ξένον*, neut. sing. of *ξένος*, *xenos*, foreign, strange, host). A gaseous element found in the atmosphere, in quantities of one part in 170,000,000 parts of air. It was discovered in 1898 by Ramsay and Travers, who obtained it as a residue in the distillation of liquid argon. Its atomic weight is 130.2. According to Ramsay its boiling point is —109.1° C. (—164.4° F.), and its melting point —140° C. (—220° F.). The spectrum of xenon resembles that of argon. It is also analogous to argon in that its spectrum undergoes a remarkable change when a Leyden jar is put into the circuit, many new blue and green lines appearing, while other lines, mostly red, either disappear or lose much of their intensity. The symbol of the xenon atom is X, and its molecules are made up of single atoms.

XENOPHANES, zē-nŏf'ă-nēz (Lat., from Gk. *Ξενοφάνης*) (second half of the sixth century B.C.) The founder of the Eleatic school of philosophy. He was born at Colophon, in Asia Minor, about 570, but early removed to Elea, in Lower Italy (a city founded between 536 and 533 B.C.). He brought over from his home, which had been for many generations the city of the Homeric school of poetry, the practice of rhapsodic recitation (see RHAPSODISTS); and after the manner of the genealogists he himself had composed a poem on the founding of Colophon (*Κολοφῶνος Κτίσις*), and a second on his removal to Elea (*Ἀποικισμὸς εἰς Ἐλέαν τῆς Ἰταλίας*). He also employed poetry to set forth his philosophic views in a work entitled *On Nature* (*Περὶ Φύσεως*). In this he zealously upheld the monotheistic view and charged Homer and Hesiod with ascribing to the gods actions which would be disgraceful for mortals. He seems to have held that whatever is existent must have always existed from eternity without being derived from any prior elements; and that all nature is one, unlimited, and that all the parts of this unity must be similar, otherwise we should have multiplicity; that therefore this unity, which is infinite and eternal and homogeneous, cannot change; and further that God is of the same nature, all-pervasive and comprehending all things within Himself. In another work, the *Satires* (*Σίλλοι*), he attacks the doctrines of other philosophers and poets. The fragments of his work are published by Bergk, *Poetæ Lyrici Græci* (5th ed., Leipzig, 1914). Consult also: Eduard Zeller, *Pre-Socratic Philosophy* (Eng. trans., London, 1881); Friedrich Ueberweg, *History of Philosophy from Thales to the Present Time;* Eng. trans. from 4th Ger. ed., by G. S. Morris (2 vols., New York, 1884); Eduard Zeller, *Die Philosophie der Griechen* (4th ed., Leipzig, 1900); H. Diels, *Poetarum Philosophorum Fragmenta* (Berlin, 1901); id., *Die Fragmenta der Vorsokratiker* (ib., 1906); Ritter and Preller, *Historia Philosophiæ Græcæ* (9th ed., Gotha, 1913).

XENOPHON, zĕn'ŏ-fŏn (Lat., from Gk. *Ξενοφῶν*) (c.434–c.355 B.C.). An Athenian historian, soldier, and philosophical writer, the son of Gryllus, born near Athens. His own writings and the account in Diogenes Laërtius (q.v.) are the chief sources for his biography. The story that Socrates saved his life at Delium in 424 B.C. is incompatible with his representation of himself as quite a young man in 401. Our first authentic glimpse of him is as a disciple or companion of Socrates, at the end of the Peloponnesian War. An opportunity presented itself through his friend Proxenos, a captain of Greek mercenaries, to accompany the military expedition which Cyrus the Younger was organizing against his brother, Artaxerxes, King of Persia, and Xenophon accepted the invitation. The historic significance of the expedition lies in the exploits of the 10,000 Greek mercenaries of Cyrus's army, who, encompassed by foes and betrayed by friends, after the assassination by Persian treachery of all their chief officers, made their way from the heart of a hostile empire to the shores of the Black Sea and so back to the Bosporus, thus demonstrating the weakness of the Persian Empire and preparing Greek public opinion for the conquests of Alexander the Great. The history of the expedition is given in detail by Xenophon in his *Anabasis* (q.v.), or *Upward March* of Cyrus, which in its last six books is rather a Catabasis or March Down of the 10,000. Xenophon takes virtual command and throughout plays the leading rôle, but the work was published some 30 years after the events, and we have no means of verifying his statements. On reaching the Hellespont (399) Xenophon and his comrades, after some more or less creditable adventures, entered the service of the Spartan Thibron and his successor Dercyllidas against the Persian satraps of Asia Minor. Because of this or his participation in the expedition of Cyrus the Athenians passed a decree of banishment against him. We next find Xenophon in the camp of the Spartan King Agesilaus (q.v.), who in 396 went out to infuse new vigor into the war against the satraps. When the Corinthian War summoned Agesilaus back to Greece Xenophon accompanied him and was present as an eyewitness, if not as a participant, at the battle of Coronea, in which the Spartan King defeated the allied Theban and Athenian forces (394). After Xenophon had resided a few years at Sparta, the Spartans bestowed upon him an estate on the road to Olympia in territory taken from Elis. Here he spent the next

16 years in the pursuits of literature and the chase. Here his two sons grew to manhood, and here his chief works were written.

The defeat of the Spartans by the Thebans at Leuctra in 371 emboldened the Eleians to expel the Spartan protégé; but though the Athenians, now friendly to Sparta, repealed the decree of banishment, and though he sent his son Gryllus with the Athenian cavalry at Mantinea, Xenophon did not himself return to Athens, but made his home at Corinth, where he died about 355.

Besides the *Anabasis*, Xenophon's chief works are: (1) The so-called *Memorabilia*, or recollections of Socrates and Socratic conversations. This was probably called forth by the declamation against Socrates of the Sophist Polycrates (about 394). After 10 years of campaigning and adventure Xenophon could not possibly have remembered all the details which he professes to give, and a comparison with his other writings shows that much of the material of the book is Xenophontic rather than Socratic. Especially famous are the chapters on the evidences of design in nature, and the apologue of the choice of Herakles, borrowed, so Xenophon tells us, from the Sophist Prodicus (q.v.). Complementary to the *Memorabilia* are the representation of Socrates' table talk in the *Symposium* or *Banquet*, the relation of which to Plato's *Symposium* is much debated, and the *Œconomicus*, or dialogue on the management of a house and family, often quoted for its pleasing picture of the young Greek wife and her education by her husband. (2) The *Hellenica* begins abruptly in 411, as a continuation of Thucydides' unfinished history of the Peloponnesian War. The first two books bring the story down to the overthrow of the Thirty Tyrants in 403. The last five books are a general sketch of the history of Greece to the battle of Mantinea in 362. An allusion to the death of Alexander of Pheræ dates the publication after 357. The work suffers by contrast with the philosophic history of Thucydides and has been severely censured for lack of proportion, and for failure to appreciate the greatness of the Theban Epaminondas. (3) The *Cyropædia*, or education of Cyrus, is a philosophical romance embodying in the person of Cyrus the Elder, the founder of the Persian Empire, Xenophon's favorite notions of the sound training of mind and body and the art of commanding men and winning willing obedience. The love story of the wedded pair Abradates and Panthea and the dying speech of Cyrus on the immortality of the soul are often quoted.

Minor works are the *Lacedæmonian Polity*, the laudatory biography of Agesilaus, the tract on the *Revenues of Athens*, the *Hiero*, or dialogue on Tyranny, the (probably spurious) *Apology of Socrates*, and the special treatises on *Horsemanship*, *The Chase*, and the *Duties of a Cavalry Officer*.

Xenophon is the perfect amateur. As soldier, orator, philosopher, essayist, historian, he gives us the measure of the ability and versatility of an Athenian gentleman of extraordinary talent, but not of genius. He writes a simple unaffected style, but is not nicely scrupulous for the purity of Attic idiom or vocabulary.

Bibliography. Xenophon may be read in Teubner texts or in the edition of Sauppe (Leipzig, 1867–70). Consult also: A. and M. Croiset, *An Abridged History of Greek Literature*, Eng. trans. (New York, 1904); W. C. Wright, *A Short History of Greek Literature* (ib., 1907); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i (5th ed., Munich, 1908); the article "Xenophon," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914). Xenophon's complete works have been translated by H. G. Dakyns (1890–94); the *Art of Horsemanship* by M. H. Morgan (1890); the *Cyropædia* by W. Miller (1914). Useful annotated editions of the several works are the following: of the *Anabasis* by Kelsey (Boston, 1891), W. W. Goodwin (ib., 1896); Mather and Hewitt (New York, 1910), by Murray (Chicago, 1914); of the *Hellenica*, by Büchenschütz (Leipzig, 1866), Breitenbach (Berlin, 1884), Manatt (Boston, 1888), Brownson (New York, 1908), Bennett (Boston, 1892); of the *Memorabilia*, by Cluer (London, 1902), Smith (Boston, 1903). An excellent *Dictionary to the Anabasis* is that by J. W. White and M. H. Morgan (Boston, 1892).

XENOTIME, zĕn'ō-tīm. An yttrium phosphate and an important source of yttrium, found in sands of North Carolina and Georgia.

XENY, zē'nĭ, or **XENIA**, zē'nĭ-à (Neo-Lat. nom. pl., from Gk. ξένος, *xenos*, host; so called because the fruit is modified by its host, the hybrid ovule). This term was proposed by Focke for certain alleged hereditary phenomena in plants which are analogous to telegony (q.v.) in animals. Darwin held that the action of foreign pollen on the mother plant is of the highest theoretical importance, and is in itself a remarkable and apparently anomalous circumstance, for the male element not only affects, in accordance with its proper function, the germ, but at the same time various parts of the mother plant, in the same manner as it affects the same parts in the seminal offspring from the same two parents. Eminent botanists, such as Focke and De Vries, have expressed doubt as to the interpretation given to xeny, though Romanes accepts Darwin's facts and interpretation. In maize (*Zea*) this phenomenon is said to occur regularly. The variety with white kernels, fertilized by a kind with yellow, brown, or blue kernels, bears kernels of these colors, the reverse never taking place. Gärtner found that white peas fertilized by colored peas bore colored seeds, and white and colored seeds have often occurred in the same pod. At present xeny is in the same unsettled state as telegony. Consult: Focke, *Die Pflanzen-Mischlinge: Ein Beitrag zur Biologie der Gewächse* (Berlin, 1881); G. J. Romanes, *An Examination of Weismannism* (Chicago, 1893); M. Y. Delage, *La structure du protoplasm, et les théories sur l'hérédité* (Paris, 1895); Charles Darwin, *The Variation of Animals and Plants Under Domestication* (authorized ed., 2 vols., New York, 1900). See HYBRIDITY.

XÉREZ, hā'râth. A city in Spain. See JÉREZ DE LA FRONTERA, and JÉREZ DE LOS CABALLEROS.

XÉREZ, hā'râs, FRANCISCO DE (1504–?). A Spanish historian, born at Seville. He became the secretary of Pizarro, and as such wrote an account of the conquest of Peru, *Verdadera relación de la conquista del Perú y de la provincia del Cuzco llamada la Nueva Castilla* (1534). This narrative, translated into French by Ternaux-Compans, and into Italian by Ramusio, is occasionally found appended to Oviedo's history of the Indies, where it made its second appearance (Salamanca, 1547), although mutilated.

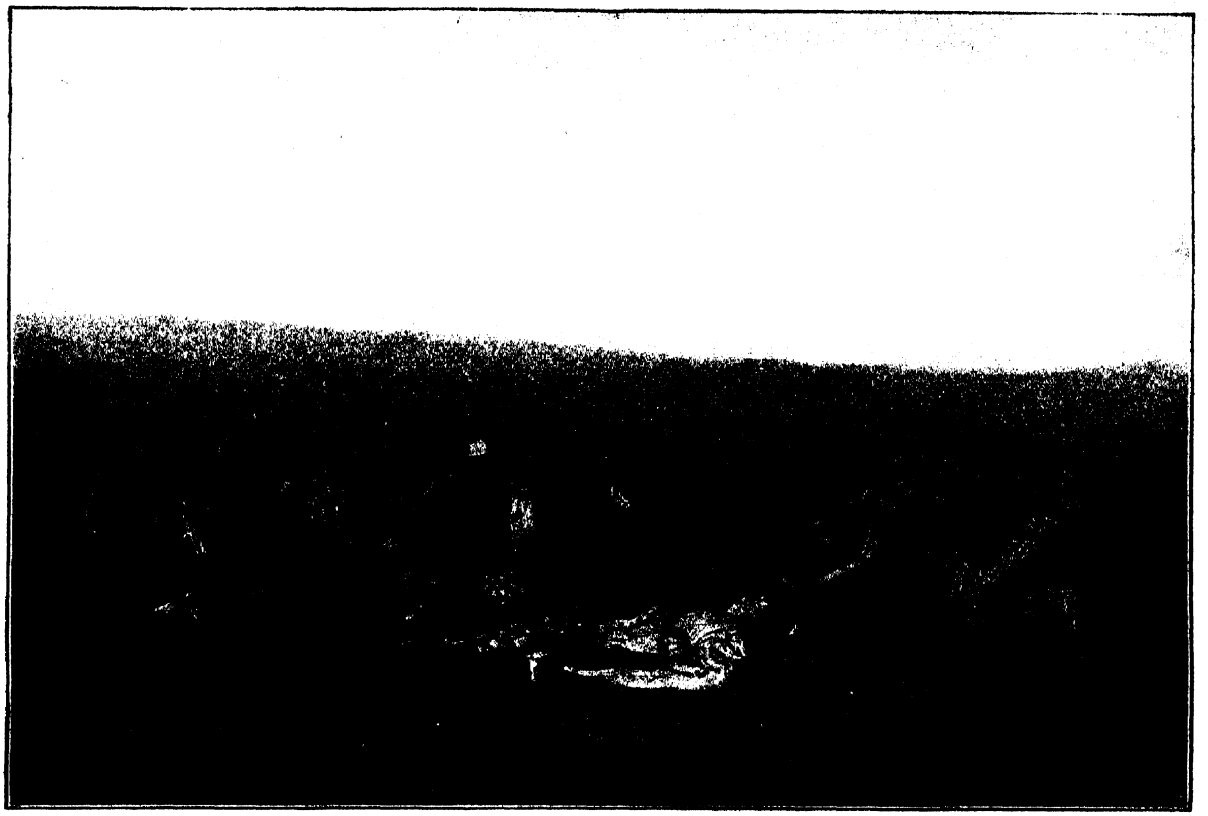
XERODERMA, zē'rō-dēr'mà, or **XEROSIS**,

zē-rō'sĭs (Neo-Lat., from *ξηρός, xēros*, dry, + *δέρμα, derma*, skin). A congenital skin disease, commonly appearing in the first year of life, and characterized by dryness, harshness, and roughness of the skin, together with a fine scaly desquamation. The skin shows a yellowish dirt-colored hue, chiefly on the temples and extremities. Later on there is malignant degeneration of the skin, and death occurs about the age of puberty. Under this term Kaposi describes a form of diffuse atrophy of the skin of unknown origin.

XEROFORM, zē'rō-fôrm *or* zĕr'ō-fôrm. A yellowish insoluble powder, known chemically as bismuth tribromphenolate, and used in surgery as a dusting powder. It is neither poisonous nor irritating and is practically without odor. The latter quality makes it superior to iodoform, which it has largely superseded as an antiseptic. It may be given internally, but it is chiefly valuable as a dusting powder in the treatment of foul ulcers, infected wounds, etc.

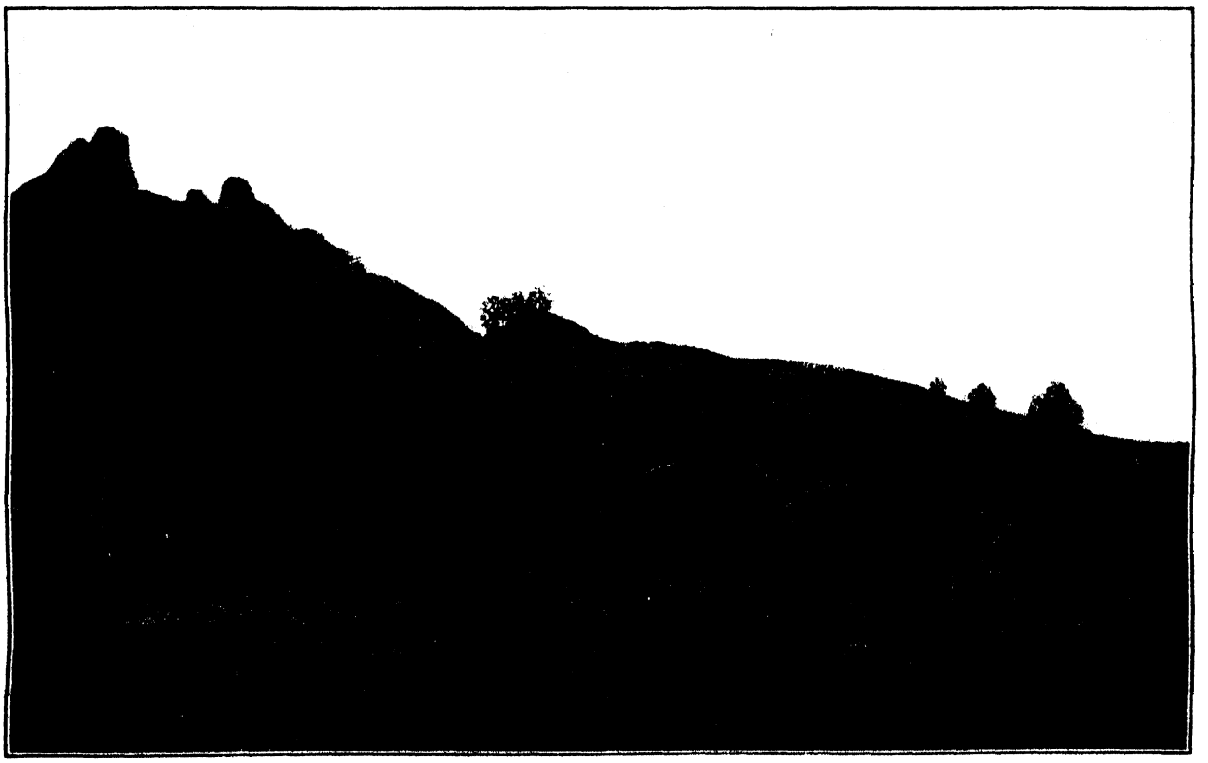
XEROMORPHS, zē'rō-môrfs *or* zĕr'ō-môrfs. Plants possessing xerophytic structures. The term is applied not only to those plants that grow in xerophytic habitats and possess structures which seem fitted to such surroundings, but also to plants that while growing in mesophytic conditions have the structure of xerophytes. For a discussion of xerophytic structures see XEROPHYTES and citations under that title.

XEROPHYTES, zĕr'ō-fīts (from Gk. *ξηρός, xēros*, dry + *φυτόν, phyton*, plant). Plants that are able to grow under conditions of high evaporating power of the air or whose structure specially fits them to withstand excessive transpiration, especially plants of deserts and sandy or rocky habitats, to which form the term was previously restricted. It is coming to be recognized that the term applies more correctly to those plants that are able to grow where the water supply is small compared with the demand made upon it by the aërial environment of the plants. Thus Schimper defines xerophytes as plants which inhabit physiologically dry areas, by which phrase the inability of the plant to get water from the soil is emphasized rather than the actual quantity of water present. For example, a frozen soil is physiologically dry, as may also be a salt marsh; the first self-evidently, the other because osmotically acting substances may partially inhibit the natural processes of absorption and conduction of water by plants. Further, it is known that there are plants that are able so to control the loss of water from their aërial parts that their transpiration is relatively low under conditions of high evaporation. Such plants form the vegetation of arid and semiarid regions. Some portion of this control of transpiration seems to be due to internal forces as yet not understood but the greater amount of it is due to various peculiarities of structure.



The more prominent xerophytic structures may be defined as follows: (1) Reduction in surface as compared with plants of other areas—this reduction may be permanent, as in the case of cacti and desert shrubs, where leaves are entirely absent, or reduced to very small dimensions; or temporary, as illustrated by plants which shed their leaves at the beginning of a season, dry because of heat, as in deserts, or cold, as in high latitudes and altitudes; (2) vertical placement of the foliage organs, illustrated not only by the cacti, in which the chlorophyll work is done in the stems, but also by the so-called compass plants, where the leaves assume a profile or vertical position instead of the horizontal; (3) the annual habit as is typified by a short life cycle restricted to the rainy season; (4) bulb and tuber plants, in which the vegetative development is conspicuous during the rainy season, but ceases during the dry period; (5) ligneous tissue—in many xerophytic areas a very high proportion of the plants are trees or shrubs; (6) storage organs, as in succulent plants, such as cacti, various sedums, and aloes; (7) modifications of tissue; e.g., hairs as in some alpine plants, such as edelweiss; thick-walled epidermis due to cutinization; waxy deposits, varnish or mineral crusts on the epidermis; cork in woody plants; abundant palisade cells; reduction of air spaces, occurrence of stomata mainly or wholly on the lower surface, away from the light; below the surface, as in the carnation; and protection of stomata by hairs, as in the oleander.

It will be seen that most structures can be regarded as advantageous, since they protect plants against excessive transpiration. For example, if the cork and cutin layers, which are relatively impermeable to water, be removed, the loss of water is tremendously accelerated. Some of these structures can be shown by experiment to be the direct result of xerophytic conditions, although in most cases the exact stimulating cause is not clear. Doubtless the most potent factor is a dry atmosphere. Experiments show that dry air as compared with moist air accelerates the development of cutin, cork, collenchyma, bast, waxy tissue, incrustations, and lignin. These structures may at times be produced experimentally in mesophytes grown under xerophytic conditions. Mesophytes which are transferred to xerophytic conditions approach normal xerophytes in the reduction of leaf and stem surfaces. This reduction, while of advantage to the plant, may also doubtless be referred to mechanical or climatic causes. For example, the available food materials may be less abundant in the xerophytic soil, the absorption may be less, and transpiration may be great. All of these conditions would probably tend to cause reduction. See LEAF.



The xerophytic formations of the world may be subdivided into two great classes: climatic, occurring over wide areas, and edaphic, occurring over limited areas. For examples of the former, see ALPINE PLANT; ARCTIC REGION; DESERT VEGETATION; FOREST; GRASSLANDS; PRAIRIE; TUNDRA. For examples of the latter, see BEACH PLANTS; DUNE VEGETATION; HEATH; ROCK PLANTS; SWAMP.

XERXES, zĕrk'sēz (Lat., from Gk. *Ξέρξης*, from OPer. *Xšayāršā*, mighty hero). Three kings of Persia, the first two of whom belonged to the celebrated Achæmenian dynasty.—XERXES I. (c.519–c.465 B.C.), commonly identified with the Ahasuerus of the Bible, was the son of Darius I Hystaspis and of Atossa, daughter of Cyrus. Born after the accession of his father, in 521 B.C., Xerxes seized that pretext to supersede three older brothers, and ascended the throne upon the death of Darius in 485. His first act was to subdue the revolt of Egypt. He then spent three years in preparing to punish the Greeks for the humiliations they had put upon his father. Collecting at Critalla, in Cappadocia, a huge army, he marched to Sardis (Lydia) and thence set out for the Hellespont

XEROPHYTES

1. ALPINE PLANTS. STUNTED HEMLOCKS ON MOUNT HOOD, OREGON

2. DESERT PLANTS. SEMI-DESERT, SHOWING SAGE BRUSH AND STUNTED PINES

in the spring of 480. A fleet of 1200 sail had in the meantime assembled at Doriscus, in Thrace. The fate of this unwieldy expedition, successful at first at Thermopylæ, but crushed at Salamis (480) and at Platæa (479), is one of the most familiar stories in history. (See GREECE.) Xerxes, who had fled from Greece after the disaster to his fleet at Salamis, advanced against Babylon, where Samaserba the Chaldæan had usurped the royal power. After razing the temples of the city he returned to Persepolis and Susa. He was murdered with his eldest son, Darius, by Artabanus, captain of the guard.—XERXES II (c.450–c.425 B.C.) was the son of Artaxerxes I and Damaspia, and the grandson of Xerxes I. He ascended the throne upon the murder of his parents (c.425). After a reign of 45 days he was himself assassinated and was succeeded by his half brother Sogdianus or Secydianus.—XERXES III was the name given to Oarses, who reigned in 337–336 B.C. He was controlled by the eunuch Bagoas, by whom he was proclaimed.

XICAQUE, hē-kä′kâ. An important Central American tribe, constituting a distinct linguistic stock, occupying the region of the upper Ulua River, in Yoro and Santa Barbara districts, northern Honduras. They are said to have a compact tribal organization under a head chief, who is elected for life. They number about 6000.

XIMANA, hē-mä′nâ. A wild tribe in the forests between the Putumayo and Yapura rivers, northern affluents of the Amazon, in western Brazil. Although said to be industrious, they are entirely savage in their mode of life. They kill their first-born children, and burn the bones of their dead, mingling the ashes with their drink.

XIMENA, hē-mā′nâ. The wife of the Cid in Spanish legend. In Corneille's tragedy she is known as Ximène.

XIMENA, or THE HEROICK DAUGHTER. A tragedy by Colley Cibber, first acted at Drury Lane Dec. 28, 1712, largely drawn from Corneille's *Le Cid*.

XIMÉNEZ (or **JIMÉNEZ**) **DE CISNEROS**, hē-mā′nâth dā thēs-nā′rôs, FRANCISCO (1436/37–1517), commonly spoken of as CARDINAL CISNEROS. A Spanish cardinal, statesman, inquisitor, and promoter of education. After studying at Salamanca, where at 20 he received the degree of Bachelor in Civil and Canon Law, he took orders and in 1459 went to Rome, whence he returned in 1465, bearing an expectative bull preferring him to the first benefice of a specified value that should become vacant in the diocese of Toledo. By virtue of this bull he took possession of the archpriestship of Uceda in 1473. He maintained his post despite the opposition of Archbishop Carillo, who had him thrown into prison. Released (1480) and restored to his benefice, Cisneros at once exchanged it for a chaplaincy at Sigüenza. Cardinal Mendoza, Bishop of Sigüenza, became his friend and soon made him vicar-general of the diocese, a position which he filled with distinction. He suddenly turned his back upon ecclesiastical preferment, entered the Franciscan monastery of San Juan de los Reyes, and from this time forward led a life of rigorous asceticism. Queen Isabella appointed him to the delicate post of confessor in 1492. In 1494 he was made provincial of his Order in Castile and set about making some drastic reforms, which were energetically opposed even by the general of the Order. Cardinal Mendoza died in 1495, and the Queen privately secured from the Pope the appointment of Cisneros as his successor to this the richest and most powerful see in the whole Church, in dignity second only to the papacy itself. Accompanying the court on its trip to Granada in 1499, Cisneros eagerly joined the work of pious Archbishop Talavera for the conversion of the Moors. But Talavera's methods seemed to Cisneros entirely too mild and slow. His own more vigorous policy speedily brought about numerous conversions, but they met with opposition from the unconverted masses of the Moors, who later broke out in open rebellion. This was quelled with difficulty, the Cardinal having meanwhile been besieged in his own palace. When the revolt was crushed baptism and exile were offered to the Moors as alternatives and the majority chose baptism.

Upon the death of Isabella, in 1504, Ferdinand at once resigned his title of King of Castile, in favor of their daughter Juana and her consort, Archduke Philip of Austria (known as Philip the Beautiful), and kept for himself only the title of Regent. Even this title offended the hypersensitive Philip, and Cisneros had much difficulty in bringing the two princes to an interview. Two years later Philip's sudden death completely crazed Juana. Their son and heir Charles was but a child, and Ferdinand was at Naples. The mutually jealous nobles of Castile placed affairs in the hands of Cisneros, who worked hard to have Ferdinand return and look after the interests of Castile. In 1507 Ferdinand did so, and brought with him the appointment of Cisneros as cardinal. Shortly thereafter Cisneros became Grand Inquisitor General of Castile and León.

In 1505, at his own expense, Cisneros had sent to Africa an expedition, which captured the port of Mers el Kebir; in 1509 a stronger expedition, likewise fitted out at his expense, was accompanied by the Cardinal in person, and in one day of brilliant fighting took the city of Oran. Thereupon he returned to Spain, and devoted himself to administering his diocese and trying to obtain from Ferdinand a reimbursement of his expenses at Oran.

On the death of Ferdinand in 1516 Cisneros became regent of Castile for Charles, who later in the same year required the Cardinal to proclaim him King of Castile, despite the fact that his mother Juana, through whom he obtained his rights to that throne, was still alive. Cisneros in the meanwhile had taken firm hold of affairs, transferring the Cortes to Madrid and establishing a standing army, by drilling the citizens of the principal cities and towns. In September, 1517, Charles, who had thus far been living in Flanders, entered Spain at an Asturian port, and Cisneros hastened to meet him. On the way he fell sick and at Roa he died, Nov. 8, 1517.

Despite the claims of his other great achievements, he will probably be remembered most enduringly for his creation of the great University of Alcalá de Henares. Founded in 1508, it took rank at once as almost an equal of Salamanca. It was at this university that the great Complutensian Polyglot Bible was made. In 1836 the University of Alcalá was transferred to Madrid, with the style of *La Universidad Central*.

Barrett, *The Life of Cardinal Ximenes* (London, 1813); Léonce de Lavergne, "Le Cardinal Ximenès," in the *Revue des Deux Mondes* (Paris, May, 1841); *Memorias de la Real Academia de la Historia de Madrid*, vol. iv (Madrid).

XIMÉNES (JIMÉNEZ) DE QUESADA, dā kā-sā'dā, GONZALO (c.1500–c.1579). A Spanish adventurer, born probably in Granada. He came to South America in 1535 as judge of the Province of Santa Marta. Two years afterward he led an expedition against the Chibcha Indians, and captured the districts of Bogotá and Tunja in New Granada, found a large amount of treasure, and broke the power of the Chibchas. He founded the city of Bogotá in 1538, visited Spain the next year, and received the title of marshal. In 1550 he returned to South America and (1569) went in search of El Dorado.

XINCA, hēn'kä, or **JINCA**. A Central American tribe occupying the coast region and valley of Rio de los Esclavos, in southeastern Guatemala. They are of low culture and appear to have occupied central Guatemala before the Quiché (q.v.) and Cakchiquel (q.v.) pressed them southward. Long supposed to have been a separate linguistic stock, the recent investigations of Dr. Lehmann indicate that they are possibly related to the Lenca and other tribes.

XINGÚ, shēn-gōō'. A large tributary of the Amazon, formed by a number of headstreams on the plateau ridge which forms the watershed between the Amazon and the Paraguay, in the State of Matto Grosso, Brazil (Map: Brazil, G 5). Thence it winds northward about 1200 miles till it joins the Amazon near the estuary. The river is interrupted by a number of impassable falls and rapids, the last 110 miles above its mouth. Near its mouth the Xingú spreads into a lakelike expanse, whence it communicates with the Amazon and its estuary, as well as with the estuary of the Tocantins, through a network of channels and backwaters.

XIPHILINUS, zĭf'ĭ-lī'nŭs. See DIO CASSIUS COCCEIANUS.

XIPHOSURA, zĭf'ō-sū'rä (Neo-Lat. nom. pl., from Gk. *ξίφος, xiphos*, sword + *οὐρά, oura*, tail). That division of the Merostomata which contains the modern representatives of this almost wholly Paleozoic group, viz., the genus *Limulus*. See MEROSTOMATA and KING CRAB.

XISUTHRUS, zē-zōō'thrŭs (Lat., from Gk. *Ξίσουθρος, Xisouthros*). The hero of the deluge according to the fragments of the Babylonian history of Berosus (q.v.). He is said to have been the tenth and last King of the first Babylonian dynasty, which reigned for a period of 432,000 years. Xisuthrus is identical with *Atra-hasis* (read *Hasis-atra*), as his father *Opartes* (misread *Otiartes*) is identical with Atra-hasis' father *Ubartutu*. He is mentioned already in a tablet from the time of Ammisaduga (1978–1963 B.C.) as entreating Ea in a terrible famine lasting for six years, which seems to have preceded the deluge. In another Sumerian text he appears as the hero of the deluge. See DELUGE; NOAH.

X RAYS. A particular type of radiation proceeding out from the interior of a highly exhausted glass bulb through which a discharge of electricity is taking place. This radiation was discovered in 1895 by Professor Röntgen (q.v.) of the University of Würzburg, who was performing some experiments involving the discharge of electricity through glass bulbs exhausted until they contained only traces of air. This radiation was discovered, and, as far as could be told, differed in all respects from light and other known radiations. To it Professor Röntgen gave the name of X rays, signifying that its mechanism was unknown.

Professor Röntgen discovered that the essential feature in its production was an exhausted bulb or Crookes tube (q.v.) into which entered two metal conductors serving to introduce and to withdraw the electric current. The conductor which introduces the current may be an ordinary wire or it may have at its end inside the bulb a small metal plate; it is called the anode. The conductor by which the current leaves the exhausted bulb consists of a wire carrying at its end inside the bulb a concave metal surface; it is called the cathode. Professor Röntgen found that the centre from which the X rays proceeded was the points of the solid walls of the bulb which were struck by the cathode rays proceeding out from the cathode, and he therefore devised the plan of introducing in the bulb a disk of platinum so placed that it received practically all the cathode rays, and served, therefore, as the source of X rays for all outside points. The face of this disk was oblique to the cathode rays, so that the X rays might have a free field to escape from the bulb. It was found later that the intensity of the radiation could be increased by joining the anode to this small piece of platinum, which is called the anticathode, or target. Röntgen observed that as the electrical discharge was continued through such a tube the intensity and character of the radiation of X rays varied. This is owing in the main to a change in the vacuum, i.e., in the pressure of the traces of gas left in the bulb, occasioned by the electric current. In order, therefore, to maintain constant conditions in the tube it is necessary to keep the gas at a constant pressure, and some modern forms of X-ray tubes have such side attachments to the main bulb as will permit the evolution of minute amounts of gas whenever the vacuum in the bulb becomes too perfect. Bulbs satisfying all these requirements are furnished by instrument makers under the name of "X-ray self-acting tubes."

PROPERTIES

Optical. X rays do not experience regular reflection, refraction, diffraction, interference, or polarization when tested as light would be; they pass in straight lines through any noncrystalline medium which does not absorb them. See below for action of crystals.

Absorption. The most striking feature of X rays at first sight is the fact that they penetrate with great ease certain substances which are opaque to light, and, on the other hand, are absorbed by certain substances which are very transparent to light. Thus the X rays are absorbed largely by glass, but are transmitted mostly freely by aluminium, by wood, by human

flesh, etc. It is owing to these facts, combined with those stated in the preceding paragraph, that photographs may be obtained of many objects hidden from view, by allowing X rays to cast a shadow picture of them on a photographic plate. In this manner photographs of the bones of the body, of metal objects contained in wooden boxes, etc., may easily be obtained.

When a careful study is made of the absorption produced in X rays by various substances, it is found that there is a close connection between the intensity of absorption and the density of the absorbing body; and it is a general law that the greater the density of the body, the greater is its absorptive power. This fact is of the utmost importance in the interpretation of photographs of portions of the human body and of other objects taken by the X rays; the intensity on the photographic plate is in reality a measure of the density of the absorbing substance whose photograph is taken. The power of any substance to absorb X rays depends also upon the nature of the latter. It has been found that rays coming from a tube in which there is a nearly perfect vacuum are extremely penetrating; they and the tube are called hard. Whereas the rays from a tube in which the vacuum is not so good are easily absorbed; they and the tube are called soft.

Photographic and Fluorescent Action. X rays are observed to affect a photographic plate in the same manner as ordinary light, and this fact is made use of in nearly all applications of these rays. It was found also—in fact, it was the fundamental observation of Röntgen—that X rays excite the fluorescent action of certain substances, so that when excited by the rays they emit light. A careful study has been made of various substances which are affected in this way, and certain of them are used in making so-called fluorescent screens, which may be used to receive the shadows cast by an X-ray tube instead of receiving them on a photographic plate.

Physiological Action. Röntgen himself observed that if the X rays were allowed to enter the eye of an observer who is situated in a room entirely dark, the retina of the eye received a stimulus and light was perceived. It is extremely probable that this is due to the fluorescent action of the X rays on certain portions of the eye. It was observed, a few months after the discovery of the X rays, that if the radiation is too intense its action on the skin of an observer might produce most serious changes and cause what are known as X-ray burns. Some years later it was found, as a result of careful experiments, that in the case of certain kinds of cancer and of a limited number of skin diseases the action of X rays was extremely beneficial. See *Medicine and Surgery* below.

Ionization. Röntgen made the important observation that if an electrified body were placed near an X-ray tube, so that the radiations fell upon it, the electrical charge disappeared. This was found to be true of both positively and negatively electrified bodies. It was later shown, however, by Prof. J. J. Thomson of the University of Cambridge, England, that the real explanation of this phenomenon was not any direct action of the X rays on the electrified body itself, but was that in their passage through the air around the electrified body the X rays ionized the gas, i.e., made it a conductor for electricity. (See IONIZATION and RADIOACTIVITY.) This discovery of Professor Thomson's was, from a scientific point of view, the most important one in regard to the properties of X rays, for it led at once to a study of the conditions under which ionization can be produced and to the discovery of other methods of causing it. (When a gas is ionized, experiments show that its minute parts are broken up into smaller ones, some charged positively and some negatively, and that it is owing to this fact that the gas becomes a conductor.)

Diffusion. It has been stated above that X rays do not experience ordinary reflection, but many experiments have shown that they are able to penetrate into regions behind obstacles which are opaque to them and where they could not come by any direct path. This led many observers to believe that the rays were reflected diffusely in the same manner that ordinary sunlight is reflected from a white wall. The true explanation, however, seems to be that under the action of X rays those bodies which absorb them have the power of emitting others, so that they become, as it were, new sources of X rays. This is called secondary radiation. There has been much important work on X rays dealing with the nature of these secondary radiations from different bodies. Barkla has shown that each substance has its own characteristic secondary radiation, quite distinct from what may be called the scattered radiation from the primary beam. Each characteristic radiation has its definite hardness and can be excited only if the primary incident X rays are harder than itself. These characteristic X rays may also be excited directly if the incident cathode rays have a sufficient velocity.

When Röntgen made his first observations on X rays there seemed no obvious explanation of these varied phenomena. The possibility of there being waves at all was not settled at first owing to the lack of knowledge in the first few months in regard to interference and diffraction; and for some time the prevalent idea was that they were due to longitudinal waves in the ether. Another explanation, however, which was much more satisfactory, was advanced almost simultaneously by Professors Stokes and Thomson of the University of Cambridge, England, and by Professor Wiechert of Göttingen, Germany. According to this, X rays are disturbances in the luminiferous ether of the nature of wave motion, but not consisting of trains of waves. It is exactly as in the similar phenomena of sound. A musical note is due to a long continued train of waves produced by the regular vibrations of some musical instrument, while a noise is produced by a series of short disconnected pulses in the air. It was shown mathematically by Stokes that pulses, or extremely short disturbances, in the ether would travel in straight lines and would not exhibit refraction, diffraction, polarization, or interference. The explanation of the origin of these pulses is extremely simple. The cathode rays are known to consist of streams of minute material particles which are electrically charged and which are moving at a rate as great in many cases as 40,000 miles a second. If these rapidly moving electrified bodies are suddenly brought to rest by impact on a solid wall, there will be necessarily a great change in the electrical and magnetic properties of the ether at the point where one of the particles of the cathode rays strikes the wall, and this point will therefore serve as a centre of disturbance from

which a pulse will be sent out into the ether. It follows also that, since there is no regularity in the cathode rays, there can be no regularity in the emission of these pulses. It is thus seen that all the main properties of the X rays, at least from a physical point of view, are explained. The above statements refer to the "general" X rays, not to the "characteristic" ones.

A new epoch in the knowledge of X rays was made in 1913 by a discovery by Dr. Laue of Zurich. A test of the nature of light is offered by allowing it to fall upon a diffraction grating (q.v.), or by looking through an umbrella at a strong arc light. As a result of diffraction, regular colored patterns are formed, depending upon the fineness of structure of the grating or umbrella and upon the nature of the light. If, as was probable, X rays were similar to light of extremely short wave lengths, it should be possible to demonstrate this if one could obtain a dispersing device—such as a grating—of sufficient fineness. The idea occurred to Laue to use for this purpose a thin crystal plate, because crystals evidently consist of molecules (or atoms) in an exact orderly array, exceedingly close together. When tested in this manner, X rays were found to undergo diffraction; and thus their nature was proved definitely. The investigation was continued by W. L. Bragg at the Cavendish Laboratory, Cambridge, England, by his father W. H. Bragg of Leeds, and by many others, notably Moseley. The two Braggs (to whom jointly the Nobel prize in physics was awarded in 1915) devised methods by which the actual wave lengths of X rays could be measured and the innermost structure of the crystals used could be studied, i.e., the shape and size of the fundamental lattice and the distribution of the atoms in this. They showed, further, that each characteristic secondary radiation, e.g., that from tungsten, was made up of a small number of rays, each having a definite wave length. Moseley studied most successfully the relations between the X-ray spectra characteristic of different elements.

Great progress has been made in X-ray tubes, Coolidge developing the tube known by his name. Its characteristic feature is that in it there is a vacuum as complete as possible, the supply of cathode rays being furnished by the emission of corpuscles from a wire maintained at a high temperature by an electric current. (See IONIZATION.) This hot wire is directly in front of the cathode, and by varying the electric intensity in the bulb almost any velocity may be imparted to the corpuscles; these then strike the target, and X rays are produced. If the velocity imparted is great, the rays are hard and are those characteristic of the metal of the target; if the velocity is not so great, the resulting rays are soft.

Medicine and Surgery. The usefulness of this radioactivity to the physician depends on the power of the X rays to penetrate various substances of different density and opacity, and the absorptive power of the different tissues of the body. X-ray pictures of parts of the body as seen on the screen, or when photographed, are due to the fact that substances of different chemical composition, molecular grouping, and thickness absorb different amounts of the rays. In experiments or observations with the X rays the physician needs the following outfit: some service of high potential such as a transformer, induction coil, a static machine, a vacuum tube and holder, and a fluorescent screen or a fluoroscope. In order to preserve records of his work, he will need, further, a photographic outfit. During an X-ray examination the patient must be properly supported. He must either lie flat on a canvas stretcher or special table or be seated on a stool with his back against a vertical canvas screen. The sitting or the recumbent position is chosen in accordance with the part of the body to be examined. In certain cases he may be examined standing. Examinations with a fluoroscope or screen must be made in a dark room. An open fluorescent screen may be used, or a fluoroscope may be held, as in using a stereoscope, against the body of the patient. If a radiograph is to be taken, all metal (such as buckles and buttons) and all bone articles, glass, etc., must be removed from the clothing of the patient. While ordinary dressings of gauze and cotton covering a wound do not interfere, iodoform, plaster of Paris, adhesive plaster, and ordinary wooden splints cast shadows that obscure the results. It is customary to take two views of fractures, new growths, and foreign bodies, from different points, to avoid errors.

The physician must first study radiographs of normal structures under normal conditions, before he can hope to interpret properly X-ray appearances on the screen or when photographed. When proficient, the observer may, in most cases, recognize the presence and extent of tuberculosis, pneumonia, pleurisy, hydrothorax, emphysema, and empyema, and the presence of bronchitis may be inferred in some instances from the shortened excursion of the diaphragm and the restricted movement of the lower part of the chest, as well as from collections of secretion when found. Much can be judged concerning the heart, and the inaccuracy of percussion may be corrected, as to size and position. If the heart be displaced, as, e.g., by fluid or gas in the pleural cavities, pneumonia, pleurisy, tuberculosis, aneurysm or tumor, or if the heart be attached or unusually placed or malformed, the condition may be ascertained by the X-ray examination. Effects of treatment of the organ may be watched. Aneurysms may be clearly defined in many cases, or recognized when no other method is of service. All new growths as well as enlarged glands within the thorax are within the scope of the diagnosing X ray.

Similar information may be gained concerning the œsophagus, stomach, and other abdominal organs and viscera. The conditions in the stomach and the intestines—in fact all their motions—may be studied by feeding the patient large doses of bismuth, which is very opaque to X rays and affords a fluid cast of the stomach. In this manner sets of moving pictures of the various portions of the digestive tract have been taken. In the pelvic cavity, measurements of the uterus may be made; extra-uterine pregnancy may be diagnosed.

Therapeutically, the X ray is serviceable in the treatment of lupus, eczema, syphilitic lesions, nævus, sycosis, favus, acne, and psoriasis. In many cases of new growths, such as cancer (both carcinoma and epithelioma) and sarcoma, it has produced amelioration and actual cure. Pain and itching may be permanently removed by X-ray treatment in certain cases. It is possible that the X ray offers greater capabilities than Finsen's light. (See PHOTOTHERAPY.) The serious X-ray burns to which both operator and subject were exposed in the early

use of X-ray apparatus are now known to be due to soft rays, i.e., to the rays coming from a tube in which the vacuum is not very good. These rays are easily absorbed, and it is now not difficult to guard against them.

In surgery, the Röntgen rays were first used to detect the position or presence of foreign bodies, such as bullets, and to recognize fractures. Development of the methods of their application has led to their successful use in diseases of bone, rachitis, subperiosteal abscess, dental and orthopædic surgery, and the detection of calculi. Much has been added to the anatomist's knowledge of the skeleton, especially of the joints. Latterly in dental surgery the use of the X rays to study diseased conditions of teeth and jawbone have been found invaluable and are frequently made. The value of X rays in cases of fracture remains preëminent, both to confirm diagnosis and to decide if a fracture has been properly reduced, after it has been put into a retaining apparatus. In military surgery, authorities earnestly advocate the use of X-ray apparatus in the general base hospital or in the hospital ship and in the military surgery of the great war they were constantly employed. The X ray is a valuable adjunct in life insurance examinations, and also in medico-legal cases. In the latter, radiographs, it must be remembered, can be interpreted only by those who are skilled in the use of the Röntgen ray and in the reading of the pictures.

Barker, *Röntgen Rays*, in "Scientific Memoirs Series," vol. iii (New York 1899).

XUREL, hōō-rĕl′. A fish. See JUREL.

XYLEM, zī′lĕm (from Gk. ξύλον, *xylon*, wood). One of the two regions of the vascular system characterized by water-conducting vessels (tracheids and tracheæ). See BARK; CAMBIUM; CONDUCTION; PHLOEM.

XYLENE, zī′lēn (from Gk. ξύλον, *xylon*, wood), or XYLOL, C_8H_{10}. A name applied in chemistry to three compounds of carbon and hydrogen, similar to benzene and found along with it in coal tar (q.v.). The three xylenes have the same chemical composition; the differences in their physical and chemical properties are due to differences in the arrangement of the atoms within their molecules.

XYLOGRAPHY, zī-lŏg′rȧ-fĭ. See WOOD ENGRAVING.

XYLOÏDIN, zī-lō′ĭ-dĭn (from *xyloid*, from Gk. ξυλοειδής, *xyloeidēs*, like wood, from ξύλον, *xylon*, wood + εἶδος, *eidos*, form). A substance produced by the action of nitric acid on starch. It is a constituent of certain explosives.

XYLOPHONE, zī′lō-fōn (from Gk. ξύλον, *xylon*, wood + φωνή, *phōnē*, sound, voice). A musical instrument composed of a diatonically graduated series of wooden keys arranged horizontally upon two cords. It has a compass of about two octaves, and is played by two little mallets held in the musician's hands. It is a very ancient and widely used instrument.

XYS'TUS, zĭs′tŭs. The name of two early popes, taken as equivalent to Sixtus (q.v.), so that the later popes named Sixtus are numbered consecutively from them.

X Y Z CORRESPONDENCE. In American history, the name applied to dispatches sent to the United States Government by three special envoys in France in 1797–98. In May, 1797, C. C. Pinckney, John Marshall, and Elbridge Gerry were named as commissioners to the French Republic, between which and the United States strained relations then prevailed. The commission arrived in Paris in October, and attempted to open negotiations with the Directory. Official recognition was refused them; but the secretary of Talleyrand, French Minister of Foreign Affairs, informed the commissioners that, although the Directory was much incensed by certain passages in the President's recent message, some agents would be sent to them to conduct negotiations. On October 18 one of these agents, M. Hottinguer (X), informed Pinckney that in order to gain the favor of the Directory, a loan must be made the French Republic, with private *douceurs* for the Directors; that the sum of 1,200,000 livres would be necessary, which should be placed at Talleyrand's disposal. A few days later two other agents, M. Bellamy (Y) and M. Hauteval (Z), engaged in the negotiations, and it was then explained that if the United States would buy at par certain stock amounting to 32,000,000 florins (its market value was about half that sum), which France had extorted from the Dutch Republic, the transaction would be considered as equivalent to a loan. The envoys were also given to understand that unless money was forthcoming nothing could be accomplished and a war might result. The commissioners rejected the proposals, and, though they remained, accomplished nothing. Gerry, the only Republican member of the commission, remained for some time after the departure of Marshall and Pinckney and thereby incurred much criticism. (See GERRY, ELBRIDGE.) After seeing the dispatches sent home by the commissioners, President Adams on March 19, 1798, informed Congress that no terms "compatible with the safety, the honor, or the essential interests of the nation" could be obtained. At the request of Congress copies of the dispatches were communicated to that body. In the copies, however, the letters X, Y, and Z were substituted for the names of the French agents, hence the name X Y Z Correspondence. As a result of the affair the President and his party were for a time exceedingly popular, but soon lost public favor through the Alien and Sedition acts and through the President's sending to France a new commission, composed of Chief Justice Ellsworth, William R. Davis, and William Vans Murray. This commission, however, in September, 1800, arranged a convention that once more put the two nations upon friendly terms. The so-called X Y Z Correspondence may be found in *American State Papers, Foreign Relations*, vol. ii (Washington, 1832). Consult: *Works of John Adams*, edited by C. F. Adams (10 vols., Boston, 1850–56); J. S. Bassett, *Federalist System* (ib., 1906); J. T. Morse, *John Adams*, in "American Statesmen Series," vol. vi (ib., 1908).

Y

Y The twenty-fifth letter in the English alphabet. Its form is derived from the Greek upsilon (Υ), which in turn was borrowed from the Phœnician *vau*. (See ALPHABET.) Of like derivation are U, V, W. The Romans adopted Y to transliterate the Greek upsilon, which they had represented by V previous to the reign of Augustus.

Phonetic Character and Philological Value. As a phonetic character *y* is both consonantal and vocalic. Its vowel usage (like *i*) is seen in such words as *holy, lady, handywork, y-clept* (where it stands for an older palatalized *ig, ge;* cf. Anglo-Saxon *hālig, hand-geweork, ge-clept*), and in *my*, etc., where it was chosen by scribes instead of *i*, and again for upsilon in words of Greek origin, as *myth, syntax* (Greek *μῦθος, σύνταξις*). As a palatalized consonant *y* is found generally in words of Germanic origin, *yield* (Anglo-Saxon *gieldan*), *yard* (Anglo-Saxon *geard*). As a consonant English *y* (through palatalization of Anglo-Saxon *g*) may represent (1) Indo-Germanic *i*, for example, English *young*, Anglo-Saxon *geong*, Latin *juvenis*, Sanskrit *yuvan;* (2) Indo-Germanic *gh*, as English *yesterday*, Anglo-Saxon *giestra*, Latin *hesternus*, Greek *χθές*. In the archaic form *ye olden time*, the peculiar character is really not *y* by origin, but is a substitute for the Anglo-Saxon rune þ (thorn), and it should be pronounced the.

As a Symbol and Abbreviation. In chemistry Y is the symbol for *yttrium*. In algebra *y* stands for the second variable or unknown quantity, and in analytical geometry *y* = the ordinate of the rectilinear coördinate. As a mediæval Roman numeral Y = 150; $\overline{Y}$ = 150,000. Consult: Philippe Berger, *Histoire de l'écriture dans l'antiquité* (2d ed., Paris, 1892); Maurice Prou, *Manuel de paléographie latine et française* (2d ed., ib., 1910); Sir E. M. Thompson, *Introduction to Greek and Latin Paleography* (London, 1912).

Y or IJ, I (*het Ij*). An arm of the Zuyder Zee immediately north of Amsterdam (Map: Netherlands, C 2). It is now almost wholly drained and reclaimed, except the central portion, which has been dredged to form a part of the North Sea Canal, and is connected through a lock with the Zuyder Zee.

YACHT (MDutch *jacht*, Dutch *jazt*, yacht, chase, from *jagen*, OHG. *jagōn*, Ger. *jagen*, to hunt, chase) AND **YACHTING.** A yacht is a boat used for pleasure. Pleasure ships were built and sailed in the days of Homer, and at Rhodes. Ptolemy, the son of Lagus (283 B.C.), had 800 *thalamegi* (pleasure boats), of which some were more than 300 feet long, and were propelled by oars and sails. In origin modern cruisers are *thalamegi;* modern racers are yachts.

The first British yacht of which there is record (though it is doubtful if the word yacht was in use at that time) was the *Rat* of Wight, built at Cowes in 1588. In July, 1660, a Dutch yacht arrived in the Thames and created such interest in pleasure ships that the King and the Duke of York each built one. The first formal British yacht race on record was held between these two on the lower Thames course, Oct. 1, 1661. The Water Club of the Harbor of Cork, first of all yacht clubs, was established in 1720. The Royal Yacht Squadron was founded at Cowes in 1812. But yacht racing was not universally popular until after 1843, when Queen Victoria began to encourage it by giving cups as racing prizes.

In America a Boston yacht built in 1774 by Lord Percy to demonstrate the value of a centreboard on vessels of shoal draft was one of the first on record, though the word yacht, as applied to dispatch boats, was in use much earlier. From the earliest times people living along shore in America used various kinds of small boats for pleasure, but yachts fit for a venture beyond headlands are not recorded until the nineteenth century. In 1801 George Crowninshield, of Salem, Mass., had built for him a sloop of 22 tons, called the *Jefferson*, which he used as a yacht for some years, and this was probably the first vessel of any size built for yacht use in America. In 1816 the same Crowninshield had a larger yacht, 83 feet long on the water line, built for him. She was named *Cleopatra's Barge*, and in her he made a voyage to Spain and the Mediterranean in 1817. This is said to be the first American yacht to visit a foreign country. The first American yacht to gain fame as a racer was the schooner *Wave*, built by John C. Stevens of Hoboken, N. J., in 1832. She was 65 feet long and had a wide V-shaped cross section.

The schooner *Gimcrack*, also a Stevens yacht, is notable because she had a plate of iron 12 feet long and 4 feet deep fastened to her keel as a fin, to serve as ballast and give lateral plane—the first fin-keel yacht. On July 30, 1844, the New York Yacht Club was organized in her cabin. This is called the first American yacht club, and while there were one or two earlier attempts to organize boating clubs, none of them survived. The New York Yacht Club began with eight yachts. Its first home was a wooden structure on the Elysian Fields, Hoboken, N. J. Its

first races were sailed on New York Bay. In 1916 its home was in the finest yacht club house in the world, and its fleet numbered 585, of which several were steamers nearly twice as large as any merchant ship afloat in 1844. Its record is illustrative of the growth of yachting in America. In 1850 an English merchant wrote to friends in America suggesting that one of New York's famous pilot boats be sent to England to take part in certain yacht races that were to be sailed during the time of a great international exposition to be held in London in 1851. In answer to this invitation a syndicate of members of the New York Yacht Club built the schooner *America*, of 170 tons measurement. The *America* arrived at Cowes, England, on July 31, 1851, and on August 22 sailed against 14 yachts belonging to the Royal Yacht Squadron in a race around the Isle of Wight. The fleet included cutters of from 47 to 193 tons and schooners of from 75 to 392 tons, and there was no time allowance for either rig or size. The prize, a silver cup, valued at £100, which the Royal Yacht Squadron had offered for a race free to the yachts of all nations, was won by the *America*. The owner of the *America* presented this cup (July 8, 1857) to the New York Yacht Club, to be held thereafter as a world trophy.

The *America* was designed by George Steers. She had a sharp, vertical-wedge bow that showed slight hollows in its lines; the centre of buoyancy well aft; the turn of the bilges high. The sections showed great deadrise with straight lines from the bilges to the garboards; her heel was low under water, and her toe well up; her sails were cut to set flat and were laced to booms to keep them so. The British yacht of the day had a "cod's head and a mackerel tail"; the centre of buoyancy was well forward; the under-water body was round like a barrel; the sails were of loose-woven flax that bagged like a purse net. Thomas Waterman, a British designer, had built a yacht, the *Mosquito*, on lines somewhat like those of the *America*, but his countrymen had ignored him. When the *America* had beaten every yacht they matched against her, however, the British yachtsmen at once began lengthening the bows of their racers and flattening their canvas. But before the improvements then begun could be fully carried out by British yachtsmen, an arbitrary rule of measurement was adopted that greatly influenced designers.

Because large yachts had obvious advantages in races with small ones, unless the wind was light and variable, the British yachtsmen agreed to handicap the big ones by a number of seconds for each ton of difference in custom-house measurement. The rule for obtaining this measurement was: Subtract the breadth of the hull from the length of the keel, multiply the remainder by the breadth of the hull, that product by half the breadth, and divide the final product by 94.

The rule was fair enough then, because the hull was usually half as deep as it was wide, and the length of the interior space that could have been conveniently used for storing cargo was about equal to the length of the keel less the breadth of hull. But a way to evade the rule and build a large ship that should show the tonnage of, and be classed with, a small one, had been found before the rule was adopted. The cutter *Cygnet* (1846) had a water-line length of 51 feet, but, because her sternpost raked forward and her stem aft, her keel was less than 43. The *Cygnet* method of maintaining size and reducing tonnage became popular. The rule was therefore changed, and the length of the yacht was measured from stem to sternpost on deck. Since 1878 the length has been measured on the water line. But while the length was measured on deck, the designers began to build an extension to the hull beyond the sternpost, thus obtaining a long ship that would yet show a small measurement, and that overhang is still popular.

Because the rule assumed the depth to be one-half the beam, and thus taxed beam twice and left depth untaxed, the designers, in their efforts to produce large ships that would class with small ones, pinched the beam and added to the depth and length. Thus the 5-ton *Doris* (1885) was 33 feet 8 inches long on the water line, 5 feet 7 inches beam, and 7 feet draft; she spread 1116 feet of canvas and her displacement (the true measure of size) was 12.55 tons. Yet she was classed with the *Diamond* (1873), that was only 25 feet 3 inches on the water line, spread 671 feet of canvas, and displaced 4.92 tons. Models like that of the *Doris* wrought an improvement in ballasting. The designers first substituted iron ore for the shingle of the old times, and then used lead, bolted under the keel. As the centre of gravity of the hull was thus lowered it was possible to increase the sail area —a step in advance. In America the racing model came from the small boat, usually a sloop or catboat, formerly called a sandbagger, as they carried bags of sand, which could be readily shifted, for ballast, or "skimming dish." This had great width in proportion to its length, and extremely shoal draft. A centreboard (a plank on edge that could be moved up and down through a slot in the keel) gave lateral plane.

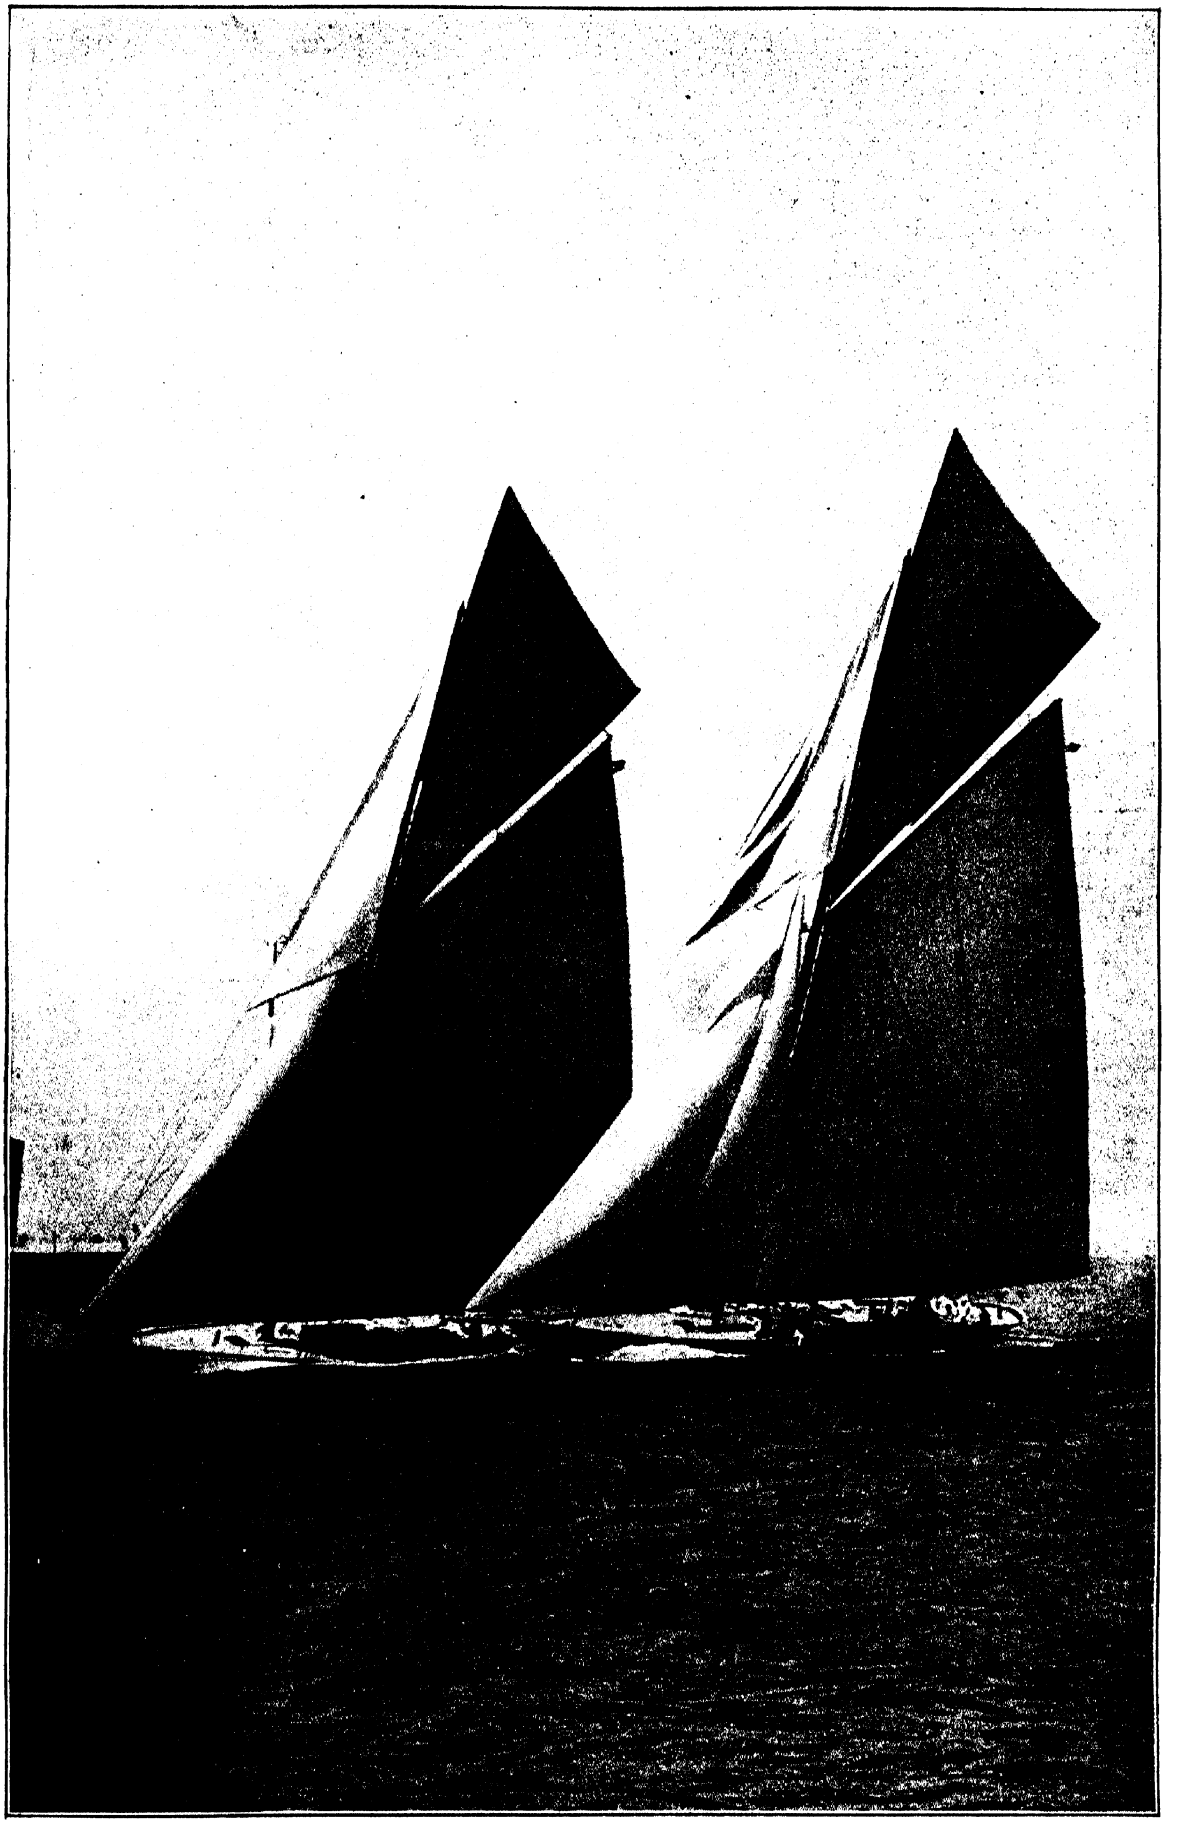
When the first challenger for the America's Cup—James Ashbury's schooner *Cambria*—met a fleet of 23 yachts of the New York Yacht Club (Aug. 8, 1870), many of the defenders were yachts developed from the broad and shoal hulls of the sandbagger sloops. The schooner *Magic* led the fleet. She was 79 feet long on the water line, 20.5 feet beam, drew 6.25 feet of water, and measured 92.2 tons. The *Cambria* was 98 feet long on the water line, 21 wide, drew 12 feet of water, and measured 248 tons. Each was a type of its nation, and the race therefore had no direct influence on American racing models, though it did have a tremendous influence on American yachting. This was the only race for the America's Cup where the challenger was called upon to meet the whole racing fleet of the challenged club, and the next year, when Mr. Ashbury challenged again with the schooner *Livonia*, he only met one boat in each race of the series that had been arranged; and subsequent to that but one yacht of the New York Yacht Club was named to meet the challenger in any one series of races. Within ten years after the defeat of the *Cambria* there were three series of races for the *America's* Cup without changing the conditions influencing the American type of model. Keel yachts were built in America for cruising and rough water use, and the *Vindex*, the first American yacht that was laid down without a whittled model, and the first American iron yacht, was built at Chester, Pa., on lines similar to the British *Mosquito*. But for racing the skimming-dish model retained its popularity.

In 1881, however, a British cutter of deep and narrow hull was imported—the *Madge*. She was 46 feet 1 inch long over all, 38 feet 9 inches on the water line, 7 feet 9 inches wide, and 8 feet 8

draft. She had an enormous displacement in proportion to her sail area, but she won seven races out of eight starts against smart American yachts. The influence of this yacht was great and lasting and she did much to popularize the keel boat in America, though for many years following her advent there was a heated discussion over the comparative merits of the keel and centreboard types. Many yachts of similar design were built in America, or imported. The *Genesta* and the *Galatea*, two British cutters of the extreme narrow design, came as challengers for the America's Cup (1885 and 1886). They were defeated by the centreboard sloops *Puritan* and *Mayflower*, but their failure did not immediately injure the popularity of the plank-on-edge model. In fact, after the fashion of the British model, the *Puritan* and the *Mayflower* both carried lead on their keels, and both were of greater depth and displacement than the type of American racer of previous years, from which they were radical departures. They and the *Volunteer* were designed by Edward Burgess (q.v.) and did much to revolutionize yacht design. Edward Burgess's predilections were towards the stanch and able yacht and in his designs he strove to combine the best points of the English cutter and American centreboard types. The *Volunteer*, that defended the cup when the *Thistle* came (1887), was still deeper and of greater displacement, while the *Defender*, built to meet the America's Cup challenger *Valkyrie III* (1895), was much like the British type of the day. The *Defender* was designed by N. G. Herreshoff (q.v.) of Bristol, R. I. She was an out-and-out keel yacht instead of a centreboarder and was narrower than the challenger. She was 88.5 feet long on the water line, 23.25 wide, and 19.33 draft. She displaced 143 tons. *Valkyrie III*, designed by G. L. Watson, was 26.17 feet wide, to a water-line length of 88.9. She displaced 158 tons. Although her draft was 20 feet, the cross section of her hull, exclusive of her fin keel, was something like that of the American *Vigilant*. These facts are important because the *Defender* was designed to the narrow model through the influence which British cutters had had on American yachtsmen, while the *Valkyrie* was built to the wide model for two reasons: it had become apparent that increase of sail area (or driving power) could be obtained more advantageously by adding to the width of the hull than by increasing the cargo of lead on the keel; the British Yacht Racing Association, seeing the advantage of wide beam, had abolished (1886) the old rule of measurement altogether, and substituted the simple rule that considered the water-line length and sail area only—Rating $= L \times S \div 6000$. This freed the hand of the British designer.

Meantime (1891) an epoch-making yacht appeared—the *Gloriana*, designed by N. G. Herreshoff. The memorable features of her model include a long overhang at each end, and a straight-line bow in place of the hollow vertical wedge. Where the *America* had shown hollow lines the *Gloriana* had convex. The *Gloriana* started in eight races her first year and won them all. She was 45.25 feet long on the water line and 70 over all. The advantages of overhangs at each end were: They added to the initial stability; lengthened the fore and aft lines of the hull, thereby refining the angle presented to the water, and thus the heaping up of water under the lee bow in windward work was avoided. As the racer heeled, the overhangs were pressed into the water, lengthening the water-line length and increasing the lateral plane for windward work.

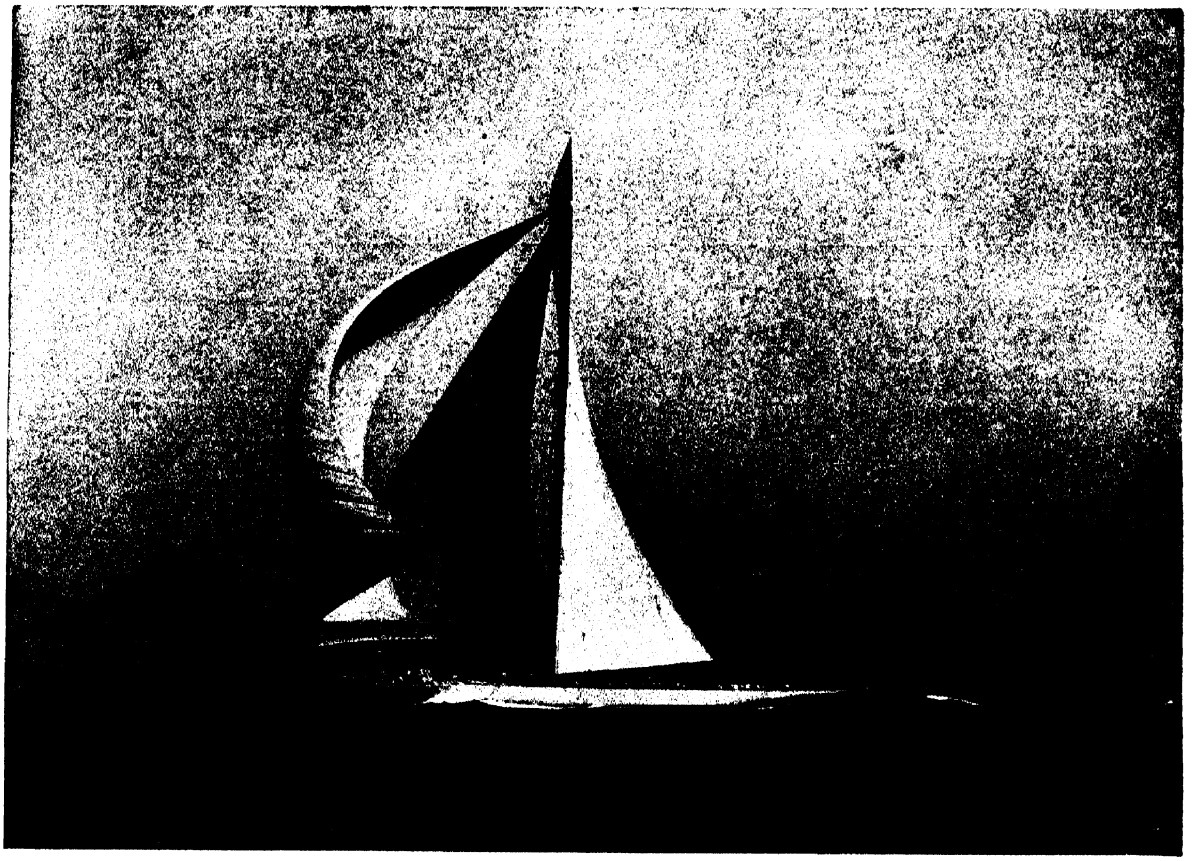
The absurd knife-blade model had been slowly dying since the defeat of the *Genesta* and the *Galatea*. With the advent of the *Gloriana* the illusion that a racer must necessarily have a sharp, vertical-wedge bow with hollow lines vanished.



The *Vigilant*, built (1893) to meet the *Valkyrie II*, in races for the America's Cup, was the last of the big American centreboard racers. She was, in fact, a keel boat with the addition of a weighted centreboard working through her keel to increase her lateral plane when going to windward; but in some of her races the board became jammed and could not be used, and her sailing qualities were hardly impaired. Large racers with centreboards have been built since then, but they have been virtually keel yachts with very small boards to allow the draft to be cut down or to enable the yachts to fit the requirements of some rating rule. Both the *Defender* and the *Valkyrie III* demonstrated the value of the fin keel, and they confirmed the good opinion of overhangs that had been created by the *Gloriana*. As there was no tax on beam in the international races, the line of development which followed was inevitable. By successive steps through the *Columbia* and the *Constitution*, the model of the *Reliance*, built in 1903 to defend the America's Cup, came as a natural growth. The *Reliance* was 25.58 feet broad to a water-line length of 89.9, an over-all length of 143, and a draft of 19.58. She was the largest racing sloop that has ever been built, spreading 16,160 square feet of sail on her single mast, or over three times as much as the schooner *America* which won the cup and was approximately the same water-line length.

In smaller American racers these proportions have been carried much further. The *Outlook*, a Boston model, was 53 feet long over all to a water-line length of 21 feet, while her beam was 15 feet and her draft was 6 inches. She had the marvelous record of 13 knots an hour and was an example of the extreme to which designers had gone in the "scow" type of racing yacht. Even in yachts of this type the tendency is towards much more normal proportions.

While the international races for the America's Cup have had great influence on yacht design in both America and Great Britain, the various rating rules of the two countries, which were intended to furnish a basis of handicapping or equalizing boats of different size when racing, have been even more of a factor on the types of boats that have been produced. In America the rule adopted in 1882 and most generally used until 1905 was known as the "length-and-sail-area rule," and was as follows:



$$\text{Rating} = \frac{\text{L (water line)} + \sqrt{\text{Sail Area}}}{2}.$$

This rule, while good in a way, only took into account two of the factors that govern a boat's speed, viz., length and driving power (sail area). The third factor, displacement, or the weight of the vessel, was not regarded in any way. The consequence was that under this rule the tendency was to shorten the water line, lengthen the overhang, and cut down displacement to a minimum, and resulted in the flat, light-displacement, scow-like boat, often with a

SHAMROCK III

fin keel, that was of no use for anything except racing in smooth water. The development of racing boats, therefore, under this rule was not along healthful lines.

In 1903 the New York Yacht Club adopted a racing rule that sounded the death knell of the flat, light-displacement, scow-like boats. This rule took into account displacement as well as length and sail area, and by putting a premium on the first named, encouraged a sharper, fuller-bodied hull instead of the flat abortions that had grown up under the old rule. At a conference of most of the leading yacht clubs and racing associations of the East, held in 1905, this rule was pretty generally adopted, until it stood as the racing rule in force in the United States; and, while it is generally called the "universal rule," it was only used in the United States, England and the other European yachting countries having adopted (in 1906) a rule intended to bring about the same desired results, and known as the "international rule." Under these two rules a very fine type of racing craft has been produced—able, seaworthy, safe, and yet fast. Boats built under these rules were of some use other than for mere racing, and had a value as cruisers even when their racing days were over.

This universal rule now generally used in America is as follows:

"Yachts shall be rated for classification and time allowance according to the following formula:

Eighteen per cent of the product of length (water line) multiplied by the square root of sail area divided by the cube root of displacement.

$$\text{Measurement} = 0.18\,\frac{L \times \sqrt{S\,A}}{\sqrt[3]{D}}.$$

The result is the measurement and rating for classification and time allowance of sloops. Yawls shall be rated at 93 per cent and schooners at 90 per cent of their measurement by above formula."

There are besides other limitations provided, all tending to abolish extreme types and to produce a sane, healthful type of yacht. The following classifications of yachts are provided under this rule:

SCHOONERS

First class		All over 100 feet, rating
100-foot class	A	Not over 100 feet and over 88 feet, rating
88-foot class	B	Not over 88 feet and over 76 feet, rating
76-foot class	C	Not over 76 feet and over 65 feet, rating
65-foot class	D	Not over 65 feet and over 55 feet, rating
55-foot class	E	Not over 55 feet and over 46 feet, rating
46-foot class	F	Not over 46 feet, rating.

SLOOPS AND YAWLS

First class		All over 100 feet, rating
100-foot class	G	Not over 100 feet and over 88 feet, rating
88-foot class	H	Not over 88 feet and over 76 feet, rating
76-foot class	J	Not over 76 feet and over 65 feet, rating
65-foot class	K	Not over 65 feet and over 55 feet, rating
55-foot class	L	Not over 55 feet and over 46 feet, rating
46-foot class	M	Not over 46 feet and over 38 feet, rating
38-foot class	N	Not over 38 feet and over 31 feet, rating
31-foot class	P	Not over 31 feet and over 25 feet, rating
25-foot class	Q	Not over 25 feet and over 20 feet, rating
20-foot class	R	Not over 20 feet and over 17 feet, rating
17-foot class	S	Not over 17 feet and over 15 feet, rating
15-foot class	T	Not over 15 feet, rating.

In adopting the international rule Great Britain endeavored to have the United States become a party to it, but that country believed that its own universal rule would better fulfill its own individual needs.

After the last America's Cup race in 1903, between the *Reliance* and the *Shamrock III*, there was no challenge for the America's Cup that was acceptable to the New York Yacht Club until 1913, when Sir Thomas Lipton, owner of *Shamrocks I, II,* and *III*, again sent a challenge for a race, naming a sloop 75 feet on the water line, and a race was arranged for September, 1914, under the universal rule of measurement, the first America's Cup race to be held under this rule. To meet the challenger, the *Shamrock IV*, three 75-foot sloops were built in the United States, the largest sloops to be built under the present universal rule. These three yachts, the *Resolute*, designed by N. G. Herreshoff, the *Vanitie*, designed by William Gardner, and the *Defiance*, designed by George Owen, raced in the summer of 1914 to see which should have the honor of defending the cup, but the great war breaking out while the *Shamrock IV* was on her voyage to America, the race was abandoned and the *Shamrock* laid up in New York.

In the early days of yachting sails were made to bag like a purse net. Now they are made as flat as possible save for a slight hollow in the luff, and are of closely woven material instead of soft, loosely woven stuff.

Lug sails, that were common 50 years ago, have disappeared, except in some very small boats; so have square topsails set on yards above the fore and aft sail of schooners, sloops, and cutters. Where the *Maria* (in 1845) set a single jib forward of the mast, modern racers may carry two or three in moderate weather. Instead of a great square sail spread from a yard when running before the wind there is now a spinnaker, a triangle of canvas that extends from the topmast head to the deck and out along a boom rigged broad off on either side.

Among other trophies that have had an influence on American yachting is one provided in 1895 by the Seawanhaka-Corinthian Yacht Club for an international challenge cup for racers not smaller than the 15-foot class nor larger than the 25-foot class—from a half rater to a two and a half rater, according to the British nomenclature. A British challenger, Arthur Brand, brought the *Spruce IV*, a yacht 15.83 feet long on the water line and spreading 197 feet of canvas. The *Ethelwynn*, designed by W. P. Stephens, defended the cup successfully. She

was 23 feet 4 inches over all, 14 feet 6 inches on the water line, 6 feet 7 inches broad, and 7 inches draft. She carried a metal centreboard that dropped five feet below the keel and weighed 55 pounds. In 1896 the Royal St. Lawrence Yacht Club won this cup, with a half rater called *Glencairn*. Since then the size of the yachts has increased to the limit allowed by the original conditions, and the cup returned to America in 1905, and was retained in the races of 1906 and 1910. In addition there are many cups for ocean races and on the Great Lakes for small boats, the longest being from New York to Bermuda.

On the steam-yachting side of the sport, Capt. R. F. Loper, of Philadelphia, built the first American steam pleasure boat, the *Colonel John Stevens*. She was 92 feet long and carried two low-pressure engines with cylinders 18 by 14 inches. The paddle-wheel *Firefly*, built by the Aspinwalls in 1854, was the first American steamer to be properly classed as one of a fleet belonging to a recognized yacht club. In Great Britain, the paddle-wheel *Victoria and Albert*, launched for the Queen, April 6, 1843, was the first notable steam yacht. She was 225 feet long, and had a record of 11.5 knots—something remarkable for that period. Nevertheless the introduction of compound engines (see STEAM NAVIGATION), with their economy of space and fuel, marks the real beginning of steam yachting, and since that time steam yachts have had a wonderful development. The list of the New York Yacht Club alone shows steamers of which 11 register about 1000 tons.

Because of their speed, steam yachts have come into use for fast ferry service, carrying business men between their country homes and town. The *Stiletto*, built by the Herreshoffs, was the first notable high-speed steam yacht in America. Though but 86 feet long and in use for 20 years, she was able (1903) to make 18 knots an hour. The *Miranda*, built by Thornycroft (1872), though but 50 feet long, had a record of 19 land miles an hour.

The limit in this class was reached in the *Arrow*, designed by Charles D. Mosher (1900). She is 139.33 feet long and displaces 66 tons, but her record, as given by her designer, is 40 knots. She is fitted with quadruple-expansion engines that take steam at a pressure of 400 pounds from water-tube boilers.

In early steam-yacht design America was far behind Great Britain and the early yachts designed were defective, the boats being built mostly from models made by men familiar only with sailing yachts. In the early eighties steam yachting began to assume definite proportions and efforts were made to improve the type of boats. From 1885 on, Americans bought in England and brought to the United States steam yachts of British design and build, and these boats had a great influence on subsequent American design, though the boats built in America were, of course, especially adapted to meet local conditions. The Herreshoffs originated a certain type of high-speed steam yacht which made that firm famous and which it developed to a high state of perfection, while the demand for higher speed in steam yachts than was usual in the English models led to the development of another type that offered good accommodations, fair seagoing ability, and speeds up to 21 miles an hour. This was a purely distinctive type, of which such yachts as *Kanawha II*, *Hauoli*, *Kismet*, and the like were exponents. This type later gave way to steam yachts of still higher speed, up to 30 to 35 miles, used almost entirely for fast ferry service between the owner's country home and the city, and where the accommodations were sacrificed to speed. This type may be said to be represented by such boats as the *Sovereign*, the *Little Sovereign*, the *Winchester*, etc. While this latter type is in demand for fast ferry service, the older English type is still adhered to for seagoing, cruising yachts. In the faster boats turbine engines are generally being used instead of reciprocating engines, while a number of them have furnaces burning oil instead of coal, and it is probable that in the future steam turbines will have the call for boats of extremely high speed. See MOTOR BOAT. Consult: N. L. Skene, *Elements of Yacht Design* (New York, 1904); A. H. Clark, *History of Yachting, 1600 to 1815* (ib., 1904); *Dixon Kemp's Manual of Yacht and Boat Sailing and Yacht Architecture* (11th ed., 2 vols., London, 1913); *Lloyd's Register of Yachts, containing Particulars and Distinguishing Flags of Yachts and Motor Boats, an Alphabetical List of Owners . . .* (ib., annually); *Lloyd's Register of American Yachts* (New York, annually).

YAD'KIN RIVER. See PEDEE RIVER.

YAGUARONDI, yä'gwà-rŭn'dê. See JAGUARONDI.

YAHGAN, yä'gän, or **YAPOO,** yä'pōō. A South American tribe apparently constituting a distinct linguistic stock, occupying the shore of Beagle Channel, in Tierra del Fuego. They are represented as very low in the scale of culture, building only rude shelters, having no government and little conception of numbers. They are of good physique, expert hunters and fishers, with bow, bola, lance, and various nets, skillful canoe builders and weavers of water-tight baskets. The race is now nearly exterminated, although about 90 are gathered in the two missionary stations of Ushnaia and Tekenika. The Yahganan language is polysyllabic and agglutinative, with prefixes and suffixes, and is rich in expressions for the ordinary needs of their life. Consult Lucien Adam, *Grammaire de la langue Jagane* (Paris, 1885), and D. G. Brinton, *The American Race* (New York, 1891).

YAHOOS, yà-hōōz'. The slaves of the noble Houyhnhnms or horse-folk, in Swift's *Gulliver's Travels*. They possess the form of man and are intended as a satire on the human race.

YAHWE, yä'wĕ. The name of the national deity of Israel. As before the eighth century B.C. the Hebrew alphabet had no vowel signs, the exact pronunciation could not be indicated, and after that time the consonants YHWH were supplied with points showing that *Adonai*, "Lord," or *Elohim*, "God" should be read instead of the name men were not permitted to use. The Samaritans, however, continued longer than the Jews to employ it. In the fifth century they said Yahwe, and this pronunciation is still known to them. The *Yāwĕ* of an Ethiopic text suggests that the Falashas may have been acquainted with it, and the *Iaoue* of the Paris magical papyrus that even pagans occasionally heard it in this form. A misunderstanding of the Masoretic directions led Christian scholars at least as early as the fourteenth century to create the hybrid form *Jehova*, consisting of the consonants of one word and the vowels of another. Gĕnĕbrard in 1567 recognized the true

pronunciation. It is sometimes written Yahweh in order to preserve the four consonants, but as the final *h* is inaudible, it is common and proper to leave it out. It is not known how old the name is. Its earliest datable appearance seems to be on the Moabite stone (q.v.). It is never used in theophorous names. In Ex. iii. 14 it is apparently explained as "he who brings into existence," "the Maker." This may be a learned interpretation. R. H. Kennett thinks it comes from the seventh century and the Assyrian province of Samaria (art. "Israel" in Hastings, *Encyclopædia of Religion and Ethics*, New York, 1915). If the name is of Aramaic origin this etymology may indeed be correct; but that is uncertain, as is also the relation of Yahwe to Yahu, Yaho, Yah, Yau, Yao, and Yo found on inscriptions at Samaria and Jericho, in the Elephantine papyri, in Assyrian texts, and in numerous Jewish theophorous names. See JEVOHAH; TETRAGRAMMATON.

YAHWIST, yä'wĭst. See ELOHIST AND YAHWIST.

YAJNAVALKYA, yâj'nyâ-väl'kyâ. A Hindu sage, the author of a legal work entitled *Yājñavalkyadharmaśāstra* and cited as the chief authority in the *Satapatha-Brāhmaṇa* (see VEDA), where he is mentioned as the pupil of the renowned teacher Aruni. According to tradition, Yajnavalkya traced his lineage back to Viśvāmitra (q.v.). He seems to have held a position of influence at the court of King Janaka in Mithila, the capital of Videha, the modern Turhut, northern Behar. (See BEHAR AND ORISSA.) In importance his code is second only to Manu (q.v.), which it resembles in many ways. It comprises 1009 slokas, or couplets, and is divided into three books. The date of its composition is about 350 A.D., when the author is believed to have lived. The *Yājñavalkyadharmaśāstra* was edited and translated by Stenzler (Berlin, 1849), and with Vijnanesvara's commentary by B. P. Moghe (3d ed., Bombay, 1892). Consult: G. B. Beaman, *On the Sources of the Dharmaśāstrās of Manu and Yājñavalkya* (Leipzig, 1895); Naraharayya and Srisa Chandra Vasu, *The Sacred Laws of the Aryas*, vol. iii (Allahabad, 1913).

YAJUR-VEDA, yâ'jur-vā'dâ (Skt., Veda of sacrifice). The name of the third Veda (q.v.).

YAK (Tibetan *gyak, gyag*). A species of ox (*Pæphagus grunniens*) found domesticated in Tibet. The wild yak of Central Asia is found only near the limits of perpetual snow, descending into the higher wooded valleys in winter, and ascending in summer to the pastures of short grass and sedges, some of which are 17,000 feet above the sea. It is hunted by large dogs, and is fierce, falling upon an adversary not only with its horns, but with its chest, and crushing him. It is generally black. The yak has been domesticated for ages, and forms a great part of the wealth of the inhabitants of the cold regions of Central Asia. The domesticated yak is about the height of an ordinary ox, which it resembles also in figure of body, head, and legs. It is covered with a thick coat of long silky hair, falling like the fleece of a sheep. The head is rather short; the eyes large and beautiful; the hŏrns not very large, spreading, tapering from the base, a little turned back at the tips, a space between them on the forehead covered with a mass of curling hair. The neck is short; the withers high and arched; the rump is low; the legs are short. Over the shoulders there appears a bunch somewhat like that of the zebu, but it consists only of long hair. The tail has long flowing hair, descending to the hock. Black and white are usual colors.

The yak does not low like an ox, but utters a short grunting sound, as the expression both of uneasiness and of satisfaction. Its milk is rich, and the curd is much used by the Tibetans, both fresh and dried. The butter is excellent, is preserved for a long time in the dry and cold climate of Tibet in bladders, and becomes important in commerce. Its flesh is of fine quality, and is often dried and eaten raw. The yak is never used for tillage or draft, but is employed as a beast of burden, and travels at a slow pace, 20 miles a day, where no other beast could well be employed. The hair is spun into ropes, and made into coverings for tents. The soft fur on the hump and shoulders is woven into a fine and strong cloth. Caps, jackets, cloaks, and blankets are made of the skin with the hair on. The tails are the *chowries*, or fly-flappers, used in all parts of India, and which are to be seen particularly on all occasions of state and parade. Consult Richard Lydekker, *Wild Oxen, Sheep, and Goats* (London, 1898). See PACK TRANSPORTATION; Plate of CATTLE, WILD.

YAKIMA, yă'kĕ-mâ (runaway, applied to them in derision by another tribe). An important tribe of Shahaptian stock (q.v.), formerly occupying a considerable territory on the Yakima and Columbia rivers, eastern Washington, and now gathered with other tribes on the Yakima Reservation in the same country. They call themselves Waptailmim, "people of the narrows," in allusion to their principal village, formerly situated at the narrows of the Yakima River, near the present Union Gap. They were called Cutsahnim by Lewis and Clark, who visited them in 1804. They came in contact with traders and missionaries at an early period, and in 1855, with other tribes, made a treaty with the government by which they ceded most of their territory and agreed to come upon the present reservation. In their original condition the Yakima were salmon fishers, root diggers, berry pickers, hunters, and active traders between the tribes east of the Rocky Mountains and those west of the Cascades. Although outside the buffalo range, they sometimes crossed the mountains in large parties to hunt buffalo in the plains. They used both the skin tepee and the mat-covered lodge. They now number 1362. See SHAHAPTIAN STOCK.

YAKOBA, yä-kō'bâ. A large city in Northern Nigeria, British West Africa, the chief town of the tributary State of Bautshi, situated in an elevated and salubrious region about 150 miles south-southeast of Kano (Map: Africa, E 3). It consists of a number of villages surrounded by a wall and has an estimated population of 50,000. The city was founded by the Fulbe at the beginning of the nineteenth century.

YAKSHA, yäk'shâ (Skt. *yaksa*). In later Hindu mythology, the name of a class of fairies, who attend on Kubera (q.v.), the god of riches, and are employed in the keeping of his treasures. In Sanskrit literature they are generally represented as inoffensive, but in some Buddhist legends they are described as demons, who feast on serpents and human corpses. Consult W. J. Wilkins, *Hindu Mythology* (2d ed., London, 1900).

YAKUB KHAN, yä-kōōb' kän' (1849–). An amir of Afghanistan. At an early age he

was made Governor of Herat by his father, the amir Shere Ali, against whom he rebelled in 1870. He was imprisoned by his father in 1874, but when the latter fled before the British in 1878 Yakub was left in charge of the government. Upon succeeding his father as amir, in February, 1879, he made peace with the British, but his troops revolted in September, 1879, and murdered the British resident and staff. Lord Roberts (then Sir Frederick) defeated the Afghans, whereupon Yakub abdicated and took refuge with the British.

YAKUTAT, yä-kōō'tät. The most northern tribe of Kolushan stock (see TLINKIT), occupying the coast about the bay of the same name, south of Mount St. Elias, Alaska. They resemble the other Tlinkit in general characteristics. They numbered about 300 in 1910.

YAKUTS, yä-kōōts'. A people of Turkic stock. They number some 200,000 and inhabit a territory of over a million and a quarter square miles in northeastern Siberia. Their language gives evidence of being the oldest of the Turkic tongues. It has been a sort of *lingua franca* over portions of Siberia. The Yakuts have a somewhat extensive mythology. Although they were (nominally, in great part) converted to Christianity in the beginning of the eighteenth century, their original Shamanism still colors their religious life, particularly in the north. They are polite, hospitable, and industrious, but dislike to hire themselves for wages and are very fond of independence. The Yakuts were formerly polygamous, with not infrequent incest. Upon their conversion they gave up polygamy. The Yakut marriage system is exogamous, but there are traces of an earlier endogamy. Consult: Böhtlingk, *Ueber die Sprache der Jakuten* (St. Petersburg, 1848); Müller, *Unter Tungusen und Jakuten* (Leipzig, 1882); Radloff, *Uebersicht der Türkenstämme Sibiriens und der Mongolei* (ib., 1883); Sumner, "The Jakuts," in *Annals of the Anthropological Institute* (London, 1901).

YAKUTSK, yä-kutsk'. A vast territory in east Siberia (Map: Asia, N–S 2). Area, 1,533,397 square miles. The southern part consists largely of elevated plains, thickly wooded and bordered on the south by the Stanovoi Mountains. Several mountain ranges also run through the interior. North of the elevated plains begins the region of tundras which extends to the coast. The chief rivers are the Lena (q.v.) with its great tributaries, the Olenek, the Yana, the Indighirka, and the Kolyma—all flowing into the Arctic Ocean. The climate of Yakutsk is very severe. Verkhoyansk is regarded as the coldest spot in the world. Agriculture is impossible, but Yakutsk possesses abundant resources in its forests and mineral deposits. The latter are found principally along the Vitim and the Olekma (tributaries of the Lena), where gold is mined on a large scale. There are also deposits of silver and lead, copper, iron, coal, kaolin, and amber. Ivory derived from mammoth tusks is exported to Moscow and European markets. Stock raising, hunting, and fishing are the main occupations of the inhabitants. Pop., 1897, 269,880; 1909, 309,900; 1912, 325,600.

YAKUTSK. The capital of the Territory of Yakutsk, in east Siberia, situated on a tributary of the Lena (Map: Asia, O 2). It is poorly built and unhealthful on account of frequent inundations. It has a cathedral. Yakutsk was founded by Cossacks in 1632. Pop., 1897, 6534; 1910, 8209.

YALE, ELIHU (1648–1721). An English colonial official, the early patron of Yale College. He was born in or near Boston, Mass., the son of David Yale, of Denbighshire, Wales, who emigrated to New England in 1638, lived for a while in New Haven, and then settled in Boston. David Yale's family returned to England in 1652, and lived in London, where Elihu was educated. In 1672 he entered the service of the British East India Company, and proceeded to India, where he rose at length in 1687 to be Governor of Fort St. George (Madras). In 1692 he returned to London with a large fortune acquired in private trade. In 1699 he became a governor of the East India Company. He became widely known for his philanthropy and the liberality of his gifts for religious and educational objects. One of the institutions in which he became interested was the collegiate school founded in 1700 at Saybrook, Conn., to which, between 1714 and 1721, he gave books and money to the amount of about £900. After the removal of the school from Saybrook to New Haven in 1718, the new college building was named after him, and in 1745 his name was applied to the whole institution. He lived during the latter part of his life at Wrexham, North Wales, and his body is there buried. Consult F. B. Dexter, *Biographical Sketches of the Graduates of Yale College* (new ed., New Haven, 1913).

YALE, LINUS, JR. (1821–68). An American inventor, born at Salisbury, N. Y. His father was an inventor and maker of bank locks, and the son at first turned his attention to portrait painting, but inherited mechanical tastes and aptitude led him also to become an inventor. He devised several locks, notable among which was the combination or dial lock for safes and banks, a type that has survived in essentially the form developed by Yale. The flat key or pin tumbler lock was invented in 1861, and immediately acquired a wide vogue. The name Yale instead of being applied to the locks of this inventor, of which there were many, soon was applied to any lock with a flat key. Consult R. H. Yale, *Yale Genealogy and History of Wales* (Beatrice, Neb., 1908). See LOCK.

YALE UNIVERSITY. One of the leading institutions of learning in the United States, situated in New Haven, Conn. The plans of the first settlers of New Haven in 1638 included the establishment of a college, but Massachusetts objected, because there was at that time not enough population in the Colonies to support the college already founded at Cambridge, and for 60 years the people of Connecticut sent their sons to Harvard. In 1700–1701 10 of the principal ministers of the Colony, all but one of whom were graduates of Harvard, at a meeting at Branford, formally founded a collegiate institution by a gift of books for a library, and on Oct. 9, 1701, the Colonial Assembly granted a charter making the 10 ministers and their successors trustees of the Collegiate School of Connecticut. The trustees elected one of their own number, Abraham Pierson, of Killingworth, rector of the school, and, in order to secure the support of the towns on the Connecticut River, voted to establish it at Saybrook, "as the most convenient town for the present." Until the death of Rector Pierson, however, the students and the one tutor lived at Killingworth, prob-

ably in the house of the rector. Under the second rector, Samuel Andrew (1707–19), the senior classes were instructed by him at Milford, the other classes by two tutors at Saybrook. In 1716, in the face of much dissatisfaction, the school was removed to New Haven and permanently located there. A wooden building was erected where Osborn Hall now stands, and was formally opened at commencement in 1718, when the name of Yale College was adopted in honor of Elihu Yale (q.v.), who had made large gifts to the school. This building, besides chambers for students and a library, contained a kitchen and dining hall, and for more than 120 years from this time students were required to board together in commons. Timothy Cutler (q.v.) was rector from 1719 to 1722, when, on account of a change in his religious views, he was removed by the trustees. Elisha Williams served from 1726 to 1739, and was succeeded by Thomas Clap (q.v.), who had greater business qualifications than any of his predecessors. He drew up and published in Latin the first code of laws, catalogued the library, and drafted a new charter which was approved by the General Assembly in 1745. By this Act the former trustees were incorporated under the name of "the President and Fellows of Yale College in New Haven." Clap erected Connecticut Hall (South Middle), then "the best building in the colony," and a chapel (the Athenæum). President Clap also successfully defended the college against attempted interference in its management by the Legislature. Naphtali Daggett, professor of divinity, served as president from 1766 to 1777, when he was succeeded by Ezra Stiles (q.v.). President Stiles succeeded in overcoming the opposition to the college which had long existed in the Legislature, and in 1792, by joint action of the Legislature and corporation, certain State funds, valued at $30,000, were applied to the improvement of the college, and the Governor, Lieutenant Governor, and six senior Senators became members of the corporation.

The administration of Timothy Dwight (q.v.), from 1795 to 1817, begins a new era in the history of the institution. At his accession there were about 100 students, and the instructors consisted of the president, one professor, and three tutors, each of the lower classes being instructed in all branches by one tutor. President Dwight established permanent professorships and filled them with recent graduates of unusual ability and promise. Among the young men appointed at this time were three who served the college together for more than half a century and brought it great honor—Jeremiah Day (q.v.), in mathematics; Benjamin Silliman (q.v.), in chemistry; and James L. Kingsley (q.v.), in language. President Dwight, anticipating the growth of the college, extended the college square, by purchase, so as to include the whole front of the present campus, and continued the brick row to Berkeley Hall (North Middle). He also planned the organization of professional schools under distinct faculties, but the medical school only was established before his death. Jeremiah Day, who became president in 1817, had been selected by Dr. Dwight as his successor, and continued to carry out his plans. The divinity and law schools were organized, and the brick row completed. Under President Day the responsibility for the government of the students was placed upon the faculty, and out of the stricter discipline now enforced grew two unsuccessful revolts known as the Conic Sections Rebellion and the Bread and Butter Rebellion. In 1831 a fund of $100,000 was raised to meet the general expenses of the college, the total productive funds before this time having been less than $20,000. When President Day resigned in 1846 the college had 587 students, of whom about one-fifth were from the Southern States. Under President Theodore D. Woolsey (q.v.), 1846–71, the corps of instructors was greatly enlarged, and the standard of scholarship raised; the Scientific School was established, and the foundation laid for the School of Graduate Instruction; the professional schools were reorganized and the School of Fine Arts was founded. During President Woolsey's 25 years of service the number of students increased to 809. Dr. Woolsey proposed the plan, which became effective in 1872, by which six graduates of the college took the place of the State Senators in the corporation. The administration of Noah Porter (q.v.), 1871–86, was one of great material prosperity. At this time a most important change was made in the course of instruction and the modern system of elective studies was adopted. On the resignation of Dr. Porter the student body numbered 1079. He was succeeded in 1886 by Timothy Dwight (q.v.), grandson of the elder President Dwight, under whose administration (1886–99) the growth of the institution was unprecedented. In five years the number of students increased more than 50 per cent, and at the end of President Dwight's term they numbered over 2500. The title of Yale University was authorized by the Legislature in 1887. Under the last three presidents the productive funds were greatly augmented, and more than 20 buildings were erected at a cost of above $2,000,000. Upon the retirement of President Dwight, Professor Arthur Twining Hadley (q.v.) was made president and inaugurated on Oct. 18, 1899. The corporation as now constituted is composed of the president and 18 fellows, viz., 10 successors by election of the original trustees, the Governor and Lieutenant Governor of Connecticut, who were made members ex officio in 1792, and six representatives elected by the graduates from their own number, one every year for a term of six years.

The courses of study offered in the university are comprehended in nine schools, each school being under the administration of a distinct faculty of instruction: the college with courses leading to the degree of B.A.; the Sheffield Scientific School with an undergraduate course leading to the degree of Ph.B., a graduate course leading to the degree of M.S., and graduate courses in engineering leading to the degrees of M.E., C.E., E.M., and E.E.; the Graduate School with courses leading to the degrees of M.A. and Ph.D.; the School of Medicine with courses leading to the degree of M.D.; the School of Religion with courses leading to the degree of B.D.; the School of Law with courses leading to the degrees of LL.B. and B.C.L., and graduate courses leading to the degrees of M.L., D.C.L. and Jur.D.; the School of Fine Arts with courses leading to the degree of B.F.A.; the School of Music with courses leading to the degree of Mus.B.; and the School of Forestry with courses leading to the degree of M.F. The library, the Peabody Museum of Natural History, and the Observatory are organized independently of the several schools.

The college, the oldest school of the university

and the one from which the university and its several departments have sprung, requires for admission the passing of entrance examinations on specified subjects covering the entire course of a high school or preparatory school. A candidate for the degree of B.A. must complete studies aggregating 60 hours per week through a year. Although the choice of courses is wide, there must be completed during the junior and senior years a major subject and a correlated minor subject, insuring intensive study in some special field.

The college campus faces the New Haven Green and occupies one-half of one of the original nine squares in which the city was laid out, as well as additional land on adjoining squares. The campus is arranged in the form of a rectangle, 850 feet long and 400 feet wide.

The dormitories include Connecticut Hall, erected in 1750, Farnam (1869), Durfee (1870), Lawrance (1884), Welch (1891), Berkeley (1893), Vanderbilt (1893), White (1893), Pierson (1896), Fayerweather (1902), Haughton (1909), and Wright (1912).

Other buildings of the college are Battell Chapel, Dwight Hall—the home of the Y. M. C. A.—Kent Laboratory, and the following halls used for recitations and lecture purposes: Sloane, Osborn, Phelps, and Lampson.

The Sheffield Scientific School is devoted chiefly to instruction in the mathematical, physical, and natural sciences, and furnishes both graduate and undergraduate courses. It was established in 1847 as a school of applied chemistry. In 1860 Joseph E. Sheffield of New Haven provided it with a building and a permanent fund, and the next year the school was reorganized and called by its present name. In 1863 it received from the Legislature $135,000, being the proceeds of the congressional land grant of 1862, and thus became the College of Agriculture and Mechanic Arts of Connecticut. In 1892 this Act was revoked and the special relation of the school to the State ceased. The undergraduate course occupies three years. Admission is on the basis of examination covering as thorough preparation as that required for the college though in somewhat different subjects. The courses of study are arranged in specific groups, as the mechanical engineering course, the chemistry course, the course of selected studies, etc. The specific course once selected there is small opportunity for choice by the student of specific electives within the course. The Sheffield buildings include South Sheffield Hall, the school administration building and lecture hall, North Sheffield Hall, Winchester Hall, the Sheffield Chemical Laboratory, Kirtland Hall, the Sheffield Laboratory of Physiological Chemistry, Lecte Oliver Memorial Hall, all of these devoted largely to lecture halls and laboratories; the Electrical Engineering Laboratory, the Mason Mechanical Engineering Laboratory, the Hammond Laboratory of Metallurgy and Mining Engineering, Byers Hall, the home of the Sheffield Y. M. C. A. and other student interests. The Vanderbilt Halls, dormitories erected on Vanderbilt Square, are the only dormitories maintained by this school.

The Graduate School was formally organized in 1847, and is therefore the oldest of the regularly established graduate schools in this country. The only degrees conferred on recommendation of the Graduate School are those of Doctor of Philosophy and Master of Arts. The former degree normally requires a minimum of three years of resident graduate study, with successful examination and an approved dissertation evidencing capacity to make some real contribution to scholarship. The latter degree presupposes the completion of a minimum of two years of resident study and a satisfactory essay. Instruction is given in 15 departments, by 70 professors, 42 assistant professors, and 23 instructors. A number of fellowships and scholarships in aid of students are provided.

The earliest professional school organized at Yale was the Medical School. Four professors in medicine were appointed in 1813 and medical degrees were given the following year. The school was aided in the beginning by a grant of $30,000 from the State, and for 70 years was under the joint control of the college and the State Medical Society, until in 1884 the university authorities assumed full control of the school. The course was extended in 1896 to four years and the present requirement for admission is at least two years of college study. A campaign carried out in connection with the centennial of the Yale School of Medicine assured an endowment to this school of not less than $2,500,000. The buildings of the school include Medical Hall, the Laboratory Building, the Clinical Laboratory, and the University Clinic. An agreement between the university and the New Haven Hospital gives the university the power to nominate the hospital staff, and thus provides for thoroughly continuous clinical instruction.

The School of Religion, originally called the Divinity School, was organized in 1822, but instruction in theology had been given at Yale since its foundation, and the first professorship in the college was that of divinity, established in 1755. This school, originally Congregational in doctrine, is now undenominational. Its courses are partially elective. A three-year course, admission to which is based upon the completion of four years' college work, leads to the degree of B.D. There is also regular provision for graduate study. The buildings of the school comprise Edwards and Taylor halls, dormitory and recitation buildings, the Marquand Chapel, and the Day Missions Library.

The School of Law became a part of the college in 1824, though no degrees were conferred until 1843. Its course of instruction, covering three years, leading to the LL.B. degree is designed to fit the student for the practice of law in any State. Admission to the course is based upon the completion of four years' college work. A graduate course leading to the degrees of M.L., or Jur.D., or D.C.L. is also offered. The special law library of some 40,000 volumes and 11,000 pamphlets is particularly strong in Roman law and in Sessions' laws of the various States and Territories of the United States. The Law School is housed in Hendrie Hall. The School of Fine Arts was established in 1866. Thorough instruction is offered in the Arts of Design, viz., drawing, painting, sculpture, and architecture, supplemented with courses of lectures on related subjects and the history of art.

The School of Music, founded in 1890, aims to provide instruction for those who intend to become professional musicians, either as teachers or composers, and to afford a course of study for such as intend to devote themselves to musical criticism and the literature of music. A gift provided for the erection of an adequate

new building to be used for the teaching and other activities of the school and to contain a concert hall seating over 700 auditors.

The School of Forestry was founded in 1900 as a graduate department of the university. It is engaged in instruction and research in the various branches of forestry. It has its separate funds, teachers, and regulations but is governed by the corporation of Yale University. In addition to the two years' graduate course leading to the degree of Master of Forestry advanced courses and research work are offered in silviculture, lumbering, management, and other branches of technical forestry. Field and research work are conducted at the school camp at Milford, Pa., at New Haven and Union, Conn., in the Adirondack Mountains, New York, and in the Southern States. The School Forest of 1000 acres is at Keene, N. H.

The University Library, housed in Chittenden and Linsly Halls and in the group of buildings adjoining these, contains about 850,000 volumes with annual accessions exceeding 30,000 volumes, and with 5000 periodicals and publications of learned societies on file.

There are many special libraries connected with the various departments of the university, numbering in all about 150,000. The library of the Elizabethan Club contains a remarkable collection of Tudor and Stuart rarities, including a fine collection of Shakespeare quartos and folios.

In addition to the regular university courses, a large number of lecture courses under the auspices of the various university departments and organizations are carried on. Among the latter are the Lyman Beecher Lectures, the Silliman Memorial Lectures, the Dodge Lectures, Harvard Lectures, and others.

The Peabody Museum of Natural History was founded in 1866 by a gift of $150,000 from George Peabody, the London banker, and the first wing of the museum was completed in 1876. It contains the collections in mineralogy, geology, paleontology, and zoölogy, with several laboratories and workrooms.

The buildings of the Observatory stand on Prospect Street, about a mile from the college. The principal astronomical instruments are a 6-inch heliometer by Repsold of Hamburg, an 8-inch equatorial by Grubb of Dublin, and a 15-inch photographic telescope with a 10-inch follower and with a plane mirror to be used for star photography. The late Prof. Elias Loomis (q.v.) bequeathed to the observatory a fund of more than $300,000, the income of which is to be used for the promotion of astronomical observations and investigations.

The Gymnasium, completed in 1891 at a cost of $200,000, is under expert supervision. Near the gymnasium and connected with it are the Carnegie swimming pool and indoor baseball cage and a running track. The athletic grounds of the university have been greatly enlarged in accordance with plans worked out in coöperation with a committee of graduates. Across Derby Avenue is the new playing field of some 80 acres of land. Upon this is located the Yale Bowl, a football coliseum which accommodates about 60,000 people. Upon this new field several football fields and baseball diamonds have been laid out and provision has been made for soccer and lacrosse.

The university, under the control of the corporation, is directed by the president, who has the assistance of two executive officers, the secretary and the treasurer.

The buildings which are held by the university generally as distinct from any of the separate schools or affiliated institutions are Woodbridge Hall (the administration building) and the group of buildings erected at the time of the bicentennial, including Memorial Hall, Woolsey Hall (the university auditorium), and the University Dining Hall. The large new laboratories in physics and in the biological sciences are held for the common use of the college, the Sheffield Scientific School, and the Graduate School.

The total student enrollment in 1915–16 was 3260, divided among the several schools as follows: Graduate School, 346; College, 1479; Sheffield Scientific School, 1020; School of the Fine Arts, 49; School of Music, 99; School of Forestry, 25; School of Religion, 106; School of Medicine, 58; School of Law, 119. The officers of instruction and administration include 494, divided as follows: professors, including other university officers, 141; assistant professors, 75; instructors, including lecturers, etc., 162; assistants in instruction, 116. The president in 1916 was Arthur T. Hadley. Consult E. E. Slosson, in *Great American Universities* (New York, 1910), and A. P. Stokes, *Memorials of Eminent Yale Men* (2 vols., New Haven, 1915).

YALTA, yäl'tä. A district town in the Government of Taurida, South Russia, on the south coast of the peninsula of the Crimea, 60 miles south of Simferopol. It is a well-known sea-bathing resort. Pop., 1911, 23,498. Yalta is identified with the Galita or the Yalita of the Arabs. It was held by the Genoese in the fifteenth century.

YA-LU-KIANG, yä'lo͞o'kyäng' (Yalu River). A river of Korea, also called Amnok or Apnok, and by the Japanese renamed Oryoku (Map: China, N 3). It rises in the Paik-tu-san (8900 feet high), the highest of the Shan-a-lin or Chang-peh-shan system of Manchuria, and flows in a generally southwest direction into the Yellow Sea near the city of Wiju, forming in its course the northwest boundary of the country. It is navigable by seagoing junks for 30 miles from its mouth, and by smaller craft as far as the vicinity of Wi-wŏn, 145 miles farther up. In its upper course it is obstructed by dangerous rapids, yet rafts of timber are floated down to the sea. Off the mouth of the Yalu a great naval battle between the Chinese and the Japanese was fought in 1894, resulting in the destruction of the Chinese fleet. The crossing of the Yalu by the Japanese, May 1, 1904, was marked by the first great battle of the Russo-Japanese War (q.v.). See KOREA.

YA-LUNG-KIANG, yä'lo͞ong'kyäng'. A river of west China, rising on the south slope of the Bayan-kara, an eastern extension of the Kuen-lun Mountains in eastern Tibet, near the headwaters of the Yellow River. It flows under different names south through deep gorges parallel with the Kin-sha-kiang or Yang-tse, which it joins after a course of several hundred miles. It is a very swift stream, much impeded by rapids, and is not navigable except in local stretches.

YAM (from Sp. *ñame, iñame, ignamc, ignama*, Port. *inhame*, yam, from African *nyame*, yam), *Dioscorea*. A genus of mostly East and West Indian plants of the family Dioscoreaceæ, distinguished by an inferior ovary and membranous

winged fruit. They have herbaceous twining stems, and fleshy roots in some species used as food, like potatoes. They contain much starch, and generally become somewhat mealy and pleasant to the taste when boiled. The tubers of all the yams contain an acrid substance, which, however, is dissipated by boiling, except in the species with compound leaves. The winged yam (*Dioscorea alata*) has roots 1½ to 3 feet long, and often 30 pounds in weight, with a brownish or black skin, juicy and reddish within. They vary exceedingly in form. Small tubers are generally found in the axils of the leaves. This species is the original of most, or perhaps all, of the yams cultivated in tropical Asia, Africa, and America: the common yam of the West Indies (*Dioscorea sativa*), which has a round stem and heart-shaped leaves; *Dioscorea bulbifera*, in which the tubers in the axils of the leaves attain the size of apples; the prickly yam (*Dioscorea aculeata*), which has a prickly stem and a fasciculated, tuberous root; *Dioscorea globosa*, the most esteemed yam of India, which has fragrant flowers and roots white internally; *Dioscorea rubella*, another Indian kind, with tubers sometimes 3 feet long, tinged with red below the skin. The Chinese yam (*Dioscorea divaricata*) is a hardy sort. Its edible club-shaped roots descend perpendicularly into the ground from 2 to 3 feet, and on this account it is little cultivated. See SWEET POTATO.

YAM, WATER. See LATTICE LEAF.

YAMA, yä'mȧ (Skt. *yama*, Av. *yima*, twin, but in later Sanskrit literature erroneously regarded as restrainer, punisher, from *yam*, to restrain). In Hindu mythology, a deification of the first mortal that died, who thus became king of death and ruler of souls hereafter. In the Veda Yama is the lord of the blessed dead. His abode is in the highest heavens, near the sun. Agni (q.v.), the god of fire, is his friend and conducts the souls to his presence. Yama, moreover, has two dogs as messengers, and past these all the spirits of the dead must go. As a king in the Veda he is the child of Vivasvat, a personification of the sun and of Saraṇyū, a sun maiden. He has also a twin sister named Yamī, who desires to seduce him, and a hymn of the *Rig-Veda*, which gives a dialogue between them, contains evidently a protest against incest.

In later Hindu mythology, especially in the epic poems and in the *Purāṇas* (q.v.), Yama is the judge of the dead and regent of the lower world. His realm is in the south, where he has a number of hells. His messengers go about the earth, drawing the souls out of the dead with a noose, although he sometimes performs this office himself.

In Iranian mythology Yima or Jamshid answers in part to the Indian Yama, but is also the ideal ruler of the golden age of the world. Consult: Ehni, *Die ursprüngliche Gottheit des vedischen Yama* (Leipzig, 1896); A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897); W. J. Wilkins, *Hindu Mythology* (2d ed., London, 1900); Alfred Hillebrandt, *Vedische Mythologie* (Breslau, 1902); L. D. Barnett, *Antiquities of India* (London, 1913).

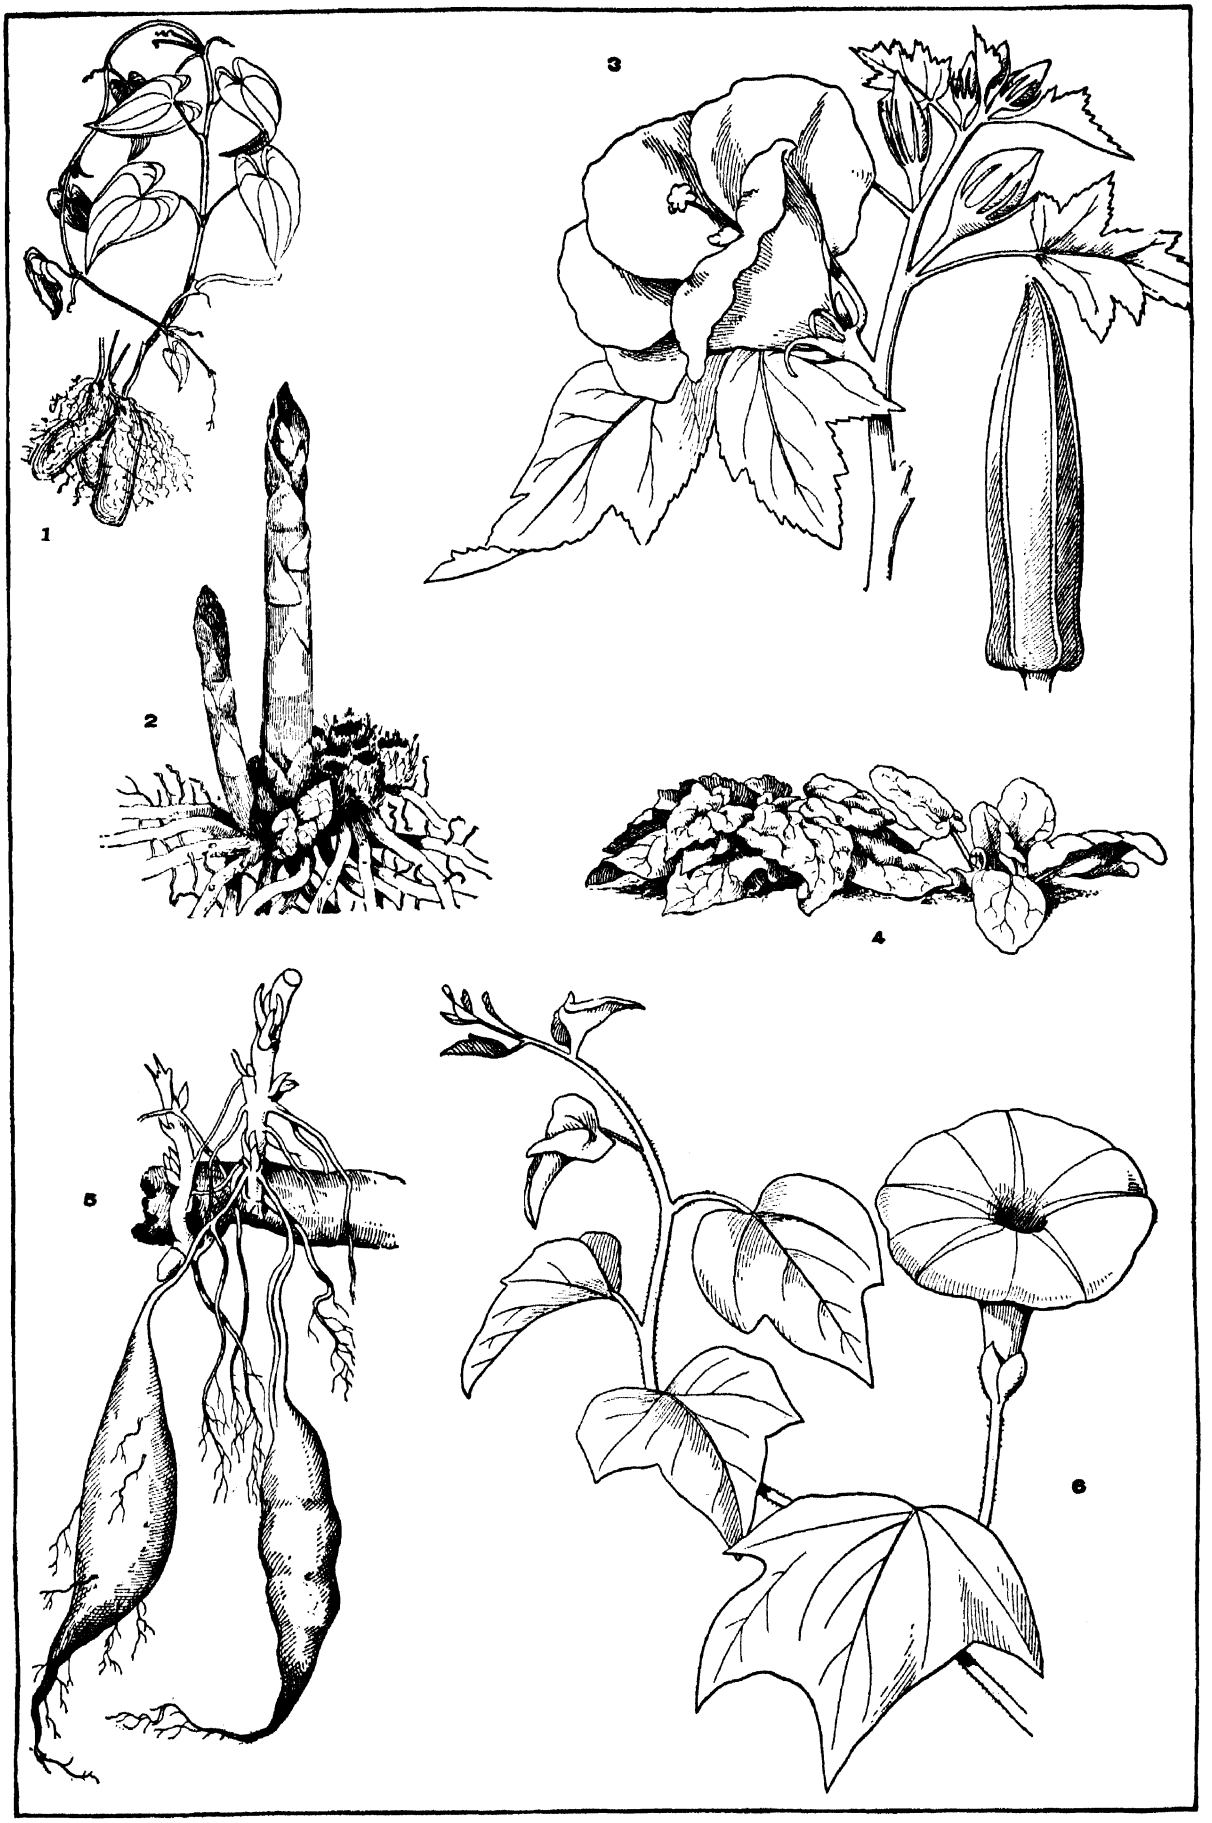
YAMACRAW, yä'mȧ-krȧ. A refugee band from the Creek confederacy (see CREEKS), formerly occupying a village on the south side of the Savannah River at Yamacraw Bluff, now included within the limits of the city of Savannah, Ga. A treaty was made in 1733 between the Georgia colonists and the Lower Creek towns. The Yamacraw afterward retired to the Chattahoochee River, from which they had originally come. See YAMASSEE.

YAMADA, yȧ-mä'dȧ. See UJI-YAMADA.

YAMAGATA, yä'mȧ-gä'tȧ. The capital of the Prefecture of Yamagata, in Japan, situated in the northern part of the island of Hondo, about 40 miles north of Fukushima (Map: Japan, G 4). It is a former castle town, and has a considerable trade. Pop., 1908, 42,234.

YAMAGATA, ARITOMO, PRINCE (1838–). A Japanese general and statesman. He was born in the Province of Choshu, the son of a Samurai. Having distinguished himself in the suppression of the Shoguns, he was given a place in the Ministry of War under the new régime in 1870. He was made Minister of War in 1873, and as author of the conscription bill of this period became known as the father of the Japanese army. At the outbreak of the Satsuma rebellion in 1877 he defeated Saigo and was rewarded with the command of the Imperial Guard and the direction of the general staff. In 1885 he was given the portfolio of the Interior, in 1889 succeeded Kuroda as Premier, and in 1892 became Minister of Justice. In the Chinese War of 1894–95 he swept the enemy out of Korea, crossed the Yalu, and was marching upon Mukden when ill health forced him to retire. He was elevated to the marquisate in 1895, and appointed field marshal in 1898. In the latter year he was again Premier. He was a member of the group of so-called Elder Statesmen, whose influence with the Emperor was a powerful force in parliamentary Japan, especially during the Russo-Japanese War of 1904–05. Yamagata served as chief of the general staff in 1904, in 1905 served as president of the Privy Council, in 1907 was created a prince, and later again became president of the Privy Council.

YAMAGUCHI, yä'mȧ-gōō'chē. The capital of the Prefecture of Yamaguchi, in Japan, situated in the southwest end of the island of Hondo, a short distance from the coast (Map: Japan, B 6). It was formerly the seat of the famous lords of Choshu. A Christian mission was established here by St. Francis Xavier in 1550. Pop., 1908, 21,100.



YAMAJI, yä'mȧ-jē, MOTOHARU, VISCOUNT (c.1840–1903). A Japanese soldier, born in the Province of Tosa (Shikoku). He was popularly known as the One-eyed Dragon. He won recognition in the Satsuma rebellion; was promoted to be lieutenant general, and after the reorganization of the nobility in 1884 was created a baron. During the Chinese campaign of 1894–95 he made a brilliant attack on Port Arthur. In acknowledgment of his military services he was created a viscount in 1895.

YAMAMAI (yäm'ȧ-mī') **MOTH.** See SILKWORM.

YAMANOUCHI GUN. See MACHINE GUN.

YAM'ASSEE (peaceable, hospitable). A tribe of Muskhogean stock (q.v.) formerly holding both sides of the lower Savannah River and extending as far as the Salkiehatchee in South Carolina, with some villages southward almost to Florida. At the time of the settlement of South Carolina they were one of the most important tribes of the coast region and were friendly to the colonists until the exactions of the traders and the raids of slave dealers provoked them to war. They enlisted the Catawba, Cherokee, Congaree, and others almost to the

YAM, SWEET POTATO, ETC.

1. YAM (Dioscorea alata).
2. ASPARAGUS (Asparagus officinalis).
3. OKRA (Hibiscus esculentus).
4. SPINACH (Spinacia oleracea).

5 and 6. SWEET POTATO (Ipomœa Batatas).

Virginia border in a rising against the whites, and began the war on April 15, 1715, but were defeated by Governor Craven a year afterward and driven from South Carolina, retiring to Florida. They were finally incorporated into the cognate Creeks and Seminole, but retained their distinct name up to the Creek War.

YAMBOLI, yäm'bō-lē, or **JAMBOLI**. A town in eastern Rumelia, 49 miles west of Burgas, on the Tunja River, here spanned by two bridges (Map: Balkan Peninsula, F 3). The remains of an old mosque and the old fortifications are of interest. There are prominent wine and wool interests. Pop., 1905, 15,708.

YAMBU, yäm'bōō, or **YEMBU**. The port of Medina, in Arabia, situated on the Red Sea, about 120 miles west-southwest of that city (Map: Turkey in Asia, C 6). Pop., estimated at from 5000 to 7000. Yambu is important for its pilgrims' caravans, being on the route from Cairo to Mecca. It is called the Gate of the Holy City. It carries on a considerable trade with the ports of the Red Sea.

YAMEL, yä'měl. See KALAPUYA.

YAMEO, yä-mā'ō. An important tribe, with several subtribes and apparently constituting a distinct linguistic stock, along the Marañon (Amazon) from the Huallaga to the Javary and along the lower courses of these two streams, in northeastern Peru. They are also known as Llameo, Lama, and Lamista, and a part of them were anciently known as Motilon, but are not to be confounded with another tribe of the same name formerly living upon Lake Maracaibo in Venezuela. (See MOTILON.) They are small and Mongoloid in appearance, contrasting with other tribes of the region. They were formerly very warlike, but are now agricultural and industrious. A part were civilized by the Franciscans and settled at Moyobamba and other stations on the Huallaga, where they are now farmers and cotton weavers. Those farther to the east were also visited by missionaries later, but retain their original character. Consult D. G. Brinton, *The American Race* (New York, 1891).

YANAM. See YANAON.

YANAON, yä'nä'ŏn', or **YANAM**. A French possession in India, on the east coast of Madras, near the mouth of the Godavari River (Map: India, E 6). It is an administrative dependency of Pondicherry (q.v.). Area, about nine square miles. Pop., 1913, 5135.

YAN'CEY, WILLIAM LOWNDES (1814–63). An American orator and political leader, born at Ogeechee Shoals, Ga. He studied law at Greenville, S. C., was admitted to the bar in 1834, and besides practicing his profession edited a Unionist paper, the Greenville *Mountaineer*, and spoke against nullification. In 1836 he removed to Oakland, near Catawba, Ala. His slaves having been accidentally poisoned, he reëntered law and journalism, was prominent as an anti-Whig orator in the presidential campaign of 1840, and from 1841 to 1844 was a member of the State Legislature. From 1844 to 1846 he was a member of Congress, and soon attracted national attention by his participation in a bloodless duel with Representative Clingman of North Carolina. Resigning from Congress, he became a bitter opponent of compromise between the North and South, was the author of the famous "Alabama Platform" of 1847 which demanded Federal protection for slavery in the Territories, fought vigorously against the compromise measures of 1850, anticipated the coming conflict between the sections, and became the recognized leader of the radicals in the South. He led the seceders from the national Democratic Nominating Convention at Charleston in 1860; and then made a canvass of the North, speaking in many States. "It was he more than any other," says Woodrow Wilson, "who taught the South what Douglas really meant, he more than any other who split the ranks of the Democratic party at Charleston, made the election of Douglas impossible, and brought Mr. Lincoln in." Just before the Civil War, Yancey was sent by the Confederate government as the head of a commission, consisting besides himself of P. A. Rost and Dudley Mann, to secure recognition for the Confederacy by various European governments; but after vain attempts in London and Paris, he returned in 1862, and thereafter until his death was a member of the Confederate Senate. Consult J. W. Du Bose, *Life and Times of William Lowndes Yancey* (Birmingham, 1892), and W. G. Brown, in *The Lower South in American History* (New York, 1902).

YANG-TSE-KIANG, yäng'tsĕ'kyäng' (the Yang-tse River). The longest and most important river of China, having a length of over 3000 miles and a drainage area of between 650,000 and 700,000 square miles (Map: China, J 5). It has its origin in a number of small rivulets which at a height of over 16,000 feet above the level of the sea dash down the northern slope of the snow-covered Tang-la Mountains of Tibet, near latitude 33° 45′ N., and longtitude 90° E. Under the name of the Murui-usu or Tortuous Stream it flows in a general east direction for some distance, receives two important affluents—the Napchi-tai and the Toktonai—from the Kuenlun Mountains in the northwest, and takes the name of Di-chu or Dré-chu. At about 98° E. longitude it enters Sze-chuen flowing in a southeasterly course but soon turns southward and under the name of Kin-sha (Golden Sand) it enters the Chinese Province of Yun-nan, bursts through its rocky barriers on the east, and after a great double bend, receives from the north the turbulent waters of the Ya-lung in latitude 26° 35′ N. and the name of Pei-(or *Pai*-)shui (white waters), forms in part of its course the boundary between Yun-nan and Sze-chuen, and again enters Sze-chuen, which it traverses in a northeasterly direction. Here it receives from the south the waters of the Hêng or Ta-kwan, the Nan-kwang, the Yungning, the Chih-shui, the Ki-kiang, and from Kwei-chow the Wu or Kung-tan at the city of Fuchow, 72 miles east of Chung-king. From the north it receives the Min at Hsü-chow or Sui-fu (taking the name of Min-kiang), the To at Lu-chow fu and the Kia-ling at Chung-king (q.v.) in latitude 29° 34′ N. and longitude 107° 2′ E., all navigable by native craft for hundreds of miles. Between 500 and 600 miles farther east, at a point 15 miles west of I-chang (q.v.), it escapes from the mountains, and with slackened pace and many a bend and detour pursues a generally east and east-southeast course through the heart of China, receiving the drainage of the provinces of Hu-peh, Hu-nan, Ngan-hwei, Kiang-si, and Kiang-su, and in latitude 31° 25′ N., and longitude 122° 14′ E., split by Chung-ming Island it pours into the Yellow Sea 770,000 cubic feet of water per second, and annually deposits in it about 6,000,000,000 cubic feet of suspended matter.

From the city of Fu-chow, in Sze-chuen, as far east as Ngan-hwei and beyond, it is known as the Ta-kiang or Great River, the Chang-kiang or Long River, or simply as Kiang or The River. From Ngan-hwei—the old Province of Yang—to the sea, it is properly known as the Yang-tse, but foreigners are in the habit of applying the name to the whole river. With its numerous tributaries and feeders the Yang-tse provides an unrivaled system of internal communication, which is now practically open to foreign commerce. Hankow, 680 miles from the sea, may be reached by the largest ocean steamships trading with the East, and I-chang, nearly 500 miles farther up, by light-draft steamboats. Above this the river presents a succession of gorges and rapids, with a very strong and swift current up which native craft (up to 60 or 70 tons burden) are hauled at great risk and expense, and frequent loss of life, by large crews of native trackers, at the rate of a few miles a day. All attempts to use steam as far as Chung-king have resulted in failure. Ping-shui-hien, 200 miles above Chung-king, is the limit of native navigation. Towards the end of summer the river frequently rises as much as 50 feet, flooding the fields and towns on its banks over a vast area, and sometimes causing terrible destruction of life.

YANINA, yä'nē-nȧ. See JANINA.

YANKEE, yăn'kē (of uncertain etymology). The popular name given to a native or citizen of New England, and by foreigners often applied indiscriminately to the entire population of the United States. One explanation of its origin, which is, perhaps, the most plausible, is that it is a corruption of the word English as pronounced by the Indians (Yenghies, Yanghies, Yankees). As a term of reproach to the New Englanders (who afterward adopted it themselves), the word seems first to have been used by the British soldiers about 1775. The South applies it to the North generally.

YANKEE DOODLE. A national air of the United States, the origin of which is unknown. The words, which were in derision of the ill-assorted provincial troops, were probably written by Edward Bangs some time between 1775 and 1777. The original title of the song, not the tune, was *The Yankee's Return from Camp*, and several versions are extant. The tune passed through various changes. The melody is shallow and shrill. It has been ascribed to various countries, but is probably of English birth. That it must have been generally known before 1767 seems likely, as in Barton's opera *The Disappointment* (1767) one of the lyrics is to be sung to the tune of *Yankee Doodle*. Consult O. G. Sonneck, *Report on the Star Spangled Banner, Hail Columbia, Yankee Doodle* (Washington, 1909).

YANK'TON. A city and the county seat of Yankton Co., S. D., 65 miles northwest of Sioux City, Iowa, on the Missouri River, and on the Chicago, Milwaukee, and St. Paul, the Chicago and Northwestern, and the Great Northern railroads (Map: South Dakota, G 5). It is the seat of Yankton College (Congregational), opened in 1881, and of the South Dakota Hospital for the Insane. The city is known for its large cement works and flouring mills. There are also grain elevators, brick yards, and breweries. The commission form of government has been adopted. Yankton was the capital of the Territory of Dakota until 1883. Pop., 1900, 4125; 1910, 3787; 1915 (State census), 4780.

YANKTON. See SIOUX.

YANKTO'NAI, or **PABAK'SA SIOUX.** See SIOUX.

YANTIA, yȧn'tĭ-ȧ. See COCCO.

YAO, you. One of the ancient sovereigns of China. The Shu-King or Book of History—the oldest historical record the Chinese possess—begins with the reign of Yao (2357 B.C.), and shows him at the head of an elaborate, well-organized governmental system, carefully searching out able and virtuous men to be placed at the head of the different departments, and appointing astronomers to regulate the seasons. In the sixty-first year of his reign (2296 B.C.) occurred the great inundation commonly known among foreigners as the Chinese Flood, whose regulation taxed the energy of one engineer for nine years and his successor for 13. In the seventieth year of his reign (2287 B.C.), wishing to retire, Yao, passing over his own son, selected Shun, noted for his filial piety, as his colleague and successor. He died in 2258 B.C. Very little more is known regarding him, except that he was the son of one of the kings who had succeeded Hwang-ti (q.v.). He is the first of the ancient kings of China so much lauded by Confucius for their virtues. Consult Friedrich Hirth, *Ancient History of China* (New York, 1911).

YAPOK, yȧ-pōk' (from the Oyapok River, between French Guiana and Brazil). An aquatic opossum (*Chironectes palmatus*) of Central and South America, rather larger than a rat, and differing from true opossums mainly in its webbed hind feet and aquatic habits. It has cheek pouches, in which it stows away crustaceans, mollusks, and aquatic insects, until it can reach a comfortable eating place. Its marsupial pouch is perfect.

YAPON, yȧ'pon, or **YAU'PON** (*Ilex cassine*). An evergreen holly native in the coastal States from Virginia to Texas and Arkansas. Generally it is a shrub which forms dense

YAPON.

thickets from its suckering roots, but in the Southwest it sometimes becomes arborescent. Its abundant scarlet berries are valued for winter decoration. Popularly it is known as cassena, and South Sea, Carolina, and Appalachian tea.

YAPOO, yä'pōō. A tribe of Tierra del Fuego. See YAHGAN.

YAPURÁ, yä'pōō-rä', or **JAPURÁ**. One of the two largest north tributaries of the Amazon, rising in the Colombian Andes, where it is known under the name of Caquetá (Map: America, South, C 3). It flows through the Territory of Caquetá in a southeastern direction and then enters the Brazilian Province of Amazonas, where, after flowing east for some distance, it divides into a large number of arms which join the Amazon at various points, the western and easternmost mouths being 500 miles apart in a straight line. The central and principal arm enters the Amazon opposite the town of Teffe, about longitude 64° 40′ W. The total length of the Yapurá is estimated at nearly 1800 miles, of which about 900 are navigable. Much of its course is unexplored and the region is sparsely inhabited.

YAQUI, yä'kē. An important and warlike tribe of Piman stock (q.v.), with villages along the Yaqui River in central Sonora, Mexico. They are robust, industrious, enterprising, and of determined bravery. The men are stock raisers and cultivate corn, cotton, beans, tobacco, and the maguey from which mescal liquor comes. The women are expert weavers. Their houses are light structures. Each village has its own chief; the clan system prevails, and they have ceremonial societies resembling those of the Pueblo tribes. In the outlying country the men are employed as miners, cattlemen, teamsters, and pearl divers. They make good soldiers, but have been in almost constant revolt against the Mexican government. A rising in 1740–41, in which they were joined by the neighboring Mayo (q.v.), was put down by Governor Vildosola, who defeated the Indians in two great battles, and shot their chiefs. The Yaqui remained quiet until 1825, when an attempt at taxation by the newly established Mexican government led to another revolt under Juzucanca, known as Banderas, from a banner which he carried, claimed to have originally belonged to Montezuma. He proved an able general and organizer, arranging alliances with neighboring tribes, restraining his people from unnecessary cruelties, and hiring white soldiers to drill his men. After three years' fighting, said to have cost 3000 lives, the war was brought to a close on the promise of concessions by the Mexican government, with permission to the Yaqui to retain their captured arms, cattle, and supplies. Banderas was commissioned captain general of the tribe with a regular salary. In 1832 Banderas headed another rising with the purpose of organizing the tribes of Sonora into an Indian state with himself as king. With 1000 Yaqui warriors, reënforced by contingents of Pima and Opatá (qq.v.), he marched upon Ures, but was defeated by Escalante. Banderas was taken and shot. The war continued nearly a year longer, but the Indians were finally brought to submission. Another war, begun about 1884, ended in April, 1887, with the capture of the Yaqui chief Cajenie, who was publicly executed in the presence of his people. The Indians were now supposed to be completely crushed, but continued inroads of gold hunters upon the Yaqui territory, with the connivance of the Mexican government, led to serious disturbances a few years afterward and culminated in 1900 in a general rising. In one of the first engagements a small detachment of Mexican troops was surprised near Mazatlán and half their number were killed. Soon afterward General Torres with 700 troops surrounded a large force of Yaqui in a cañon near the same place and killed 124 men, women, and children, and captured 234 women and children, who were at once deported to practical slavery in Yucatan. In 1740 the Yaqui were supposed to number about 40,000, but continued wars have reduced them to about 13,000.

YAQUI. A river of northwest Mexico (Map: Mexico, D 4). It is formed by two headstreams, both bearing the name of the main stream, one rising on the plateau of Chihuahua, the other in Arizona. From the confluence the main stream flows southwestward through the mountains of Sonora, and empties into the Gulf of California after a course of 520 miles. Coursing through a rugged mountain valley, it is not navigable to any extent.

YARCHI, yär'kĭ. See RASHI.

YARD. See WEIGHTS AND MEASURES.

YARD, ROBERT STERLING (1861–). An American editor and publisher, born at Haverstraw, N. Y. Graduating from Princeton in 1883, he was for three years with W. R. Grace & Co., then was a reporter on the New York *Sun*, and from 1891 to 1900 was an editor of the New York *Herald*. Afterward he served as advertising manager (1901–05) of Charles Scribner's Sons, as editor in chief of a corporation in which he had an interest, Moffat, Yard and Company (1905–11), and as editor in chief of the *Century Magazine* (1913–14). From 1903 to 1905, in addition to other duties, he was editor of *The Lamp*.

YARDLEY, SIR GEORGE. See YEARDLEY.

YARIBA, yä'rē-bà. A former negro kingdom in Africa. See YORUBA.

YARITAGUA, yä'rē-tä'gwà. A town of Venezuela, situated in a beautiful mountain valley, 75 miles east of Lake Maracaibo. It is noted for the production of excellent tobacco, and is a commercial centre of some importance. Pop. (est.), 4177.

YARKAND, yär'känd'. A town of Eastern Turkestan, China, on the Yarkand-Darya, a headstream of the Tarim (q.v.), about 100 miles southeast of Kashgar (Map: Asia, J 5). It lies in a fertile valley and is surrounded by a high wall and a moat. It has strategic importance. In the northwestern part of the city rises the fort of Yengisher. There are also a citadel in the new Chinese quarter, an old palace of the Emir, numerous mosques, and a fine bazar. Yarkand is the centre of an agricultural and stock-raising region and manufactures felt and carpets. It also carries on a considerable trade in wool, silk, leather, dyes, sugar, opium, tea, etc. The city was taken by the Dungans in 1864, and became the second capital of Kashgar under Yakub Beg, but was recovered by the Chinese in 1877. Its population is estimated at about 70,000, composed principally of Mohammedans of Turko-Tatar descent.

YARMOUTH, yär'mŭth, or GREAT YARMOUTH. A seaport, fishing and sea-bathing town of England, on the east coast of Norfolk, 19 miles east of Norwich, at the mouth of the Yare, on a peninsula about 1½ miles broad, washed on the west by the Yare and Breydon water, and on the east by the North Sea (Map: England, H 4). The town communicates with the Suffolk suburbs of Southtown, of Little Yarmouth, and Gorleston, now part of the municipality, on the right bank of the Yare, by a bridge. Quays border each side of the river for nearly 2 miles, and here are the town

hall, the council chamber, and several other handsome buildings and many of the finest houses. There are a sailors' home, fishermen's hospital, and military asylum, the principal church being that of St. Nicholas, founded in the twelfth century, a handsome cruciform building, one of the largest parish churches in England, with a tower and spire 168 feet high. The town also has a monumental column, 144 feet high, to the memory of Nelson, several ornamental batteries of ancient guns, and a marine drive and promenade 2 miles long. Vessels of over 200 tons can enter the harbor, which is formed by the Yare. Yarmouth is the principal seat of the English herring fishery. The fishing fleet employed numbers some 6000 vessels. The curing of fish is important, and the Yarmouth bloater is highly esteemed. An extensive export trade in agricultural produce, herrings, and malt is maintained. Shipbuilding is carried on, as well as the manufacture of ropes, sails, nets, and silk goods. There are also foundries, tan works, and flour mills. Yarmouth was raided by German naval and aërial forces in the great war which began in 1914. See WAR IN EUROPE. Pop., 1901, 51,250; 1910, 55,905.

YARMOUTH. A port of entry and the capital of Yarmouth County, Nova Scotia, Canada, on a bay of the Atlantic. It is the terminus of the Canadian Pacific and the Halifax and South Western railroads, 205 miles southwest of Halifax (Map: Nova Scotia, D 9). It is the fourth shipbuilding place in the Dominion, has large fishery and lumber interests, thriving manufactures, and is a summer resort. Pop., 1901, 6430; 1911, 6600.

YARN (AS. *gearn*, OHG. *garn*, Ger. *Garn*, yarn). The name applied to the thread spun for the purpose of weaving cloths of various kinds. It differs not only in the materials of which it is made, but also in the fineness to which it is spun. The latter quality is of great importance, as upon it depends entirely the evenness and quality of the manufacture. In order that uniformity may be insured, a pound of the material is taken as the standard, and this is divided into hanks or cuts. Thus, with linen yarn, a hank or cut consists of 300 yards; and if it takes 25 of these hanks to make a pound, the yarn is called 25s; and if 40, 40s; and so on. A hank of cotton consists of 840 yards; a hank of wool is variously estimated in different countries and localities. See COTTON; SPINNING; WOOL.

YAROSLAV, yä'rô-släf' (?–1054). Grand Prince of Kiev, son of Vladimir (died 1015). Upon his father's death he inherited Novgorod. Soon afterward Svatopolk of Turov gained possession of Kiev, which in 1019 was wrested from him by Yaroslav with Scandinavian aid. After the death of his elder brother Mstislav, in 1039, Yaroslav was ruler of the greater part of what then constituted Russia. He founded, among other towns, the city of Yaroslavl. He married Indegerd, daughter of the Swedish King Olaf. His deeds were celebrated in some of the Norse sagas.

YAROSLAVL, yä'rô-slä'v'l. A government of central Russia (Map: Russia, E 3). Area about 13,723 square miles. Agriculture is the principal occupation. The household industries are developed in Yaroslavl as they are in but few parts of Russia. Linen weaving is especially important and has for its centre the industrial village of Velikoye. The production of locks, knives, nails, agricultural implements, etc., is considerable. There are besides a number of cotton and flour mills, paper mills, chemical works, etc. The transit trade in grain is important. Pop., 1912, 1,239,300.

YAROSLAVL. The capital of the government of the same name in central Russia, situated on the right bank of the Volga, 174 miles northeast of Moscow (Map: Russia, E 3). It is an ancient town with a number of interesting old churches. The manufacturing industries are important. The leading establishments are a cotton mill, tobacco factories, flour mills, and paint factories. Pop., 1910, 111,876. Yaroslavl was founded in 1071, and was the capital of a principality from the beginning of the thirteenth to the end of the fifteenth century, when the principality was absorbed by Moscow. See the article RUSSIA, *History*.

YAR'RELL, WILLIAM (1784–1856). An English naturalist, born in London. He was one of the founders of the Zoölogical Society in 1826. His chief works are: *History of British Fishes*, illustrated by 400 woodcuts (2 vols., 1835–36; 3d ed., with memoir of the author, 1859); and *History of British Birds*, with 520 wood engravings (2 vols., 1839–43; 4th ed., 1881–85).

YAR'ROW. A small stream in Selkirkshire, southern Scotland, joining the Ettrick, a tributary of the Tweed, near Selkirk (Map: Scotland, E 4). On its banks are the ruins of Newark Castle, and Bowhill, the ducal seat of Buccleuch. Yarrow has been celebrated by Scott, Wordsworth, and other poets.

YARROW. A genus of plants. See ACHILLEA.

YARUMAL, yä'rōō-mäl'. A town of the Department of Antioquia, Colombia, 52 miles northeast of Medellín, on the right bank of the Cauta. In the vicinity are gold mines and extensive pastures. Pop., 1912, 21,250.

YARURAU, yä'rōō-rä'ōō. An Indian linguistic stock of Venezuela. The Yaruros (Jaruris), or, as they called themselves, Japurin, dwelt on or near the Orinoco, between the rivers Meta and Capanapaco. Consult: D. G. Brinton, *The American Race* (New York, 1891); Tavera-Acosta, *En el Sur* (Ciudad Bolívar, 1907); L. R. Oramas, in *Anales de la Universidad Central de Venezuela*, vol. x (Carácas, 1909).

YASNAYA POLYANA, yàs-nä'yà pôl-yä'nà. The estate of Liov Tolstoy (q.v.).

YASSY, yäs'sê. See JASSY.

YATES, DAVID GILBERT (1870–). An American physician, born in New Jersey in 1870. He received his preliminary education in private schools and after a brief experience in journalism entered New York University, receiving his medical degree in 1898. Thereafter he devoted himself mainly to special practice, becoming successively senior assistant surgeon to the New York Eye and Ear Infirmary, aural surgeon to the New York City Children's Hospitals and Schools, and assistant surgeon to the Manhattan Eye, Ear, and Throat Hospital. He contributed many original papers to the literature of his specialty, and at various times was contributing editor of the *Medical Critic* and of the NEW INTERNATIONAL YEAR BOOK, and medical editor of the NEW INTERNATIONAL ENCYCLOPÆDIA.

YATES, EDMUND HODGSON (1831–94). A British journalist and novelist, born in Edinburgh. At 16 he entered the General Post Office, London, from which in 1872 he retired

on a pension of £200 to devote his time wholly to literature. In that year he came to the United States to lecture, and in 1873 and 1874 he was London correspondent for the New York *Herald*. Of his numerous journalistic ventures, the most successful was *The World*, a London society paper, which he founded in 1874. For an attack on Thackeray in *Town Talk*, he was expelled from the Garrick Club (1858); and for a libel on the Earl of Lonsdale in *The World* (1883), he was imprisoned for seven weeks (1885). Yates's first novel was *Broken to Harness*, which appeared in *Temple Bar* for 1864, a magazine which he was then editing. Among his novels are *Land at Last* (1866); *The Black Sheep* (1867); *Nobody's Fortune* (1871); and *The Impending Sword* (1874). Besides magazine articles and sketches, Yates wrote several successful farces, and an autobiography entitled *Recollections and Experiences* (1884).

YATES, RICHARD (1818–73). An American political leader, the war Governor of Illinois. He was born in Warsaw, Ky.; removed with his parents in 1831 to Springfield, Ill.; graduated at Illinois College, Jacksonville, in 1838; and practiced law in Springfield. He became prominent in local Whig politics, was a member of the State Legislature (1842–49), and a member of Congress (1851–55). Allying himself with the Republican party at its organization, he was its candidate for Governor in 1860, and was elected, serving until 1865. His activity and loyalty marked him as one of the greatest of the country's war Governors. His advice was sought by President Lincoln in regard to national problems, and in State affairs he overcame and controlled the strong pro-Southern movement that developed in Illinois at certain periods of the war. He was a member of the United States Senate (1865–71), and took a prominent part in reconstruction legislation.

YATES, ROBERT (1738–1801). An American jurist. He was born in Schenectady, N. Y., was educated in New York City, and in 1760 began the practice of the law in Albany. He sided with the Patriot party on the approach of the Revolutionary War, and wrote several anti-British essays (signed "The Rough Hewer"), which attracted widespread attention. He was a member of the Provincial Congress from 1775 to 1777, serving on the committee which drew up New York's first Constitution in 1776; was a judge of the Supreme Court of New York from 1776 to 1798; and was Chief Justice after 1790. In 1787 he was one of New York's three delegates to the United States Constitutional Convention, but being an extreme anti-Federalist, soon withdrew, after playing the part of an obstructionist, and in the following year violently opposed the ratification of the Constitution by New York. His notes of the debates in the convention of 1787 were published at Albany in 1821 as *Secret Proceedings and Debates of the Convention Assembled at Philadelphia in 1787*.

YATUNG, yä'tōōng' (said to mean "Hole-in-the-Valley"). A British trading post in Tibet, near the border of Sikkim, established in 1894 in accordance with the provisions of a convention negotiated in 1890, the necessary buildings being provided by the Chinese government. It really never became a trading post till after the convention of 1904 (Younghusband) between Great Britain and Tibet, in which the latter agreed to the maintenance of trading posts at Yatung, Gyangtze, and Gartok. It is 80 miles from Darjeeling (7400 feet), also in Sikkim, the terminus of the Indian railway system in that direction. Yatung is situated in the Chumbi valley at an elevation of 10,480 feet above the level of the sea, and is reached from Darjeeling over the Jelep Pass in seven days. The place is entirely shut in by lofty mountains and a battlemented "Chinese wall" built across the gorge.

YAUCO, yä'ōō-kō. A town on the south coast of Porto Rico, 68 miles west of Ponce, in the midst of the important coffee-growing section of the island (Map: Porto Rico, B 3). Pop., 1899, 6108; 1910, 6589.

YAUPON. See YAPON.

YAUTIA, you-tē'ȧ. See DASHEEN.

YAVAPAI, yä'vȧ-pī' (sun people). A North American Indian tribe of Yuman stock (q.v.), originally an offshoot from the Mohave (q.v.) of the Colorado River, and claiming the territory between the Bill Williams fork and the Rio Verde. From their close associations with the Apache (q.v.) they were sometimes known as Apache Mohave. They numbered 289 in 1910. In their aboriginal habits and characteristics they resembled the Mohave and the Apache, but are excellent basket makers. Consult G. A. Dorsey, *Indian Tribes of the Southwest* (Chicago, 1904).

YAVARY, yä'vȧ-rē'. See JAVARY.

YAWL. See YACHT.

YAWNING (from *yawn*, AS. *gānian, ginian*, OHG. *geinōn, ginōn*, Ger. *gähnen*, to yawn). A long, deep, involuntary inspiration accompanied by unusual expansion of the chest, wide opening of the mouth, and elevation of the shoulders. It is generally an evidence of mental weariness, though it is frequently imitative. This modified respiratory movement is caused by imperfect aëration of the blood and is essentially reflex, the stimulus determining each movement acting on the respiratory centre. It occurs during paralysis of the muscles which raise the shoulder. Yawning occurs in certain animals, as the dog, lion, and horse.

YAWS (probably from African *yaic*, raspberry, so called because of the tubercles characterizing the disease). A contagious disease characterized by an eruption of white or yellowish tubercles, granules, or papules, topped with crusts, and sometimes becoming confluent. The disease is common in Africa, Central America, Brazil, Guiana, the West Indies, Mozambique, and Madagascar, Java, Ceylon, the Fiji Islands, and Samoa, and is found in any country to which slaves have been taken from Africa, although a tropical disease. It is also called frambœsia, pian, bubas, coko, tonga, etc. An attack lasts from two to six months, or for many years. Mercury, iodide of potassium, iron, arsenic, sarsaparilla, and sulphur are used in its treatment. A spirochæta (q.v.) has been discovered which is believed to be the cause of yaws and similar to the spirochæta of syphilis. Salvarsan (q.v.) is said to have a specific effect against both organisms. See "Yaws," in *Reference Handbook of the Medical Sciences* (New York, 1916).

YAZD. See YEZD.

YAZDAGARD, yăz'dȧ-gärd. The name of three Persian kings of the Sassanidæ (q.v.) dynasty.

YAZOO (yăz'ōō) **CITY.** A town and the county seat of Yazoo Co., Miss., 45 miles northwest of Jackson, on the Yazoo River, and on the

Yazoo and Mississippi Valley Railroad (Map: Mississippi, E 5). The principal industrial establishments include a cotton mill, two cottonseed-oil mills, two lumber mills, and an ice factory. Noteworthy features are the Elks Home, and Ricks Memorial Library. Pop., 1900, 4944; 1910, 6796.

YAZOO FRAUD. A term applied to the transaction by which the State of Georgia, by Act of the Legislature of Jan. 7, 1795, granted a large portion of her western territory chiefly to four land companies known as the Yazoo Companies, from the region thus deeded. The consideration was $500,000, and the area conveyed was about 35,000,000 acres. The territory was described as extending from the Alabama and Coosa rivers to the Mississippi and from the thirty-fifth to the thirty-first parallel of latitude. It was believed the Legislature had acted from corrupt motives—every member of that body except one being a shareholder in the companies. Many buyers were notorious speculators, and many were residents of other States. The people of the State were indignant and a party was formed to agitate for the repeal of the sale. A new Legislature was elected, and the repeal was brought about. By the statute of Feb. 13, 1796, the records of the transaction were burned in the presence of the Governor and Legislature, and in 1798 a State convention made the repealing act a part of the Constitution, on the ground that the State had the right to repudiate a contract founded on improper motives. The territory in question was ceded by Georgia to the United States in 1802. In 1803 a commission was appointed by President Jefferson under an Act of Congress to investigate the Yazoo claims. Madison as chairman recommended a compromise, but Georgia refused to compensate the claimants. The bill was defeated, largely through the instrumentality of John Randolph; though taken up several times after this it failed to pass. Their claim, however, was sustained by the United States Supreme Court in the case of Fletcher *vs.* Peck, 6 Cranch 87 (1810), Chief Justice Marshall holding that the charge of bribery in 1795 could not be brought before the court as a collateral issue, that the Legislature could not in 1796 declare invalid its own Act of 1795, that the grant of 1795 was in the nature of a contract, and that the law of 1796 was unconstitutional as in effect an ex post facto law destructive of the vested estate of the grantees under the Act of 1795. Accordingly in 1814 Congress ordered the lands to be sold and appropriated $8,000,000 for extinguishing the rights of the claimants. Three years later the Treasury reported a final settlement, which involved the payment of $4,282,151. Consult Henry Adams, *History of the United States*, vols. i and ii (New York, 1889–91), and C. H. Haskins, "Yazoo Land Companies," in American Historical Association, *Papers*, vol. v (ib., 1901).

YAZOO (yăz'o͞o) **RIVER.** A river in the State of Mississippi, formed by the union of the Tallahatchie and the Yalobusha rivers just above Greenwood, Miss., whence it flows southward and enters the Mississippi at Vicksburg (Map: Mississippi, D 5). The Tallahatchie and its chief tributary, the Coldwater, rise in northern Mississippi. The Yazoo receives also the Sunflower, about 20 miles above Vicksburg. It is navigable for its entire length, and most of its main affluents are navigable for small boats, and are used for logging. Its total length is about 300 miles.

YEAMANS, yē'manz, ANNIE (1835–1912). An American actress, born on the Isle of Wight. While a child she was taken by her parents to Sydney, New South Wales. In 1853 she was married to Edward Yeamans. Her first appearance in New York City was in *Cendrillon*. She entered upon a long engagement with Harrigan and Hart at the Theatre Comique, where she became noted for her impersonations of Irish characters. Subsequently Mrs. Yeamans appeared under many managements and in a great variety of plays, both in England and the United States.

YEAMANS, SIR JOHN (c.1610–74). A Colonial Governor of South Carolina, born in Bristol, England. He went to Barbados in early manhood and became a planter. In 1665 the proprietors of Carolina appointed him Governor of the country called Clarendon, extending from San Mateo to Cape Fear. In the same year he sailed with three ships from Barbados, and at Cape Fear established a short-lived colony. In 1669 he was reappointed Governor, but soon named William Sayle in his stead. In 1671 he was once more given that position. During the next few years many new settlers arrived and negro slaves were introduced. In 1674 the proprietors became dissatisfied with Yeamans's management of affairs and removed him. He returned to Barbados, where he died.

YEAR (AS. *gēar*, *gēr*, Goth. *jēr*, OHG. *jār*, Ger. *Jahr*, year). In general, a space of time equal in length to the period occupied by the earth in completing a circuit of its orbit around the sun. Astronomers distinguish several different kinds of years. The tropical year is the year of chronologists and of the calendar (q.v.), and is defined as the interval of time between two successive passages of the sun through the vernal equinox (q.v.). Its length is 365 days 5 hours 48 minutes and 46 seconds. The sidereal year is the actual period of the earth's orbital revolution, and differs from the tropical year on account of the precessional motion of the equinoxes themselves. (See PRECESSION.) It is 365 days 6 hours 9 minutes 9.5 seconds in length. The anomalistic year is the time elapsing between two successive returns of the earth to its perihelion (q.v.) point. It is a little longer than the sidereal year, on account of the motion of the earth's perihelion. (See PERTURBATIONS.) Its length is 365 days 6 hours 13 minutes 53 seconds. The light year is a unit of linear measure, used by astronomers in stating the distances of the fixed stars. (See STAR.) It is the linear space traversed by light in one year, and as light moves at the rate of about 186,600 miles per second, the light year furnishes a linear unit large enough to measure even the vast cosmic distances of interstellar space. Bissextile, or leap year (q.v.), is a calendar year in which the ordinary number of days has been arbitrarily increased by one, making it contain 366 days instead of 365. The commencement of the year among the Jews and Mohammedans has no fixed position in relation to the sun's course or the seasons, it being a lunar year. See ANOMALISTIC YEAR; CALENDAR.

YEAR AND A DAY. Under a peculiar rule of the common law, a fraction of a day was not recognized, and the last day of any given period of time was considered to be completed for legal

purpose as soon as it began, and therefore, in order to provide for the actual expiration of a full calendar year, it was necessary to add a day. This period was adopted as the limitation of many rights and liabilities.

YEAR BOOKS. A collection of reports of cases decided in the English courts of common law from the reign of Edward I to Henry VIII. The reports were made by the prothonotaries or chief scribes of the courts and published annually by them at the expense of the crown. They were written in Norman French and are the earliest reports having any substantial value as precedents. There are somewhat fragmentary memoranda of litigation antedating the Norman Conquest, and there are official records of litigation beginning with the reign of Richard I, but these for the most part constitute a record only of the results of the litigation as determining the rights of the parties, and are consequently of little or no value as legal precedents. The *Year Books* are not now often cited in the opinions of courts, but they are of great historical value and a thorough study of them in recent years has thrown much light on many abstruse legal problems. They were originally published in 11 parts. An edition of the *Year Book* of Edward I–II by Maynard, published in 1678, has since been edited and published in English. A translation from manuscript reports of the cases in the various years of Edward I 11–35 inclusive was published by Alfred J. Harwood (London, 1866).

YEARDLEY, yärd'lĭ, or **YARDLEY,** Sir George (c.1577-1627). A Deputy Governor of the Colony of Virginia, born in England. He served in the Low Countries, sailed for Virginia as captain of Sir Thomas Gates's expedition, and was wrecked on the Bermudas, but reached Virginia in 1610. He was acting Deputy Governor of the Colony from the departure of Sir Thomas Dale in 1616 until the arrival of Argall in 1617. In the following year he went to England, and while there was chosen Deputy Governor of the Colony for three years and was knighted by King James I. He reached Virginia on April 19, 1619, and by proclamation modified some of the harsh laws under which the colonists had been living. Acting under instructions, he also convoked the famous House of Burgesses, the first legislative body that had ever assembled in America. His administration did not prove satisfactory to the company, so at the end of his term he was succeeded by Sir Francis Wyatt (q.v.). Yeardley remained in Virginia, however, as a member of the council, and in 1626 was again appointed Deputy Governor, this time by King Charles I. He continued in office until his death.

YEAR'S MIND. See Month's Mind.

YEAST, or Barm. The mass of plant cells produced during the alcoholic fermentation of sugars. Yeast is produced in large quantities in beer brewing, beer yeast consisting mainly of the cells of a species of fungi known as *Saccharomyces cerevisiæ*. *S. pasteurianus* and other species are also used in brewing, and *S. ellipsoideus* in wine fermentation. This plant, which multiplies exclusively by budding, is capable of existing for a time in a pure aqueous solution of sugar. An excellent medium is such a solution with some albuminous matter added to it. But the best medium for its existence and growth is constituted by some liquid like wort or grape juice. In such a liquid the formation of yeast, accompanying fermentation, may be induced by exposure to the air in a brewery or some other place where alcoholic fermentation is going on, the air of such places containing the germs that develop into the yeast plant. The temperature at which the plant thrives best is from 23° to 25° C. Even very intense cold does not kill it, although its vegetation is arrested below 5° C. Heat, in the presence of moisture, kills it at temperatures above 75° C.; if dry, the plant may be heated above 100° C. without losing its vitality.

In a fermenting mixture a frothy mass rises to the top, owing to the entrapped carbon dioxide; this is known as top yeast; while the yeast settling to the bottom is called bottom yeast. Higher temperatures favor the formation of the former, and lower temperatures favor the latter. Bakers use either compressed yeast (compressed cakes of top yeast) or dried yeast (a dried mixture of yeast cells with much starch). The former has high fermenting capacity and gives uniform results, but it will keep only a day or two; while the latter retains its capacity to produce fermentation for a long period. Brewers' yeast is not desirable for bread making, because it is likely to give a bitter flavor and its activity is slow in a dough mixture. Certain fungi (*Mucor alternans*, *Amylomyces Rouxii*, etc.) are coming to be used in practice as substitutes for yeast, for they have the ability to split starch, which is generally lacking in yeasts. See Ascomycetes; Brewing.

YEAST. A novel by Charles Kingsley, published as a serial in *Fraser's Magazine* in 1848, and in book form in 1851. It gives a vivid picture of the Chartist agitation.

YEATS, yēts, William Butler (1865–). An Irish poet, son of a distinguished artist, J. B. Yeats, born June 13, 1865, in Dublin, and educated chiefly in that city. He studied art for a time, but early—in his twenty-second year—turned to literature as a profession. He was the representative man of the movement known as the Irish Literary Revival. (See Irish Literature, *Irish Literature in English*.) His inspiration he drew from the myth, legend, romance, and folklore of Ireland. First of all a lyric poet, as such he was second to none of those who wrote in English in his generation. He also became known as a dramatist, writer of fiction, and critic. Settling with his family in London in 1887, he contributed to the magazines and reviews, from time to time published a book of prose or verse, and in the meanwhile worked assiduously, in collaboration with William Ellis, on the edition (3 vols., 1893) of Blake, which is a monument to that poet's genius. In 1890 Yeats was in Paris; from 1891 to 1894 in Dublin; and in the latter year in London again. In 1895, feeling that his mystic leanings, such as later found expression in *The Tables of the Law* (privately printed, 1897) and in other prose tales, were taking him too far away from the life of Ireland, he returned to his native land, and thenceforth divided his time between England and Ireland. In 1899 began the dramatic activity of the Irish Literary Theatre which Yeats, with Lady Gregory and Edward Martyn, and assisted a little later by George Moore (qq.v.), set going, and which was subsequently to become the Irish National Theatre Society. In 1903, and again in 1914, Yeats visited the United States, and lectured widely there. The volumes of his poems published in

1895, 1899, and 1901 represent him well as a lyrist; *The Wanderings of Oisin* (1899) as a narrative poet; *The Countess Cathleen* (1892), *The Land of Heart's Desire* (1894), and *Cathleen in Hoolihan* (1902) as a dramatist; and *Ideas of Good and Evil* (1903) as the subtle and finished critic. In 1916 appeared the autobiographical *Reveries over Childhood and Youth*. His *Collected Works* in 8 volumes were published in New York in 1908. Consult: H. S. Krans, *William Butler Yeats and the Irish Literary Revival* (New York, 1904); George Moore, *Hail and Farewell* (3 vols., ib., 1912–14), passim; Lady Gregory, *Our Irish Theatre* (ib., 1913); Cornelius Weygand, *Irish Plays and Playwrights* (ib., 1913); Forrest Reid, *W. B. Yeats* (ib., 1915), a critical study.

YECLA, yā'kla. A town of the Province of Murcia, Spain, 72 miles southwest of Valencia (Map: Spain, E 3). Cereals, wine, excellent oil, feather grass, and vegetables constitute the chief productions of the district, with some manufactures of spirits, soap, and leather goods. In the vicinity are many ruins. Pop., 1900, 18,117; 1910, 22,883.

YEDO, or **YEDDO**, yĕd'dō. The former name of the capital of Japan. See TOKYO.

YEGOREVSK, yĕ-gôr'yĕfsk. A district town in the Government of Ryazan, central Russia, about 60 miles southeast of Moscow (Map: Russia, E 3). It is an industrial town and has extensive cotton mills with an annual output exceeding $5,000,000 in value. Pop., 1910, 29,183.

YEISK, yā'ĭsk. A seaport in the Province of Kuban, north Caucasia, situated on the eastern coast of the Sea of Azov, 60 miles southwest of Azov (Map: Russia, E 5). It produces leather, flour, and tallow, but a large part of the population is engaged in agriculture and gardening. Pop., 1910, 48,329.

YEKATERINBURG, yĕ-kä'tyĕ-rĕn-bŭrk. A town of Russia. See EKATERINBURG.

YEKATERINODAR, yĕ-kä'tyĕ-rē'nō-där'. The capital of Kuban, north Caucasia. See EKATERINODAR.

YEKATERINOSLAV, yĕ-kä'tyĕ-rē'nō-slăf'. A town and government of Russia. See EKATERINOSLAV.

YELANSK, yĕl'ănsk. A Cossack settlement in the Province of the Don Cossacks, South Russia, on the left bank of the Don, 290 miles north-northeast of Novo-Tcherkask. It is engaged principally in fishing, farming, gardening, and sheep raising. Pop., 1910, about 13,000.

YELETS, yĕl'ĕts. A district town in the Government of Orel, Russia, on the river Sosnâ, 120 miles east-southeast of the town of Orel (Map: Russia, E 4). The town contains many factories and carries on considerable trade in live stock. Lace making is a widely spread household industry. Pop., 1900, 38,239; 1910, 58,100.

YELISAVETGRAD, yĕ-lyĕ'zâ-vĕt-grät'. A district town in the Government of Kherson, South Russia, situated on the Ingul about 740 miles south of Moscow. It consists of a town proper and four suburbs, and is well built, with straight wide streets and avenues of trees. It was founded in 1754, in the reign of Empress Elizabeth, for whom it was named. Yelisavetgrad is, after Odessa, the principal manufacturing town in the government. There are extensive flour mills, tobacco factories, etc. There is a considerable trade in grain and flour, cattle, sheep, wool, horses, crockery, timber, and leather goods. An agricultural fair is held annually. Pop., 1910, 75,800, about one-third Jewish.

YELISAVETPOL, yĕ-lyĕ'zâ-vĕt-pôl'y', or **ELIZABETPOL**. A government of Transcaucasia, Russia, bounded by Persia on the south; area nearly 17,000 square miles (Map: Russia, G 6). It belongs partly to the region of the Little Caucasus and is partly covered with steppes. It is watered chiefly by the Kur and its tributaries. The mountain slopes are thickly wooded and some of the valleys are fertile and well cultivated. There are rich mineral deposits, especially of copper, which is mined on a considerable scale. Agriculture is the chief occupation and considerable quantities of wine are produced. The government is traversed by the Transcaucasian Railway. Pop., 1912, 1,035,800, of whom more than half were Mohammedans.

YELISAVETPOL, or **ELIZABETPOL**. A town of Russia, capital of the Government of the same name, situated on an affluent of the river Kur, about 120 miles southeast of Tiflis (Map: Russia, G 6). The older portion of the town is occupied mostly by Mohammedans and is ill built, with narrow and crooked streets and low-roofed houses. The newer portion is built on a modern scale and contains some fine buildings. Yelisavetpol has a mosque dating from the seventeenth century, an ancient mausoleum, and a fine bazar. In the neighborhood of the city are found numerous ancient remains. The town became Russian by conquest in 1804, before which it was known as *Ganzha*. The fortifications constructed by the Turks are still in existence. The chief occupation of the inhabitants is agriculture. Pop., 1910, 60,447, consisting chiefly of Tatars and Armenians.

YELL. See SHETLAND ISLANDS.

YELLOW, INDIAN. See INDIAN YELLOW.

YELLOW ASH. See CLADRASTIS.

YELLOW BASS. A fresh-water bass (*Morone interrupta*) of the southern Mississippi valley, about 15 inches long, brassy yellow, with about seven distinct longitudinal black lines, the continuity of which is broken towards the tail. See BASS, and Plate of BASS.

YELLOWBELLY. A common sunfish (*Lepomis auritus*). See SUNFISH; and Plate of DARTERS AND SUNFISH.

YELLOWBILL. A sportsman's name for the American black scoter. See SCOTER.

YELLOWBIRD. Any of many distinctively yellow birds. In the United States the common, thistle, or black-winged yellowbird is the goldfinch (q.v.); the summer yellowbird, or wild canary, is a warbler (q.v.).

YELLOW FEVER, or YELLOW JACK. An acute specific disease, occurring within certain geographical limits and characterized by a fever of short duration, a yellow tint of the skin, gastro-intestinal disturbances, and hæmorrhages into the skin and mucous membranes. It is due to the action of a specific virus, the precise nature of which is unknown, transmitted by a mosquito of the genus *stegomyia*. The disease was first recognized definitely in 1647 in the West Indies. In 1691 it was very fatal in Barbados, where it was called the "new distemper." From this date the disease has been endemic in the West Indies. It is also prevalent along the west coast of Africa at Senegal and Sierra Leone. At times the disease extends southward along both shores of South America,

and northward to the South Atlantic and Gulf States. Occasionally it is brought to the large Atlantic seaports by ships sailing from countries where the fever prevails. Severe visitations occurred in the lower Mississippi valley in the autumn of 1878, the deaths in New Orleans and Memphis alone exceeding 5000. Until the American occupation of Cuba in 1898 yellow fever was practically never absent from that island. It appeared in the Panama Canal zone in 1905, but under Gorgas it was controlled and is now practically exterminated. See PANAMA.

Experiments carried on in Cuba by Walter Reed (q.v.), James Carroll, Aristide Agramonte, and Jesse W. Lazear (who died from yellow fever from the effects of an accidental mosquito bite) by order of the United States army have proved that this disease, like malaria, is communicated from one individual to another only by a species of house mosquito (*Stegomyia fasciata*). (See INSECTS, PROPAGATION OF DISEASE BY; MOSQUITO.) After the recognition of the true etiology of yellow fever, and the institution of sanitary reforms in Cuba based on this knowledge, the disease disappeared from that island, to return when the Cubans discontinued precautions. Its occurrence in hot and moist areas and at low levels coincides with the distribution of the mosquito. It is more fatal from May to August, and is stopped by the onset of frost. Negroes are less susceptible than whites. One attack confers immunity.

While the mosquito is undoubtedly the medium of communication in yellow fever the ultimate reservoir of the disease has not been discovered. Balfour has recently advanced the hypothesis that this reservoir exists in certain tribes of monkeys, basing his belief upon the fact that in certain localities prior to an outbreak of yellow fever monkeys of the red howler tribe have been observed lying dead or dying in neighboring forests, apparently as the result of a disease similar to yellow fever. It is also noteworthy that the disease is endemic only in regions where monkeys are plentiful. It is suggested that these animals may bear a relation to yellow fever similar to that of the rat to bubonic plague.

Attempts to discover the causative germ of yellow fever (if one exists) have been unremitting. The fact that a definite time elapses between infection of the mosquito and the development of its power to communicate the disease to man points to a germ, probably an ultramicroscopic protozoön, or filterable virus, as the agent. The blood and serum of yellow-fever patients are capable, when injected into healthy persons, of communicating the disease.

The period intervening between infection and the onset of the disease is as a rule three or four days, but may be from one to seven days. The attack may come on suddenly with severe chills or rigors or may be preceded by symptoms of languor, headache, and malaise. The temperature rapidly rises and in two or three days may reach 105° F. or even higher. The fever lasts from three to five days and is attended by pains in the back, limbs, and head. The tongue is coated but bright red at the tip and sides; there is tenderness and pain over the epigastrium, with nausea and vomiting. About the second or third day jaundice begins in the conjunctivæ, and quickly spreads over the whole body. In favorable cases the fever abates at the end of the fourth or fifth day, and recovery is complete in two or three weeks. But in severe cases the symptoms continue with increased violence. The skin becomes yellower, small hæmorrhages take place into the skin, and vomiting becomes frequent. The rejected material is at first light in color (white vomit), but is soon followed by the black vomit, which is an ominous symptom, since it betokens an extensive alteration in the blood. Black vomit has somewhat the appearance of coffee grounds, and consists of blood which has been extravasated into the stomach and further altered by the action of the gastric juice. Blood may also be discharged from the bowels and hæmorrhages take place from the nose, mouth, or gums. At this stage delirium is apt to set in and the patient soon lapses into unconsciousness. In violent cases death sometimes takes place within a few hours of the onset of the first symptoms. In these cases jaundice and high temperature are absent. Death is due to hæmorrhage, cardiac failure, suppression of the urine, or to the direct effect of the poison on the vital centres. The mortality in different epidemics varies greatly and may be as low as 10 per cent or as high as 85 per cent of the individuals attacked. Among alcoholic patients and those who are weakened from hardship or other causes the death rate is exceedingly high.

The solution of the problem of preventing outbreaks of yellow fever is one of the most remarkable achievements of sanitary science. The disease is known to be favored by heat, moisture, bad drainage, house and communal uncleanness, and generally unhygienic conditions, and these must be remedied as a first step in stamping out the malady. Chief attention, however, is paid to the mosquito, and its breeding places should be destroyed. During an epidemic the greatest care is exercised to prevent yellow-fever patients from being bitten by mosquitoes; special pains are taken to disinfect houses and rooms in which a case has occurred and to kill all mosquitoes in them. People residing in infected districts should be careful to guard against being bitten by these insects, both indoors and out. It is customary to enforce a strict quarantine against vessels sailing from ports where it is known that yellow fever exists. (See QUARANTINE.) Sanitary scientists predict confidently that the world will soon be rid of this scourge. Preventive inoculations of specially prepared serums have been tried, but not found generally effective. Serums also have been used for treatment, but with indefinite results.

Yellow fever is a self-limited disease, but is likely to be attended by serious lesions of important organs. Absolute rest in bed, from the first apearance of symptoms until convalescence is well established, is imperative. In no other disease is rest so important, and disregard of this precaution fraught with such serious danger. Sudden death has occurred from too early exertion when the patient was apparently on the highroad to recovery. At the outset of the attack a mild emetic such as ipecac or warm water and mustard may be given to empty the stomach, and the bowels should be evacuated quickly by means of castor oil, or an effervescent saline cathartic, as magnesium citrate or a Seidlitz powder. During the following days one or two daily bowel movements should be obtained, preferably by enemas of magnesium sulphate in warm water. Fever is best controlled by means of cold sponging. Baths, while

effective in lowering the temperature, are dangerous on account of the movement they entail. Antipyretic drugs have to be given with caution because of their tendency to depress an already weakened heart. Threatened suppression of the urine is a grave complication and is combated by wet or dry cups over the region of the kidneys, intravenous or intracellular injections of normal saline solution or high rectal injections. Free stimulation with whisky and strychnine is necessary at times to counteract the tendency to collapse and heart failure. If possible, attendants should be immune. Contrary to the practice in other fevers, no food should be allowed yellow fever patients for the first three or four days, or longer in severe cases, and then only the blandest and most easily digestible liquids may be taken. Milk and lime water, or vichy, barley water, or buttermilk, may be continued well on into convalescence. Solid food cannot be absorbed by the patient and it may work serious harm. See C. B. Camerer, "A Résumé of Etiological Factors Concerned in Yellow Fever," in *United States Naval Medical Bulletin* (Washington, January, 1915); *Yellow Fever*, Document No. 822 of the Sixty-first Congress, 3d Session (ib., 1911), containing the collected papers of Walter Reed on the disease.

YELLOWFISH. See NIGGER FISH.

YELLOWHAMMER (from *yellow* + *hammer*, from AS. *amere*, *amore*, OHG. *amero*, Ger. *Ammer*, bunting, yellowhammer). A name popularly, but erroneously, given in some parts of the United States to the common flicker (q.v.). The name properly belongs to a fringilline bird of Europe, the yellow bunting (*Emberiza citrinella*), one of the most common of small birds in Great Britain and in most parts of Europe. It is about seven inches long, and the male is brilliant in plumage. The head and nape of the neck are lemon yellow, with a few dusky black patches; the upper part of the back and wings reddish brown, tinged with yellow; the wing and tail quills dusky black, with narrow external edges of bright yellow or bright brown; the upper tail coverts reddish chestnut, edged with yellow; the throat and whole under surface lemon yellow, clouded on the breast and flanks with reddish brown. The female is much less vivid. The yellowhammer frequents hedges and low trees, and generally nests on the ground. The song of the male is very sweet, and consists of few notes. In Italy yellowhammers are caught and fattened like ortolans for the table. See Plate of BUNTINGS AND GROSBEAKS.

YELLOW-HEADED BLACKBIRD. See BLACKBIRD.

YELLOW JACK. A popular name for the yellow fever (q.v.).

YELLOWJACKET. Any of several species of the smaller yellow-marked social wasps, particularly *Vespa germanica* and *Vespa cuneata*. See WASP.

YELLOW LARKSPUR. See TROPÆOLUM.

YELLOWLEGS. The popular name of two species of American snipes inhabitating the entire hemisphere; in summer North America is their home, while in winter they reach Chile. The common or summer yellowlegs (*Totanus flavipes*) is about ten inches long from the tip of the bill to the end of the tail, with wings about six inches long. Its flesh is delicious. The greater yellowlegs (*Totanus melanoleucus*) is 14 inches long, wing eight inches, but similar in appearance, with ashy color above, under parts whitish, with transverse spots and stripes on breast and sides. The two species resemble each other so closely not only in color, but in habits, call notes, nest and eggs, and haunts, that the size is almost the only constant difference; both are known as tattlers or yelpers, because on discovering a gunner they raise a hue and cry to warn other birds. See Plate of BEACH BIRDS.

YELLOW LOCUST. See CLADRASTIS.

YELLOW MURRAIN. See TEXAS FEVER.

YELLOW PARILLA. See MOONSEED.

YELLOW PERCH. See PERCH.

YELLOWPLUSH PAPERS. A series of articles by Thackeray, portraying the rise and fall of a stock-dabbling London flunky, first published in *Fraser's* in 1838. They afterward appeared among the author's *Comic Tales and Sketches*.

YELLOW PUCCOON. See HYDRASTIS.

YELLOW RIVER. A river of China. See HOANG-HO.

YELLOW ROOT. See HYDRASTIS.

YELLOW-RUMPED WARBLER. See MYRTLE BIRD.

YELLOWS. See PEACH, *Diseases*.

YELLOW SEA, or HWANG-HAI. A large arm of the Pacific Ocean, 600 miles long, lying between Korea and the east coast of China (Map: China, M 4). Its north shore belongs to Manchuria. It is over 300 miles wide in the south, where it opens widely into the Eastern Sea, which is separated from the Pacific Ocean by the Luchu Islands. South of Korea the Korea Strait connects the Yellow Sea with the Sea of Japan. In the north the large Shan-tung peninsula cuts off Korea Bay, the Gulf of Liaotung, and Gulf of Pechili. The Yellow Sea is nearly everywhere less than 300 feet deep. The Korean shore is lined with numerous small islands, and near the Chinese shore there are large sand banks. The sea receives the Yang-tse-kiang while the Hoang-ho which discharging yellow mud gives the sea its name, flows to the Gulf of Pechili, but frequently changes its course to the Yellow Sea.

YELLOWSTONE LAKE. The principal lake in the Yellowstone National Park (q.v.)

YELLOWSTONE NATIONAL PARK. A United States government reservation set apart as a public pleasure ground and game preserve. It occupies a rectangular area in the northwestern corner of Wyoming, overlapping into Montana and Idaho on the north and west by strips about two miles wide (Map: Wyoming, A 1). The park measures 54 miles from east to west, and 62 miles from north to south; its area is about 3350 square miles. The area immediately surrounding the park, with the exception of the valley of Yellowstone River on the north, is comprised within the following national forests: the Beartooth on the northeast, the Absaroka on the north, the Gallatin on the north, northwest and west, the Madison on the west, the Targhee on the west and south, the Teton on the south and east, and the Shoshone on the east.

Yellowstone Park lies in the heart of the Rocky Mountains. It consists of an elevated plateau basin with a mean altitude of 8000 feet, surrounded by lofty and rugged mountain ranges. On the east runs the Absakora range, a northern extension of the Shoshone Mountains, whose spurs cover the Shoshone National Forest with

an almost impassable complex of peaks, ranges, and deeply eroded river valleys. Several peaks in the national forest are more than 11,000 feet high, and the Fortress and Dead Indian Peaks rise respectively to altitudes of 12,073 and 12,253 feet. The southern national forests are occupied by northern outliers of the lofty Wind River and Teton ranges, the latter running also up the west boundary. The Gallatin Range on the northwest and the Snowy Mountains on the north complete the barrier. The central basin consists of more or less level or undulating lava fields, but spurs from the surrounding mountains run into it from all directions, volcanic cones and other peaks as well as small isolated mountain groups project from the plateau floor, while most of the larger streams have cut their way through the lava in yawning cañons, so that the surface is extremely diversified, and the plateau cut into a number of separate fields, basins, or peaks. There are 30 peaks within the park whose altitude exceeds 10,000 feet. The loftiest as well as the most rugged portion lies east of Yellowstone Lake, where Mount Humphreys and Turret Mountain rise respectively to altitudes of 11,000 and 10,400 feet. Directly on the northern boundary Electric Peak towers to a height of 11,155 feet, and affords a wide view of the park and environs to the north.

The Continental Divide crosses in an irregular line from the middle of the west boundary to near the southeast corner, so that the waters of the park go to both oceans. South of the Divide the upper course of the Snake River receives some of its headstreams from Shoshone, Lewis, and Heart lakes. North of the Divide all streams are tributary to the Missouri. The most important is the Yellowstone which traverses the park from the southeastern corner to the middle of the northern boundary, and expands into Yellowstone Lake, one of the central features of the region. The Madison River, one of the headstreams of the Missouri, is formed on the central plateau by the junction of the Gibbon and Firehole rivers, while the eastern mountains give rise to the Shoshone, an affluent of the Bighorn.

The original geological structure of the park is almost completely hidden by a great Tertiary lava flow, the easternmost extension of the Snake River basalt plains, which are connected to the west with the vast Oregon lava fields. The underlying sedimentary rocks range from Cambrian to Cretaceous, but are chiefly Cretaceous. The present plateaus and mountains, with the exception of the Gallatin range, are composed of lava. See *Hot Springs and Geysers*, below.

Owing to the elevation, the climate is rigorous, but not excessively cold compared with lower surrounding regions. The summer is short and characterized by great diurnal extremes of temperature, frosts occurring occasionally at night even in midsummer. At Mammoth Hot Springs the mean temperature for July is 61°, and the mean maximum 76°, the mercury rising occasionally as high as 96°. The growing season does not begin until May, and vegetation reaches its greatest luxuriance near the end of July. In January the mean temperature is about 20°, and the mean minimum about 10°, with an occasional fall to 40° below zero. In the higher portion of the park lower temperatures prevail. The average annual rainfall is about 20 inches, sufficient to support the forests and mountain vegetation.

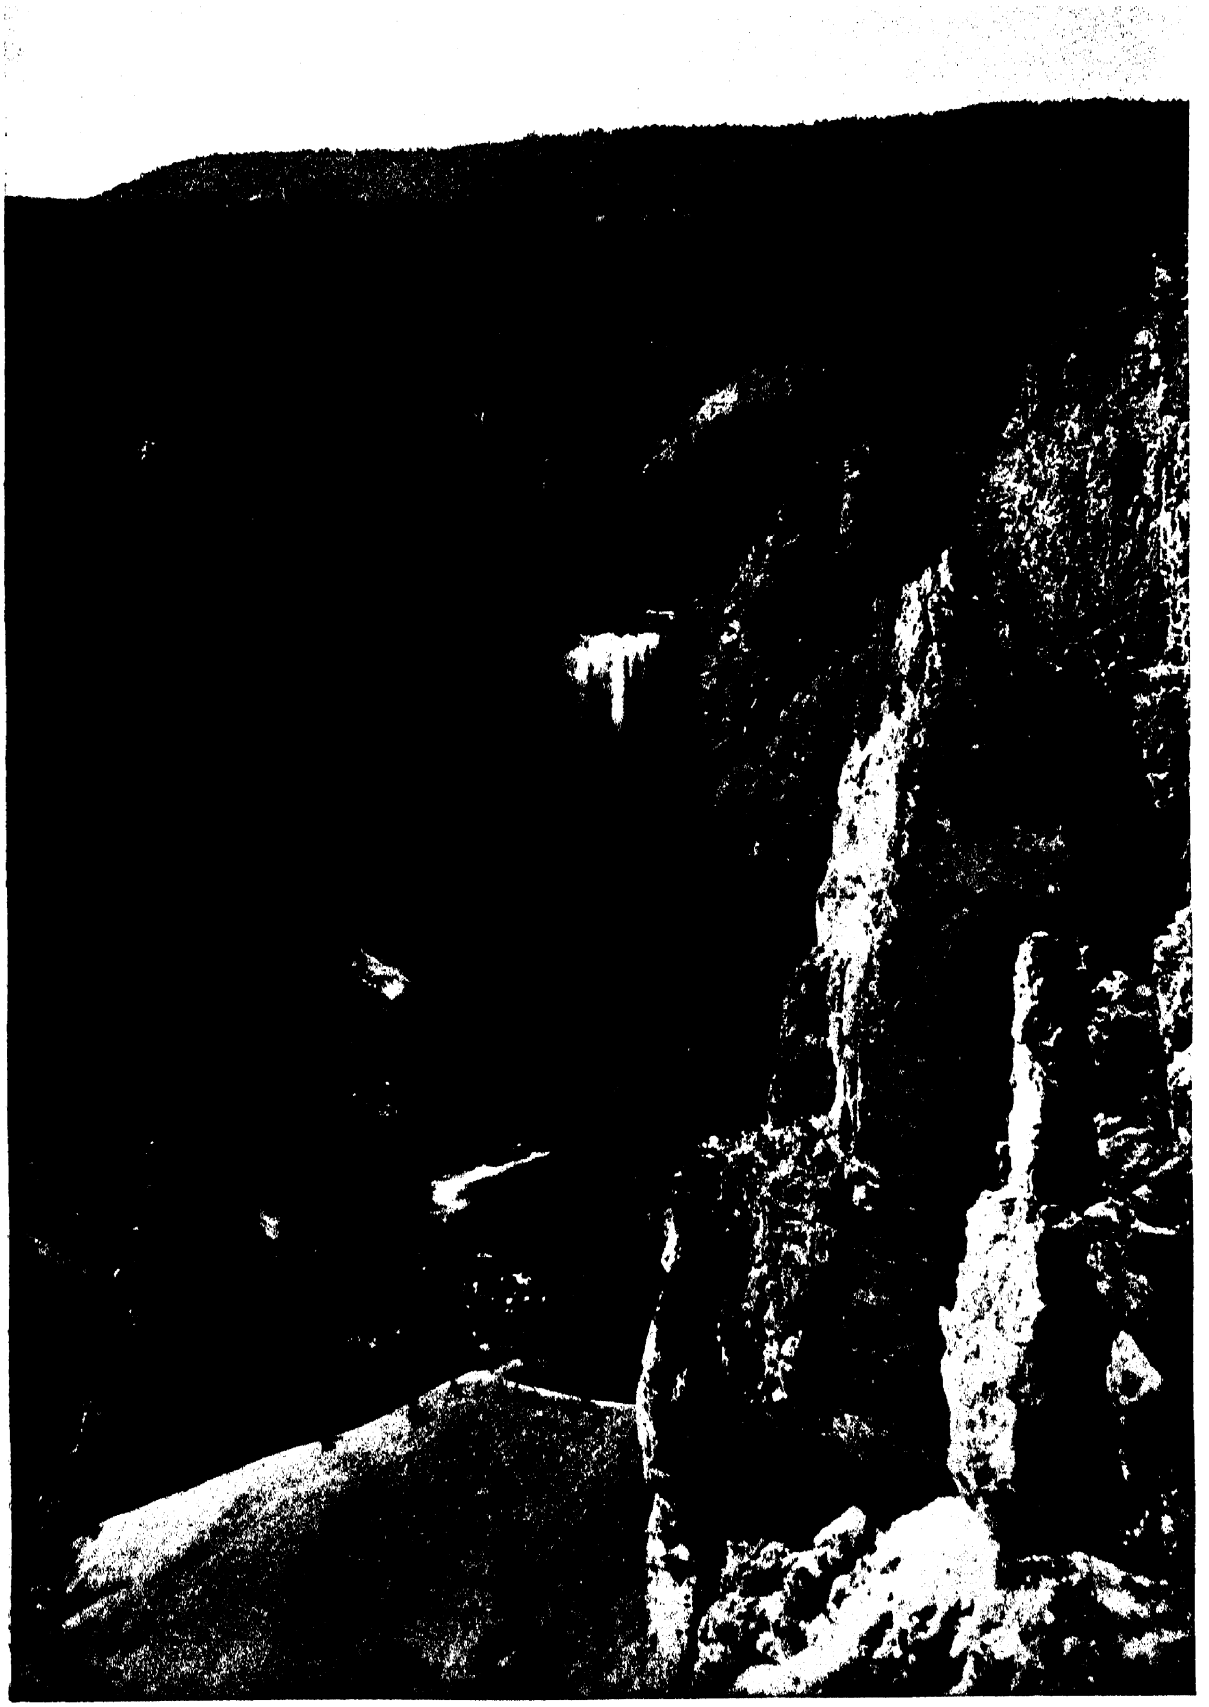
Nearly nine-tenths of the area is under forest. Dense forests cover the mountains up to an altitude of about 9000 feet, but on some of the basin floors there are scattered open, park-like spaces covered with grass or incrustations from the hot springs. The forests are almost wholly coniferous, although birches, willows, and poplars (*Populus tremuloides*) are not uncommon. The most common tree, and the only one monopolizing extensive forest areas, is the lodgepole pine (*Pinus contorta*), and the second in distribution is the balsam (*Abies lasiocarpa*), chiefly confined to the higher and moister regions. Engelmann spruce (*Picea engelmanni*) and the Douglas fir (*Pseudotsuga taxifolia*) are also common, but the trees do not nearly reach the size attained in western Oregon and Washington, and the forests can scarcely be called grand, though they add charm to the scenery. The herbaceous vegetation is chiefly that of a mountain flora, though sage brush occurs on some of the plateaus, and the alpine species above the timber line include nearly all common to the Rocky Mountains. The regions immediately surrounding the hot springs have a peculiar flora, partly resembling the xerophytes of the desert, partly allied to plants found on the seashore.

Owing to protection, the wild animals in the park are increasing. Elk or wapiti abound, and can be seen in large bands of hundreds or thousands. Moose, deer, antelopes, and mountain sheep are noted in winter, though in summer they generally retreat to the less frequented mountain regions. In 1902 there were about 25 head of buffalo (bison) roaming wild in the park. In that year three of these were corralled and 21 others were purchased. This herd increased until in 1916 it numbered 239 animals, 28 males and 21 females having been born during the summer of 1915. These animals are kept on the range, but forage is fed to them during the winter months. There is also a wild herd, which is seldom seen; it probably numbers over 50 head. Mountain lions (pumas) are numerous, but they are killed by the park authorities. Bears, especially the black and the brown bear, are increasing in numbers. Beavers have also increased, and their dams and houses can be seen on the streams throughout the park. Many varieties of song birds are found in the park in summer, though they can hardly be said to be numerous. Ducks, geese, and other waterfowl are numerous and tame, and many of them are seen in winter along streams that are fed by hot springs and consequently never freeze. Trout of several varieties are so plentiful in nearly all the streams that with the existing regulations and the hatching and planting of many thousand eggs annually it will be impossible for the tourists to deplete them.

There is probably no region of equal area which excels the Yellowstone Park in the variety of its scenery. For the beautiful as well as the grand and merely interesting effects of volcanic forces the region has been unapproached since the destruction by an eruption of the White Terrace in New Zealand. Besides the three chief natural features described under separate subheads below there are many minor objects of interest, such as cliffs of obsidian or volcanic glass along the shores of Beaver Lake, and the curious freaks of erosion seen in the mushroom-shaped stone pillars in the Hoodoo

Region and in the natural bridge spanning one of the creeks flowing into Yellowstone Lake.

Yellowstone Lake and Cañon. The Yellowstone River enters the park at its southeastern corner in a marshy valley, and soon flows into the southeastern arm of Yellowstone Lake. The lake lies at an altitude of 7741 feet above sea level, being the largest lake at that altitude in North America, and one of the most beautiful mountain lakes in the world. It is 20 miles long and 10 miles wide, but of a shape so irregular that it has a shore line of over 100 miles, having several arms extending westward and southward. Its shores are densely forested, and on the east tower numerous lofty peaks, including the highest within the park. Ancient beaches indicate that the lake was formerly much larger and deeper than now, and that instead of discharging into the Yellowstone River, and thence to the Atlantic, it formerly sent its waters to the Pacific. After leaving the lake at the northern end the river is broad and tranquil. Then it becomes narrow, rapid, and broken by huge rocks, and, after turning to the northeast, it falls over a precipice 109 feet high, and is narrowed to a width of 100 feet. A half mile below this cataract, which is known as the Upper Falls, the river plunges again over a ledge of rhyolite, and falls 308 feet into the Grand Cañon. Here it rushes for 20 miles as a foaming stream shut in by precipitous or exceedingly steep walls of lava 1200 to 1500 feet high, which are brightly colored red, yellow, and green as a result of the decomposition of the rhyolite, and which are crowned by dark-green spruces above. Turning again to the northwest, the river passes through another cañon whose walls are lower and less definite, and then leaves the park.



Hot Springs and Geysers. Springs of all kinds abound. There are countless springs of cold pure water and some cold mineral springs, but the peculiar phenomena which have especially made the park famous are the hot springs due to heat still beneath the surface. There are hot springs everywhere, in valleys and on mountain summits, on plateaus and at the bottoms and on the sides of cañons, and even at the bottoms of rivers and lakes. Most of them are highly charged with mineral matter, usually siliceous, while many emit sulphurous fumes, and some are distinctly poisonous. The ground around the principal hot springs and geysers is covered with white incrustations of silica or calcareous minerals, often streaked with bright coloring matter; the larger springs have built up small cones of these materials. Of the noneruptive springs the most famous are the Mammoth Hot Springs, situated near the northern entrance to the park. They are charged with calcareous matter derived from the Cretaceous limestone beneath the lava, and have deposited this material in a dazzling white cone several hundred feet high consisting of semicircular basins arranged in terraces on the hill slope. The basins are 1 to 8 feet in diameter and 1 to 2 feet deep, and their walls are beautifully scalloped, ornamented with natural beadwork, and streaked with bright red and yellow. The colors around the springs and geysers are due to the presence of algæ which are found in nearly all the pools and springs. The water issues at a boiling temperature in the large basin at the summit, and cools gradually while descending to successive basins below. There are several extinct basin cones in the neighborhood covered with humus and vegetation, such as Terrace Mountain, which is much larger than the present Mammoth Springs.

There are at least 70 eruptive hot springs or geysers in the park, including the largest geysers in the world. (See GEYSER.) These are grouped in five basins, the Norris Basin in the north central part of the park on the Gibbon River, the Lower and Upper Basins on the Firehole River between the Central and Madison Plateaus, and minor basins near Shoshone and Heart lakes. Among the most celebrated individual geysers is the Giant, which at somewhat uncertain intervals throws up a column of hot water over 200 feet high, and maintains it for over an hour. Old Faithful is the most regular in its intervals, spouting every 65 minutes a column 125 feet high. Excelsior Geyser was the most violent, but it has not been in eruption since 1888. The bed rock was sometimes torn up for many feet around it, while the volume of water ejected was enormous. Castle Geyser is one of the most beautiful, having a symmetrical white cone composed of coral-like geyserite. Most of the geysers are irregular in their periods, Old Faithful being nearly the only one whose eruptions can be safely predicted. Some are doubly periodic, having a smaller and a larger eruption at more or less regular intervals. New geysers occasionally burst forth, while others become extinct; thus one of the large geysers in the Norris Basin was formed suddenly in 1878. See Plate with article GEYSER.

Fossil Forests. In the northeast portion of the park are some fossil forests (q.v.), which are in many respects the most remarkable ones that are known. These are found along the valley of Lamar River on the slopes of Specimen Ridge. These fossil forests are different from those in other regions in that most of the fossil trees stand erect on the hillsides in practically the same position that they occupied when they were living.

Along the slopes of Specimen Ridge there are 12 fossil forests superimposed one upon another. One forest grew to maturity and was buried by the outflows of ashes, mud, and other volcanic material. Another forest then grew on top of this deposit, and so on until 12 forests had flourished and been buried during the period in which the 2000 feet of beds were being accumulated.

Government and Artificial Improvements. The park is under the sole jurisdiction of the Federal government, and is administered by the Secretary of the Interior. It is directly in charge of a superintendent, who is an army officer, and who is aided by a detachment of Federal troops in enforcing the regulations. Hunting, trapping, or killing any animal except to prevent it from doing serious injury is prohibited, but fishing for pleasure or food is permitted. All private commercial enterprises are excluded except that small plots of land may be leased to private parties for hotel purposes, and all hotels are thus privately conducted, but under government inspection. Licenses are also issued to private parties to provide traveling facilities within the park. Good carriage roads now give access to all the principal objects of interest, and a small steamboat plies on the Yellowstone Lake. The Northern Pacific Railway reaches the park on the north at Gardiner, Montana; the Oregon

COPYRIGHT 1902 BY DETROIT PHOTOGRAPHIC CO.

THE GREAT FALLS OF THE YELLOWSTONE

Short Line Railroad reaches it on the west at Yellowstone, Montana; and the Chicago, Burlington, and Quincy Railroad reaches Cody, Wyoming, from which the eastern entrance to the park may be reached by a drive of 63 miles.

The Yellowstone region was originally occupied by peaceful Sheepeater Indians. There are evidences that white trappers had entered the region as early as 1808, but the rumors of its wonders, which from time to time reached the civilized world, were given little credence until Henry D. Washburn, Surveyor General of Montana, published the first real account of it in 1870. In 1871 the region was explored and mapped by the United States Geological and Geographical Survey of the Territories, and in 1872 Congress made it a national park.

Consult: *Twelfth Annual Report United States Geological and Geographical Survey of the Territories* (Washington, 1883); United States Geological Survey, *Geologic Folio No. 30* (ib., 1896); Chittenden, *Yellowstone National Park*, with bibliography (Cincinnati, 1915); Hague, *Geological History of Yellowstone National Park* (Dept. of the Interior, 1912); Weed, *Geysers* (Dept. of the Interior, 1912); Knowlton, *Fossil Forests of the Yellowstone National Park* (Dept. of the Interior, 1912); and *General Information regarding Yellowstone National Park*, with bibliography (issued annually by the Dept. of the Interior).

YELLOWSTONE RIVER. A tributary of the Upper Missouri. It rises in the Shoshone Mountains, in northwestern Wyoming, near the southeast corner of the Yellowstone Park, flows northwestward for about 40 miles and enters Yellowstone Lake, which may be considered the source of the main stream (Map: Wyoming, A 1). After leaving the lake the stream flows northwestward for about 15 miles, plunges over the Great Falls and then dashes through the impassable Grand Cañon. From the Snow Mountains it runs eastward and northeastward to the Missouri at Fort Buford. The river is about 500 miles long and drains an area of about 67,500 square miles. Between the Bighorn, its chief tributary, and the Powder, the Yellowstone is from 2400 to 2700 feet wide, and becomes turbid.

YELLOWTAIL. The name of several marine fishes, specifically one of the amber fishes (q.v.). (See Plate of HORSE MACKEREL.) A related species (*Elegatis bipinnulatus*), one of the runners, is called yellowtail in the West Indies.

YELLOWTHROAT. See MARYLAND YELLOWTHROAT.

YELLOW WELD. See WELD.

YELLOW WOOD. See CLADRASTIS; OXLEYA.

YEMASSEE, yĕm'as-sē', THE. A Colonial romance of South Carolina by William Gilmore Simms (1835).

YEMBU. See YAMBU.

YEMEN, yĕm'ĕn. A region in the southwest corner of Arabia, extending along the coast of the Red Sea from Hedjaz to the Strait of Bab-el-Mandeb. It forms part of the Turkish Empire (Map: Turkey in Asia, E 8). Area, about 73,800 square miles. Yemen is the southern and most favored part of the ancient *Arabia Felix*, or Happy Arabia. It is a mountainous country, some of the greatest elevations in Arabia being in its southern portion. From the coast a series of arid terraces rise to the mountains from 30 to 50 miles away. The upper level is the physical anomaly of the Arabian plateau, containing treeless arable land with coffee gardens and clean, substantial towns. This area divides an uninhabited littoral save where ports must exist for commerce and the high range behind which stretch desert sands. The high plateau extending north and south along the central region is scarred by black, ugly volcanic formations.

The coast has a mean annual temperature of 85° F., little water and a sorry soil, but the inland climate is generally good, a daily mist rising there and protecting the land from the scorching, vertical rays of the sun. The rainfall here is ample except in the north. Coffee is the main crop. Hodeida and Loheia are the leading ports, while Mocha has decayed. Transportation is effected by camel caravans over the difficult mountain roads. Yemen has recently been divided into four vilayets—Azir, Hodeida, Sana, and Tais. Pop., estimated at about 750,000. In ancient times the Sabæans (q.v.) held sway in Yemen. The country passed under the dominion of the Turks in the sixteenth century. In 1630 the Arabs drove out the Turks, and later the Imam of Sana became a powerful potentate ruling over an extensive domain. In 1872 the land came under control of the Turks again, and in recent years a constant unrest among the Yemenis is apparent which arises from the falling off of their export trade in coffee and frankincense under Turkish yoke.

YEN (Jap., from Chin. *yuen*, round object). A Japanese coin minted in both gold and silver. The gold yen is worth about $0.997; the silver yen about $0.528.

YENIKALE, yĕn'ĭ-kä'lĕ, STRAIT OF. A narrow passage connecting the Sea of Azov with the Black Sea and separating the Crimean Peninsula from the western extremity of the Caucasus (Map: Russia, E 5). It is 25 miles long and from 2½ to 23 miles wide, an expansion in the middle forming the harbor of Kertch (q.v.). The channel, which was shallow because of a bar, has been deepened to 24 feet.

YENISEI, yĕn'ĕ-sā'ĕ. One of the three great rivers of Siberia, and one of the longest rivers in the world. It rises on the south slope of the Sayansky Mountains in northwest Mongolia, and after breaking through the range flows in a general north-northwest direction across Siberia and within the Territory of Yeniseisk until it empties into the Arctic Ocean in long. 80° E. through the Gulf of Yenisei (Map: Asia, K 2). The gulf is a large estuary 10 to 100 miles wide and about 250 miles long, a few miles east of the Gulf of Obi. The length of the Yenisei proper, excluding the estuary, is about 2500 miles, but measuring from the source of the Selenga which rises in western Mongolia and flows into Lake Baikal and thence through the Angara to the Yenisei, the length is 3250 miles. This length is about equal to that of the Obi-Irtysh and the Yang-tse-kiang, and is exceeded only by that of the Amazon, the Nile, and the Mississippi-Missouri. The passage through the Sayansky Mountains is turbulent. Navigation begins a few miles farther down at Minusinsk and after receiving the Angara, the Yenisei flows through the Siberian plains with a sluggish course, though its east bank is flanked by highlands and mountain ranges almost to its mouth. Along its middle course the banks are generally covered with forests of pine, birch, and larch, but the extreme lower portion passes through the Arctic tundras. In its lower reaches the

river sometimes has a width of 4 miles during the floods, and near the estuary it divides into parallel branches inclosing a number of islands, while the upper part of the estuary itself is filled with a large archipelago which has given it the name of the Liman of the Seventy Islands.

The Yenisei receives three great tributaries from the east, the Angara, or Upper Tunguska, which drains Lake Baikal, the Stony Tunguska, and the Lower Tunguska. Through these and its smaller western tributaries it approaches so closely to its two great neighboring rivers, the Obi and the Lena, that with the aid of a few canals a continuous waterway is afforded throughout western Siberia. There is a canal between the Kas, a tributary of the Yenisei, and the Ket, flowing into the Obi, but, owing to the shallowness of the two connecting streams, it is passable only by small vessels. The river is free from ice for 155 days at Turukhausk and for 196 days at Krasnoyarsk. About a dozen steamers ply regularly to Minusinsk but traveling is at times rendered dangerous by severe northern gales. Nevertheless sea-going vessels can ascend the river as far as Yeniseisk, near the mouth of the Angara, and ships from Europe have for a number of years regularly carried supplies for the mines along the river, by way of the Arctic Ocean, a good harbor having been found in the estuary. The Trans-Siberian Railroad crosses the river at Krasnoyarsk. An attempt is already under way to establish regular communication between Yeniseisk and the Atlantic ports of Europe via the Yenisei and the Arctic seas.

YENISEISK, yĕn'ĕ-sā'ĭsk. A government of Siberia extending from the Arctic Ocean to Mongolia (Map: Asia, L 3). Area, estimated at over 988,000 square miles, or nearly half of European Russia (exclusive of Finland). The region has a greatly varied surface. In the south the Sayansky Mountains extend in parallel chains inclosing deep and narrow valleys and rising in their highest peaks to over 5000 feet. North of the Sayansky Mountains the surface is mostly undulating or hilly and is densely wooded. The entire portion north of the Tungus Mountains consists of tundras varied to a slight extent by hilly patches east of the Yenisei River. The region belongs largely to the basin of the Yenisei (q.v.), which receives many tributaries. In the northern part there are also a number of rivers such as the Khatanga, the Taimur, and the Pyassina flowing directly into the Arctic Ocean. The lakes are comparatively small. The climate is on the whole continental and extremely severe. In the northern part the soil remains frozen at a depth of 2 feet even in summer, and the winter temperature in that part is lower than in Nova Zembla (q.v.). The mean annual temperature ranges from 8° at Tolsty Nos (lat. 70° 5′ N.) to 31° at Minusinsk (lat. 53° 43′ N.). Yeniseisk is not rich in minerals, although gold is found in the extreme south. Flax growing has steadily increased in importance. In 1913 about 5000 puds of flax was raised. There is an abundance of agricultural land in the south, but labor is very scarce. The land belongs almost entirely to the crown. The extensive and valuable forests are utterly unprotected by the government and are suffering greatly from conflagrations. Fishing is carried on extensively in the north. The Trans-Siberian Railway runs through the southern part of the government. Pop., 1912, 970,800, of whom the non-Russians (chiefly Tunguses, Yakuts, Samoyeds, Ostyaks, and Tatars) numbered about 50,000. The Russian population includes over 57,000 exiles and a large number of dissenters. Capital, Krasnoyarsk (q.v.).

YENRI, yĕn'rē. A Japanese word meaning circle principle, and used to designate a crude kind of calculus invented possibly by Seki (q.v.), and certainly known to his pupils early in the eighteenth century. It seeks to approximate the area and circumference of the circle by the aid of infinite series. Consult Smith and Mikami, *History of Japanese Mathematics* (Chicago, 1914).

YEO, yō, Sir James Lucas (1782–1818). A British naval officer, prominent in the War of 1812. He was born at Southampton, and entered the British navy in 1793. He served at the siege of Genoa in 1800 and later in the Adriatic. In 1809 he captured Cayenne, the capital of French Guiana, securing about 1000 prisoners. On Feb. 3, 1812, in command of the frigate *Southampton*, he captured a superior piratical frigate, the *Amethyste;* and in 1813 he became commodore and commander in chief of the British naval force on the Great Lakes, where he was opposed by Commodore Chauncey, commanding the American fleet. The two fleets seem to have been about equal in fighting strength. Yeo took formal command at Kingston, on Lake Ontario, in May, and on the 29th, the American fleet being at the west end of the lake, united with Sir George Prevost (q.v.) in a half-hearted and unsuccessful attack on Sackett's Harbor, where the Americans were building two vessels. On Aug. 10, 1813, in an indecisive engagement with Chauncey's fleet off Fort Niagara, Yeo captured two small American vessels, and on September 11 an unimportant engagement occurred off the mouth of the Genesee, Chauncey gaining a slight advantage. In another engagement, on September 28, in York Bay, Yeo was somewhat crippled, and for some time was blockaded by Chauncey in Kingston harbor. On May 6, 1814, Yeo, with a strengthened fleet, captured Oswego, which was immediately reoccupied by the Americans; and from May 29 to June 6 he blockaded Chauncey at Sackett's Harbor. Thereafter neither officer felt strong enough to attack, and both avoided a general engagement. In 1815 Yeo became commander in chief of the British naval forces on the west coast of Africa, and in 1818 died while returning to England.

YEOMAN, yō'mąn (probably from AS. *gā, gē,* Goth. *gawi,* OHG. *gowi, gouwi,* Ger. *Gau,* district, province + *man,* man). A term in early English history applied to a common menial servant, but after the fifteenth century denoting a class of small freeholders, forming the next grade below gentlemen. The term yeoman is sometimes considered identical with the freeholder, possessed of the elective franchise.

YEOMANRY. The mounted branch of the British volunteers (see Volunteer) up to the Boer War were described as Yeomanry Volunteers, owing to the fact that they were recruited from the yeomanry classes, and thus were financially able to support the necessary cavalry charger and equipment. In the Boer War these troops served with considerable success, so that (April 17, 1901) the title was changed to Imperial Yeomanry, and the strength of the force very considerably increased. The Imperial Yeomanry were designed primarily as mounted forces for home defense, while Colonial Yeo-

manry for Imperial defense were also enlisted. The yeomanry in 1907 were absorbed in the Territorial army. See UNITED KINGDOM, *Army;* MILITIA.

YEOMEN OF THE GUARD. An English company forming a part of the Royal Household and serving on state occasions as the bodyguard of the sovereign. The yeomen of the guard wear a picturesque uniform which dates back to the fifteenth century, the corps being formed by Henry VII in 1485. It consists of old soldiers and is officered by a captain, who is usually a member of the Ministry and a peer, a lieutenant, an ensign, a clerk of the cheque and adjutant, and four exons. These appointments are usually awarded to retired officers and are much valued. There are also noncommissioned officers and 100 yeomen or privates. The yeomen of the guard, though uniformed similarly to the Tower Warders, well known to visitors to London, are a distinct corps. They are armed with partizans, a form of long-handled cutting weapon. Consult Preston, *Yeomen of the Guard* (London, 1887). See BEEFEATER.

YER'KES, CHARLES TYSON (1837–1905). An American capitalist, born in Philadelphia. He was educated in the Quaker School and the Central High School in Philadelphia, was a clerk for a time in a flour and grain commission house there, opened a money and stock-broker's office in 1858, and from 1861 to 1886 was in the banking business, making a specialty of dealing in bonds. In 1871 he was forced to make an assignment, and as he refused to give any preference to the city of Philadelphia, to which he was in debt for bonds sold on its account, he was tried on a charge of having misappropriated public funds, was convicted, and for a short time, until pardoned, was imprisoned. In 1873–74, at the time of the Jay Cooke failure, he reëstablished himself financially by a series of fortunate investments, and he gradually became identified largely with the development of the street railway system in Philadelphia. In 1881 he removed to Chicago, where after 1886 he secured virtual control of the city's street and elevated railway systems, which he greatly extended. In 1892–93 he was an influential member of the board of directors of the World's Fair in Chicago, and devoted his attention particularly to the fine arts department, to which he lent his own notable collection of paintings. In 1892 he endowed the famous Yerkes Observatory (q.v.), which was completed in 1896. He took an active part in the construction and extension of the new London underground railway system.

YERKES, ROBERT MEARNS (1876–). An American psychologist, born at Breadysville, Pa. He graduated from Ursinus College in 1897, and studied at Harvard (Ph.D., 1901), where he was an instructor in comparative psychology (1901–08) and thereafter assistant professor. After 1913 he was also psychologist to the Psychopathic Hospital, Boston. He became editor of the *Journal of Animal Behavior*. His writings include: *The Dancing Mouse, A Study in Animal Behavior* (1907); *Introduction to Psychology* (1911); *Methods of Studying Vision in Animals* (1911), with J. B. Watson; *Outline of a Study of the Self* (1914); *A Point Scale for Measuring Mental Ability* (1915), with Bridges and Hardwick.

YERKES OBSERVATORY. The astronomical observatory of the University of Chicago, located at Williams Bay, Wis. It is named after its founder, Charles Tyson Yerkes (q.v.), who supplied the funds for buildings and instruments. This institution contains the largest refracting telescope in existence. It is of 40 inches diameter and used principally for the observation of close or faint double stars, the planets and satellites, and spectroscopic work. See OBSERVATORY; TELESCOPE.

YERMAK TIMOFEYEV, yĕr'mäk tē'mô-fā'yĕf (?–1584). Conqueror of Siberia. He was chief (hetman) of the Don Cossacks, and, in consequence of his depredations, was defeated and outlawed by Ivan the Terrible, but he was subsequently pardoned. In 1579 the family of Stroganov, to whom the Czar had granted lands on both sides of the Urals, applied to Yermak for assistance against Kutchum, Khan of Sibir, who ruled the country between the Tobol and Irtysh rivers, and whose tribesmen had interfered with the operation of the great Stroganoff salt works. Yermak invaded the country, took the town of Sibir (Isker) in October, 1581, and subjugated the people as far as the Irtysh. The conquered country he gave to the Czar Ivan, who made him Prince of Siberia. Conflicts, however, were renewed with Kutchum in 1584. In September of that year Yermak was drowned in the Irtysh, and it was not until 1587 that the Khanate of Sibir was definitely conquered by the Russians. Yermak's deeds are celebrated in Russian folk songs and in Khomyakov's *Yermak*, a drama in verse (1832).

YESSENTUKI. See ESSENTUKI.

YEW (AS. *īw, ēow, ēoh,* OHG. *īwa, īha,* Ger. *Eibe,* Swiss *Iche, Ige,* yew; connected with OIr. *éo,* Welsh *yw,* Corn. *hivin,* Bret. *iven, ivinen,* yew, OPruss. *inwis,* Lith. *jëvà,* Lett. *ëva,* black alder, OChurch Slav. *iva,* willow). A name applied to species of *Taxus*, a genus of conifers

YEW (*Taxus baccata*).

which includes about seven species, distributed throughout the temperate and subtropical regions of the Northern Hemisphere, also in tropical Asia and the mountains of Mexico. The European yew is *T. baccata,* which becomes a large forest tree, while the American yew or ground hemlock is *T. canadensis,* a low straggling shrub. The most distinguishing feature of the genus is the fruit, which is a red, fleshy cup, nearly inclosing the bony seed.

YEZD, yĕzd, or **YAZD,** yăzd. The capital of the Province of Yezd, Persia, 165 miles east by

south of Ispahan, on the route between that city and Kirman (Map: Persia, F 7). The chief features are the ruins of the old walls, numerous mosques, and a large bazar. The manufactures of silk and felt goods are important, and there is a considerable trade in opium and sugar. In the neighborhood are deposits of cobalt, antimony, and nickel. Pop., estimated at 45,000. Yezd is the leading centre of Zoroastrianism in Persia.

YEZIDIS, yĕz'ē-dēz (etymology uncertain). The name given to a sect known as Devil Worshipers found in Kurdistan, Armenia, and the Caucasus. They call themselves Dasni, after the name of certain tribes in the vicinity of Mosul. The Mohammedans associate the term with Yezid, the second Ommiad Caliph (720–724 A.D.), but the religion is undoubtedly older. Some have sought to connect it with the city of Yezd in Persia or with the Kurdish and Persian *Yazdān*, God. The symbol of their faith is a peacock, which they call Malik Taus, the term by which they designate the devil. Otherwise they shrink from mentioning him. The devil is a creative agent of the supreme god and is the author of evil. He was a fallen angel, but God reinstated him to heavenly rank and forbade the angels to scorn him. Hence mankind should not venture to treat the power of evil with contempt. It is largely this that gives the idea that they are devil worshipers, although it is possible, owing to their geographical position, that the Yezidis may actually show some surviving traces of the old devil worship in Mazanderan (q.v.) anathematized by Zoroaster (q.v.). In numbers the Yezidis are not large, although there are said to be some 12,000 in the Caucasus region alone. Throughout history they have suffered much from persecution. The religion shows traces of old Iranian and Assyrian beliefs, such as dualistic traits and regard for the fire, the sun, and the elements, combined with some Mohammedan traits and influenced likewise by Manichæism (q.v.) and Nestorian Christianity. (See NESTORIANS.) They recognize Mohammed as a prophet beside Abraham and the Patriarchs; and they consider that Christ was an angel in human form. The belief in a future life forms part of their faith. The rites of baptism and generally of circumcision are practiced among them, and there are special offices connected with marriage and death. Polygamy is not common among them. Their chief book of divine revelation is entitled *Al-Yalvah*, and its great interpreter was Shaikh Adi, who lived about 1200 A.D. Consult: Sir A. H. Layard, *Nineveh and its Remains* (London, 1850); Joachim Menant, *Les Yézidis* (Paris, 1892); Chabot, *Notice sur les Yézidis* (ib., 1896); Henri Lammens, *Le Massif du Gabal Siman et les Yézidis de Syrie* (Beirut, 1906); R. Frank, *Scheich 'Adî, der grosse Heilige der Jezidis* (Kirchheim, 1911).

YEZO, yĕz'ō. The most northerly of the large islands of Japan, forming with its 12 adjacent islands and the Kurile Islands (q.v.) a division of the Japanese Empire known as the Hokkaido, or North Sea Circuit (Map: Japan, G 1). It is separated from the main island of Japan on the south by the deep strait of Tsugaru, 10 miles wide, and is included within the meridians of 139° 11′ and 146° 7′ E., and the parallels of 41° 21′ and 45° 30′ N. Area (including the Kurile Islands), 30,143 square miles; pop., 1903, 843,615; 1908, 1,459,424.

The surface is much broken by two great intersecting mountain systems, one volcanic, from the Kurile Islands, and the other of granite and old schists, from Sakhalin, culminating in Tokachi-dake (8200 feet). The volcanic peaks are numerous, the best known being Komagatake (4000 feet), still active. The chief rivers are the Ishikari, 407 miles long, the seat of a great salmon-fishing and canning industry, and the Tokachi. There is comparatively little level land that is suitable for cultivation. The principal industries, besides farming, are hunting, fishing, and mining—chiefly gold and coal. Mineral oil is found near Hakodate (the principal seaport) and elsewhere, and is being developed by foreign companies. Brewing is carried on at Sapporo, the capital of Ishikari province, and glass works for bottle making and several paper mills are in operation. The chief exportable commodities are canned salmon, fish manure, fish oil, dried fish roe, seaweed, salt, and sulphur. In 1913, 829.9 miles of railway were in operation. The forests are dense, and many wild animals, including deer and bears, abound. The climate is severe, and for nearly six months the country is covered with a deep mantle of snow and ice. Besides Sapporo and Hakodate, already mentioned, the chief towns are Okkashi, Nemuro, Muroran, a naval station on Volcano Bay, and Fukuyama or Matsumai. From 1600 to 1868 the southwestern portion of the island was the possession of a daimyo named Matsumai, and Hakodate belonged to the Shogun. In 1871, fearing Russian aggression, active colonization was begun, a new department—the *Kaitakushi*, or Colonization Department—was established, and much development work was done under foreign superintendence. This was abolished in 1881, and the country was divided into prefectures as in Japan proper. It is still regarded as a colony, however, and electoral privileges have not as yet been extended to its inhabitants.

YGGDRASILL, ĭg'drȧ-sĭl (ONorse *yggdrasill*, the bearer of Yggr, a name of Odin). The name given in Scandinavian mythology to a tree which was conceived as binding together heaven, earth, and hell. It is an ash, whose branches spread over all the world, and reach above the heavens. It sends out three roots in three different directions: one to the Æsir in heaven, another to the frost giants, the third to the underworld, or, according to other accounts, to the world of mankind. Under each root springs a wonderful fountain, endowed with marvelous virtues; under the root extending to the Æsir in heaven, the Urdar fountain; under the root to the giants, Mimer's fountain, in which wisdom and wit lie hidden; under the root to the underworld, the fountain Hvergelmir. From the tree itself drops honey. In it dwell an eagle, between whose eyes the hawk Vedhrfölmir or Vedhrlanfnir sits, and a squirrel, named Ratatoskr, while at its roots gnaws the serpent Nidhhöggr. Between the eagle and the serpent the squirrel continually tries to breed dissension. The mythological basis of the tree Yggdrasill is uncertain, but from certain features it seems probable that Christian ideas have been blended with the original Scandinavian concepts.

YGNERNE. See IGERNA.

YID'DISH (Judæo-Ger., Jewish, from Ger. *jüdisch*, Jewish). The language spoken by the Jews in eastern Europe, the most widely spread dialect of the Jews. Those Jews who, towards

the end of the Middle Ages, left Germany for the Slavic lands (Bohemia, Poland, Galicia, and Lithuania) spoke the Middle High German of their places of origin and up to the sixteenth century wrote it quite correctly, although they employed the Hebrew alphabet. The absence of active intercourse with Germany, however, led in time to a process of simplification of morphology and syntax. Thus the genitive in *-s*, the imperfect, subjunctive, and to a large extent the neuter gender were lost; all the prepositions came to be constructed with the dative, etc. At the same time the German sounds underwent certain changes, and a large number of Hebrew, Aramaic, and Slavic words were incorporated in the language. The resultant idiom, the Yiddish, supplanted the Slavic spoken by the primitive Jewish settlers in the east of Europe and has been carried to all parts of the world, including Germany, admitting words and idioms from all the languages with which it has come into contact. See JEWS; LADINO (3).

Literature. Hebrew throughout the Middle Ages was the literary language of the Jews, and was employed not only in religious services, but also in business correspondence, and in the preparation of legal documents. As early as the sixteenth century translations of the Bible into Yiddish began to make their appearance to supply the wants of women, who did not receive a Hebrew education, and of the ignorant. The most popular Yiddish edition of the Pentateuch and of the Five Scrolls is the one known as *Zenah Urenah*. This is a paraphrase of the biblical text, embellished with the homiletic interpretations of the Talmud and Midrash. The compiler of the book was Jacob ben Isaac, of Janowo, Poland, who lived at the end of the sixteenth century. Besides translations of the Bible there appeared books of a purely religious or moral character.

It was not, however, until the beginning of the nineteenth century that Yiddish began to be used as a literary language. The movement for reform and for modern culture (*Haskalah*), aroused by the Mendelssohnian translation of the Bible, soon gained a firm foothold in Russia and in Galicia. The neo-Hebraic writers of the Haskalah despised Yiddish which they regarded as a corrupt jargon. Nevertheless the desire to instruct the great mass of the Jewish people led some of them, like the talented Dr. Ettinger, to write in Yiddish, and their example was followed by a number of popular poets like Michel Gordon and Goldfaden (1840–1908). The *pogrom* of 1881 and the persecutions which followed it helped invest Yiddish literature with a thoroughly national character. This literature is cultivated almost exclusively in Russia and the United States.

Solomon Abramowitsch (Abramowitz), better known by his pseudonym "Mendele Mocher Seforim," ranks among the best Yiddish authors of modern times. Best known of his works are: *Die Kliatsche* (The Mare), a beautiful allegory of the history of Jewish persecution and its effects on the national character (Vilna, 1873); *Das kleine Menschel* (The Mannikin), a satire of a self-made man (ib., 1865); *Fischke der Krumer* (Fischke the Lame), a study of beggar life (Zhitomir, 1888); and *Die Takse* (The Tax), a criticism of the Jewish communal system (1869). His masterly arraignment of sham and wrong and his quaint humor won for him the sobriquet of "The Jewish Cervantes." I. I. Linetzki's *Das Polishe Jüngel* (The Polish Boy) is valuable for the picture it gives of the Chassidic life among the Jews. I. M. Dick (1808–93) was a prolific writer of the Romantic school. Jacob Dinesohn produced a number of popular sentimental novels. N. M. Shaikewitsch, otherwise known as "Shomer," wrote more than 100 lengthy books marked by a talent for narration and little else. Mordecai Spector, Shalom Rabinowitsch, better known as "Shalom Aleichem" (1859–1916), and I. L. Perez (q.v.) are, after Abramowitsch, the most prominent of modern prose writers in Yiddish. They resemble Abramowitsch in the general undercurrent of sadness which runs through all their work, but like him, too, they display prominently a taste for humor, which in Rabinowitsch is often mingled with acute satire and in Perez with pathos and mysticism.

The influence most conducive to the rise of the Yiddish literature was the introduction of the Yiddish newspaper. The first successful newspaper in the language was established in 1863, when A. Zederbaum began to publish the *Kol Mewasser*, as a supplement to his Hebrew weekly *Hameliz*. Since then many Yiddish periodicals have appeared in various lands. The *Jüdisches Tageblatt*, the first Yiddish daily, appeared in New York in 1885, under the management of the editor of the weekly *Jüdische Gazetten*. The first Yiddish daily in Russia, *Der Freind*, made its appearance in January, 1903, at St. Petersburg. In January, 1904, another daily, *Der Tag*, began publication at the office of the Hebrew daily *Hameliz*, St. Petersburg. The national awakening among the Jews following the Kishineff massacre of 1903 and intensified by the revolutionary movement which began in 1905 has resulted in the greatly extended use of Yiddish as a literary medium. It is almost exclusively in connection with the newspaper that Yiddish literature has developed in the United States. The Socialist press has counted among its contributors many men of high gifts and wide attainments who have enlarged the intellectual horizon of the Jewish public. Prominent in the ranks of Yiddish journalism was Abraham Cahan (q.v.), who has also written successfully in English. J. Rombro, better known by his nom de plume of Philip Krantz, gained reputation as an editor and writer on topics of general history. S. Libin (q.v.) has shown in his sketches of Ghetto life a finished art approaching that of the French masters. Morris Wintchevsky (q.v.) is in style probably the most original and effective of the group of Yiddish journalists. J. Goido, Leon Kobrin, and B. Feigenbaum may also be mentioned. Of writers not identified particularly with the liberal movement, the best known are Alexander Harkavy, Abraham Tannenbaum, Selikowitsch, Seiffert, and A. M. Sharkansky. Eliokim Zunser, originally one of the class of badchens, or professional jesters, has gained wide note as the writer of songs whose fervent national spirit and sympathy for the workingman are made to atone for their lack of poetic art. Indisputably first, however, among writers of verse is Morris Rosenfeld, who has become known to the non-Yiddish public through translations of his poems into English (*Songs from the Ghetto*, Boston, 1898), and into German (*Lieder aus dem Ghetto*, Berlin, 1899). From the sweatshop and the tenement he has drawn most of his themes, and the pervading tone in

his verse is one of deep melancholy. Yet at times he has shown himself capable of turning his fine lyric powers to the singing of the joys of life—nature, love, children. One of the most appreciated writers of lyrics is S. Blumgarten Jehoash (q.v.). (See REISEN, A.) The Yiddish drama also received its fullest development in America. In the beginning of the eighteenth century two Yiddish plays, *The Sale of Joseph* and the *Ahasuerus Play*, had appeared in print. These were performed in private Jewish homes, especially on the festival of Purim. In 1878 the poet Goldfaden who had first performed in Rumania with an itinerant company of actors, established the first Jewish theatre in Odessa. This soon found imitators in other large towns of Russia. But the government closed these theatres in 1883 and the actors had to seek their audiences in New York, where about the same time Tomaschewski and Golubok started a Jewish theatre followed by several others. The Yiddish drama, however, up to 1890 was of a very low order from the artistic point of view. A great advance began with the work of Jacob Gordin (q.v.), who dealt skillfully with numerous phases of Jewish life in Russia and America. Creditable work has also been done by Wintchevsky, "Shalom Aleichem," D. Pinski, P. Hirschbein, Shalom Asch, and Libin.

Slouschz, *The Renascence of Hebrew Literature (1743–1885)* (Philadelphia, 1909); A. S. Waldstein, *The Evolution of Modern Hebrew Literature, 1850–1912* (New York, 1916).

YING-TSE. yĭng′tsĕ. A treaty port of Manchuria. See NEWCHWANG.

YIN-YANG, yēn′yäng′ (Chin. *yin*, shade, darkness + *yang*, light). The two primordial forces, essences, or principles developed from the self-existing *T'ai-yi* or Great Monad, by the action and interaction of which, according to Chinese cosmogonic theories, the universe has been produced and cosmic harmony is maintained. The terms *yang* and *yin* primarily mean light and darkness, but they are also taken to represent heaven and earth, male and female, positive and negative, odd and even, etc., and the whole conception bears a striking resemblance to the Pythagorean theory of number as the principle of order, and of the 10 fundamental opposites of that system. (See PYTHAGOREANISM.) In Japanese these two principles are known as *In-yō*.

YLANG-YLANG, ē′läng-ē′läng. *Cananga odorata*, a large rapidly growing tree, 60 to 80 feet high, belonging to the family Anonaceæ. The tree is native in the Philippines, Java, and elsewhere, and it has been successfully introduced into many tropical countries. Its large, greenish-yellow flowers are strongly scented, and by distillation they yield the popular perfume ylang-ylang, the production of which is quite an industry in the Philippines. About 150 to 200 pounds of flowers yield a pound of the volatile oil. The best oil comes from Manila and is valued at about $3.00 an ounce.

YOAKUM, yō′kŭm. A town in De Witt and Lavaca counties, Tex., 118 miles east of San Antonio, on the San Antonio and Aransas Pass Railroad (Map: Texas, D 5). It has railroad shops, a canning factory, creamery, turkey abbatoir, kiln-drying plant, ice factory, flour and corn mill, cistern factory, and bottling works. Yoakum adopted the commission form of government in 1914. Pop., 1900, 3499; 1910, 4657.

YODEL. See JODELN.

YOGA, yō′gȧ (Skt., *yōga*, union, concentration). The name of one of the orthodox systems of philosophy of the Hindus. While the basis of this system, the Sankhya (q.v.), is chiefly concerned in teaching the *tattvas*, or principles of creation, and the successive development of the latter, the main object of the Yoga is to establish the doctrine of a Supreme Being, and to teach the means by which the human soul may become permanently united with it. This Lord, or Supreme Being, is defined by Patanjali (q.v.), the reputed founder of the system, as "a particular *Puruṣa*, or spirit, who is untouched by affections, works, the result of works, or deserts; who is the preceptor of even the first, because he is not limited by time; and whose appellation is Om, the term of glory." See OM.

To attain the concentration which leads to union of the soul with the Supreme Lord, eight stages are necessary. These are self-control (*yama*), religious observance (*niyama*), postures (*āsana*), regulation of the breath (*prāṇāyāma*), restraint of the senses (*pratyāhāra*), steadying of the mind (*dhāranā*), meditation (*dhyāna*), and profound contemplation (*samādhi*). The first stage, self-control, consists in not doing injury to living beings, veracity, avoidance of theft, chastity, and nonacceptance of gifts. The second stage, religious observance, comprises external as well as internal purity, contentment, austerity, muttering of the Vedic hymns, and devoted reliance on the Lord. The third stage, of Yoga postures of various sorts, is regarded as essential to those following. The fourth stage, regulation of the breath, is threefold, according as it concerns exhalation or inhalation, or becomes tantamount to suspension of the breath. The fifth stage, the restraint of the senses, means the diversion or withdrawal of the senses from their respective objects, and their entire accommodation to the nature of the mind. This stage is preparatory to the

sixth, or the steadying of the mind, which means the freeing of the mind from any sensual disturbance, by fixing the thoughts on some part of the body, on the navel or the tip of the nose. Meditation, the seventh stage, is the fixing of the mind on the one object of knowledge, the Supreme Spirit, so as to exclude all other thoughts. The eighth and last stage, profound contemplation, is the perfect absorption of thought into the one object of contemplation, the Supreme Spirit; it is devoid of all thought, even of meditation. In such a state a Yogin is insensible to heat and cold, to pleasure and pain; he is the same in prosperity and adversity; he enjoys an ecstatic condition. The last three stages are also comprised under the distinctive name *saṃyama*, or restraint, because it is chiefly on the perfection attained in these three collectively that depend the wonderful results which are promised to a Yogin when he applies them to the contemplation of special objects. Such results are, i.e., a knowledge of the past and future, a knowledge of the sounds of all animals, of all that happened in one's former births, of the thoughts of others, of the time of one's own death, a knowledge of all that exists in the different worlds, of stars and planets, of the structure of one's own body, etc. There are especially, however, eight great powers which a Yogin will acquire when properly regulating and applying the *saṃyama*—the power of shrinking into the form of the minutest atom, of becoming extremely light, of becoming extremely heavy, of unlimited reach of the organs, of irresistible will, of obtaining perfect dominion over everything, of changing the course of nature, and, lastly, of going anywhere at will. If the Yogin applies *saṃyama* to the contemplation of the smallest divisions of time, and the successive order in which such divisions occur, he obtains a discrimination which enables him to understand the subtle elements, and to see all objects at once. When his intellect has become free from all considerations of self, and his spirit is no longer subject to the result of acts performed, and when both have thus obtained the same degree of purity, the Yogin obtains eternal liberation.

This is seldom obtained in one birth, for usually only a succession of births brings to maturity the result obtained in a prior birth. (See KARMA; METEMPSYCHOSIS.) When, however, final liberation is attained, first, all ideas of self cease. In consequence, thought is turned inward, and this is the commencement of liberation. But as recollections, derived from former existences, sometimes prevail in his mind, they must be abandoned. When the Yogin has succeeded in this, his knowledge will have become so infinite that but little will remain for him to know. Then the cosmical *guṇas*, or qualities (see SANKHYA), having accomplished the main object of spirit, gradually arrive at the end of their functions, and, as a consequence, matter becomes separated from spirit. This is *Kāivalya*, or true liberation. The practical part of the Yoga was admitted into the later Vedanta (q.v.).

The great power which this system of philosophy has at all periods exercised on the Hindu mind is less derived from its philosophical speculations or its moral injunctions, than from the wonderful effects which the Yoga practices are supposed to produce, and from the countenance they give to the favorite tendency of orthodox Hinduism, the performance of austerities. But to acquire such powers for show is expressly condemned by Patanjali and he recommends them merely as a means of practicing the Yoga dispositions, so as to fit one's self for the knowledge which can come only to those who have overcome all resistance. The perfect Yoga thus attained is called *Rāja-Yōga* or *Kāivalya*, in distinction from the practical Yoga called *Haṭha-Yōga*, which latter is but a means to the supreme end of liberation. The textbook of this form of Yoga is Jogindra's *Haṭhapradīpika* (edited and translated by Tatya and Iyangar, Bombay, 1893).

Originally, Yoga was not theistic; the Purusha was not God, but the perfected (liberated) spirit. But this individual spirit gradually, in the course of centuries, being influenced by the Vedanta, assumed the place of a personal supreme spirit or God, and *yōga* was interpreted as "union with God," whereas at first every spirit was individually eternal and *yōga* was the attempt to isolate spirit from matter. The system of Patanjali was taught by him in a work called *Yōga-sūtra* (edited and translated by Mitra, Calcutta, 1883; translated by Dvivedi, Bombay, 1890), which consists of four padas, or chapters, each comprising a number of sutras (q.v.).

The oldest commentary on it is ascribed to one Vyasa (q.v.); and this was commented on by Vachaspati Miśra. Of other commentaries, those by Vijnanabhikshu (edited by Sastri, Benares, 1884) and Bhojadeva (edited by Mitra, Calcutta, 1883) are the best.

Macdonell, *History of Sanskrit Literature* (London, 1913).

YOKKAICHI, yōk'kī'chĕ. A town in the Prefecture of Miye, Japan, situated on the Owari Bay, in the southern part of the island of Hondo, 23 miles southwest of Nagoya (Map: Japan, E 6). It is an industrial town with many factories built in European style. The manufactures include silk, paper, and porcelain ware known as Banko faience. Pop., 1908, 30,704.

YOKOHAMA, yō-kō-hä'mȧ (Cross Strand). The principal treaty port of Japan, situated on the south coast of the main island, 18 miles south of Tokyo, the capital (Map: Japan, F 6). It stands on a little indentation on the west shore of Tokyo Bay opposite the small prefectural city of Kanagawa, 2 miles north, originally designated in the treaty of 1858 as the port to be opened to foreign trade in the following year. Its position on the Tokaido, however, exposed the foreign residents to frequent attacks by the military retainers of the territorial barons as they journeyed to and from

Yedo (Tokyo), and the native authorities favored the removal of the settlement to its present site on the opposite strand, where stood at that time only a few fishermen's huts. The settlement then established, and the large native town which has grown up alongside of it on the north, occupy the original sea beach and a large stretch of filled-in swamp land at the back, bounded on the south and southwest by a tidal creek stretching west and southwest to Mississippi Bay. At a later date a well-wooded hill on the south of this creek, now known as the Bluff, was thrown open to foreigners for residential purposes, and it is now thickly dotted with handsome villas and bungalows. In 1901 the villages of Honmoku, Negishi, and Nakamura, lying along the foot of the bluff as far as Mississippi Bay, were annexed to the municipality, which in 1908 contained a population of 394,303. The town is well laid out and contains many fine buildings of stone, including the prefectural buildings, the Saibansho or courthouse, post office, customhouse, railway station, a public hall, an Anglican, a French-Catholic, and a Protestant Union church in the settlement, and several native churches. There are also hospitals, a fine cricket and recreation ground, a race course, a public garden on the Bluff, hotels, club houses, banks, and several weekly and daily newspapers, in English, French, and Japanese. A fine water supply was introduced in 1887, brought about 30 miles, from the Sagamigawa. Ships load and unload at a great pier 2000 feet long, and the anchorage is rendered safe by two great breakwaters 12,000 feet in length. Two large graving docks were completed in 1896–97. Imports and exports of merchandise were valued at 235,102,000 and 316,821,000 yen respectively in 1913 (this figure is slightly over half the total Japanese export). At Kobe, which is the other great Japanese port, imports in 1913 were valued at 346,609,000 yen and exports at 170,470,000 yen. Yokohama is the great silk emporium of the country, as Kobe is the great emporium for tea. The railway between Yokohama and Tokyo, built in 1872, was the first in Japan.

YOKOHAMA. See FOWL.

YOKOSŪKA, yō'kō-sō̄'kà. A coast town of Japan, and the greatest of the six Imperial naval stations (Map: Japan, A 2). It is situated on a landlocked inlet of the Bay of Yedo, 12 miles south of Yokohama, with which it is in hourly communication by steamer. It is also connected by rail with Yokohama and Tokyo, via Kamakura. Here are the Imperial dockyards and arsenals, with great graving docks and every appliance for turning out large armored vessels; begun during the Shogunate in 1866; opened under the Empire in 1871; initial cost $1,470,431. Pop., 1908, 70,364. At Hemmi-mura, a mile distant, is the grave of Will Adams (q.v.), the English pilot who arrived in 1600, and after whom *Anjin-chō* or Pilot Street in Tokyo is named. His memory is still honored in Japan.

YO'KUTS. A group of California Indian tribes constituting the Mariposan (q.v.) stock, living in the southern San Joaquin valley, among which are the Tachi, Wechikht, Wikchamni, and Yowdanchi. In 1910 they numbered 533. Consult A. L. Kroeber, "The Yokuts Languages of South Central California," *University of California Publication in American Archaeology and Ethnology*, vol. ii, part 5.

YOLK. See EGG.

YOLOF, yō'lŏf, **JOLOF,** yō'lŏf, or **WOLOF,** wō'lŏf (Speakers). Negroes of the western Sudan between the lower Senegal and the Gambia and stretching inland. They are said to be a handsome race, tall in stature (68–70 inches), dolichocephalic (index 75.2), and intensely black in color, but having regular features due without doubt to mixture with the Hamitic peoples north of them. The Yolof language is the medium of communication throughout Senegambia. In religion the Yolof are Mohammedans, but they still wear fetishes on their foreheads, breasts, and abdomens, mixed with bits of the Koran wrapped in parchment. They pay great attention to dress and personal adornment. Consult: De Roger, *Recherches philosophiques sur la langue oulofe* (Paris, 1829); Bérenger Féraud, "Etude sur les Ouolofs," in *Revue d'Anthropologie, IV* (ib., 1875); Delafosse, *Haut-Sénégal-Niger* (ib., 1912).

YOM KIPPUR, yŏm kĭp'ŭr. A late rabbinical term now in use as a designation of the *yom ha-kippurim*, or day of atonement. The laws relating to it are found in Lev. xvi.; xxiii. 26–32; xxv. 9; Num. xxix. 7–11. Concerning the ceremonies of the day see ATONEMENT, DAY OF. Modern Jewish and Christian scholars have maintained that this institution is of comparatively late origin. Since it is not mentioned in Deuteronomy or by Ezekiel, J. F. L. George regarded it as having been instituted during the Babylonian exile, and called attention to the fact that Ezekiel ordained an analogous rite of purification of the temple for the first and the seventh days of the seventh month. B. Wechsler pointed to the significant silence in Nehemiah viii concerning this day, and suggested that Lev. xvi. 1–28 describes an earlier festival characterized by the purification of the altar, while verses 29 ff. refer to a later annual ceremony. This view was somewhat further developed by S. Adler and I. Benzinger. The former emphasized the difference between the old ritual affecting only the altar, and the fully developed institution which secured to the people as a whole pardon for sins unwittingly and unintentionally committed; the latter brought these observations into connection with the current system of Pentateuchal criticism. Consult: J. F. L. George, *Die älteren jüdischen Feste* (Berlin, 1835); B. Wechsler, "Zur Geschichte der Versöhnungsfeier," in Geiger, *Jüdische Zeitschrift für Wissenschaft und Leben*, vol. ii (Breslau, 1863); S. Adler, "Der Versöhnungstag in der Bibel" in Stade, *Zeitschrift für die alttestamentliche Wissenschaft*, vol. iii (Giessen, 1883); I. Benzinger, *Hebräische Archäologie* (2d ed., Tübingen, 1907).

YONEZAWA, yō'nĕ-zä'wà. An important town in the Province of Uzen, Japan, 125 miles north of Tokyo, on the island of Hondo (Map: Japan, F 5). It is in the southeast of a fertile plain which is surrounded by lofty mountains, 30 miles distant. It is connected with Fukushima by railway. Pop., 1908, 35,380.

YONGE, yŭng, CHARLOTTE MARY (1823–1901). An English novelist, born at Otterbourne, in Hampshire. She was educated at home; resided in her native place throughout her life; and may be regarded, in many respects, as the mid-Victorian ideal of all a lady of her position should be. In religion she was an adherent of the High Church, whose doctrines she quietly took for granted in her novels, or sought to commend to the good graces of her

readers. Her orthodoxy led her to disapprove of workmen's institutes, lest the geological instruction there offered should imperil the foundations of the faith of those who attended them. For more than 30 years she edited the *Monthly Packet*, in which many of her novels made their first appearance. Miss Yonge published 160 separate books, comprising historical and educational works and novels, most of them bearing a strong religious or moral stamp, and some historical, some stories of contemporary domestic life. Her first great success as novelist was with *The Heir of Redclyffe* (1853), which was very widely read. Its spiritual romanticism was not only popular with the lay public, but it was received with enthusiasm by Morris and Rossetti. When Miss Yonge began authorship, a family council decided that it would be wrong or indelicate for one of her sex and station to become an author, unless the earnings of her pen were devoted to some good purpose, in which decision she dutifully acquiesced. The profits of *Redclyffe* bought a schooner for the use of a Melanesian missionary, while royalties from *The Daisy Chain* (1856) went to a New Zealand mission. Miss Yonge's books for girls are perhaps best represented by *The Daisy Chain*, and her essays in the field of historical romance by *The Dove in the Eagle's Nest* (1866). Village life was admirably depicted in a series of tales closing with *Forget-Me-Not* (1900). *Modern Broods*, written the year before her death, is a picture of the younger generation with which she was out of touch, and is perhaps her poorest book. Among miscellaneous publications may be cited *Catherine of Aragon and the Sources of the English Reformation* (1881); *Life of Hannah More* (1888); and *Life of the Prince Consort* (1889). Miss Yonge still remains a school classic. Consult Christabel Coleridge, *Life of Charlotte M. Yonge* (New York, 1903), and Ethel Romanes, *Charlotte Mary Yonge, An Appreciation* (London, 1908).

YONGE, Sir William (c.1695–1755). An English politician and wit, fourth baronet, son of Sir Walter Yonge. He was born at Colyton, Devonshire, and in 1722 entered Parliament. He became an office-hunting Whig, disliked and distrusted, but so useful to Sir Robert Walpole and the King that he held important positions, such as Secretary for War and joint vice treasurer of Ireland. Yonge's career was successful, in spite of the universal contempt he aroused. This was perhaps due to his skill as a parliamentary debater and the fact that he was an unswerving and useful supporter of the Whig party. He had no qualities of statesmanship, and perhaps prided himself as much on his reputation as a wit as on his successes in politics. His satirical verses led to the dislike of Pope, who mentions him in the *Essay on Man* as Sir Billy and refers to him elsewhere with great contempt. That his opinion carried some weight is evidenced by the fact that Dr. Johnson once appealed to him in a question of pronunciation.

YONKERS, yŏn'kĕrz. A city in Westchester Co., N. Y., adjoining New York City on the north; on the east bank of the Hudson River, with a water front of 4½ miles, and on the New York Central and Hudson River Railroad, from whose terminal in New York it is 15 miles distant (Map: New York, B 2). It is situated on ground rising gradually from the river. The more elevated section affords a magnificent view of the Hudson and of the Palisades (q.v.) on the opposite bank, and has handsome residences. There are more than 107 miles of streets, most of which distance is paved, the greater part with macadam. The most interesting structure of the city is the Philipse Manor House (now a museum) dating from 1682, which served as the city hall until 1909, when a handsome new city hall was built in Washington Park. Other noteworthy features include the Hebrew Home for the Aged and Infirm, the Leake and Watts Orphan House, St. John's Riverside Hospital, St. Joseph's Hospital, the Homœopathic Hospital, the Elks Building, new Y. M. C. A. and Y. W. C. A. buildings, "Greystone," formerly the residence of Samuel J. Tilden, seven parks, and a Carnegie library in Washington Park. There are also St. Joseph's Catholic Seminary, with a large library, Saunders Trade School, the Hollywood Inn for Workingmen, and the free circulating library of the Woman's Institute. Not only is Yonkers an attractive residential city, but it has important industrial interests. According to the 1914 census of manufactures the 186 manufacturing establishments had an invested capital of $59,409,000, and an output valued at $67,223,000. Hats, carpets, and rugs are among the principal products. There are large grain elevators, sugar refineries, foundries and machine shops, wire works, patent medicine and chemical factories, and the extensive works of the Otis Elevator Company. The government is vested in a mayor, chosen biennially, and a common council. The water works, which represent a total expenditure of $3,000,000 are the property of the municipality. The city maintains a steel recreation pavilion on the water front and three public bathhouses. For maintenance and operation it spends annually over $3,500,000, the chief items of expenditure being: principal and interest on debt, $992,000; public works, $555,000; public safety (police and fire), $555,000; education, $669,000; water bureau, $380,000; other appropriations, $349,000. Pop., 1890, 32,033; 1900, 47,931; 1910, 79,803; 1915 (State census), 90,948.

Yonkers was first settled about 1650, and derives its name from Adrian Van der Donck, called De Jonkheer, or young nobleman, by the Dutch, who owned the surrounding territory from 1645 to 1672. From 1672 to 1779 it was included in the Philipse Manor, the part now constituting the city being called Philipsburg. During the Revolution it was in the midst of the Neutral Ground. In 1788 the township of Yonkers was organized, and in 1855 the village of Yonkers was incorporated. In 1872 the town was divided, the north portion being chartered as a city, and the south portion becoming Kingsbridge, which two years later was annexed to New York City. Consult Allison, *The History of Yonkers* (New York, 1896); Scharf, *History of Westchester County* (ib., 1886).

YONNE, yôn. A department of north central France, formed of portions of Burgundy and Champagne (Map: France, N., J 5). Area, 2892 square miles. The department is traversed by the Yonne, a tributary of the Seine, and its surface is undulating or hilly, with many beautiful valleys. A considerable portion is covered with forest, but more than half of the area is under cultivation, producing large crops of wheat, oats, beets, and potatoes. Vineyards cover about 84,000 acres and its wines, especially Chablis, are famous. The chief mineral product is building stone, and the most impor-

tant industries are sugar refining, lumbering, and glass manufacture. Pop., 1901, 321,062; 1911, 303,889. Capital, Auxerre.

YONNE. A tributary of the Seine, having its source in the mountains of Morvan, in the Department of Nièvre, France (Map: France, N., J 4). It empties into the Seine from the south, near Montereau. It becomes navigable at Auxerre. Length, about 150 miles.

YORCK (or YORK) **VON WARTENBURG,** yŏrk fŏn vär'tĕn-bŭrk, HANS DAVID LUDWIG, COUNT (1759–1830). A Prussian field marshal. He was born at Potsdam, entered the army in 1772, and was cashiered for insubordination and imprisoned (1779–81). He was in the Dutch East Indian service in 1783–84 and was reinstated in the Prussian army in 1787. He served in the Polish campaign of 1794 and distinguished himself in the struggle against France in 1806. In 1807 he attained the rank of major general and in 1811 was made Governor-General of East and West Prussia. In the Russian campaign of 1812 he commanded the Prussian contingent in Napoleon's army, but he had no heart in this service, and during the retreat from Russia entered into a convention with the Russians, Dec. 30, 1812, by which the Prussian troops were neutralized. Yorck distinguished himself in the campaign of 1813–14, defeated Eugène Beauharnais at Möckern, took part in the battle of Bautzen and that on the Katzbach, and fought at Leipzig. He shared also in the fighting which preceded the capture of Paris by the Allies. He was made a count in 1814 and a field marshal in 1821. For his life consult Droysen (10th ed., Leipzig, 1890).

YORICK. 1. The former jester of the King of Denmark in Shakespeare's *Hamlet*. 2. The pseudonym assumed by Laurence Sterne in most of his works after the publication of *Tristram Shandy*.

YORITOMO MINAMOTO. See MINAMOTO YORITOMO.

YORK. A county borough and city, the county town of Yorkshire, England, situated at the junction of the Ouse and Foss, 188 miles by rail N. by W. from London (Map: England, E 3). The city preserves its mediæval aspect with its narrow streets, quaint houses, ancient gateways, and double walls. The walls, with a circuit of a little over 2½ miles, date mainly from the fourteenth century and are well preserved; their top has long formed an interesting promenade. There are remains or memorials of Roman towers and temples, and of the earliest British churches. One of the most magnificent of the Anglo-Saxon churches was erected at York in the eighth century, and, destroyed by fire, rebuilt, enlarged, and changed from time to time, is now the cathedral known as York Minster. A portion of the original church was disinterred during excavations in 1829. The present structure ranks with the finest specimens of Gothic architecture in the world. It was built mainly in the thirteenth and fourteenth centuries. Its length is 525 feet, 6 inches, and its extreme breadth 250 feet. The height of the central tower is 213 feet, that of the western towers 202 feet. Besides the cathedral, York has numerous churches of great architectural interest. Among the modern churches is the Roman Catholic pro-cathedral. The educational institutions include St. Peter's School, founded in 1557, Archbishop Holgate's free school, dating from Henry VIII, and the Yorkshire School for the Blind, conducted in a palace originally built for the Lord President of the Council of the North.

The building erected for a fine-art exhibition held in 1879 contains a concert hall and picture galleries. The Yorkshire Philosophical Society possesses a handsome building and gardens, with a museum, rich in antiquarian relics and specimens illustrative of natural history. In the gardens are the interesting ruins of St. Mary's Abbey. There are also the county hospital, the first established in England north of the Trent, the lunatic asylum, and the Friends' retreat. The ancient castle, with the exception of its imposing Clifford's tower, is superseded by the modern and commodious assize courts. The Guildhall, a fine Gothic building, was erected in 1446. The government is vested in 12 aldermen and 36 councilors, of whom one is Lord Mayor. The city has returned two members to Parliament since 1295. The municipality owns the Foss Canal, provides tugs for towing vessels between Hull and York, and constitutes the Ouse navigation authority. It has built promenades and baths along the river. The city's industries include the making of leather gloves, combs, glass, etc., iron founding, flax spinning, the manufacture of linen, and the construction of railway cars.

Before the Roman invasion York was one of the chief towns of the Brigantes, the most numerous and powerful of the British tribes. It was constituted a Roman station, under the name of Eboracum, by Agricola about 79 A.D., and became the principal seat of Roman power in the north, perhaps in all Britain. Here Hadrian lived and Severus and Constantius Chlorus died. When the emperors visited the province, York was their chosen residence. It suffered during the long conflict between the Britons and the Picts, against whose incursions York was a material defense. It afterward became the capital of Northumbria. The first metropolitan church in England was built here by Edwin, the Northumbrian King, whom Paulinus baptized in 627 shortly before he became the first archbishop of York. William the Conqueror was long unable to overcome this stronghold of the north.

York has an interesting record, reaching from early Norman times down to the Civil War, of royal visits and conferences. In 1536, during the insurrections consequent upon the dissolution of the monasteries by Henry VIII, the city was seized by the insurgents of the "pilgrimage of grace." In its immediate neighborhood, Fairfax, in 1644, conquered Prince Rupert on Marston Moor. The city and castle surrendered to the Parliamentarians a few weeks after. Pop., 1891, 67,749; 1901, 77,914; 1911, 82,282. The area is 3730 acres. Consult: A. W. Twyford, *York and York Castle* (London, 1883); A. P. Purey-Cust, *Heraldry of York Minster* (2 vols., Leeds, 1890–96); James Raine, *York*, in "Historic Towns Series" (London, 1893).

YORK. A town in York Co., Me., 40 miles southwest of Portland, on the York Harbor and Beach Railroad (Map: Maine, B 5). It is situated on the coast, and, aside from its historic interest, has considerable reputation as a summer resort. Pop., 1900, 2668; 1910, 2802. York was settled as Agamenticus in 1624, and was chartered by Sir Ferdinando Gorges as a borough in 1641, and in 1642 as the city of Georgeana—the first English municipal corpora-

YORK MINSTER

tion in North America. Consult Emery, *Ancient City of Georgeana and Modern Town of York* (Boston, 1874).

YORK. A city and the county seat of York Co., Neb., 52 miles west of Lincoln, on the Chicago, Burlington, and Quincy, and the Chicago and Northwestern railroads (Map: Nebraska, G 4). It is the seat of York College (United Brethren), opened in 1890, and has the School of the Holy Family, the State Odd Fellows Home, the Mothers Jewels Home (M. E.), and a public library. There are also a fine county courthouse and two parks. York has large alfalfa mills and nurseries, and a music-publishing house, and manufactures flour, blank books, and foundry products. Pop., 1900, 5132; 1910, 6235.

YORK. A city and the county seat of York Co., Pa., 96 miles west of Philadelphia, on the Pennsylvania, the Western Maryland, and the Maryland and Pennsylvania railroads (Map: Pennsylvania, H 8). Among the prominent institutions are the York Collegiate Institute, the York County Academy, Children's Home, Christian Home, Tuberculosis Dispensary, hospital, almshouse, and the public, St. John's Episcopal, and York County Law libraries. There are seven parks—Penn and Farquhar being the largest. York derives considerable commercial importance from its situation in a productive farming region, and is also a prominent industrial centre. In the census year 1914 the various manufacturing establishments had $29,328,000 invested capital and an output valued at $21,969,000. The city is especially interested in the manufacture of foundry and machine-shop products, tobacco and cigars. There are also silk mills, farm-implement works, piano and organ factories, planing mills, breweries, brickyards, and manufactories of carriages and wagons, automobiles, wall paper, nails and spikes, paper and wood pulp, furniture, shirts, safes, ice machines, turbines, hosiery, flour, chains, wire cloth, cigar boxes, leather, artificial stone, etc. An extensive wholesale trade is carried on. The commission form of government, providing for a mayor, elected quadriennially, and four commissioners, elected biennially, has been adopted. Pop., 1900, 33,708; 1910, 44,750; 1915 (U. S. est.), 50,543.

Several Germans settled here in 1729, but a town was not laid out until 1741. From Sept. 30, 1777, until June 27, 1778, the Continental Congress, driven from Philadelphia by the approach of Howe's army, was in session here. Consult Gibson, *History of York County* (Chicago, 1886).

YORK. A city and the county seat of York Co., S. C., 41 miles southwest of Charlotte, N. C., on the Southern and the Carolina and Northwestern railroads (Map: South Carolina, C 1). The leading manufactures are cotton, cotton-seed oil, buggies, lumber, and monuments. The place was settled in 1774. Until 1915 the city was known as Yorkville. Pop., 1900, 2012; 1910, 2326.

YORK, House of. A royal house of England which contended with the House of Lancaster for the possession of the throne in the fifteenth century. The Lancastrian line had obtained the crown in 1399 in the person of Henry IV (q.v.) and remained in possession until the incapacity of Henry VI (q.v.) afforded an opportunity for the assertion of the Yorkist claims by Richard, Duke of York (1411–60), who united in his person the claims of Lionel, Duke of Clarence, third son of Edward III, and Edmund Langley, Duke of York, fifth son of that monarch. He thus could show a stronger title than Henry VI, who traced from John of Gaunt, fourth son of Edward III. Richard's aspirations for the crown and his rivalry with the ambitious Duke of Somerset led to the outbreak of the Wars of the Roses. (See Roses, Wars of the.) Richard perished at Wakefield in 1460, but the struggle was continued by his son, Edward, who ascended the throne in the following year as Edward IV (q.v.). Edward died in 1483, and the throne was usurped by his brother, Richard, Duke of Gloucester, but the popular belief that he was responsible for the murder of the sons of Edward and that he intended to marry Edward's daughter, Elizabeth, cost him his throne and his life. He fell at Bosworth in 1485. (See Richard III.) Henry, Earl of Richmond, the victor of Bosworth, by his marriage with Elizabeth, eldest child of Edward IV, united in himself the claims of the houses of Lancaster and York and reigned as Henry VII (q.v.). George, Duke of Clarence, younger brother of Edward IV, who was executed in 1478, left a son, Edward, Earl of Warwick, and a daughter, Margaret. Edward was kept a prisoner in the Tower by Henry VII until 1499. Margaret married Sir Richard Pole and her fourth son was the celebrated Cardinal Reginald Pole (q.v.). See Plantagenet; Tudor.

YORK, Richard, Duke of (1411–60). An English statesman, only son of Richard, Earl of Cambridge (died 1415), by Anne Mortimer, sister of Edmund, Earl of March. Before his majority he was appointed constable of England, and in 1436, under Henry VI, Regent of France. He resigned in 1437, was reappointed in 1440, and recalled in 1445. In 1447 he was made the King's lieutenant in Ireland, returned to England in 1450, and, gaining in influence, in 1454 he was chosen protector of the kingdom during the illness of Henry VI. About the beginning of 1455 the King recovered, and various charges of treasonable intentions, arising from York's claim to the heirship to the throne, culminated in a short engagement in May (regarded as the first battle of the Wars of the Roses), but reconciliation between the King and the Duke followed. York was relieved of the protectorship in 1456. In 1460 his title to the heirship was admitted, but, as the Lords were unwilling to dethrone the King, a compromise was reached in October whereby it was agreed that York should succeed to the throne upon the death of Henry, and the Duke was proclaimed heir apparent and protector. Queen Margaret's objection to this arrangement led to hostilities, and York fell in the battle of Wakefield on the 30th of December. Two of his sons became kings of England, Edward IV and Richard III.

YORK COLLEGE. An institution for higher education founded in 1890 at York, Nebraska, under the control of the United Brethren. The departments include the college, academy, college and normal departments, music department, department of expression, and department of art. The total enrollment in 1916 was 375, and the instructors numbered 19. The value of grounds and buildings was $105,000, and the annual income about $20,000. There is an endowment of about $75,000. The library contains about 3500 volumes. The president in 1916 was M. O. McLaughlin.

YORK DEVIL. See Moloch.

YORKE, PHILIP. See HARDWICKE, EARL OF.

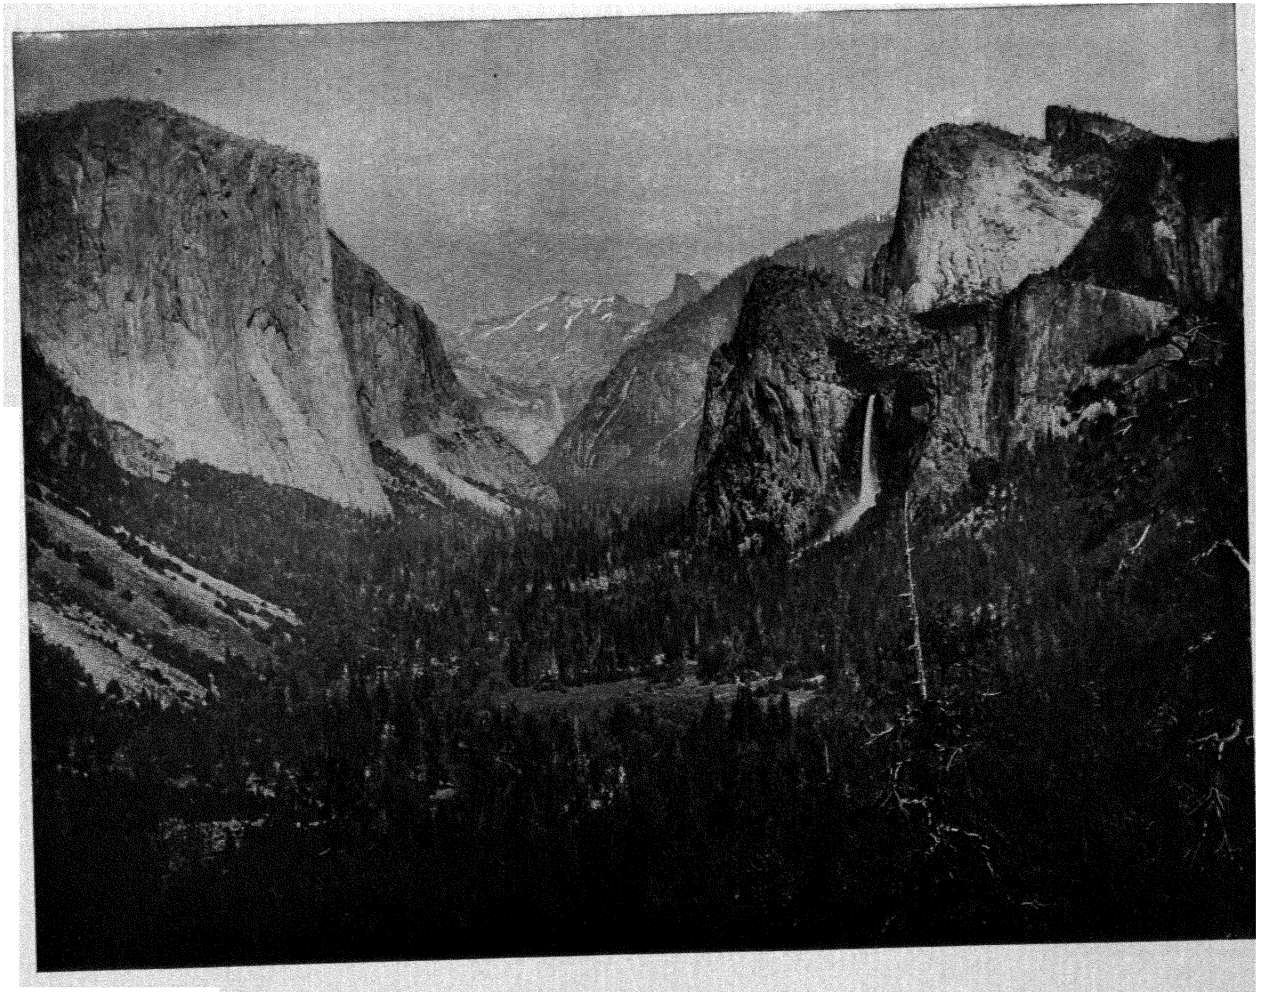
YORKER BRETHREN, OLD ORDER OF. See RIVER BRETHREN.

YORK HOUSE. For a short time the London residence of the archbishops of York, after their old residence, York Place, now Whitehall, had passed from the hands of the Church to those of the crown, upon the downfall of Cardinal Wolsey. It stood on the Strand, west of Salisbury House. It was subsequently the official mansion of the chancellors, and was the birthplace of Francis Bacon. York House came into the possession of the Duke of Buckingham, who began extensions, never completed, from designs by Inigo Jones.

YORK RIVER. The common estuary of the Pamunkey and Mattapony rivers in Virginia, which unite at West Point, 32 miles east of Richmond. It extends 40 miles southeastward, and opens into Chesapeake Bay north of the mouth of the James (Map: Virginia, H 4). It is about 2 miles wide, and navigable to its head.

YORKSHIRE, yôrk'shēr. A maritime county of northeast England (Map: England, E 2). It is the largest county in the Kingdom, with an area of 6067 square miles, but is divided into three sections known as East, West, and North Riding, which for most administrative purposes form separate counties. The surface is very diversified, the Pennine Chain occupying the western part, with lower groups of hills in the east, while the central portion forms the valley of the Ouse, which enters the Humber estuary on the southern boundary. East Riding is chiefly an agricultural region, producing oats, barley, wheat, turnips, and potatoes. West Riding is one of the greatest manufacturing districts in the Kingdom. The textile industry is the most largely represented, but smelting, founding, and other metal industries, such as the manufacture of machinery, are very important, their chief centres being Leeds and Sheffield. Mining is also extensively carried on, the chief products being coal in West Riding and iron in North Riding, the production of pig iron amounting to over 2,500,000 tons annually. Pop., 1901, 1,819,960; 1911, 2,054,729. The county town is York, and the chief cities are Leeds, Sheffield, Bradford, Halifax, Middlesbrough, and Hull. Yorkshire formed part of the Anglo-Saxon Kingdom of Northumbria. It was largely settled by Danish invaders, who from the eighth to the eleventh century were the ruling class. It is exceedingly rich in the remains of castles and monastic houses.

YORKSHIRE DON. A long, slim variety of canary bird bred in Yorkshire, England. See CANARY and the accompanying Plate.



YORKSHIRE TRAGEDY, A. A play by an unknown author, printed in 1608 under Shakespeare's name. It was founded on a story in Stow's *Chronicle.*

YORK'TON. A town and the capital of Mackenzie District, Saskatchewan, Canada, on the Canadian Pacific, Canadian Northern, and Grand Trunk Pacific railways, 130 miles northeast of Regina (Map: Saskatchewan, H 6). It contains Dominion Land and Lands Titles offices, and a hospital, and has a variety of manufactures. Pop., 1901, 700; 1911, 2309.

YORK'TOWN. A town and the county seat of York Co., Va., 70 miles southeast of Richmond; on the York River, and on the Baltimore, Chesapeake, and Richmond and the Old Dominion Steamship lines (Map: Virginia, H 4). Pop., 1910, 136. It contains the oldest customhouse in the United States and a monument commemorating the surrender of Lord Cornwallis. The town has considerable historic interest, having undergone two notable sieges (1781 and 1862). Cornwallis, after establishing himself here early in August, 1781, fortified the town with seven redoubts and six batteries on the land side, and a line of batteries along the river. Gloucester Point, on the opposite side of the river, was also strongly fortified. He had an army of about 8000 men supported by several vessels anchored in York River. Washington, with the combined American and French forces, left his headquarters near West Point, N. Y., on August 19, proceeded by land, by way of Philadelphia, to Elkton, at the head of Chesapeake Bay, then down Chesapeake Bay, reached Williamsburg on September 14, and on September 28 marched to the investment of Yorktown with a force of about 16,000, of whom two-thirds were Frenchmen, under the command of Rochambeau. A French fleet under Count de Grasse had immediately before entered the Chesapeake, and, by blocking the James and York rivers, cut off communication between the British at Yorktown and New York. On October 6 the first parallel was opened and on the 9th the batteries opened, dismounting many of the guns and destroying several vessels. On the 11th the second parallel was opened only 300 yards from the fort. On the 14th the two advanced redoubts were carried by assault, one by American, the other by French troops. On the 16th the walls and fortifications of the British works were broken down and almost every gun dismounted. The British general attempted now to escape by night by way of Gloucester Point, but the attempt was frustrated by a furious storm, which scattered his boats. On the 19th he surrendered to the allies, the land army with its munitions being surrendered to the Americans, the marines to the French. The prisoners, exclusive of seamen, numbered more than 7000, of whom 2000 were sick or wounded. Among the spoils the Americans obtained 235 pieces of cannon, 8000 stand of small arms, 28 regimental colors; the French 2 frigates and 20 transports. The total loss of the British was about 550, and of the allies 300. This victory virtually ended the Revolutionary struggle.

The second siege was begun by McClellan with about 53,000 Union troops on April 5, 1862. The Confederate general, Magruder, with 15,000 men, had taken possession early in the spring and had erected formidable works around the town and on Gloucester Point. He was soon reënforced by General Johnston, who took command, the total Confederate force now numbering about 55,000, while the Federal army, also reenforced, now numbered about 95,000. During the night of May 3–4 Johnston secretly evacuated Yorktown and retreated towards Richmond, but was pursued by a part of the Union army, and on the 5th was forced with a part of his troops under Longstreet to fight the battle of Williamsburg (q.v.).

In 1881 the centennial of the surrender of Cornwallis was celebrated with elaborate ceremonies, and a monument commemorative of the event was dedicated in the presence of many distinguished Americans and foreigners. Consult: Johnston, *The Yorktown Campaign and the Surrender of Cornwallis, 1781* (New York, 1881);

YOSEMITE VALLEY

LOOKING EASTWARD, SHOWING EL CAPITAN, BRIDAL VEIL FALLS AND CATHEDRAL ROCKS

Report of the Commission Created in Accordance with a Joint Resolution of Congress Providing for the Erection of a Monument at Yorktown, Va. (Washington, 1883); Johnson and Buel (eds.), *Battles and Leaders of the Civil War* (New York, 1887); Balch, *The French in America During the War of Independence* (2 vols., Philadelphia, 1891–95); M. L. D. Foster, *Colonial Capitals of the Dominion of Virginia* (Lynchburg, 1906).

YORK VON WARTENBURG, HANS DAVID LUDWIG, COUNT. See YORCK VON WARTENBURG.

YORUBA, yō'rōō-bȧ, or **YARIBA.** Formerly a powerful state in Africa, comprising the territory lying southwest of the Nupe country and east of Dahomey and extending from Borgu south almost to the Bight of Benin. The invasion of the Fulbe in the first half of the nineteenth century led to the partition of the Yoruba empire into small states constantly warring with each other. Hence the existence of the large walled cities in that region, such as Oyo, the Yoruba capital, Ibadan, the chief commercial city, Abeokuta, Ilorin, and a few others, some of which are supposed once to have had as many as 200,000 inhabitants. At present Yoruba is practically embraced in southern Nigeria. The population is estimated at from 1,000,000 to 2,000,000 and is of negro origin. They are chiefly agriculturists. Palm oil is the main export article. The Yorubas are shorter than negroes in general (1.64 m. to 1.65 m.). These characters, joined with their fair color, are regarded as evidence of dwarf elements. They have large towns of rectangular houses with heavy, palm-thatched roofs, wide plazas, and merchants' booths. Professedly Mohammedan, they practice their ancient cult, which is chiefly conciliation of evil spirits and fetishism, but they punish sorcery with death. Consult: Crowther, *Grammar and Vocabulary of the Yoruba Language* (London, 1852); A. B. Ellis, *The Yoruba-Speaking Peoples* (ib., 1894); C. F. Harford-Battersby, *Niger and Yoruba Routes* (ib., 1896); Gouzien, *Manuel franco-yoruba de conversation* (Paris, 1899).

YOSEMITE (yō-sĕm'ĭ-tē) **VALLEY.** A celebrated valley on the western slope of the Sierra Nevada Mountains in the county of Mariposa, Cal. (Map: California, F 5). It is about 7 miles long and from ½ mile to 1 mile wide. The Merced River traverses the valley in a general direction from east to west. The scenery is famous for the numberless masses of picturesque rock formations and gigantic waterfalls, for striking heights and deep creek valleys. On both sides of the Merced rise perpendicular heights of granite, represented among others by El Capitan (3600 feet high), Cathedral Rocks (2500 feet), Three Brothers (3830 feet), and Half Dome (4900 feet). The most celebrated of the waterfalls are the Yosemite Falls (1430 feet), the Ribbon Falls (1612 feet), Bridal Veil Falls (620 feet); Nevada Falls (600 feet), Illilouette Falls (360 feet), Lower Yosemite and Vernal Falls (320 feet), etc. In the eastern part of the valley is Mirror Lake, a beautiful sheet of water. The valley was discovered in 1851. In 1864 it passed to California by Act of Congress, under the condition that it be kept open as a public park. In 1890 the Yosemite National Park, including the Valley, was established by Act of Congress, and in 1905 the original reservation was ceded back to the Federal government by the State. The celebrated big trees of California are in this immediate region. Consult the *Guide to the Yosemite*, by the California Geological Survey, and Bunnell, *Discovery of the Yosemite* (New York, 1893). See PARK, NATIONAL.

YOSHIHITO, yŏsh'ĭ-hē'tō (1879–). Emperor of Japan. This name is little used by the Japanese, the common people calling him *Tewshi Sama*, "August Son of Heaven," and the educated *Shu-jo*, "Supreme Master." He was born Aug. 31, 1879, the third son of Emperor Meiji Tenno (q.v.). His elder brothers having died, he became Crown Prince Nov. 3, 1890. For eight years he attended the Gakushu-in or Peers' School and continued his study at his palace in Aoyama, Tokyo. In July, 1897, when he became of age, he took his seat in the House of Peers, and three years later, May 10, 1900, married Princess Sada-ko, the fourth daughter of the late Prince Kujo. To them were born three children, Prince Hirohito, the Crown Prince (born 1901), Prince Yasuhito (born 1902), and Prince Nobuhito (born 1905). Soon after his marriage he spent nearly three years in travels of observation that covered the whole realm. Every opportunity was given him to see for himself the real life of the people. On Aug. 30, 1912, upon the death of his father, he ascended the throne. Beloved by his people, he came to be known as the most democratic emperor who ever sat on the throne of Japan Consult J. H. Longford, *The Evolution of New Japan* (New York, 1913).

YOUATT, yōō'ȧt, WILLIAM (1776–1847). A noted British veterinarian and author, born at Exeter. Having been educated for the ministry, he officiated in London from 1810 to 1812 or 1813, when he established, with D. P. Blaine, a veterinary infirmary which came under his sole management about 12 years later. From 1828 to 1835 he delivered lectures and conducted practicums on veterinary practice. At the same time he established the *Veterinarian*, a monthly magazine, still published. Besides important work in conjunction with the Royal Veterinary College and the Royal Agricultural Society, to whose *Journal* he was a frequent contributor, he exercised a profound influence upon his profession. His voluminous writings, both in the *Veterinarian* and in his books upon the domestic animals are widely consulted and quoted. Among his books are: *The Horse* (1831; 2d ed., 1843); *Cattle, their Breeds, Management, and Diseases* (1824); *Sheep, their Breeds, Management, and Diseases, and the Mountain Shepherd's Manual* (1837); *The Dog* (1845); *The Pig: A Treatise on Breeds, Management, Feeding, and Medical Treatment of Swine; with Directions for Salting Pork and Curing Ham* (1847).

YOUMANS, yōō'mȧnz, EDWARD LIVINGSTON (1821–87). An American scientist, born at Coeymans, N. Y. Despite an incurable malady of the eyes, he managed to acquire a good education. In 1845 his sister, Eliza Ann Youmans, became his reader and amanuensis. In 1851 he prepared a *Chemical Chart* which won such favor that the next year he published a *Class-Book of Chemistry*. From that time on he devoted himself with remarkable success to popularizing science. He became a lecturer, founded (1872) and until his death edited the *Popular Science Monthly* magazine, planned the publication of the "International Scientific Series," by means of which works by the greatest scientists

of all nations were published simultaneously in the principal modern languages, and introduced the works of Herbert Spencer and of other British scientists to American readers. Among his own publications are: *Alcohol and the Constitution of Man* (1853); *Handbook of Household Science* (1857); *The Correlation and Conservation of Forces* (1864); and *Culture Demanded by Modern Life* (1867). Consult John Fiske, *A Century of Science, and Other Essays* (Boston, 1899).

YOUMANS, William Jay (1838–1901). An American scientist, born at Milton, N. Y., brother of Edward Livingston Youmans (q.v.). He studied chemistry under his brother and at Columbia and Yale, then took a course in medicine at New York University, and in 1865 studied natural history under Huxley in London. On his return to the United States he settled at Winona, Minn., and practiced medicine for about three years. In 1872 he assisted his brother in establishing and subsequently was associated in editing the *Popular Science Monthly*. After his brother's death in 1887 he became its editor in chief. He edited Huxley's *Lessons in Elementary Physiology*, and wrote *Pioneers of Science in America* (1895).

YOUNG, Sir Allen (1827–1915). An English mariner, born at Twickenham. Entering the merchant marine at 15 he soon rose to be captain. After twice circumnavigating the world, he participated with distinction in the transport service of the Crimean War. Sailing without pay as master of the *Fox*, in the Franklin search under McClintock (q.v.), Young distinguished himself by extended sledge journeys and original discoveries (1857–59). He commanded the *Fox* in the North Atlantic Telegraph surveying expedition (1862) via the Faroe Islands, Iceland, and Greenland. For a brief period he commanded a gunboat in the European-Chinese navy. In 1871 he was commissioner to the Naples maritime congress, and in 1875 commissioner in the Suakim War to the National Aid Society. He made two Arctic voyages in the *Pandora*, one in 1875 in an unsuccessful attempt to pass through the Northwest Passage, and another in 1876 to communicate with the Nares polar expedition (see Nares, Sir George). In 1882 as commander of the *Hope* he rescued Leigh Smith's expedition wrecked on Franz Josef land. Besides receiving other honors, Young was knighted for his Arctic services. He wrote *The Two Voyages of the Pandora* (London, 1879).

YOUNG, Arthur (1741–1820). A noted British agriculturist and author, born in London. Prior to 1759 he had written four novels and several political pamphlets which seem to have had no permanent value. In 1763 he took up farming, which, combined with rural investigations at home and abroad, became his life work. The value and amount of his agricultural writings, based upon personal experience, place him in advance of British agricultural authors. His *Travels in France* pictures not only French agriculture, but conditions in France prior to the French Revolution; it is a source of information upon both these subjects. Young was secretary of the British Board of Agriculture (1793), and honorary member of the leading scientific societies of the world. Some of his best-known works are: *A Six Weeks' Tour through the Southern Counties of England and Wales* (1768); *Annals of Agriculture* (1784–1809, 1812–15); *Travels in France during the Years 1787, 1788, and 1789* (1794).

YOUNG, Brigham (1801–77). The successor of Joseph Smith, Jr., as president of the church of Jesus Christ of Latter-Day Saints. He was born in Whitingham, Windham Co., Vt., June 1, 1801. He removed to Mendon, Monroe Co., N. Y., and was baptized into the Mormon church April 14, 1832. He was at once appointed an elder, and first met Joseph Smith at Kirtland, Ohio. After a successful mission to Canada he went to Missouri in the "Army of Zion." Elected as one of the original Quorum of Twelve in 1835, he was called to preach to the Indians and presently went on a mission to the eastern States. In 1838 he directed the exodus of the saints from Missouri into Illinois. In 1840 he was sent to Liverpool to assist Apostles John Taylor and Wilford Woodruff (qq.v.) in the English mission. In 1844 he became president of the Twelve, and he held this position until elected president of the church in 1847. After the murder of Smith in 1844, Young assumed the leadership of the main body of saints, and organized their emigration to the West. In February, 1845, he led the first party from Nauvoo, and spent the following winter in a camp on the Missouri. There he promulgated his first and only "revelation," which can be found in the *Book of Doctrines and Covenants*, describing in detail the extraordinary manner of organizing the "Camps of Israel" and conducting the journey. Reaching the Salt Lake valley in 1847, he selected the site of the new temple, and carefully planned a city (see Salt Lake City). A legislature was elected and the "State of Deseret" organized. Brigham Young was chosen Governor in 1849 and applied to Congress for admission into the Union. The Territory of Utah was organized instead and Young was appointed Governor by President Fillmore and served until 1858, when there occurred the so-called Mormon War. Concerning this incident Prof. Theodore Smith in his book, *Parties and Slavery* (New York, 1906), says: "An attempt in 1857 to displace Young as Governor of Utah brought on, therefore, something very like an insurrection, for the Territory supported Young in refusing to submit. Federal judges and land officers were promptly expelled from the region, and bands of Danites committed outrages upon non-Mormon residents. . . . In the spring of 1858 he [Buchanan] issued a proclamation calling upon the Mormons to submit, sent a new governor, Cumming, over the mountains with a considerable military force, and was able to report to Congress that Young and the Mormons had ceased to resist." Prof. Levi Young of the University of Utah in giving the Mormon version of the war says: "In 1858 a United States army was sent to Utah to put down a supposed rebellion, but there were no hostilities and the soldiers were well received and made favorable reports concerning the people." In 1868 Brigham Young established a system of coöperative stores, which still controls a large part of the business of the State. In 1851 he organized a public-school system. In 1852 he declared polygamy to be a tenet of the Mormon church. He died Aug. 29, 1877, and was reputed to have left $1,000,000 and 19 wives. He was the father of 57 children. See Mormons.

YOUNG, Charles Augustus (1834–1908). An American astronomer, born at Hanover,

N. H. He graduated at Dartmouth (1853), and till 1855 taught at Phillips Academy, Andover. From 1857 to 1866 he was professor of natural philosophy and mathematics in the Western Reserve College, Ohio. In 1866 he was made professor of astronomy and natural philosophy in Dartmouth, and from 1877 to 1905 held a similar position at Princeton. In 1883 he held the presidency of the American Association for the Advancement of Science. In observing the total eclipse of August, 1869, he made the first observation of the spectrum of the solar corona. He was also the discoverer of the "reversing layer in the solar atmosphere." (See SUN.) He also studied the prominences and chromosphere, the spectroscopic measurement of the sun's rotation, solar cyclones, and explosions. He was a member of Winlock's party of 1870, and observed the total eclipse at Jerez, Spain. He published *The Sun* (1881; rev. ed., 1895); *Textbook of General Astronomy* (1888; rev. ed., 1898); *Manual of Astronomy* (1902).

YOUNG, EDWARD (1683–1765). An English poet, born at Upham, in Hampshire, where his father was rector. He was educated at Winchester and at Oxford. He first came before the world as a poet with an *Epistle* to George Granville on Granville's being created a peer (1713). The next year this piece of fulsome flattery was followed by *The Last Day*, dedicated to the Queen; *Force of Religion*, with a dedication to the Countess of Salisbury; and an epistle on *The Late Queen's Death*. In 1719 Young tried his hand at a tragedy entitled *Busiris*, which was succeeded by *Revenge* (1721), long popular on the stage, and *The Brothers* (first produced in 1753). Perhaps it was for writing *The Instalment* (1726), on the occasion of Walpole's being invested with the Order of the Garter, that Young was granted a government pension of £200 a year. Between 1725 and 1728 appeared in succession a series of satires entitled *The Love of Fame, the Universal Passion*. Taking orders, Young became chaplain to the King (1728), and rector of Welwyn, in Hertfordshire (1730). In 1731 he married Lady Elizabeth Lee, who was a daughter of the second Earl of Lichfield, and died in 1741. Then followed the famous *Night Thoughts on Life, Death, and Immortality* (1742–45). Young passed his last years mostly in retirement, and died at the rectory of Welwyn.

Young's reputation rests almost wholly upon *Night Thoughts*. This series of poems contains passages of fine imagination in the midst of much religious gloom and religious sentimentality, and it coins many proverbial sayings, such as "Procrastination is the thief of time," that have passed into popular speech. The *Night Thoughts*, read by everybody, gave rise to a school of graveyard poets. Translated into French and German, the series was received with equal enthusiasm abroad. Besides his verse, Young wrote a remarkable essay entitled *Conjectures on Original Composition* (1759). Like the *Night Thoughts*, its influence on the Continent was notable, and especially in Germany. Young collected his works (4 vols., 1757). The poems, with a memoir by Herbert Croft, were included in Johnson's *Lives of the British Poets*, vol. iii, edited by J. B. Hill (Oxford, 1905). A folio edition of *Night Thoughts* (1797) was illustrated with designs by William Blake (q.v.). Consult: Young's *Poetical Works*, in Aldine edition, with a *Life* by J. Mitford (London, 1844; reprinted, 1864); and by G. Gilfillan (Edinburgh, 1853); also the Riverside edition (Boston, 1906); the exhaustive study of his life and works by W. Thomas, under the title *Le poète Edward Young* (Paris, 1901); and H. C. Shelley, *Life and Letters of Edward Young* (New York, 1914). For his influence in France, consult Joseph Texte, *Cosmopolitisme littéraire* (Paris, 1895; Eng. trans. by J. W. Matthews, London, 1899). George Eliot wrote a famous essay on Young, entitled "Worldliness and Other Worldliness," in *Westminster Review* (London, 1857).

YOUNG, EDWARD (1831–96). An English explorer, born at Hastings. In 1862–64 he commanded the ship *Pioneer* to the Zambezi and the Shire rivers under Livingstone. In 1867 he commanded the Livingstone search expedition. He was commissioned by the Free Church of Scotland to conduct a mission to Lake Nyassa in 1875, and at this time discovered the Livingstone Mountains and established the Livingstonia settlement. He wrote: *The Search After Livingstone*, a journal revised by Rev. Horace Waller (1868), and *Nyassa, a Journal of Adventures while Exploring Lake Nyassa, Central Africa, and Establishing the Settlement of Livingstonia* (1878).

YOUNG, ELLA FLAGG (1845–). An American educator, born at Buffalo, and educated at the Chicago Normal School and at the University of Chicago (Ph.D., 1900). She was married to William Young in 1868. Beginning her teaching career in 1862, she became district superintendent of schools in Chicago in 1887; professor of education in the University of Chicago 1899, where she took the degree of Ph.D. the next year; principal of the Chicago Normal School in 1905; and was superintendent of schools of Chicago from 1909 until her resignation in 1915. She took an active part in the work of educational associations, and in 1910–11 was the first woman president of the National Education Association. Mrs. Young also identified herself prominently with the woman's suffrage movement. The University of Illinois conferred on her the degree of LL.D. She published many educational works, including: *Isolation in the School* (1901); *Ethics in the School* (1902); *Some Types of Modern Educational Theory* (1902); and from 1906 to 1909 she was editor of the *Educational Bi-Monthly*. See biography by John T. McManis (Chicago, 1916).

YOUNG, SIR GEORGE (1837–). An English publicist and author, born at Cookham, and educated at Eton and at Trinity College, Cambridge. As third Baronet, he succeeded his father in 1848. He served on the royal commission on the coolie immigration in British Guiana in 1870, was secretary of the Factory and Workshops Acts Commission in 1875, and of the Irish Land Acts Commission in 1881, and Chief Charity Commissioner in 1903–06. His publications include: *Essay on Greek Literature in England* (1862), for which he received the Le Bas prize; *Dramas of Sophocles Rendered in English Verse, Dramatic and Lyric* (1888; 2d ed., 1906); *Cookham Church: A Village Lecture* (1901); *Poems from Victor Hugo* (1902).

YOUNG, GEORGE PAXTON (1818–89). A Canadian educator. He was born at Berwick-upon-Tweed, Scotland, and was educated at the University of Edinburgh. He became a minister of the Free Church of Scotland, came to

Canada in 1847, and in 1850–53 was pastor of Knox Church, Hamilton. In 1853 he was appointed professor at Knox College. In 1864 he was appointed inspector of grammar schools for Ontario, and during his term of office reorganized the grammar schools of that province. He was professor of metaphysics and ethics in University College, Toronto, in 1871–89, and was considered one of the ablest teachers and professors that Canada ever had. His earlier works include: *Miscellaneous Discourses and Expositions of Scripture* (1854), and *The Philosophical Principles of Natural Religion* (1862). He also contributed to mathematical and philosophical periodicals. Consult J. C. Dent, *Canadian Portrait Gallery* (Toronto, 1880).

YOUNG, JAMES (1811–83). A Scottish chemist, born at Glasgow. He was for several years assistant to Thomas Graham. About 1847 he began a series of analyses of petroleum, and succeeded in producing a lubricating oil for machinery and a lighter oil for lamps. He afterward took out a patent for a process of slow destructive distillation of coal, paraffin being among the useful products obtained, and thus founded a new and important industry. (See PARAFFIN.) His discoveries showed the value of coal oil and petroleum, and have contributed greatly to the development of the American petroleum industry. In 1872 he fitted out an expedition in search of Dr. Livingstone.

YOUNG, JAMES (1835–1913). A Canadian author and legislator, born at Galt, Ontario. In 1853–63 he was editor of the Dumfries *Reformer*, and later was an editorial contributor to the Montreal *Trade Review*, the *Monetary Times* (Toronto), and the *Globe*. While Liberal member for South Waterloo in the Dominion House of Commons in 1867–78, he procured the enactment of much useful legislation. He was a Liberal member of the Ontario Legislature in 1879–86, and in 1883 was provincial treasurer in the administration of Sir Oliver Mowat (q.v.). Young, with Joseph Howe and Isaac Buchanan (qq.v.), was a delegate to the Detroit Trade Convention in 1866, and later wrote able pamphlets on financial and political questions, emphasizing Canadian nationality. His publications include: *Reminiscences of the Early History of Galt* (1880); *Our National Future* (1887); and *Public Men and Public Life in Canada* (2 vols., 1902), chiefly a history of the Canadian Confederation.

YOUNG, JESSE BOWMAN (1844–1914). An American Methodist Episcopal clergyman and editor, born at Berwick, Pa. He graduated at Dickinson College in 1868. During the Civil War he served for three years as captain of the Eighty-fourth Pennsylvania Volunteers. He entered the ministry in 1868, joining the Central Pennsylvania Conference of his church. From 1892 to 1900 he was the editor of the *Central Christian Advocate* of St. Louis, and he published: *What a Boy Saw in the Army* (1894); *Helps for the Quiet Hour* (1900); *The Hungry Christ, and Other Sermons* (1904); *Wellsprings in the Desert* (1905); *To-Day: An Age of Opportunity* (1909); *Charms of the Bible* (1910); *The Battle of Gettysburg* (1913).

YOUNG, SIR JOHN (1807–76). A British administrator, born at Bombay, India. He was educated at Eton and at Corpus Christi College, Oxford, where he graduated in 1829. From 1831 to 1855 he was a moderate Tory member of Parliament. He became a Lord of the Treasury in 1841, was Chief Secretary for Ireland from 1852 to 1855, and was Lord High Commissioner of the Ionian Islands from 1855 to 1859, when he was recalled. From 1861 to 1867 he was Governor-General of New South Wales. In 1869 he was appointed Governor-General of Canada and Governor of Prince Edward Island, which province had not then entered the Canadian Confederation. When he arrived in Canada the first rebellion headed by Louis Riel (q.v.) was in progress, and after its suppression in 1870, Young was created Baron Lisgar. He returned to Europe in 1872 and spent the rest of his life in retirement.

YOUNG, JOHN RUSSELL (1841–99). An American journalist and diplomat, born in Downington, Pa. He was educated in the public schools of Philadelphia and New Orleans. He became news editor of the Philadelphia *Press* in 1861, when as private secretary he went to Washington with Forney, the owner of the paper, who had been elected secretary of the Senate. Subsequently until after the battle of Williamsburg he was with the Army of the Potomac as a war correspondent. In 1864 he accompanied General Banks on his Red River expedition. After the war he was managing editor of the New York *Tribune* (1866–69); in 1870 founded the New York *Standard*, to which he contributed letters from Paris during the Franco-German War; and in 1872 became special foreign correspondent for the New York *Herald*. In 1877 he accompanied ex-President Grant on his trip around the world, an account of which he published under the title *Around the World with General Grant* (1879). He was then a member of the *Herald* editorial staff until 1882; and was United States Minister to China from 1882 to 1885. He continued in literary and journalistic work until 1897, when he was appointed by President McKinley librarian of the new Congressional Library at Washington. He edited a *Memorial History of Philadelphia* (1895), and was a frequent contributor to magazines and reviews.

YOUNG, LUCIEN (1852–1912). An American naval officer, born at Lexington, Ky. He graduated from the United States Naval Academy in 1873. On various occasions he distinguished himself by the rescue of persons from drowning, and in saving part of the crew of the wrecked *Huron*. For a time he taught in the Naval War College, and later was in the Bureau of Equipment, was commander of the port of Havana (1899–1900) and then commandant of the United States naval station at Havana. Young had command of the *Bennington* when its boilers exploded off San Diego, Cal., in 1905, and for this accident was court-martialed, but was vindicated. He was also in command of the Mare Island Navy Yard at the time of the San Francisco earthquake and fire, and did much relief work. Later he was transferred to Key West, and in 1910 was promoted to rear admiral. Young published: *Simple Elements of Navigation* (1898; 2d ed., 1898); *The Real Hawaii* (1899).

YOUNG, ROBERT (1822–88). A Scottish biblical scholar, born in Edinburgh. He was superintendent of the Mission Press at Surat from 1856 to 1861, and in 1864–74 was in charge of the Missionary Institute at Edinburgh. His works include: *The Book of the Precepts by Rabbi Moses*, translated with a *Life* of the author (1852); *Bible Commentary* (1870);

Analytical Concordance to the Bible (1879); *Two-Fold Concordance to the Greek New Testament* (1884); and *Grammatical Analysis of the Hebrew, Chaldaic, and Greek Scriptures* (1885).

YOUNG, SAMUEL BALDWIN MARKS (1840–). An American soldier, born in Pittsburgh, Pa. He served throughout the Civil War, rising from private to brevet brigadier general of volunteers, which rank he received for services in the last campaign against General Lee. In 1866, he entered the regular army. He attained the rank of colonel in 1897, and in 1898 that of brigadier general of volunteers. Later in 1898, after serving with marked ability under General Shafter in the early part of the Santiago campaign, he was promoted major general of volunteers and for a time commanded the Second Army Corps. From July, 1899, to March, 1901, he served with distinction in the Philippines, where for a short time he was military governor of northwestern Luzon and commander of the first district of the Department of northern Luzon. He became brigadier general in the regular army in 1900 and major general in 1901. After his return from the Philippines he commanded the Department of California and helped to organize the new War College, and in 1903, on the retirement of General Miles, he was promoted lieutenant general. From August, 1903, till his retirement the next year, General Young was first chief of staff of the army. In 1909–10 he served as governor of the United States Soldiers' Home at Washington.

YOUNG, THOMAS (1773–1829). A British scientist and archæologist. He was born June 13, 1773, at Milverton, Somersetshire, of Quaker parents. He studied in London, Edinburgh, Göttingen (M.D., 1796), and Cambridge, and in 1799 began to practice medicine in London.

In 1801–03 he was professor of natural philosophy in the Royal Institution, then newly established. Elected a fellow of the Royal Society in 1794, he was its foreign secretary from 1802 till his death. Young was elected one of the physicians of St. George's Hospital in 1811. He published several medical works, of which the most important were *Medical Literature* (1813; 2d ed., 1823) and *Practical and Historical Essay on Consumptive Diseases* (1815). He retired from practice in 1814 on his appointment as inspector of calculations in the Palladium Insurance Company. He served in 1814 also on a commission appointed to investigate the dangers involved in the introduction of illuminating gas in London, and in 1816 he was appointed a member of a commission which was to determine the length of the seconds pendulum, and which also determined the Imperial gallon of 10 pounds of water. In 1818 Young became secretary of the Board of Longitude and superintendent of the *Nautical Almanac*, in which capacity he served until the dissolution of the board in 1828, when he became the sole conductor of the *Nautical Almanac*. During the last years of his life he was a member of a council appointed to advise the Admiralty in scientific matters. Young was the first to describe and measure astigmatism, as well as to study the optical constants of the eye, and explained color sensation by the theory that the eye contained three sets of nerves or receptive systems located at the retina and corresponding to red, green, and violet, and that color blindness was the result of a deficiency of one or the other of these systems. ("On the Mechanism of the Eye," in the *Philosophical Transactions*, 1801.) Young is often called the founder of physiological optics, and his theory was adopted and amplified by Helmholtz with the result that at present it is generally accepted. His most famous work in optics was his demonstration of the wave theory, which since the time of Huygens (1690) had made but slight progress. This was accomplished by his discovery of the interference of light (see INTERFERENCE; LIGHT, *Interference and Diffraction*), which served to explain the color of thin and thick plates and various other phenomena. (See his paper "On the Theory of Light and Colors," *Philosophical Transactions*, 1801.) Many of the phenomena of polarized light were also discussed by Young, and to him are to be credited many discoveries later developed by other physicists. Young first used the terms "energy" and "labor expended" (equals "work done"), as they are now understood in physics. The expression known as Young's modulus represents the use of absolute measurements in elasticity and denotes the weight which would stretch a rod or wire of unit cross section to double its length. His explanation of capillary phenomena was the first correct one. ("Essay on Cohesion of Fluids," *Philosophical Transactions*, 1804.) His lectures before the Royal Institution were published in 1807 (2 vols.).

Young also conducted researches in Egyptology (q.v.), assisted greatly in the translation of the demotic text of the Rosetta stone (q.v.), and published an *Account of Some Recent Discoveries in Hieroglyphical Literature and Egyptian Antiquities* (1823). He was at work on an Egyptian dictionary when he died, May 10, 1829. Consult: George Peacock, *A Life of Young* (London, 1855); *Miscellaneous Works of Young*, edited by Peacock and Leitch (ib., 1857); Henry Crew, *The Wave Theory of Light* (New York, 1900).

YOUNG, SIR WILLIAM (1799–1887). A Canadian jurist and administrator. He was born in Falkirk, Scotland, and was educated at Glasgow University. In early life he removed to Nova Scotia, where he was called to the bar in 1826, and in 1832 was elected to the Legislative Assembly. In 1838 he went to Quebec as a delegate to inform Lord Durham (q.v.) as to the political condition of Nova Scotia, and shortly afterward was sent to England to urge the British government to grant responsible government to the province, a course later followed. In 1842 he was a member of the Executive Council, Speaker of the Assembly in 1843–54, Premier in 1854–57 and again in 1860, and Chief Justice of Nova Scotia in 1860–81. He was knighted in 1868.

YOUNG, WILLIAM HENRY (1863–). An English mathematician. Born in London, he was educated at Peterhouse, Cambridge, where he was a fellow in 1886–92. After 1887 he lectured at Girton College, was chief examiner to the Central Welsh Board in 1902–05, and in 1913 became professor of the philosophy and history of mathematics at Liverpool University. He was elected a fellow of the Royal Society. Besides more than 120 mathematical papers, he published *The Fundamental Theorems of the Differential Calculus* (1910).

His wife, GRACE CHISHOLM YOUNG, a sister of Hugh Chisholm (q.v.), studied at Girton College, Cambridge, and at Göttingen (1893–95), where she took the degree of Ph.D., *magna cum laude*,

being the first woman allowed a degree in Prussia. With her husband she was joint author of *The First Book of Geometry* (1905; Ger. trans., 1908; Ital. trans., 1910), and *The Theory of Sets of Points* (1906).

YOUNG CHEVALIER, THE. A title given to Charles Edward Stuart, son of the Old Pretender.

YOUNG ENGLAND. A faction of the Conservative party which had its rise about the year 1843 under the leadership of Disraeli and Lord John Manners. It sought to combat the rise of militant democracy by bringing about a closer connection between the upper classes and the people in the spirit largely of the mediæval feudalism, adapting itself to modern industrial conditions. The party disappeared in 1845. Disraeli has delineated the character of the movement in his novels *Sybil* and *Coningsby*.

YOUNG EUROPE. An international association formed in 1834 on the model of Mazzini's Young Italy (q.v.). It was composed of the national societies of Young Italy, Young Poland, and Young Germany, which, independent in their own sphere, acted in common, through a central committee, for the furthering of the principles of liberty, equality, and humanity in Europe. The headquarters of the society were in Switzerland, where, in 1835–36, was brought about the organization of a French society, Young France. The activity of the society speedily aroused the opposition of the Swiss authorities, who expelled many of its members from the country. Its influence quickly disappeared.

YOUNG GERMANY. The name given to a group of German writers, of whom Heine (q.v.) was the most famous, which in the third decade of the nineteenth century initiated a revolt against the prevailing spirit of romanticism in the national literature, which had resulted in a total separation of literature from the actualities of life. Against the dominant spirit of absolutism in politics and obscurantism in religion the writers of this school maintained the principles of democracy, socialism, and rationalism. Among many things they advocated the separation of church and state, the emancipation of the Jews, and the raising of the political and social position of women. In 1835 the Federal Diet issued a decree forbidding the publication of the works of Heine, Gutzkow, Laube, Mundt, and Wienbarg (qq.v.).

YOUNG IRELAND. A party which had its rise during the agitation for the repeal of the Act of Union carried on by O'Connell (q.v.) after 1841, and differing from that great leader in their advocacy of forcible means for the attainment of their demands. The break between the Young Ireland party and the conservative section became definite about the year 1844. Those who took a prominent part in the movement were Thomas Osborne Davis (q.v.), Gavan Duffy (q.v.), John Mitchel, Thomas Francis Meagher (q.v.), John Blake Dillon, and William Smith O'Brien (q.v.). In the *Nation*, the organ of the party, the people of Ireland were repeatedly called upon to revolt, and in the stormy year 1848 the British government grew alarmed. Mitchel was arrested and deported to Tasmania, whereupon the other leaders of the Young Irelanders set to work with renewed activity to bring about an uprising. The attempted insurrection, however, failed miserably, and the leaders were all speedily arrested. Meagher and O'Brien were sentenced to death, but the sentence was commuted to transportation. The movement therewith quickly collapsed. See IRELAND.

YOUNG ITALY. A society organized by Mazzini (q.v.) in 1831 for the purpose of effecting the liberation of the Italian peninsula from Austrian domination and its union under a republican form of government. As distinguished from the Carbonari (q.v.), the new society sought to attain its aims by a campaign of agitation and open insurrection rather than by conspiracy. It first became openly active in the beginning of 1834, when occurred the abortive invasion of Savoy by Mazzini. Before this, however, the Sardinian government had obtained full cognizance of the movement through its spies and had entered upon a course of severe repression, a number of the leaders being put to death and others being subjected to imprisonment and exile. The impracticable character of Mazzini made it evident that a successful revolution was impossible, and the society rapidly declined in influence, its place being taken by the more conservative national movement of which the Sardinian monarch was coming to assume the leadership. The society, nevertheless, did great good in quickening the spirit of Italian patriotism, and to a very large extent made the work of Victor Emmanuel and Cavour possible. It was the model for a number of revolutionary societies throughout Europe in the stormy period preceding the upheaval of 1848. See ITALY; YOUNG EUROPE.

YOUNG MEN'S CHRISTIAN ASSOCIATIONS. Societies of young men composed of an active controlling membership identified with evangelical churches and of a more numerous associate membership not yet connected with the churches. They seek to promote the physical, social, mental, and spiritual welfare of their members and of other young men.

North America. The associations in the United States and Canada have been always affiliated, and in 1902 a promising organization was added in Mexico.

The first associations on the continent were organized in December, 1851, at Montreal and Boston, both as a result of information received regarding the society organized seven years earlier in London, England. Forty more were formed within three years. Their first international convention was held at Buffalo, N. Y., June 7, 1854. A confederation was formed, with a central committee and an annual convention, which lasted until the Civil War. The war greatly diminished the membership, and the organizations that survived worked chiefly among soldiers in the field. At a special convention of the northern associations, held in New York, November, 1861, the United States Christian Commission was formed. It received the practical sympathy of the Christian public, sent 5000 helpers to camps and hospitals, and distributed over $5,000,000 in money and stores. The associations in the South did similar army work, but not in a general organized capacity.

After the war the association entered upon a period of growth. Leading business men consented to serve in official positions. Employed officers increased in number and much more in experience and efficiency. Carefully planned buildings were erected, the indebtedness on earlier buildings was canceled, and great improvement in equipment was realized. But the chief gain came in the steady advance, through accumulated experience, of all standards of work.

In addition to the data in the following table showing the growth of the work, there were in 1915 associations for colored men in 45 cities and in 102 educational institutions; there were 78 organized counties employing over 100 secretaries; there were 84 Indian associations with 2745 members; the army and navy department reported 30 branches.

NORTH AMERICA	1866	1886	1915
Total number of associations	90	1,176	2,583

Current expenses, State and provincial work	. . .	$38,959	$437,018

Work of Each Association. The local association has absolute autonomy, except that to affiliate with the international convention there must be constitutional provision restricting active (voting and office-bearing) membership to men in communion with some evangelical church. A typical association may be thus described: (1) Membership—(*a*) active, who carry most of the responsibility; (*b*) associate, young men of good moral character. (2) An incorporated board of directors, the usual officers, and numerous committees. Real estate is generally held by a board of trustees. (3) As executive officer a salaried secretary, whose chief responsibility is to supervise, organize, and administer. (4) A specially constructed building with reception room, offices, reading room, library, meeting and recreation rooms, educational classrooms, and quarters for boys' department. Modern buildings usually contain dormitories and gymnasia for young men, which produce revenue and contribute towards the social life, especially when a restaurant is added. (5) Organized departments: (*a*) business—general supervision, membership; (*b*) religious—Bible and workers' training classes, evangelistic and devotional meetings, work in behalf of personal purity, and a specially emphasized personal work; (*c*) educational—evening classes, literary societies, and lectures; (*d*) physical—gymnasium and athletic field, with instructors qualified to make physical examinations and prescribe and direct safe and beneficial use of these facilities; (*e*) social—a pleasant resort with companionable supervision, music, recreative games, social gatherings, and entertainments; (*f*) information and relief—employment bureau, boarding-house register, savings fund, medical club, visitation of the sick; (*g*) a work along all these lines for boys. During recent years the associations have undertaken more and more effort outside their buildings and among nonmembers. Leaders, imbued with clean-sport principles, have been furnished for physical work in factories, settlements, missions, boys' clubs, and public schools and playgrounds, as well as for Sunday-school athletic leagues and civic athletic contests. Religious meetings and Bible classes have multiplied in shops, cabooses, street-car barns, and homes. These various endeavors have been so conducted as to promote healthy social intercourse and good citizenship. Its work is carried on under two main divisions: home and foreign. Through an important change in 1915 Mr. John R. Mott was made general secretary of both divisions. The home work division employed 77 secretaries in 1915 in the following departments: district executive, army and navy, *Association Men* (the official organ published monthly), boys' work, building bureau, Canal Zone, colored men's, county work, educational, industrial, physical, publication, railroad, religious work, secretarial bureau and fellowship, and student. A new department for city associations was formed in 1916.

General Work. The North American conventions are triennial. Each convention elects one-third of the 75 members of its Executive or International Committee, who reside in different parts of the continent. It is incorporated, and its headquarters and working quorum have been located in New York since 1866. The fund needed having been pledged, the committee erected (1907) a building as its permanent home at 124 East Twenty-eighth Street, New York. Its permanent funds are held by a board of 14 trustees; the endowment in 1915 was $1,384,000. State and provincial organizations, 41 secretaries and 103 assistant secretaries in 1915, exercise a closer and more immediate supervision, each over its own field. Forty-one State and provincial conventions are held either annually or biennially.

Physical Work. The first well-equipped gymnasium was opened in New York in 1869, and the first physical director was employed in it. There are now 654 physical directors and several hundred thousand men and boys using the various means of physical training. The aid of 10,400 trained volunteer leaders makes possible the handling of this multitude. Some associations have well-equipped athletic grounds and many more have summer camps for both boys and young men.

The Athletic League of the Young Men's Christian Associations of North America and a similar league in Canada are the media for coöperation between associations that desire it in the holding of games, the establishment of athletic records, and in lines of scientific work. Associations in all the larger cities and more than 100 in smaller cities are members of these leagues.

Educational Work. This department includes the work of the reading room, library, educational lectures and practical talks, educational clubs, and classes in commercial, political, industrial, scientific, and linguistic subjects. Courses in these subjects, on which annual examinations are held and certificates granted, are suggested by the International Committee. In 1915 there were employed 2500 paid teachers

and $1,034,000 were spent in educational work. *Educational Notes* is published monthly.

Religious Work. Frequent references show the dominating religious purpose of all the work. The committee has promoted this through the influence and efforts of all its agents; through printed suggestions, especially of Bible study courses; and, since 1899, through the employment of several secretaries for special religious work.

Securing and Training Employed Officers. In 1871 was held the first of a series of annual secretarial conferences. This has been followed by the association training schools, which were organized as independent institutions at Springfield, Mass., in 1885, and at Chicago in 1890. Their courses of study include the history, organization, and methods of the entire work, Christian history, physiology, athletics, psychology, sociology, the study and teaching of the English Bible, and opportunity for participation in practical association work. The corporation controlling the Chicago school also conducts an extensive summer training conference on its grounds at Lake Geneva, Wis. School and conference training were begun at Silver Bay, N. Y., in 1901; at Lake Conchiching, Ontario, in 1906; at Estes Park, Colo., in 1910; at Blue Ridge, N. C., in 1912; at Arundel, Md., in 1912 (but transferred to Harper's Ferry in 1915); at Hollister, Mo., for railroad secretaries in 1906; and at Asilomar, Cal., in 1913.

Boys' Work. The first separate boys' department was organized at Salem, Mass., in 1869. The New York State committee employed the first boys' work supervisory secretary in 1897, and the International Committee secured a similar officer in 1900; it had five such in 1915. Commonly each class of boys—school boys, working boys, and street boys—can receive the most benefit by itself, and the largest possibilities are in the order just given. Accommodation is provided by some associations for a membership of more than 1000 boys. Community boys' work consisting of physical, educational, social, and religious centres was organized in 1915 in 22 places in Canada and the United States.

Work Among Railroad Men. The first association organization for definite work of this kind originated at Cleveland, Ohio, in 1872, although the International Committee had made evangelistic efforts among the men engaged in building the Union Pacific Railroad, beginning in 1868. Delegations from Cleveland started 18 other associations during the next five years. In 1877 the International Committee secured its first railroad secretary; there were eight in 1915. In 1915 there were 234 secretaries and 272 assistant secretaries besides 51 membership, religious work, social, and boys' secretaries and physical directors of railroad associations. In 1915 the 250 organizations expended $1,602,470. Of this amount the employees and others paid more than half, chiefly in membership fees. The remainder, together with large sums for buildings and equipment, was contributed voluntarily by the railroad corporations. The early railroad branches opened reading rooms and held religious meetings. Now every form of work done by city associations is carried on, while dormitories and restaurants, first made prominent in the railroad work, have spread from it to the city work. Emergency hospitals are sometimes maintained and many visits made to the sick and injured. Membership tickets are reciprocal. Several organizations have been formed recently among street-railway employees. Several European governments have investigated this work, with a view to starting it in their own countries.

Work Among Industrial Men. The methods and spirit of the railroad associations are also being extended to other large bodies of employed men and their employers. Numerous manufacturing, mining, and lumbering corporations have aided in establishing similar work among their men, sometimes in expensive buildings erected for the purpose. Eight international secretaries are engaged in this field of effort. Moreover, city and railroad associations hold midday meetings in shops and factories. In 1915 over 300 associations reported religious meetings in 768 different shops with total attendance of 1,772,000.

Work Among Students. The first student associations were organized in the University of Michigan and the University of Virginia in 1858. In 1877 the 30 scattered societies became united in an Intercollegiate Movement, for which a secretary was secured by the International Committee. There are now 16 international student secretaries and a total of 770 student associations with a total membership of over 75,000. A body of literature has been created, and *The Intercollegian* is published monthly. In large cities the students of various institutions are affiliated through an intercollegiate organization, which is a department of the city association, and through this much important work is carried on. As a result of this work over 38,000 students in 1915 were enlisted in private and voluntary Bible study, and a strong impetus has been given to the study of the Bible in the curriculum. With the aid of the Student Volunteer Movement for Foreign Missions, which is an outgrowth of the student associations, mission study classes have been formed with an enrollment in 1915 of 8500. Moreover nearly 9000 students were directed in community service. Summer conferences for the study of the Bible, and for the promotion of the religious life of students, commencing in 1886, have spread from Northfield to all sections of the United States, and to so many other lands that in 1895 these societies were federated by organization under American leadership into the World's Student Christian Federation.

Work in the Army and Navy. About 1880 some State and provincial committees established association tents in summer militia encampments. This effort is still growing in extent and usefulness. Three days after the first call for volunteers for the Spanish-American War, the International Committee decided to undertake a similar work in the regular army and navy. Under government authorization facilities for the comfort and welfare of the soldiers were maintained by international, State, and local committees in the United States, Cuba, Porto Rico and the Philippines. In charge of the work 223 trained secretaries were employed. Similar work was carried on from Key West for sailors. At the close of the war, the President and other officials requesting the continuance of this work, the International Committee began to form associations wherever the number of soldiers or sailors warranted. The first army association building, dedicated in 1900, was the gift of Mr. William E. Dodge to the New York City association for the work on Governor's

Island. Several other buildings have since been erected. Army work is now carried on at 20 points in the United States and its dependencies, together with much visitation of outlying camps. This work has had the cordial support of the government.

In the navy (1) associations in coast cities have extended their privileges to sailors. (2) Branches of the naval associations have been formed on warships. A Naval Temperance League has been organized. (3) A house fitted up in 1899 near the New York Navy Yard as a resort for enlisted men was superseded in 1902 by a seven-story building, 75 by 100 feet in size, and costing $415,000. It was the gift of Miss Helen Miller Gould through the Woman's Auxiliary of the International Committee. (4) Similar work, both for sailors and soldiers, is done in the Philippines and at Shanghai, China.

Work Among Negro and Indian Young Men. A few scattered associations of colored young men were formed prior to 1875, but systematic effort among them began at the international convention of that year, and a visiting secretary was put in this field soon after. Six competent colored men are now fully engaged in this work. Unlike the other departments, it has had the great advantage of a beginning among the student class. Student associations are now organized in 102 educational institutions, including nearly every important school for colored young men in the South. The first fully organized city association, with a general secretary, was started in Norfolk, Va., in 1888. There were 45 in 1915.

Christian young men of the Sioux tribe spontaneously formed what were practically Young Men's Christian Associations as early as 1881. Since 1894 the International Committee has employed one of their own number, specially trained for the service, to develop this work among the Indians. Under this guidance there were, in 1915, 84 associations with 2745 members.

Work in the Panama Canal Zone. One international secretary and nine local secretaries are in charge of association activities at six centres in the Canal Zone. The government has furnished several buildings and the Canal Commission appoints an advisory committee.

Publications. Reports of all international conventions and of most of the State conventions have been printed, and constitute the detailed history of the movement, in connection with the Year Books issued by the International Committee. Hundreds of books and pamphlets have been issued.

County Work. This department employed 5 international, 14 State, and 94 county secretaries in 1915. Work was organized in 563 communities, and departments for training county secretaries had been opened at Springfield and Chicago.

Foreign Work. The International Committee sent its first foreign secretary to Japan in 1889. For several years previously urgent united appeals had come from many foreign missionaries for this aid, and in no case has a step been taken without such requests. The committee in 1915 had 175 secretaries in foreign lands; of these 73 were in China, 44 in India, and the remainder in Argentina, Brazil, Ceylon, Chile, Egypt, Japan, Mexico, Philippine Islands, Turkey, Uruguay, and West Indies. Their function is to train and develop native workers as rapidly as possible. Apart from the salaries of these secretaries, which involved an expenditure in 1914 of $433,000, the work in each locality is self-supporting. During the war with

Russia association work was done successfully in the Japanese army, Japanese and American secretaries and many missionaries participating. Expensive buildings have been erected in many foreign centres, notably Tientsin, Shanghai, Manila, Kyoto, Seoul, Constantinople, Hongkong, Canton, Tokyo, and Calcutta.

The London association was formed June 6, 1844, as the result of religious effort among dry-goods clerks, by George Williams, then one of their number. From London as a centre associations were propagated throughout the United Kingdom and many other countries. The first of a series of annual British conferences was held in 1858, and the first association building was erected in 1866. A National Union for England and Wales was formed in 1882, and for Ireland in 1884. The Scottish general organization was formed in 1884.

The leading facts regarding the associations of the world in 1914 are given in the table on page 895.

Between 1806 and 1841 a number of Christliche Jünglingsvereine came into existence in Germany. They were small bands of young men for mutual encouragement in the Christian life, and were usually connected with an individual church. Many others have since been formed, and all have come in affiliation with the more recently organized World's Committee. In 1883 a new and broader form of organization, Christliche Vereine Junger Männer, resembling the American associations, was started in Berlin. This has since spread to other cities, and its methods have been adopted by many of the older societies. Associations were organized in France about 1850. The first world's conference, meeting in Paris in 1855, and notable for formulating a basis since universally adopted, gave impetus to the French societies. The present national alliance was formed in 1867. In 1893 the Paris Association entered its new building, adapted to the advanced methods of work, and in 1902 held an enthusiastic celebration of the jubilee of its organization. The Swiss associations form two independent unions, the German and the French. The existing movement in Sweden began with the organization of the Stockholm Association in 1884, after the model of those at Paris and Berlin. Various European associations do special work for soldiers and many have boys' branches.

World's Conference and Committee. Eighteen world's conferences have met in leading European cities. At the eighth conference (Geneva, Switzerland, 1878), a Central International Committee was established, composed of representatives from the affiliating national organizations, and with a quorum resident in Geneva. This World's Committee includes an executive committee of 18 members, 31 advisory members representing and resident in 24 different countries, and corresponding members for Bohemia, Moravia, Ceylon, Iceland, and Turkey. The thirteenth conference was held in London in June, 1894, coincidently with the fiftieth anniversary of the London association. Twenty-six nationalities were represented by 2000 delegates. The sixteenth conference, which met at Paris in 1905, commemorating the fiftieth anniversary of the first conference also held there, was one of the most notable Protestant gatherings ever held in that city. The basis of 1855 was reaffirmed. A conference met in Edinburgh in 1913; there were 556 delegates.

YOUNG'S THEORY AND EXPERIMENTS. See LIGHT.

YOUNGSTOWN. A city and the county seat of Mahoning Co., Ohio, 67 miles east by south of Cleveland, and about the same distance from Pittsburgh, Pa., on the New York Central, the Erie, the Baltimore and Ohio, the Pennsylvania, the Lake Erie and Eastern, and the Pittsburgh and Lake Erie railroads (Map: Ohio, J 3). It has excellent interurban trolley connection with surrounding cities, and is situated attractively on both banks of the Mahoning River. Among the most prominent institutions are the Children's Home, the Old Ladies' Home, the Y. M. C. A. and Y. W. C. A., and city and St. Elizabeth's hospitals. The park system comprises 656 acres, the most important of the seven reserves being Mill Creek, a park of great natural beauty. Noteworthy structures include the Reuben McMillan Free Library, the handsome county court house, the Federal building, Market Street viaduct, and the Wick, Mahoning, Stambaugh, and Dollar bank buildings. Youngstown has considerable importance as an industrial city, being noted chiefly as the centre of a vast iron and steel producing district. According to the census of 1914, the city's 201 manufacturing establishments represented a capital of $129,819,000, gave employment to 18,220 persons, and showed a production value of $92,111,000. Chief among the establishments are enormous iron and steel works, and large sheet and tube works. Others include lumber and planing mills, carriage and wagon works, and manufactories of roofing material, iron and steel pipe, oil cloth, bridges, etc. A rolling mill was erected here in 1845, and a furnace in 1846. The government is vested in a mayor, chosen biennially, and a council. For maintenance and operation the city spent in 1913, $1,166,000, the principal items of expenditure being: education, $407,000; interest on the debt, $133,000; police department, $118,000; fire department, $98,000; water works, $96,500; sanitation, $76,000; and highways, $75,000. In 1797 John Young made the first settlement here, and in the following year obtained a title to the land from the Connecticut Land Company. Pop., 1900, 44,885; 1910, 79,066; 1915 (U. S. est.), 104,489.

YOUNG TURK MOVEMENT. See TURKEY, *History*.

YOUNG WOMEN'S CHRISTIAN ASSOCIATION. An international organization for the improvement of the religious, intellectual, social, and physical life of young women. The movement dates from 1855, when Miss Emma Robarts formed the English Prayer Union, and when Mrs. Arthur Kinnaird opened at London

the General Female Home and Training Institution with library, Bible and mission classes, and employment bureau. The World's Young Women's Christian Association was formed in 1894. Its purpose was: to bring national associations into closer contact; to form new national committees; and to establish association work in nonchristian countries. The first world conference was held in London in 1898 with 396 delegates present from seven countries; the one held in Stockholm in 1914 had about 800 delegates present from 18 countries. The aggregate membership was nearly 800,000. The World's Committee, with headquarters in London, issues an official organ, *The Woman's International Quarterly*. This committee in 1915 maintained 72 workers in foreign fields.

The following were the 18 National Associations in 1916: Canada, 30 city and 48 college associations, 17,933 members, five national secretaries; South Africa, seven associations, 1600 European and 2000 native members, two national secretaries; United States (see below); China, 33 associations, 1300 members, four national secretaries; India, Burma, and Ceylon, 60 student, 67 city, and 30 vernacular associations, 10,000 members, four national secretaries; Japan, 24 associations, 2673 members, three national secretaries; Australasia, 21 associations, 8350 members, two national secretaries; Austria, one national secretary; Denmark, 510 associations, 19,000 members, 1 national secretary; Finland, 64 associations, 5000 members, one national secretary; France, 314 associations, 11,500 members, two national secretaries; Germany, 6000 associations, 250,000 members, one national secretary; Great Britain and Ireland, 1437 associations, 96,676 members, two national secretaries; Holland, 35 associations, 1550 members, one national secretary; Hungary, 13 associations, 1900 members, one national secretary; Italy, 44 associations, 1300 members, one national secretary; Portugal, nine associations, 365 members, one national secretary; Sweden, 44 associations, 4600 members, one national secretary. Belgium with 35 associations was not affiliated with the World's Association. Other countries in which work was carried on were: North, Portuguese East, and West Africa, West Indies, British Guiana, Argentina, Brazil, Chile, Greece, Norway, Russia, Switzerland, Turkey in Asia, Bulgaria, Malta, and Gibraltar. The following were official publications of national associations: *The Australian Quarterly; The Young Women of Canada; Le Journal de la Jeune Fille; Fürsorge für die weibliche Jugend* (Germany); *Our Outlook* (Great Britain); *The Young Women of India; L'Alba* (Italy); *The Young Women of Japan;* and similar papers in Finland and Sweden.

United States. The first organization in the United States was the Ladies' Christian Association of New York City formed in 1858 "to labor for the temporal, moral, and religious welfare of self-supporting young women." In 1866 the Young Women's Christian Association of Boston was established with employment and boarding directories, religious, educational, and social features. It opened a boarding house in 1868. In 1871 an International Conference of Women's Christian Associations met at Hartford, Conn. The first student group was the Young Ladies' Christian Association formed at Normal University, Normal, Ill., in 1873. By 1886 local groups were sufficiently numerous to permit the formation of the National Association of Young Women's Christian Associations which later became the American Committee. In 1891–93 the International Conference reorganized as the International Board of Women's and Young Women's Christian Associations. The National Young Women's Christian Association was organized in December, 1906, by union of local associations formerly affiliated with the International Board of Women's and Young Women's Christian Associations and the American Committee which latter organization was affiliated with the World's Association after 1894. Its constitution was adopted in 1909. Headquarters are in New York City. In 1916 the national work was supervised by a National Board of 56 members, including one from each of the 11 field committees, and 15 auxiliary members. Its work was conducted through eight departments: secretarial, finance, conventions and conferences, publication, office, foreign, field work, and method. The secretarial department recommended secretaries to positions and maintained an extensive system of training for workers in various branches, including the National Training School at New York. The National Board adopted for 1916 a budget of $490,000 for headquarters, field, and foreign work. The third department mentioned conducted 15 national conferences in 1915 at widely scattered points, such as Silver Bay, N. Y., Lake Geneva, Wis., Estes Park, Colo., Blue Ridge, N. C., Seaside, Oreg., and Asilomar, Cal. General conventions were held at New York, 1906, St. Paul, 1909, Indianapolis, 1911, Richmond, 1913, and Los Angeles, 1915. The publication department supervised the issue of the official organ, *The Association Monthly*, and many textbooks for Bible study, besides numerous leaflets and pamphlets. There were maintained in the foreign field 38 secretaries at the following places: Bombay, Calcutta, Lahore, Madras, Singapore, Shanghai, Canton, Foochow, Peking, Tientsin, Tokyo, Yokohama, Buenos Aires, and Constantinople. The first American secretaries were sent to India in 1894, to China and Japan in 1903, to South America in 1906, and to Turkey in 1913. The field work department divided the United States into 11 sections each with its own committee and offices serving as substations. The headquarters of these fields were at Chicago, Philadelphia, Minneapolis, New York, Seattle, Cincinnati, Richmond, Va., St. Louis, Dallas, San Francisco, and Denver. By 1915 every State was included in one of these fields. By 1915, moreover, 10 of the 11 field committees had established secretarial training centres. In 1916 the department of method included 22 secretaries devising plans for conducting all branches of local activities including student, immigration, physical education, missionary, religious, Indian, colored, girls', economic, industrial, and educational. In 1910 the board opened its first International Institute for immigrant girls at New York City. In 1915 it erected headquarters at the San Francisco exposition. Three members of the National Board sat on the Council of North American Student Movements. Affiliations were formed also with the World's Student Christian Federation, and the Student Volunteer Movement for Foreign Missions. The jubilee of the organization was celebrated in 1916.

There were in the United States in 1915 a total of 988 local associations; of these 254 were

town and city, 17 county, and 717 student. There were 289,777 city members, 6372 county, and 61,310 student. There were 1881 employed officers; and the annual current expenses aggregated $5,067,717, nearly all for city associations. The total value of real property owned by 144 associations was $12,444,879. The enrollment in various classes was as follows: Bible study, 73,345; mission study, 21,007; physical education, in over 200 associations, 66,473; general education, 57,438. Work among adolescent girls was conducted by 214 associations, 28,940 girls being enrolled. Lunch rooms were managed by 157 associations; 162 provided lodgings for 160,773 transients; 60 found employment for 21,004 women; 90 granted travelers' aid to 310,807 women. The student associations employed 67 general secretaries; and the county associations 26. Bible study, mission classes, and social activities were the principal lines of work of the student associations, while the country associations devoted themselves to the organization of clubs and camps as well as to religious, missionary, educational, and social work. Consult: *Handbook* (New York, annually); *Year Book* (ib., annually), both published by the National Board; also Elizabeth Wilson, *Fifty Years of Association Work Among Young Women* (ib., 1916).

YOUTH. See ADOLESCENCE.

YOUTH, FOUNTAIN OF. See FOUNTAIN OF YOUTH.

YOWDANCHI. See YOKUTS.

YOZGAD. See YUZGAT.

YPRES, ē'pr', or **YPEREN,** ē'pe-rĕn. A town in the Province of West Flanders, Belgium, 35 miles south of Ostend, on the Yperlee River (Map: Belgium, A 4). In the two battles in November, 1914, and April, 1915, when the Germans unsuccessfully attempted its capture, the town suffered severely from shell fire and was reduced to a mere heap of ruins. (See WAR IN EUROPE.) Prior to the war an object of interest was the Cloth Hall, begun in 1201 and completed in 1342. Conspicuous also were the Gothic cathedral of St. Martin, dating from the thirteenth century, with rich carvings; the town hall, with frescoes and paintings; and the eleventh-century church of St. Peter. Ypres was formerly a prominent industrial centre, especially known for its extensive production of woolen goods. Linen and lace were also important manufactures. Pop., 1900, 17,371. Ypres was at the zenith of its prosperity in the thirteenth century.

In the great conflict of 1914, it was occupied by the Germans (Oct. 3, 1914). Later in the month, they evacuated it as the lines approached the sea, and it thenceforth became a position of the British lines, and as such resisted all subsequent German efforts to capture it in their desperate attempts to reach the Channel ports. See WAR IN EUROPE.

YPSILANTI, ĭp'sĕ-lăn'tē, or **HYPSILANTIS,** ĕp'sē-lăn'dēs. The name of a Fanariot family (see FANARIOTS) claiming descent from a branch of the Imperial stock of the Comneni. The claim of its members to distinction is derived from their leadership of the Greeks in the struggle for independence of Turkish rule. —ALEXANDER YPSILANTI (c.1725–1807) was Hospodar of Wallachia (1774–77, 1796–98) and of Moldavia (1787), and was executed at Constantinople for alleged complicity in Greek conspiracies. His son, CONSTANTINE YPSILANTI (1760–1816), was appointed Hospodar of Moldavia in 1799 and of Wallachia in 1802. His sympathy with Russia led (1806) to his dismissal and flight to Transylvania. Reëstablished in the government of Wallachia by the Russians, he showed his hatred for the Porte by encouraging (1807) the Serbians in their insurrection, but soon retired to Kiev, in Russia, where he died in 1816. Of his sons, the eldest, ALEXANDER (1792–1828), served for some time in the Russian army, fought with distinction against Napoleon in 1812–13, and by 1817 attained the rank of major general. He was chosen by the Hetærists as their chief in 1820. (See HETÆRIA PHILIKE.) In promotion of the cause of Greek independence, he collected large sums in Russia, and at Jassy in March, 1821, proclaimed the independence of Greece. Little suited by nature to guide the movement he had originated, he was defeated by the Turks near Dragasani (June 19), and forced to take refuge in Austria. He was arrested and kept a prisoner for six years at Munkács and Theresienstadt. Released in 1827, broken in spirit and body by chagrin and privations, he retired to Vienna, where he died. His younger brother, DEMETRIUS (1793–1832), also began his career in the Russian army. Sent to Greece by his brother to assume the leadership of the revolt there, he took part in the capture of Tripolitza (October, 1821), but was less successful in the following year in his attack on Eubœa. His gallant defense of Argos against the Turks stopped their victorious advance (1823). His stubborn resistance (1825) to the victorious Ibrahim Pasha at Napoli was another valuable service to Greece. In 1828 he was made commander in chief; but differences arising between him and the President, Capo d'Istrias, he resigned his post in January, 1830.

YPSILANTI, ĭp'sĭ-lăn'tĭ. A city in Washtenaw Co., Mich., 29 miles west by south of Detroit, on the Huron River, and on the Michigan Central and the Lake Shore and Michigan Southern railroads (Map: Michigan, F 6). Ypsilanti is the seat of the Michigan State Normal College. The industrial establishments include foundries and machine shops, a creamery, a flouring mill, a paper mill, agricultural implement works, and planing mills. The river has a descent of 32 feet in the city limits and affords abundant power. Pop., 1900, 7378; 1910, 6230.

YPURINAN, ē-pōō'rē-năn *or* ē'pōō-rē'nan. An Indian language of Brazil. The Ypurinas, Hypurinas, or Jupurinas dwell on the river Purus. The Hypurinas on the river Acre or Aquiri belong to the same tribe. They are without civilization. The women go naked, but the men wear long robes, and both sexes pierce the lips and nose. Consult: D. G. Brinton, *The American Race* (New York, 1891); Ehrenreich, in *Zeitschrift für Ethnologie*, vol. xxix (Berlin, 1897); A. F. Chamberlain in *Journal de la Société des Américanistes de Paris*, new series, vol. vii (Paris, 1910).

YRIARTE, ē'rē-är'tā, CHARLES EMILE (1832–98). A French author, born in Paris and trained as an architect. In 1859 he followed the Spanish campaign in Morocco as correspondent and illustrator, and in 1860 that of Garibaldi in Sicily. In 1881 he became inspector of fine arts and continued to be in government offices until his death in Paris. His publications include: *Portraits parisiens* (1865); *Goya, sa vie et son œuvre* (1867); *Le puritain* (1875); *Venise*

(1877; Eng. trans., 1880); *Florence* (1880; Eng. trans., 1882); *Françoise de Rimini* (1882); *La vie d'un patricien de Venise* (1885); and *Autour des Borgia* (1890).

YRIARTE Y OROPESA, TOMÁS DE. See IRIARTE.

YSAYE, ē'zä'ye, EUGÈNE (1858–). A Belgian violinist, born in Liége. His father, a successful conductor and violinist, who had acted as his teacher, sent him early to the Liége Conservatory. He next studied under Wieniawski and Vieuxtemps at Brussels, the latter of whom was so impressed with the boy's talent that he obtained for him state aid by which he was enabled to complete his studies in Paris. His first important engagement was as leader of Bilse's orchestra, Berlin, which appointment he held until 1881, after which he toured Europe and America. In 1886–98 he was professor and director of the violin department at the Brussels Conservatory, where he organized the celebrated Ysaye quartet. After his retirement from the conservatory he devoted all his time to extensive tours. He gained fame for a tone unusually large and capable of infinite variety of coloring, for a stupendous technic, and above all as an interpretative artist of compelling power and extraordinary personal magnetism. His compositions include six violin concertos, variations on a theme by Paganini, three mazurkas for violin, and *Poème élégiaque* for violin with orchestra.

YSLETA, ē-slā'tä. See ISLETA.

YSOLDE, ē-sōld'. See ISEULT.

YSOPET, ē'zō'pĕt'. A diminutive of Æsop; a general name in mediæval French literature applied to any collection of fables, more especially the title of a volume of this nature written by Marie de France. A modernized version is to be found in Roquefort's edition of the author's works (1820). Consult J. Bédier, *Les Lais de Marie de France*, in "Revue des Deux-Mondes" (Paris, 1891); Karl Waruke, "Die Quellen des Esope der Marie de France," in *Forschungen zur romanischen Philologie* (Halle, 1900).

YSSEL, ī'sĕl, or **IJSSEL.** A river of the Netherlands, connecting the Rhine with the Zuyder Zee (Map: Belgium, E 3). At Doesburg it is joined by the Oude. Yssel and the connection between this and the Rhine may have been made by Drusus (q.v.). Thence it flows north and northwest past Zutphen and Deventer, forming part of the boundary between Gelderland and Overyssel, and, passing Kampen, falls into the Zuyder Zee, forming at its mouth a delta of several arms. The Yssel is navigable for steamers throughout its length of 60 miles, the mouth being kept open by jetties. There is another river of the same name, a branch of the Lek, in the Province of Utrecht.

YSTAD, ụ'städ. A town of the Province of Malmöhus, Sweden, on the Baltic, 40 miles east-southeast of Malmö (Map: Sweden, E 9). It is an ancient town. Sugar, tobacco, ironwork, and leather are manufactured. The new port is exceptionally free from ice. Pop., 1910, 11,285.

YTTERBIUM, ĭ-tĕr'bĭ-ŭm. A metal obtained in 1878 by Marignac and considered as an element until 1907, when Urbain showed it to be composed of two distinct elements, which he named, respectively, neo-ytterbium and lutecium. As an element, it had the symbol Yb and its atomic weight was assumed to be 172.0. It occurs in monazite and gadolinite in the form of the oxide, to which was assigned the formula Yb_2O_3 (ytterbia).

YTTRIUM, ĭt'rĭ-ŭm (Neo-Lat., from *Ytterby*, in Sweden). A metallic element contained in the mineral gadolinite and first pronounced to be a new substance by Mosander in 1843. It is found with other cerium metals, as a silicate, in gadolinite and allanite, and as a fluoride in yttocerite. The metal was obtained by Berzelius as an impure powder by reducing the chloride with potassium. Yttrium (symbol, Y; atomic weight, 89.0) is a dark-gray powder that assumes the lustre and color of metallic iron when burnished. It combines with oxygen to form a sesquioxide, which is a yellowish-white powder.

YÜ, or **TA YÜ,** tä yōō (died 2197 B.C.). The third of the ancient kings so much lauded by Confucius for their virtue and their benign rule —the others being Yao (q.v.) and Shun. He was a native of Sze-chuen, a reputed descendant of Hwang-ti, and son of that Kun, Minister of Public Works under Yao, who had struggled unsuccessfully for nine years with the great inundation of that reign. Commissioned by Shun, Yao's successor, to take up his father's unfinished work, Yü set out four days after marriage, and for 13 years never rested in his task, traversing nine provinces, opening up waterways, noting soil and productions, and fixing the form of tax contributions. In 2278 B.C. he announced the completion of his labors, and received the Principality of Hia (or Hsia) as his reward. In 2224 B.C. he became the colleague and successor of Shun, and in 2205, after three years' mourning for his colleague, he founded the Hia (or Hsia), the first of the 25 dynasties of China. The greatest of the engineering feats attributed to Yü is the opening of the great gorge or defile on the Yang-tse through the Wu Mountains above I-Chang (q.v.). Consult the "Tribute of Yü," in Legge, *Chinese Classics*, vol. iii (London, 1865); Friedrich Hirth, *Ancient History of China* (New York, 1911).

YUAN. See YUEN.

YUAN SHIH-KAI, yōō-än' shē-kī' (1859–1916). President of the Republic of China. He was born in Honan Province, the son of a district governor. He early aspired to an official position but was unable to pass the exhaustive examination in the Chinese classics which at that time was the only avenue of entrance into the government service. Therefore he turned his attention to the army as offering the best means for political advancement. He went to Korea, then under the suzerainty of China, and through his military and diplomatic talents rose rapidly in the service. His abilities were so marked that he became the protégé of Li Hung Chang (q.v.), through whose influence he was appointed Director General of Trade and International Relations in Korea in 1883. As commander of the Chinese troops in the peninsula he played a bold game, which resulted in the Palace Revolution of 1884, the burning of the Japanese Legation at Seoul, and the complete domination of the Emperor of Korea and Korean affairs by the Chinese government.

As Chinese Resident at Seoul, Yuan Shih-kai revealed himself as a master of diplomacy, and successfully checked all Japanese plans to secure control of Korea. Unfortunately for him, all of his work was undone by the disastrous Chino-Japanese War of 1894–95, in which China was overwhelmingly defeated and the Chinese driven out of the peninsula. The Japanese made a strong effort to capture Yuan, whom they recognized as their ablest enemy next to Li

Hung Chang, but Yuan escaped from Seoul in time and was escorted to the coast by a guard of British sailors.

In spite of the unfortunate termination of the war, Yuan Shih-kai was one of the few who remained in the good graces of the Empress Dowager Tze Hsi (q.v.). Through his powerful friendship with Li Hung Chang, he was appointed Judicial Commissioner of Pechihli Province. Here he was able to build up, through his own initiative and energy, the only body of modern Chinese soldiers at that time, some 7000 in all, drilled by the German von Hanneken. In 1897 Yuan was rewarded with the command of an army corps.

In the following year the Emperor Kwang-sü (q.v.) and his adviser Kang Yu-wei (q.v.) inaugurated the reform movement designed to bring China abreast with Europe and America. For success they deemed it necessary to get rid of the Empress Dowager Tze Hsi, whom they regarded as the chief obstacle to reform, and also of her nephew Jung Lu, commander of the northern military and naval forces and stationed at Tientsin. It was planned to execute Jung Lu and then place the Empress Dowager in strict confinement. This task was intrusted by the Emperor to Yuan Shih-kai. But Yuan, although of modern tendencies, did not regard the reform movement of 1898 as capable of succeeding. He thought it premature and unwise, and that it would end in further disaster to China, which was then being despoiled right and left by the European Powers. Instead of making away with Jung Lu (his blood brother, by the way), Yuan informed him of the plot and also warned the Empress Dowager. The result was the coup d'état of 1898, by which the Emperor was practically deposed and imprisoned, the leading reformers beheaded or banished, and Tze Hsi returned to supreme power. To the end of his days, the Emperor Kwang-sü blamed Yuan Shih-kai for having ruined the reform cause. It is extremely doubtful, however, whether the movement would have succeeded, even without the alleged defection of Yuan. China was not yet ready for the change, the great mass of the people were unimpressed, and widespread dissatisfaction was caused by the reform edicts. Above all it was necessary to have a strong personality at the head of the government at that critical period, and such Tze Hsi assuredly was.

With the outbreak of the Boxer troubles in 1899, Yuan Shih-kai was made Governor of Shantung Province, where the movement had originated, succeeding the infamous Yu Hsien, who was transferred to Shansi. Yuan's appointment gave great satisfaction to the Diplomatic Corps at Peking. He succeeded in pacifying the province and keeping it in a fair state of order during 1899 and 1900. He was the most popular Chinese official with foreigners at this time, and it was through his instrumentality that the outside world was informed of events in Peking during the siege. His able administration of affairs did much towards preventing the spread of the rebellion. The Empress Dowager further showed her confidence in him by appointing him Acting Viceroy of Pechihli Province in 1901. Yuan was now her most trusted adviser, for Li Hung Chang had died in November of that year. In 1903 the task of reorganizing the entire army was given to him. In 1907 he became a Grand Councilor and President of the Wai Wu Pu, the Chinese foreign office, formerly known as the Tsung-li Yamen and later as the Waichiaopu.

In 1908 the Emperor and Empress Dowager died within one day of each other, and the infant Hsuan-tung (q.v.) succeeded, with his father, Prince Chun, as Regent. Prince Chun, who had never forgiven Yuan Shih-kai for the part he played in 1898 against his brother the Emperor, seized his opportunity and ordered Yuan into retirement by an edict of January, 1909, on the fiction that he was to "nurse his sore foot." He could not proceed further against him for Yuan was too powerfully intrenched in the good graces of the foreigners, the diplomats, and foreign governments. Yuan retired to his estates in Honan and calmly awaited events. The power of the Regent soon became unstable through palace intrigues, trouble in the provinces, and loss of prestige abroad. With affairs going badly for the Manchu monarchy, repeated invitations were sent to Yuan to return. But he pleaded inability because of the (imaginary) infirmity for which he had been dismissed. He remained in seclusion until 1911, and then, with the fall of the Manchus in sight, he realized his opportunity and returned to Peking. He was appointed commander in chief and later Premier, and was made a Marquis.

The Revolution had suddenly broken out at Wuchang in October, 1911, and was almost uniformly successful. It rapidly spread over all of south China. On Dec. 29, 1911, Dr. Sun Yat-sen (q.v.), the genius of the whole movement, was elected Provisional President by the Nanking Assembly. By this time Yuan Shih-kai was in full control in the north, and it looked as if China would be split up into two parts, divided by the Yang-tse Kiang, a republic in the south and a limited monarchy, with Yuan as the real power, in the north. But sentiment throughout the country was in favor of the Revolution, and on Feb. 12, 1912, the little Emperor Hsuan-tung abdicated. The next day Yuan Shih-kai was proclaimed the "Fully Empowered Organizer of the Republic of China." To preserve the fruits of victory and to unite the country, Dr. Sun nobly resigned as Provisional President, and Yuan, after a show of reluctance, and despite an outbreak among his troops, who looted a large part of Peking, was elected President and inaugurated Oct. 6, 1913, for a term of five years.

As soon as he received his high office Yuan Shih-kai began to consolidate his power. China was more or less in chaos and the future seemed doubtful and uncertain. In support of his policies Yuan had a trained army, the foreigners favored him, the people at large knew little or nothing of republican institutions, and as for money Yuan had secured a loan of $125,000,000 from the largest banking houses of Europe. He soon got into difficulties with the Kuomintang or Southern party in the Parliament. Failing to come to an agreement with them he summarily expelled these members, 132 Senators and 370 Deputies, from Parliament. Spasmodic attempts to overthrow him failed, and Sun Yat-sen retired to Tokyo and Huang-hsing (q.v.) to the United States. On Jan. 10, 1914, on the advice of the Vice President and others, Yuan dismissed the Parliament, and by a mandate of May 24, 1914, created an Advisory Council, to sit as a Provisional Congress or Council of State (*Tsan Chieng Yuan*). The members of this council varied from 50 to 75, appointed solely by President Yuan, and supposed to act

as an advisory, administrative, and legislative body until the election of the National Parliament (*Li Fa Yuan*). Throughout the year 1914 Yuan strengthened his position by successful expeditions against the bandits, White Wolf and the Red Beards (*Hunghutzes*), in Mongolia and elsewhere, and against robbers in Sze-chuen and on the Tibetan border. He ruled with dictatorial power abolishing the Provincial Assemblies and Municipal Councils. Early in the year he electrified the world by restoring the old worship of Heaven and Confucius in China, and personally went through the ceremony on behalf of the state. His purpose in this was to keep the people true to their ancient traditions.

These acts of Yuan Shih-kai seemed to presage a return to monarchical government in China, with himself as Emperor. The idea received a strong impetus through the 21 Japanese demands on China in 1915. These extraordinary demands, by which Japan took advantage of the complications in Europe to further her designs in the Far East, forced the Chinese government to concede, among other stipulations, extraterritorial and commercial privileges in Manchuria and Inner Mongolia, railway concessions, the lease of Port Arthur and Dalny until 1997 and the lease of the South Manchurian Railway until the year 2002. China protested bitterly and made a show of resistance, but was forced by an ultimatum from Japan to submit. The six demands in Article 5, seriously impairing the independence and integrity of China, the Foreign Office (*Waichiaopu*) refused to consider, and these were left "for future discussion." The sinister action of Japan convinced many thoughtful Chinese that it was imperative to have a powerfully centralized government at Peking with Yuan as Emperor. This would further relieve China, at the death of Yuan, from danger of anarchy and endless civil war. Therefore the Advisory Council petitioned Yuan to hold an election for a citizens' convention, to see whether the people desire a return to the old form of government. This was done, and it was announced that 15 out of the 18 provinces and 1993 out of 2043 representatives of this Acting Parliament favored the change. Thereupon the Council of State petitioned Yuan to accept the throne. He declined at first, according to Oriental etiquette, and the petition was forwarded a second time. He then accepted, Dec. 11, 1915, with the reservation that he would continue to act as President until a suitable time for the coronation.

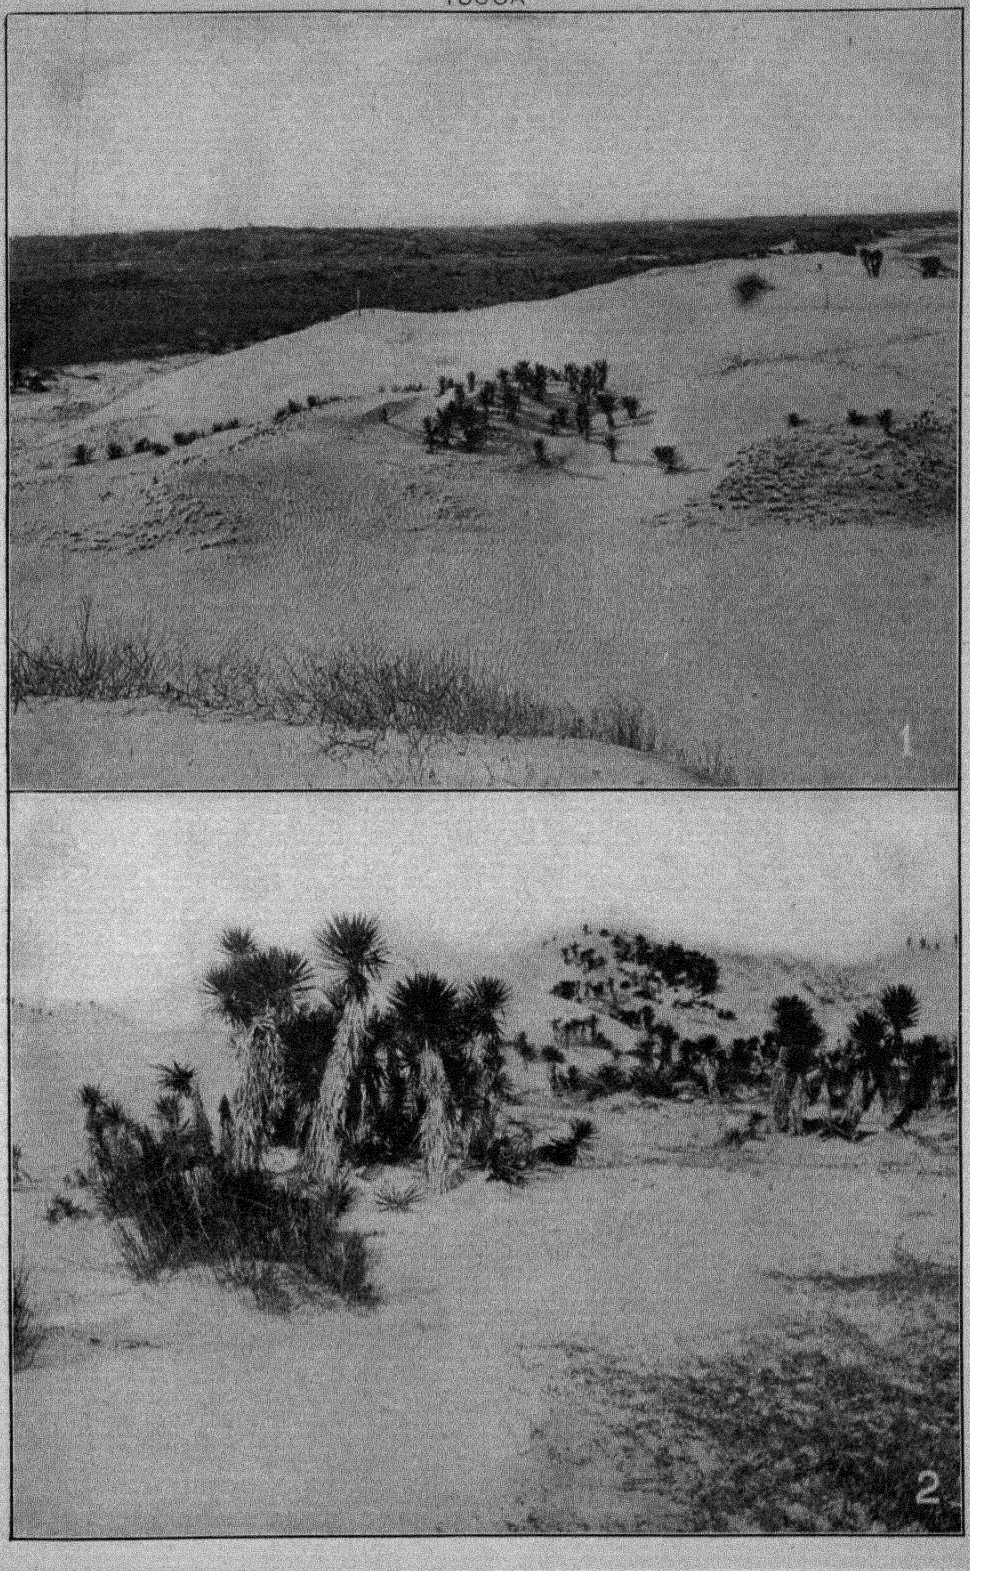
The monarchical idea failed to meet with favor in certain quarters. The ministers of Great Britain, Russia, and Japan twice warned the Chinese government against disturbing the tranquillity of the Far East, and suggested that it would be better to wait until the war in Europe was over. But Yuan Shih-kai and his advisers determined to go ahead with the project, and a date in early February, 1916, was finally chosen for the coronation. The revolt in the south, encouraged by foreign influences, continued to spread, and Yunnan, Kweichow, and Kiangsi provinces declared against the monarchy. A mutiny in Shanghai was suppressed, but with the continued fighting in the south against his authority, and because of the divided state of the country, Yuan Shih-kai found it necessary to postpone further the date for the coronation. On March 22, 1916, it was announced from Peking that the plans for the restoration of the monarchy had been abandoned and that China was a Republic for the second time. The revolt failed to end with the announcement that Yuan had relinquished the crown, and the leaders declared that he must be driven from power entirely. There is no doubt, however, that Yuan Shih-kai could have suppressed the rebellion easily had it not been for outside interference and pressure brought to bear against him, mainly from Japan. He died June 6, 1916, and was succeeded by the Vice President, Li Yuan Hung, whose accession satisfied the southern leaders. Several days before his death it was reported that Yuan had been poisoned, but an official statement said the cause of death was "stomach trouble."

A firm believer in the adoption of western methods of material progress for China, but with due regard for China's own customs and institutions, Yuan Shih-kai was a man of action rather than a scholar. In diplomatic ability, native shrewdness, and qualities of leadership, he was the successor of the great Li Hung Chang. Like the latter he possessed the gift of choosing efficient subordinates. During the critical period of change he succeeded in giving China a strong and stable government, and this despite tremendous difficulties. To rehabilitate the country he found it necessary to rule arbitrarily, with a stern but just hand. Foreign critics highly commend his administration, especially his suppression in great measure of official graft and corruption. He was a hard-working ruler, and surrounded himself with competent foreign advisers, among whom were Dr. George E. Morrison (q.v.), Dr. Ariga, Dr. Jeremiah W. Jenks (q.v.), and Dr. Frank J. Goodnow (q.v.), later president of Johns Hopkins University. Consult: J. O. P. Bland, *Recent Events and Present Politics in China* (Philadelphia, 1912); J. S. Thomson, *China Revolutionized* (Indianapolis, 1913); E. H. Parker, in *Asiatic Review*, vols. iv, viii (London, 1914, 1916); P. H. Clements, *Boxer Rebellion* (New York, 1915). See CHINA, *Modern History*.

YUCATAN, yōō'kȧ-tän'. A large peninsula projecting northeastward from the southeast extremity of Mexico, and separated from the western extremity of Cuba by the Yucatan Channel, 140 miles wide (Map: Mexico, O, P 7). With the peninsula of Florida it incloses the Gulf of Mexico The peninsula of Yucatan is about 400 miles long and 200 miles wide (area about 80,000 square miles). It forms a portion of a great bank of coralline limestone raised above sea level in geologically recent times. The bank, covered with shallow water in which coral formation is still going on, extends 150 miles into the Gulf along the north and west coasts of the peninsula, and along its margin the sea bottom falls suddenly from a depth of 600 to one of 6000 feet. The land surface is accordingly low and level, undulations rising only a few hundred feet, except in the extreme southern part, where there are projecting spurs of the Central American Cordillera. Forests are confined mainly to these southern mountains, other parts being almost treeless, except in the marshy tracts along the coast, and of a monotonous aspect. This is scarcely due to the climate, which is hot and humid, but to the peculiar Karst formation of the limestone composing the peninsula, which is perforated by numerous caverns and underground channels. These receive the rainwater, so that the peninsula is

practically without running surface water, and the natives depend almost wholly upon underground reservoirs for water supply. Sisal hemp is the principal agricultural product. Politically the greater part of the peninsula belongs to Mexico, and consists of the states of Campeche and Yucatan (qq.v.) and the territory of Quintana Roo. The southeastern part is divided between British Honduras and Guatemala. The total population is estimated at about 370,000, most of whom are aborigines. Yucatan was the principal seat of the Maya civilization, the highest form of native civilization in North America at the time of the discovery. See MAYA; MAYAN STOCK; YUCATAN, ANTIQUITIES OF.

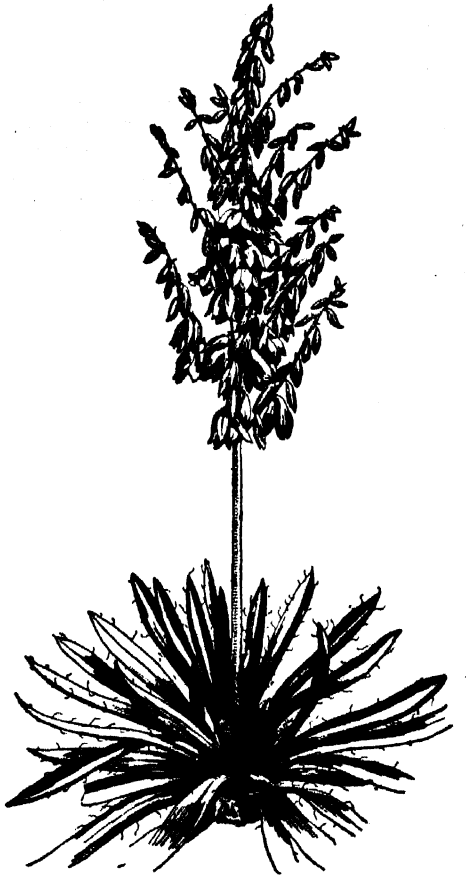
YUCATAN. A state of Mexico, occupying the north part of the peninsula of Yucatan (q.v.) (Map: Mexico, O, P 7). Area, 15,937 square miles. The chief industry is the cultivation of henequen or sisal hemp, the bulk of which is exported to the United States. Pop., 1910, 339,613. Capital, Mérida (q.v.). The size of the state was greatly reduced by the formation of the Territory of Quintana Roo in 1900.



YUCATAN, ANTIQUITIES OF. The peninsula of Yucatan, which was divided into a number of independent states, was occupied by the Maya people at the time of the discovery of America. There is evidence to show that the ruined cities of the Maya race, in the State of Chiapas, the Republic of Guatemala, and in northern Honduras, are more ancient than the cities of Yucatan. (See MAYA; MAYAN STOCK.) Shortly before the Spanish conquest the country was partly overrun by Nahua hordes (see NAHUAN STOCK), and the population decimated by famine, pestilence, and warfare, so that the ancient civilization appears to have been waning early in the sixteenth century. In no other part of Mexico are there so many remains of ancient cities attesting a large population at the time of building. At present the greater part of the country is covered with forest, completely concealing the ruins. According to some authorities climatic conditions have changed since the pre-Columbian period of occupancy, and many of the ancient cities could not support, at present, a large population. According to others the soil has been exhausted by inferior methods of farming. Peculiar conditions as to water supply evidently influenced the distribution of the larger centres of population. There are no surface rivers or lakes, except in the south, but water is found in underground streams, which make their way to the surface in caves. Near these caves, or cenotes, are found the greatest ruins, and the water supply was obtained in other portions of the country by cistern storage.

The Mayas of ancient times reached the highest level of civilization attained by any of the peoples of the New World. Their temples and palaces, their complicated system of hieroglyphic writing, and their astronomical knowledge, attest their superiority over other civilized tribes of ancient Mexico, although, owing to environment, their advancement along certain other lines was not so marked. Among the most important and best-known ruins in Yucatan are Uxmal, Chichén-Itzá (q.v.), Labna, Kabah, Mayapan, and Ake. The ancient temples and palaces were massive structures, but not for defense; this was to insure strength and permanency. None of the buildings had windows; their interior construction was characterized by the triangular arch, known as the Maya arch, in which the inclined surfaces in each apartment or covered space slope inward from the sides, and sometimes also from the ends, meeting at the top in a sharp angle, or approaching to within a foot or two the narrow way, when they are firmly held together by the superincumbent roof masonry. Many of the buildings now roofless were probably originally constructed without roofs. Stone beams were used for short spans, narrow openings, and passageways. The façades in many instances were composed of geometric designs and representations of huge grotesque masks. The material used was the common limestone of the country, cut and carved with stone tools. Mortar was extensively used; the floors and roofs were of stucco, and all of the stone work in the edifices was covered with a thin coating of the same which in many instances was painted red. In principle the construction was mortar and rubble rather than ashlar masonry. The latter appears only as a veneer. In many of the buildings the white surface was covered with mural paintings in various colors, the most famous being the frescoes in one of the temples of Chichén-Itzá. Many of the lintels of the doors were of wood. These wooden lintels have been, in themselves, an element of weakness in the structures, for, had they not decayed, most of the great façades would have been preserved. There is a certain lack of unity in the general assemblage of the structures; the common system is seen in the grouping of four edifices about a central court. Some of the ancient buildings were very extensive, notably the so-called palace of Labna, which shows four periods of construction. The total length of this building is 375 feet, and it formerly contained about 50 rooms.

On the outskirts of the main group of buildings in these ancient cities were scattered the house sites of the common people who lived then, as the Mayas of the present day, in thatched-roofed huts of adobe. Excavations among the house sites reveal the presence of the three-stone fireplace or koben, which is still used by the Mayas. There are traces of ancient cement roadways, raised a few feet above the surface, leading from one town to another. The Mayas ranked among the first in ancient ceramic art; the most interesting specimens which have been exhumed bear incised hieroglyphic inscriptions. The calendar of the Mayas was similar to that of the Nahuas and Zapotecs (q.v.). Their system of hieroglyphic writing is also similar to those of Mexico in principle although unlike in appearance. Much study has been given to these hieroglyphics and it is now possible to decipher dates and calculations but not to decipher the names, etc., that accompany the dates and tell to what they refer. The modern Mayas of Yucatan retain no knowledge of the ancient lore of their ancestors, but among the Lacandones of the remote southern frontier of the peninsula ceremonies to their ancient gods are still performed. For a study of the hieroglyphics consult S. G. Morley in Bureau of American Ethnology, *Bulletin, No. 57* (Washington, 1915); also references under MAYAN STOCK.



YUC'CA, or SPANISH BAYONET (Sp., from the North American Indian name). A genus of plants of the family Liliaceæ, natives of the southern part of the United States, Mexico, and Central America, but now widely distributed. *Yucca filamentosa,* called Adam's needle, is often

YUCCA

1. SAND DUNES WITH YUCCA, ETC., FLORIDA
2. THICKET OF YUCCA ALOIFOLIA SHOWING SHIFTING AND BUILDING UP OF DUNES, FLORIDA

cultivated in gardens on account of the singularity and splendor of its appearance. *Yucca gloriosa* is a native of the more southern parts of North America, but is hardy in the northern States. Its stem, which is 2 or 3 feet high, bears on the upper part a tuft or crown of sword-shaped evergreen leaves with

YUCCA FILAMENTOSA.

smooth margins, each leaf terminating in a sharp black spine. From the centre of this crown of leaves arises the flower stalk, of 3 feet or upward in height, branching out on every side so as to form a great panicle. The flowers are bell-shaped and drooping, white with a purple stripe on the outside of each segment of the perianth. The fibres of the leaves of *Yucca glauca* are used by the American Indians to make cloth, cordage, and baskets. The fibre of the yuccas is similar to that of the agaves and bromelias, and probably is often included under the name pita flax or pita fibre. *Yucca aloifolia* is common in the sand dunes of the South. A treelike form, *Yucca brevifolia*, is found in southern California. *Yucca baccata* is a common species from Texas to California. See YUCCA MOTH; Colored Plate of LILIACEÆ.

YUCCA MOTH. Any one of several species of the curious tineine genus *Pronuba*, of the family Prodoxidæ, all of the species of which are confined to yucca plants for food. The species of *Pronuba* are small white moths with narrow wings sometimes spotted with black. Their mouth parts are perfectly adapted for the fertilization of the yucca flowers, which are not fitted for self-fertilization, or for fertilization by other insects. The moth, having collected a mass of pollen, lays an egg in the pistil, and pushes the pollen into the orifice, thus insuring growth of the pollen tube and subsequent fertilization and the later development of the pod, in which the larva then develops. This instance of symbiosis (q.v.) is very remarkable. The yucca moths of the genus *Prodoxus* have no relation to the fertilization of the plant, but lay their eggs in the flower stem, in which their larvæ bore. Since some of the yuccas do not flower every year, these insects may pass more than a year in the pupal stage.

YUCHI, yōō′chē. See UCHEE.

YUDGHÂN, yud-gan′. A Messianic reformer of the eighth century. See MESSIAH.

YUE CHI. A nomad tribe originally consisting of 5 separate tribes, which inhabited the central part of Asia. They first appear in history during the middle of the second century B.C. They were driven westward (c.100 B.C.) by the Hiung-nu (a related tribe) and conquered Bactria (q.v.). During their occupation of this country they united to form a single tribe (called Kushans, from name of principal tribe) and became civilized. About 50 years before Christ they invaded India and took a little Greek and Persian civilization with them. They gradually annexed northern India, but were driven out at the close of the third century A.D. by the Guptas. Remnants of the Yue Chi which had remained in Bactria formed a kingdom in eastern Afghanistan, but were destroyed after the beginning of the fourth century by the Hûnas.

YUEN, yōō-ĕn′, or **YUAN,** yōō-ăn′ (1280–1367). A Mongol, and consequently an alien, dynasty that occupied the throne of China for 88 years—the twenty-third of the 25 dynasties that have ruled in that country since 2205 B.C., when the first one was founded. The Yuen was founded by Kublai Khan, grandson of Genghis Khan, and successor of Mangu, who in 1260 found the northern provinces of China in the hands of the Kin Tatars, and a native dynasty, the Sung (q.v.), in the south. Having successively vanquished these, he ascended the throne in 1280, chose his dynastic name of Yuen, and made Peking his capital. Though he displaced the Chinese high officials with uncivilized Mongols, in utter disregard of the Chinese practice of appointing only literati, he seems to have ruled wisely on the whole. He completed the grand canal between Hangchow and Tientsin; inaugurated road making and the planting of trees; introduced the use of paper money; and favored Buddhism, but proscribed Taoism, and ordered all Taoist books to be burned, except the *Tao-teh-King* of Lao-tse. He attempted the conquest of Japan, but the formidable armada and army he dispatched for that purpose were utterly annihilated by the Japanese and the terrific storms which they encountered. Of his eight successors only three are worthy of mention: Timur, his grandson (1294–1306), who proved himself honest and energetic and labored hard to correct abuses and improve the administration. Superfluous offices were abolished, the tax system was reformed and the lands of the powerful ecclesiastical establishments were taxed; but ill health proved a serious handicap, and he died at the age of 42. Kaisun, his successor (1307–10), was devoted to Buddhism, wine, and women, and accomplished little. His most important achievement was the redemption by the government of the children who in times of famine had been sold. Ayuli Palpata, the fourth Emperor (1311–20), also professed to have the welfare of the people at heart, but his devotion to Buddhism led to the expenditure of

vast sums on priests and ceremonies, and grinding taxation was the result. In 1367, during the reign of the ninth Emperor, Chu Yuan-chang, a temple servant, at the head of a large army overthrew the corrupt Yuen, and in the following year ascended the throne as the first of the Ming or Illustrious dynasty (1368–1643), and became known as Hung-wu (q.v.), making his capital south of the Yang-tse, in the present Nanking.

YUEN-SAN, yōō-ĕn′-sän′. See WÖNSAN.

YUGA, yo͞o′gȧ (Skt., yoke, period of time). In Hindu mythology and astronomy, the name of a long period of years corresponding to an age of the world. Four such eras are mentioned: *Kṛta-Yuga*, *Trētā-Yuga*, *Dvāpara-Yuga*, and *Kali-Yuga*. The first was the golden age of the world, but each succeeding period became shorter and more evil, until the last, or Kali-Yuga (q.v.). The Kali-Yuga is said to have begun in the year 3102 B.C. A description of these immense world periods is found in *Manu* (q.v.), the *Mahābhārata* (q.v.), and the *Purāṇas* (q.v.). Conceived as a day of the gods, each of these long mundane eras is believed to be preceded by a period called *sandhyā*, or twilight, and followed by a similar period *sandhyāṁśa*, or portion of twilight. The precise length is given in divine years and reduced afterward to terms of human years. The Krita-Yuga consists of 4000 divine years, its Sandhya and Sandhyaṁśa each of 400. The Treta-Yuga consists of 3000, and its Sandhya and Sandhyaṁśa of 300 divine years each; the Dvapara-Yuga of 2000 divine years, with 200 such years as its Sandhya, and 200 as its Sandhyaṁśa; and the Kali-Yuga of 1000 divine years, with 100 each as its Sandhya, and its Sandhyaṁśa. Since a divine year comprises 360 solar years of mortals, a year of men being a day of the gods, these Yugas, with their Sandhyas and Sandhyaṁśas, would severally represent 1,728,000, 1,296,000, 864,000, and 432,000 or in the aggregate 4,320,000 solar years of mortals. This cycle is called a *Mahāyuga*, or great Yuga, and 1000 such make up a day and night of Brahma (q.v.). As a designation of time Yuga is confined almost wholly to philosophical and descriptive works, for it plays no actual rôle in the scientific works of Hindu astronomy. The term "Yuga" is sometimes, though exceptionally, applied also to other divisions of time. Consult: E. W. Hopkins, *Religions of India* (Boston, 1895); Sewell and Dikshit, *The Indian Calendar* (London, 1896); Thibaut, *Astronomie, Astrologie und Mathematik* (Strassburg, 1899).

YUKAGIRS, yo͞o-kä′gērz. A stock once consisting of many tribes, as Omoks, Anauls, and Cheliags, occupying much of Siberia east of the river Lena. They call themselves Andondomni, or men. They numbered in 1898 but 700 persons speaking their mother tongue. Some of the Tungusic Lamuts, their neighbors, however, speak Yukagir, while the Yukagirs of Verkhoiansk have adopted the Lamut. The Chuvanzes of the Aniuy and the upper Anadyr are classed with the Yukagirs. In physique the Yukagirs resemble the Tungus-Lamuts, but are more brachycephalic, and generally have lighter hair. Their skin is often quite light. Consult: Kohn and Andree, *Sibirien und das Amurgebiet* (Leipzig, 1876); Müller, *Unter Tungusen und Jakuten* (ib., 1882); Jochelson, *The Yukaghir and the Yukaghirized Tungus* (Leyden, 1910).

YUKI, yo͞o′kē (Wintun Indian, aliens, enemy). A group of tribes constituting the nucleus of the Yukian stock, centring in Round valley and on the headwaters of the Eel River, in the present Mendocino County, northwestern California. They were on friendly terms with their northern neighbors, the Wailaki, with whom they are much intermarried, but maintained constant aggressive warfare upon the more peaceful Pomo (q.v.) and Wintun (q.v.), and were bitterly hostile to the whites. Their houses were conical structures of poles and bark. They wore little clothing, and both sexes tattooed the face. The dead were usually buried in a sitting posture. They were estimated on good authority at over 5000 about 1850, but were reduced to 198 in 1910. The surviving divisions are the Coast Yuki, Redwood (Huchnom), Wappo and Yuki. Consult F. W. Hodge, *Handbook of American Indians* (Washington, 1907).

YUKON, yo͞o′kŏn. A Territory of Canada occupying the northwestern portion of the Dominion (Map: Alaska, M–O, 3, 4). The area is stated at 207,076 square miles, of which 649 square miles are water. The surface, whose features were little known until the last decade of the nineteenth century, is uneven in greater part, with the general elevation between 2000 and 3000 feet, and the whole country is filled with mountain ranges and rolling hills penetrated everywhere by large navigable rivers. There are a number of peaks rising considerably above the snow line in the north and in the southwest, the loftiest being Mount Logan (q.v.), close to the Alaskan boundary adjacent to Mount St. Elias, with an elevation of about 19,500 feet. The main divide of the Rocky Mountains, separating the watershed of the Yukon from that of the Mackenzie, forms the eastern boundary. The principal river is the Yukon. With respect to climate the Yukon is one of the coldest regions in the world. A maximum temperature of over 80° F. is frequently observed in summer, but the summers are very short, and frost occurs every month in the year. In winter a temperature of 50° below zero is common, and it has been recorded as low as 63° and 68°. The air is, however, dry, and the rainfall is not heavy, though it is sufficient to support large forests of spruce and poplar, which cover the valleys and mountain slopes up to an altitude of about 2500 feet. Some of the hardier crops, such as rye and barley, are easily raised, and some little truck farming of potatoes, turnips, lettuce, peas, and cabbage has been carried on in different localities. The geological structure is largely a continuation of that of British Columbia, consisting mainly of Archean ridges flanked by extensive Paleozoic strata, which contain some of the richest gold fields in the world. Beds of lignitic coal occur. Before the discovery of gold in 1896 the Yukon district was almost uninhabited. The population, which at the census of 1901 was 27,219, declined as the rich places of the Klondike (q.v.) became exhausted, and at the 1911 census was only 8512. In 1898 the district was organized as a separate Territory, and Dawson (q.v.) is now the capital. A railroad traversing the White Pass is now in operation between Skagway and the upper waters of the Yukon. The Territory is represented by one member in the Canadian House of Commons.

YUKON GOLD FIELDS. This region is described under the titles of the component sections, i.e., ALASKA, KLONDIKE, YUKON, etc.

YUKON RIVER. One of the largest rivers of North America. It is formed at Fort Selkirk,

Yukon Territory, Canada, by the junction of the Lewes and Pelly rivers, and flows northwestward into Alaska, which it traverses in a southwest direction, finally turning west and emptying into the Bering Sea through a large delta on the south shore of Norton Sound (Map: Alaska, G 3). Its total length, including the Lewes and Teslin, is about 2300 miles, and its catchment basin covers 330,000 square miles. The Lewes, which is generally considered the upper course of the main stream, rises in a cluster of lakes (Lindeman, Bennett) in the extreme northwest corner of British Columbia and on the northern foot of the Chilkoot Pass and flows northward to the Pelly confluence at Fort Selkirk. The upper courses of the river and its tributaries generally flow through narrow valleys inclosed between mountains of moderate elevation, and in some places taking the form of cañons. In Alaska the river flows for hundreds of miles through level, moss-covered tundras, where the width, between its low, marshy banks, is from 1 to 2 miles, though its depth is not great. The delta is of vast extent, having an area, including the portion inclosed by the Kashunuk arm, of 9000 square miles. The volume of discharge of the Yukon has been thought to be fully two-thirds that of the Mississippi, and great quantities of sediment are brought down. There are 26 outlets over 200 yards wide and numerous smaller channels. All are silted up, with a depth of only 2 to 9 feet on the bars, while the sea for many miles from shore is only a few feet deep. Seagoing steamers cannot enter the river, but proceed to St. Michael, about 70 miles to the north, where they unload into stern-wheel steamers, which ply regularly in summer to Dawson. A fleet of upper-river steamboats runs between Dawson and White Horse, the terminus of the White Pass and Yukon Railroad. Navigation is continuous between White Horse and the mouth of the river. The current is often very swift, and the descent very rapid. From Dawson to the sea, about 1400 miles, the fall is on the average nearly a foot per mile. The navigation of the whole river is free to Canadian vessels; the navigable season is comprised between late May and early October. The chief settlement on the Yukon is Dawson, at the confluence of Klondike Creek, the centre of the gold-mining region. The largest tributaries are the Porcupine, the Koyukuk, and the Tanana.

YULAN, yo͞o′lăn. See MAGNOLIA.

YULE (ME. *yol*, *yole*, December, from Anglo-Saxon *geól*, *gehhol*, December; Icel. *jōl*, Swed. and Dan. *jul*, Yule, the Christmas feast; Goth. *fruma jiuleis*, first Yule, i.e., probably November). The original meaning of the word is yet unexplained. Some have considered it to be related to the Icelandic *hjōl*, wheel, indicating that at this period the sun wheels or turns the winter solstice. But this explanation is far from satisfactory. Fick (q.v.), on the other hand, connects it with the English yawl, as indicating the noise of Christmas revelry in Scandinavian countries. This etymology is likewise improbable. In England the word was originally used to indicate the two months of the winter solstice, December and January; in other words, the former yule (*se œrra geóla*) and the after yule (*se œftera geóla*). See CHRISTMAS.

YULE, SIR HENRY (1820–89). An English engineer and Orientalist, born at Inveresk, Scotland. In 1840 he entered the Bengal Engineers; he served in India on various public works, and from 1858 to 1862 was secretary to the government in the Public Works Department. In 1862 he was retired with rank of colonel, and from 1875 to 1889 sat in the Indian Council. Besides numerous articles in the *Journals* of the Royal Asiatic and Geographical societies he published: *Cathay and the Way Thither* (1866); *The Book of Ser Marco Polo the Venetian* (1871); and with Dr. Burnell, *Hobson-Jobson, an Anglo-Indian Glossary* (1886; 2d ed., 1903). In 1863 he brought out for the Hakluyt Society *Mirabilia Descripta*, and his last work for the society was the diary of Sir William Hedges (1887).

YUMA, yo͞o′mȧ. A city and the county seat of Yuma Co., Ariz., 180 miles southwest of Phoenix, on the Colorado River, at the mouth of the Gila, and on the Southern Pacific Railroad (Map: Arizona, A 5). Noteworthy features are the Elks Home, hospital, Federal building, courthouse and high school. Farming, fruit growing, and mining are the leading industries. Yuma is known for the extreme dryness of its climate. Its annual rainfall of 3.13 inches is the lowest recorded at any of the United States Weather Bureau stations. Pop., 1910, 2914.

YUMA (probably, sons of the river). The most important tribe of Yuman stock (q.v.), originally occupying a territory on both sides of the Colorado River, above and below the entrance of the Gila, in Arizona and California, and now gathered upon a reservation in the extreme southeastern corner of California to the number of 832 in 1910. See HAVASUPI.

YUMA APACHE. See YUMAN STOCK.

YUMAN (yo͞o′măn) **STOCK.** An important linguistic stock of the lower Colorado River region of California and Arizona, with portions of the adjoining Mexican States of Sonora and Lower California. Among the most important tribes are the Yuma, Mohave (Mojave), Walapi (Hualapai), Maricopa, Yavapai (Mohave—Apache), Havasupi, Cocopa, Cochimi, and Dieguenos (qq.v.). All the Yuman tribes, excepting those of the Lower California peninsula, were primarily agricultural and vegetarian, rather than hunters, and all had the arts of pottery and basket making. They were brave and warlike, but not predatory. Their ordinary dwellings were brush wikiups. The Yuman tribes of the Lower California peninsula seem to have been low among aborigines, but the Yuma (q.v.) and others of the Colorado were among the highest types. The Jesuit and Franciscan missions established among them between 1760 and 1780 made but little impression. From a probable total of perhaps 20,000 about 1760 they have dwindled to barely 5000, nearly all of whom are within the United States. The tribes of Lower California, estimated during the mission period at 12,000, have almost entirely disappeared.

YUNCA, yo͞on′kȧ (from Quichua *Yucacuna*, dwellers in the hot country). A group of ancient cultured tribes, constituting a distinct linguistic stock, formerly occupying that portion of the coast of Peru extending from about lat. 4° S. to lat. 10° S., their capital being near the present Trujillo. According to their own traditions they had coasted down from the north in canoes. They were agricultural and built reservoirs and irrigating canals, some of them solidly constructed. The ruins of the great palace at Gran Chimu, with its massive walls, spacious terraces, and elaborate frescoes, are one of the wonders of ancient America. They were famed for skill in fashioning work in gold and

silver. They were brought under subjection to the Inca Empire of Peru some time before the arrival of the Spaniards, but their language, still spoken in some secluded valleys, bears no trace of Quichua influence, although surrounded by tribes of that stock. Consult Carrera, *Arte de la lengua yunga de los valles del obispado de Trujillo* (Lima, 1644; new ed., ib., 1880). See PERUVIAN ARCHÆOLOGY.

YUNG-CHING, yōōng'chĭng', or **YUNG-CHENG**, chŭng (1677–1735). The reign title of the third Emperor of the Ta Tsing, the late dynasty of China. He was the fourth son of K'ang-hi and succeeded him in 1723 at the age of 45. He banished or imprisoned all his brothers except the thirteenth, who, until his death in 1730, was his chief adviser. The Roman Catholic missionaries fell into disfavor in this reign chiefly because in troublous times the converts followed none but their directions. An edict of expulsion from the country was changed at the last moment to one of banishment, first to Canton, and later to Macao, only those being retained at Peking who were needed in the government service; 300 churches were demolished or put to profane uses, and a persecution of the native Christians was begun. Yung-Ching's reign, which was short, was filled with famines, destructive floods, and earthquakes, which gave him opportunities for paternal care of his people. He died in 1735 and was succeeded by K'ien-lung. Consult H. A. Giles, *China and the Manchus* (London, 1912).

YUNG-LO, yōōng'-lō' (1360–1424). The reign title of Chu-ti, the third Emperor of the Ming dynasty. He was the fourth son of Hung-wu (q.v.), the founder of the dynasty, and in 1403 superseded his nephew Hwei-ti, who had ascended the throne while Chu-ti was absent in the north on a great military expedition. Throwing off his allegiance to the son of his eldest brother, he marched south, overcame all opposition, entered Nanking, the capital, and assumed the Imperial dignity, his nephew disappearing in the disturbances which followed. Yung-lo proved himself a man of great energy and enterprise, but was bigotedly devoted to Buddhism and bestowed the best offices on priests. He patronized literature, and his name is connected with the *Yung-lo Ta Tien*—the "Great Canon of Yung-lo"—an encyclopædia in 22,877 books, besides the contents (60 books), which was prepared by a commission of three eminent scholars, with the assistance of a staff of 2194 literary workers. It was begun in 1405 and completed in 1407. It contained the substance of all the classical, historical, philosophical, and literary works down to that time, and embraced astronomy, geography, occult sciences, medicine, Buddhism, Taoism, and the arts. Many rare works have been preserved in it.

YUNG WING (1828–1912). A Chinese educational reformer. He was born near Macao, of humble parentage, entered a mission at eight years of age, and later the Morrison School, under the Rev. S. R. Brown, and was by him brought to America in 1847. He became a Christian, and devoted his life to the welfare of China. He graduated at Yale College (1854), the first of his race to take a degree from an American college. He conceived a plan for having Chinese youth of promise brought to America for education. He returned to China in 1855. In 1871 his plan was adopted by the government, and the sum of $1,500,000 granted. He was made chief commissioner of the Chinese educational mission, and then placed 112 Chinese young men under a 15 years' course of instruction in the United States. He was made a mandarin of the second grade, intendant of the Province of Kiangsu, and was for a while Associate Minister to the United States. He returned to the United States in 1902, and thereafter resided in Hartford, Conn. Consult his *My Life in China and America* (New York, 1909).

YUNNAN, yōōn'năn' (Chin., 'cloudy south,' from *yün*, clouds + *nan*, south, in allusion to the banks of fog overhanging the Province of Sze-chuen on the north). One of the 18 provinces of China proper, on the border of Upper Burma (Map: China, H 7). Estimated area, 153,000 square miles; estimated pop., about 11,700,000, composed of Chinese (many of them Mohammedans), Shans, and Lolos. Yunnan consists of a great central plateau 5000 to 7000 feet above sea level, diversified by ranges of hills and mountains, which in some places rise to heights of 7000 feet or more above the plateau. The drainage is partly to the Yang-tse in the north, partly southeast through the Sikiang, but mostly southward through the Songkoi, the Mekong, and the Salween, which traverse its western parts from north to south. Its rivers have furrowed for themselves deep channels—through the prevailing red sandstones and shales. Lakes are numerous and some of them large. The province is rich in minerals; anthracite coal is widely distributed; copper is extensively mined; silver, lead, tin, zinc, and iron are found and worked; gold is found in the river sands, and salt pits are rather numerous. The chief industries are agriculture, mining, metal working, and lapidary work—jade cutting being one of the most active branches. The jade and other precious stones, however, come from Tammaw, in Upper Burma, and the west. The copper supply of the Empire comes principally from Yunnan, as well as the Chinese German silver, commercially known as *pack-tong* (white copper). The chief agricultural products are rice, wheat, maize, a poor quality of opium, tobacco, a little cotton and silk, tea, and aniseed. The tea grown in the Department of P'u-erh is noted throughout China as more refreshing than any other, and brings a high price. Two towns, Mong-tse and Sze-mao (q.v.), are open to foreign trade, and there is a British consul at Têng-yueh-chow, on the western frontier. The province shares with Kwei-chow the supervision of a Tsung-tuh or Governor-General. The Governor resides at Yunnanfu (q.v.). A rebellion, begun in 1855 by the killing of 14,000 Mohammedans, lasted until 1873, when it was suppressed with much slaughter. Consult: L. Richard, *Comprehensive Geography of the Chinese Empire* (Shanghai, 1908); H. R. Davies, *Yun-nan, the Link between India and the Yang-tze* (Cambridge, 1909); A. T. Little, *Across Yunnan* (London, 1910).

YUNNANFU, yŭn'năn-fōō'. A city of China, capital of the Province of Yunnan. It stands in a great plain 6420 feet above the level of the sea, near the northeast shore of Lake Tien-ch'ih (Map: China, H 6). Its walls, which have a circuit of 3 miles and are pierced with six gates, inclose in the northern section many swamps and vegetable gardens. The population and the business are in the southern half: the streets are wide and clean, all garbage being collected daily by bullock carts, a most unusual thing in

China. As the extensive suburbs were destroyed during the so-called Mohammedan rebellion (1855–73), most of the business is done within the city. The great salt emporium still exists outside the south gate. The climate is healthful. There are heavy snows in winter. Pop., about 50,000 .

YUOKON, yū'ō-kŏn'. An Indian village within the Arctic circle, at the junction of the Porcupine and Yukon rivers, Alaska. Formerly known as Fort Yukon (q.v.).

YURIEV, yụr'yĕf. See DORPAT.

YURIEV, UNIVERSITY OF. The official name for the University of Dorpat, in Livonia, Russia. It had its inception in the Gymnasium founded by the Swedish government when it gained possession of Livonia. This institution was changed in 1632 into a university. When war broke out in the north it was transferred in 1699 to Pernau, where it declined rapidly and became extinct in 1710. In 1802 Paul I was led to establish a German university at Dorpat, to induce the students of the Baltic provinces to remain in Russia. Up to 1891 the university was a purely German institution, but since then the government has taken strenuous measures to Russify it. Since 1895 all instruction except in the theological faculty and in zoölogy is carried on in Russian. Professors were given two years within which to acquire the Russian language. The attendance in 1913 was 2684. The university library, established in 1802, contains over 250,000 volumes.

YU'ROK, yōō'rōk (down stream, so called by the upper tribes). A group of tribes, including the Weitspec, Rikwa, and others, and constituting what is known as the Weitspekan linguistic stock, occupying the territory of the lower Klamath River from Trinity to the sea, in northwestern California. They are distinguished for their enterprising disposition, being now industrious laborers among the whites, saving money and accumulating household property. Their houses are square cabins of split logs set upright in the ground, with a small doorway. The women are skillful basket makers. Ordinary weapons in former times were the bow, lance, and knife. Chiefs have but little authority and the men marry but one wife. They bury their dead with the usual funeral rites. They have a number of dances, including one to celebrate the birth of a child. A careful estimate in 1870 made their number about 3000. They numbered 668 in 1910. Consult W. F. Hodge, *Handbook of American Indians* (Washington, 1907).

YURUCARE, yōō'rōō-kä'rā (Quichua, white men), or **YURACARE.** A group of tribes constituting a distinct linguistic stock, living in the forests on the eastern slope of the Andes, about the headwaters of the Beni River, Central Bolivia. They are noted for their light complexion and tall stature (nearly six feet), and for their handsome features. They are hunters and warriors, wild and roving, although some of them were collected into the Chiquito missions during the mission period ending with the expulsion of the Jesuits in 1767. Consult: Adam, *Principes et dictionnaire de la langue Yurucaré ou Yurujuré* (Paris, 1892); A. F. Chamberlain in *Journal de la Société des Américanistes de Paris*, new series, vol. vii (ib., 1910).

YUSCARAN, yụs'kä-rän'. The capital town of the Department of El Paraiso, Honduras, 33 miles south-southeast of Tegucigalpa (Map: Central America, D 4). In the vicinity are gold and silver mines. Pop. (est.), 4100.

YUSSUPOV, yụs'sụ-pŏf, NIKOLAI BORISOVITCH (1827–91). A Russian musical scholar and composer, specially interested in the violin. Having studied under Vieuxtemps (q.v.), he wrote a monograph on the violin entitled *Luthomonographie historique et raisonnée* (1856), valuable chiefly for its illustrations. Of another work of his, *Histoire de la Musique et de son avenir en Russie*, only the first part, *Musique sacrée suivie d'un choix de morceaux de chants d'église*, appeared in 1862. His principal compositions are a violin concerto, a programme symphony, *Gonzalvo de Cordova*, and a ballet, *Ballet d'Espagne*, which has inspired a number of violin duets by De Bériot. Yussupov maintained an orchestra, which was led by some distinguished conductors and to which fell the honor of first rehearsals of Glinka's famous opera *A Life for the Tsar*.

YUSUF-IBN-TASHFIN, yōō'sụf-ĭb'n-täsh-fēn' (BEN-TASHUFIN or -TAXFYN) (c.1006–1106). A Moorish conqueror, second of the Almoravide (q.v.) dynasty in Morocco and founder of the Almoravide dominion in Spain. He was a cousin of Abu-Bekr, the founder of the dynasty, and succeeded him on the throne, his capital being at Morocco (c.1070). In 1086 he was called into Spain by Al-Mo'tamid, Emir of Seville, to assist in checking the advance of the Castilians under Alfonso VI, and routed the Spaniards at Zalaca (Sacralias), near Badajoz. Recalled to Ceuta by the death of his eldest son, he was unable to follow up his victory, and the Castilians again threatened the hold of the Moors in Spain. At the renewed solicitation of the Emir, Yusuf crossed again into the peninsula (1090). He beat back the Spaniards, made war upon the Moorish princes, and united the whole of the Mohammedan dominions in Spain to the Kingdom of Morocco. Consult: E. A. Freeman, *History and Conquests of the Saracens* (Oxford, 1856).

YUTHIA, yōō'thē-ä. See AYUTHIA.

YUZGAT, yụz-gät', or **YOZGAD.** A town in the Vilayet of Angora, Turkey in Asia, capital of a sanjak, situated at an altitude of about 4400 feet, more than 100 miles east of Angora (Map: Turkey in Asia, C 2). The environs of Yuzgat are renowned for their horses and the annual horse fair. Pop., 15,000.

YVERDON, ē'vâr'dôN'. A town of the Canton of Neuchâtel, Switzerland, at the southwest end of the Lake of Vaud, 23 miles southwest of the city of Neuchâtel (Map: Switzerland, A 2). Its ducal castle (1135) was occupied from 1805 to 1825 by the celebrated school of Pestalozzi. The castle contains the municipal school, a museum of Roman and Celtic antiquities, and a library. There are railroad shops and foundries. Pop., 1900, 7985; 1910, 8626.

YVETOT, ēv'tō'. The capital of an arrondissement in the Department of Seine-Inférieure, France, on the plateau of Caux, 31 miles by rail northeast of Havre (Map: France, N., F 3). The ruins of the Bernardine monastery are occupied by the court and jail. Cloth fabrics and hats are extensively manufactured. Yvetot was long an independent principality, locally called a kingdom. Its sovereignty came to an end in 1681. It has been immortalized by Béranger in his burlesque song, "Le roi d'Yvetot." Pop., 1901, 7352; 1911, 7126.

YVO CARNOTENSIS, ē'vō kär'nō-tĕn'sĭs. See IVO OF CHARTRES.

YZAK, HEINRICH. See ISAAK.

Z

Z The twenty-sixth and last letter in the English alphabet. *Z* is the Greek *zēta* (ζ), and, like *y* (q.v.), was introduced into the Roman alphabet in the reign of Augustus to transliterate Greek words. In the Phœnician alphabet it was the seventh letter. For the development of the letter see ALPHABET.

Phonetic Character and Philological Value. As a phonetic character *z* is the voiced alveolar spirant. In its formation the tip of the tongue approximates the sockets of the upper front teeth and the air rushes over the flattened edge of the tongue with a sibilant sound, *zebra, zinc, gaze.* In English and other modern languages this sound is frequently represented by *s*, as in *noses, propose;* Fr. *plaisir*, Ger. *gesungen.* The letter *z* has also the hushing sound of *zh* in *azure, seizure;* this latter sound is more frequently represented by *s*, as in *measure, treasure.* In derivation English *z* represents Anglo-Saxon *s*, which became voiced when unaccented, as *freeze*, AS. *freosan; sneeze*, AS. *sneosan.* Initially, however, *z* generally indicates a word of foreign origin, as in *zeal, zodiac, zenith*, from the Greek, Arabic, etc., but in the old exclamation *zounds* the *z* stands for *s* (God's wounds).

As a Symbol and Abbreviation. In algebra *z* stands for the third variable or unknown quantity, and in analytical geometry one of the system of point coördinates. Consult: Henry Sweet, *Primer of Phonetics* (3d ed., Oxford, 1907); Daniel Jones, *The Pronunciation of English* (Cambridge, 1909); Maurice Prou, *Manuel de paléographie latine et française* (2d ed., Paris, 1910); Sir E. M. Thompson, *Introduction to Greek and Latin Paleography* (London, 1912).

ZAANDAM, zän'däm', or **SAARDAM.** A town in the Province of North Holland, Netherlands, at the meeting of the canalized Zaan and the Y, 6 miles north-northwest of Amsterdam (Map: Netherlands, C 2). It is a typical Dutch town, famous for its cleanliness. The small brick or wooden houses are surrounded by stiffly arranged gardens in which the favorite tulip predominates. Along the banks of the Zaan—in the Zaanstreek—there were formerly more than 400 windmills, but the machinery is now mostly run by steam. These mills are employed in sawing wood, grinding corn, and manufacturing oil, cement, and paint. The cabin occupied for a week in 1697 by Peter the Great, while he worked as a ship carpenter, is an object of great local pride. During the seventeenth century the town had large interests in the whale fishery, and shipbuilding flourished. Pop., 1910, 24,575.

ZABEL, tsä'bel, EUGEN (1851–). A German author, born at Königsberg, where he studied philosophy and philology. In 1876 he went to Berlin and became associate editor of the *Nationalzeitung.* Besides the monographs *Berthold Auerbach* (1882), *Ivan Turgenieff* (1884), *Graf Schack* (1885), *Anton Rubinstein* (1892), *Hans von Bülow* (1894), *Verestchagin* (1900), and *Tolstoi* (1901), he published *Litterarische Streifzüge durch Russland* (1887); *Im Reiche des Zaren* (1898); *Russische Litteraturbilder* (1899); *Europäische Fahrten* (2 vols., 1901); *Zur modernen Dramaturgie* (1902), of which *Theatergänge* (1908) was a continuation; *Moskau* (1902); *St. Petersburg* (1905); *Russische Kulturbilder* (2d ed., 1906), and others. He is also the author of several short stories, as *Getrennte Herzen* (1888) and *Der Stammtisch und andere Chorellen* (1894), and comedies, as *Die Mitternachtssonne, Bauernfänger,* and *Verfehlter Beruf;* of translations from the Greek and modern languages; and of books of travel, including *Auf der sibirischen Bahn nach China* (1904).

ZABERN, tsä'bĕrn (Fr. *Saverne*). A town in Alsace, 20 miles northwest of Strassburg, on the Zorn and on the Rhine-Marne Canal (Map: Germany, B 4). The manufactures include agricultural implements, grindstones, leather, and spectacle glasses. Pop., 1910, 8643. Conspicuous are the castle of the bishops of Strassburg, erected in its present form in 1779 and now used as a barrack, and the Hauptkirche, built in the late Gothic style and dating from the second half of the fifteenth century. Zabern, which was the Tres Tabernæ of the Romans, was destroyed by the Alemanni in 357, but in the same year was rebuilt and fortified by Julian. In the tenth century it belonged to the bishops of Metz and then to the bishops of Strassburg. At Zabern in 1525, 18,000 insurgent peasants were massacred. In 1622 it withstood the Count von Mansfield; and subsequently was taken by the French, who in 1696 destroyed the fortifications.

In 1913 occurred the "Zabern Incident." This grew out of the attitude of the German officers stationed in the town towards the native Alsatians. A young lieutenant of noble birth remarked that he would give 10 marks to any one who would run his sword through an Alsatian blackguard. The lieutenant was upheld by his superiors and further earned the hatred of the town by striking with his sword a lame cobbler

who jeered at him in the street. As a result of this, antimilitarist meetings were held in different parts of Germany. The Kaiser ordered that the army was to be upheld without compromise or apology. The Reichstag passed a vote of no confidence in the government (293 to 54), but the coalition failed to hold together and the Chancellor was able to announce that his position rested solely upon imperial prerogative and that votes of censure implied no control of the government. The officers involved in the incident were acquitted after trial.

ZABRZE, zäbr'zhe. A village of Silesia, 95 miles southeast of Breslau. It lies in the coal-mining district and near one of the richest mines of Silesia, operated by the state. The place contains a number of machine shops, wire mills, and coke ovens. Pop., 1910, 63,373.

ZACATECAS, tsä'kä-tä'käs. An interior state of Mexico (Map: Mexico, G 6). Area, 24,757 square miles. The state belongs to the central plateau of Mexico and has a mean altitude of over 7000 feet. The western part belongs to the region of the Sierra Madre and rises to about 10,000 feet. The climate is temperate, but dry. Owing to its mountains, Zacatecas has only a limited area of cultivable land but is favorable for grazing. In the southern part, there are tracts of land adapted to cereals and cotton. The chief importance of the state lies in extensive silver deposits, which have been worked since 1548. From 1610 to 1810 at least 670,000,000 pesos were taken from the three famous mining centres of Zacatecas, Fresnillo, and Sombrerete. There are deposits of copper, lead, and quicksilver. The chief products are cotton and woolen goods, sugar, rum, and wine. The state is crossed from north to south by the national railways of Mexico. Pop., 1900, 462,190; 1910, 477,556. Capital, Zacatecas (q.v.).

ZACATECAS. A city of the State of Zacatecas, Mexico, 439 miles by rail northwest of the city of Mexico, in a lofty valley some 8000 feet above the sea (Map: Mexico, G 6). Owing to the narrowness of the valley in which it is situated, the city spreads in irregular blocks, with winding streets, up the sides of the encircling hills. The cathedral, in the heart of the city, with elaborately sculptured façade, unfinished towers, and costly interior, dates from the seventeenth century. The plazas of Juarez and of Villareal, and the paseos of the Alameda and of Cañada de San Francisco, add much to the charm of the city. There is a municipal palace, containing an attractive courtyard, the mint, and the Calderon Theatre. Zacatecas owes its settlement and subsequent prosperity to its silver deposits. In the reduction of the silver ore the ancient and wasteful *patio* process is still employed, though a few foreign firms have introduced modern methods. There are manufactures of pottery, some simple household weaving, and an extensive transit trade. Pop., 1910, 25,900. Zacatecas was founded in 1546 and became a city in 1585. The Franciscan friars from this city played an important part in the early history of Texas. The state and city opposed the centralizing policy of Santa Anna, but were overthrown by him, in 1835, before he departed on his memorable Texas campaign. In 1871 a battle between the government troops and a revolutionary force took place on the Hill of the Bufa. In 1914 Zacatecas was captured by the Constitutionalists after a bloody battle.

ZACATON, sä'kä-tōn'. *Epicampes macroura*, an American grass occurring from Texas to Central America, abundant in Mexico, especially in the states Jalisco and Mexico. The strong, wiry roots are extensively used for brushes, and considerable quantities are exported from Vera Cruz to Europe for this purpose. Recent experiments have shown that the grass is valuable as paper stock, comparing in this respect with esparto (q.v.). The name Zacaton or Saccaton is applied to other grasses, particularly to *Muhlenbergia distichophylla* and *Sporobolus wrightii*.

ZACCHÆUS, zä-kē'ŭs *or* zăk'ē-ŭs. 1. An officer put to death by Judas Maccabæus for treachery (2 Macc. x. 18–22). The Hebrew name was probably Zakkai, pure. 2. A chief publican, or superintendent of customs, at Jericho who climbed up into a fig-mulberry tree to see Jesus, who called him down and asked him to receive him and his companions in his house. Jesus probably learned his name and character from those around him. Zacchæus showed his gratitude by promising to give half of his wealth to the poor and restore four times the amount of which he may have wronged anybody. Doubts as to the historicity of the incident have been expressed by Keim, but they are not of a serious nature. Consult: Theodor Keim, *Geschichte Jesu von Nazara*, vol. iii (Zürich, 1872); Nathaniel Schmidt, *The Prophet of Nazareth* (2d ed., New York, 1907).

ZACH, tsäg, Franz Xaver, Baron von (1754–1832). A German astronomer, born in Pressburg, Hungary. He served for a short time as an officer in the Austrian army, then became private tutor in London, and in 1786 entered the service of Duke Ernst of Saxe-Gotha. The Duke built an observatory for him on the Seeberg, near Gotha, of which Zach was director (1787–1806). Afterward he assisted in the establishment of observatories at Naples and Lucca, and edited the *Monatliche Correspondenz zur Beförderung der Erd- und Himmelskunde* (28 vols., Gotha, 1800–13). He also published *Tabulæ Motuum Solis Novæ et Correctæ* (ib., 1792, supplemented 1804); *Tabulæ Speciales Aberrationis et Nutationis* (ib., 2 vols., 1806–07), and edited *Allgemeine geographische Ephemeriden für 1798 und 1799* (1796), and *Correspondance astronomique, géographique, hydrographique, et statistique* (14 vols., Geneva, 1818–26).

ZACHARIAS, zăk'ä-rī'as, Saint. Pope 741–752. He is notable as one of the Greek prelates by whom the destinies of Rome and Italy were much influenced in the seventh and eighth centuries, and was instrumental in the redemption of captives from the pagan masters by whom they had been held in slavery. Zacharias, by his interposition in more than one instance in favor of the city of Rome with the Lombard kings, contributed to that prestige of the Roman see which eventually led to its obtaining the leadership of Italy, and in the end the temporal sovereignty of Rome and the adjoining territory. He died at Rome on March 14, 752. His letters are in Migne, *Patrologia Latina*, vol. lxxxix, and his Greek translation of the *Dialogues of Pope Gregory the Great* is in the same work, vol. lxxvii. Consult H. K. Mann, *Lives of the Popes in the Early Middle Ages*, vol. i (London, 1902).

ZACHARIÄ VON LINGENTHAL, tsäg'ä-rē'ä fŏn lĭng'en-täl, Karl Salomo (1769–1843). A German jurist, born at Meissen. He was edu-

cated at Leipzig, and in 1792–94 at Wittenberg, where in 1797 he became professor of law. In 1807 he was called in the same capacity to Heidelberg. The reputation which he earned with his *Handbuch des kursächsischen Lehnrechts* (1796), and with *Die Einheit des Staates und der Kirche* (1797), was greatly increased through the publication of the *Handbuch des französischen Civilrechts* (2 parts, 1808; 8th ed., 4 vols., 1894–95) and of *Vierzig Bücher vom Staate* (5 vols., 1820–32; rev. ed., 7 vols., 1839–43). Consult the biography by Charles Brocher (Paris, 1870).

His son, KARL EDUARD (1812–94), born at Heidelberg, was distinguished as an adapter of Byzantine law, and through his writings really established the science of Græco-Roman jurisprudence. These include: *Delineatio Historiæ Juris Græco-Romani* (1839); *Innere Geschichte des griechisch-römischen Privatrechts* (1864; 3d ed., 1892); *Jus Græco-Romanum* (7 vols., 1856–84), the best collection of Byzantine law books; *Paralipomena ad Basilica* (1893); and an edition of *Justiniani Novellæ* (2 vols., with index, 1881–91).

ZACHTLEVEN, CORNELIS. See SAFTLEVEN, CORNELIS.

ZACK. See KEATS, GWENDOLINE.

ZACYNTHUS, zȧ-sĭn'thŭs. See ZANTE.

ZADOKITES, zā'dok-īts. The probable name of an ancient Jewish sect whose existence has been revealed through a document published by Schechter in 1910. This document consists of two manuscripts, written in Hebrew, one of the tenth century, 16 pages in length, the other, whose text partly overlaps the first, of the eleventh or twelfth century, occupying two pages; both were found in the Geniza of an old synagogue at Fostat, near Cairo, and are now in the library of Cambridge University. The members of the sect are designated as the covenanters in the land of Damascus (viii, 21; xix, 33), but apparently also as the sons of Zadok (iv, 3). From the historical allusions it is evident that a company of priests, Levites, and laymen emigrated from Jerusalem to Damascus and there established a new covenant, or religious community, under the leadership of a teacher of righteousness and interpreter of the law; that among these covenanters a schism broke out headed by a man of lies and a scoffer whose followers perished by the sword some 40 years after the death of the original founder of the sect; and that the covenanters looked forward to the coming of a Messiah from Aaron and Israel, consequently an anointed high priest born in the midst of this true Israel, not a descendant of David, of the tribe of Judah. The statement that this party originated 390 years after the destruction of Jerusalem by Nebuchadnezzar (i, 6) would be a valuable indication of the date of the schism, if there were not reason to suppose that it is simply a vague number borrowed from Ezek. iv. 5, and if the knowledge of the chronology of the Achæmenian period on the part of later Jewish writers were not so defective. In the case the emigration to Damascus is placed in the middle of the second century B.C., it must be chiefly on other grounds. While the Zadokites severely condemned the builders of the wall, by which the Pharisees, or their like-minded predecessors among the scribes, seem to be meant, they were often more strict themselves in their principles of interpreting and applying the law. Thus they treated marriage with a niece as incest, by analogy to the prohibition against marriage with an aunt; they condemned polygamy, quoting Adam, Noah, and the prohibition to the prince to multiply wives, and regarded remarriage after divorce as polygamy; and they construed the raising of an animal that has fallen into a pit or ditch as work forbidden on the Sabbath day. They considered themselves as the true Israel and as a priestly people, and therefore called even the laity sons of Zadok, had six laymen to four priests and Levites in the court of judges, appointed the inspector (mebakker) as regardless of descent as the Christians would a deacon or a bishop, and apparently resorted frequently to the ban to preserve the priestly purity. In addition to the law, which they regarded as having been hidden until it was brought to light again by Zadok, probably the contemporary of Solomon, they also valued the prophets highly, and cherished among their sacred books, not only the hagiographa, but apparently also such works as the *Book of Hagu*, the *Foundations of the Covenant*, the *Book of Jubilees*, and the *Testament of Levi*. They do not seem to have believed in a resurrection or in a life beyond the grave. Though there are points of contact with many dissenting bodies in Judaism, they cannot be identified with any hitherto known sect, not even with the Sadducees with whom, however, they may have been confused by Kirkisani (in 937) and other Karaites. The Zadokites pledged themselves not to enter the temple in Jerusalem to bring fire upon its altar; but in their own house of prostration in Damascus they appear to have offered sacrifices, as the Jews did at Elephantine and Leontopolis. The most probable date for the emigration from Jerusalem would seem to be the end of the high priestly dynasty of the Oniads in 170 B.C. and the desecration of the temple two years later by Antiochus IV. This is the well-considered view of Moore. Levi and Bacher have suggested the years immediately before 70 A.D., Gressmann and Lagrange the Bar Kokba period (132–135 A.D.). Charles thinks the work was written between 18 and 8 B.C. Margoliouth looks upon the Zadokites as a Jewish-Christian sect, and finds allusions to John the Baptist, Jesus, and Paul; but the absence of anything distinctively Christian, even of an Ebionitish type, renders this theory inadmissible. Consult: Solomon Schechter, "Fragments of a Zadokite Work," in *Documents of Jewish Sectaries*, vol. i (Cambridge, 1910); Israel Levi, in *Revue des études juives* (Paris, 1911); G. Margoliouth, in *Athenæum* (London, 1911); G. F. Moore, in *Harvard Theological Review* (Cambridge, Mass., 1911); J. Lagrange, in *Revue biblique internationale* (Paris, 1912); R. H. Charles, *Apocrypha and Pseudepigrapha of the Old Testament* (Oxford, 1913).

ZAFFARINES, zȧf'ȧ-rēnz'. A group of islands off the coast of Morocco. See CHAFARINAS.

ZAFFRE, zăf'ẽr (Fr. *zaffre, saffre, safre*, Sp. *zafre*, probably from Ar. *safrā*, yellow). An impure cobalt oxide prepared by roasting cobalt ore, reducing it to powder, and then mixing with two or three parts of fine sand or ground quartz. It is used as a blue color by enamelers and painters on porcelain and glass.

ZAGAZIG, zä'gȧ-zēg', or **ZAKAZIK.** A town of Lower Egypt, situated on the Muizz Canal, about 20 miles north of Cairo (Map: Egypt, C 1). It lies in a fertile region and carries on a

considerable trade in cotton and grain. It has also a number of cotton-spinning establishments. Pop., 1907, 34,999. In the vicinity is the site of the ancient Bubastis (q.v.).

ZAGOS'KIN, MIKHAIL NIKOLAIEVITCH (1789–1852). A Russian novelist and dramatist, born in the Government of Penza. After a few years in military service he devoted himself to literature, and in 1817 received a position in the directorship of the Imperial Theatre. In 1820, having become favorably known through several comedies, he was made director of a theatre at Moscow and in 1831 director of the court theatre there. Zagoskin wrote several volumes of essays on *Moscow and the Muskovites*, and novels, of which *Yuri Miloslavski* (1829) was the most popular. In 1834 this was translated into English as *The Young Muskovite, or the Poles in Russia*. His books are gracefully written and constitute a good portrayal of Russian manners at various periods.

ZAGREB, zä'grĕb. See AGRAM.

ZAHN, tsän, ERNST (1867–). A Swiss novelist. He was born and educated in Zurich. After spending some time in Italy and England, he returned to Switzerland in 1894 and with his father became proprietor of a restaurant at Göschenen. He occupied several local offices and the presidency of the Landrat of Uri. The University of Geneva gave him an honorary Ph.D. Among Zahn's numerous works are: *Herzenskämpfe* (1893); *Bergvolk* (1896); and *Neue Bergnovellen* (1898), these three being collections of excellent short stories of Swiss mountain folk; *Erni Behaim* (1898), a novel; *Albin Indergand* (1901), one of his best-known novels; *Die Clari-Marie* (1904), a novel; *Lukas Hochstrassers Haus* (1907), another of his popular novels; *Einsamkeit* (1909), artistically perhaps his best piece of work; *Die Frauen von Tannè* (1911), a novel; *Der Apotheker von Klein-Weltwil* (1913), a novel. Some of these went through many editions. His portraits, especially of proud unbending Swiss peasants, are well and faithfully drawn, but here and there are perhaps too melancholy in tone. Consult Erich Schmidt, in *Deutsche Rundschau* (Berlin, 1907).

ZAHN, THEODOR VON (1838–). A German theologian. He was born at Mörs, studied at Basel, Erlangen, and Berlin, lectured at Göttingen in 1868–71, and became professor at Kiel (1871), at Erlangen (1878), at Leipzig (1888), and again at Erlangen (1892). He stands at the head of the conservative New Testament scholarship of his time. Some of his more important writings are: *Der Hirt des Hermas untersucht* (1868); *Patrum Apostolicorum Opera* (1875–78; 5th ed., 1905); *Forschungen zur Geschichte des neutestamentlichen Kanons und der altkirchlichen Litteratur* (8 vols., 1881–1908); *Geschichte des neutestamentlichen Kanons* (2 vols., 1889–92); *Das apostolische Symbolum* (1892; Eng. trans., *The Apostles' Creed*, 1899); *Einleitung in das neue Testament* (2 vols., 1897–1900; 3d ed., 1906–07; Eng. trans., *Introduction to the New Testament*, 3 vols., 1909); *Brot und Salz aus Gottes Wort*, 20 sermons (1901; Eng. trans., *Bread and Salt from the Word of God*, 1905); *Grundriss der Geschichte des neutestamentlichen Kanons* (1901; 2d ed., 1904); *Das Evangelium des Lucas* (1913).

ZÄHRINGEN, tsā'rĭng-en. The reigning family of Baden. It traces its descent from Gebhard, eldest son of Guntram the Rich, Count of Breisgau, who lived in the early part of the tenth century. His younger brother Lanzelin is said to have been the founder of the Hapsburg line. In 1077 the line of Zähringen divided into the ducal or Zähringen branch, which became extinct in 1218, and the present branch of Baden. The dukes of Zähringen ruled over extensive possessions in what is now southern Baden and northern Switzerland. They had their seat in the castle of Zähringen, which now lies in ruins some 2 miles north of Freiburg. Consult Eduard Heyck, *Geschichte der Herzoge von Zähringen* (Freiburg, 1891).

ZAIMIS, zä'ê-mēs, ALEXANDER (1855–). A Greek statesman, born in Athens. He was educated at the universities of Athens, Leipzig, Berlin, Heidelberg (Ph.D.), and Paris. Elected a deputy in 1885, he was Minister of Justice in the Delijannis cabinet in 1890–92, and served as president of the Chamber of Deputies in 1895–97. After the defeat of the Greeks by the Turks in 1897 he was called to the premiership by King George, but in April, 1899, gave way to Theotokes of the Trikoupist party. He was again head of the ministry in 1901–02. In 1906–11, as High Commissioner of the Powers in Crete, he helped to bring about conditions that resulted in 1913 in the annexation of the island by Greece. When King Constantine blocked the pro-Ally policy of Venizelos (q.v.) during the European War, he called upon Zaimis to form a new cabinet in October, 1915, but the next month the new premier failed to receive a vote of confidence and resigned. He was again called to the premiership in June, 1916, succeeding Skouloudis. See GREECE, *Recent History*, and WAR IN EUROPE.

ZAINAB, zä'ê-näb'. 1. One of Mohammed's wives. She was the wife of Zaid, the adopted son of the prophet. But Zaid yielded to his wishes and divorced her; a special revelation (Koran xxxiii, 37) gave a general permission which enabled Mohammed to marry her. 2. The wife of Abu Bekr ben Umar, one of the chiefs of the Lamtuna in south Morocco. In her husband's absence in 1058 she commanded the troops and assisted Yusuf ibn Tashfin (q.v.) in his ambitions. She secured a divorce from Abu Bekr and married Yusuf, who, upon the death of the Mahdi, in 1059, assumed the title Amir al Muslimin and became the real founder of the Almoravid Empire. Consult A. Müller, *Islam in Morgen- und Abendland* (Berlin, 1887), and Clement Huart, *Histoire des Arabes* (Paris, 1913).

ZAÏRE, zä'ēr'. 1. The best of Voltaire's tragedies and one of the best dramas of the French classic school. It was produced in Paris, Aug. 13, 1732, and owes much to Shakespeare's *Othello*. 2. An opera by Bellini, produced in 1829.

ZAIRE, zär. See CRUIVE.

ZAKAZIK, zä'kà-zēk'. A town of Egypt. See ZAGAZIG.

ZALDÍVAR, säl-dē'vär, RAFAEL (1834–1903). A Salvador statesman, born at San Alejo. Educated in medicine and surgery, he so distinguished himself in epidemics of cholera (1857) and yellow fever that he was called in 1860 to the University of Guatemala as professor of physiology and hygiene. In the same year he was elected to the Chamber, and thereafter was a member of the Senate, Minister to Germany, and Minister of War. He was elected President in 1876, in 1880, and in 1884, and greatly im-

proved the finances and industries of the country. He was Minister to the United States until shortly before his death, and withdrew because of an arbitration decision adverse to Salvador, growing out of a United States claim in behalf of the Salvador Commercial Company. He was transferred to Paris, where he died.

ZALEUCUS, zȧ-lū'kŭs (Lat., from Gk. Ζάλευκος, *Zaleukos*) (seventh century B.C.). A celebrated law giver of Epizephyrian Locri, in southern Italy. Of his life nothing is known, and most of the traditions in regard to him are untrustworthy. He flourished in the middle of the seventh century B.C., and his code is reputed to have been the first written code which any Greek state ever possessed. It is said that the occasion for his legislation was given by an appeal which the people made to the Oracle of Delphi to remedy their troubles, whereon they were told to make laws for themselves. These laws, though most severe, were for a long time greatly celebrated. So averse were the people to a change that if any one proposed a new law, he was obliged to appear in public with a noose around his neck; and if his proposal was rejected the noose was tightened and the proposer strangled on the spot. See GERACE; LOCRIS.

ZALIN'SKI, EDMUND LOUIS GRAY (1849–1909). An American artillerist and inventor, born at Kurnik, Prussian Poland. His parents early came to the United States and settled at Seneca Falls, N. Y. Zalinski served in the Civil War, and in 1866 he was appointed second lieutenant in the Fifth United States Artillery, attaining the rank of captain in 1887, and being retired in 1894. In 1872–76 he was professor of military science in the Massachusetts Institute of Technology. He then studied at the Artillery School at Fortress Monroe, Va., where he graduated in 1880, and at the School of Submarine Mining at Willets Point, N. Y. He was one of the first officers of his arm of the service to devote himself to its improvement through the investigation of scientific subjects. His *magnum opus* was the pneumatic dynamite gun, long since superseded. From 1888 to 1890 he was in Europe for the United States army, investigating British and Continental ordnance methods and equipment. See AIR GUN; ORDNANCE.

ZALUSKI, zȧ-lōōs'kē, JÓZEF ANDRZEJ (1702–74). A Polish bishop and scholar. He was born of an influential family, and at an early age took orders, becoming canon of Plock and a dignitary of the ecclesiastical courts. After the death of Augustus III he espoused the cause of Stanislas Leszczynski, and with him fled to Lorraine, where he held several benefices. He soon returned to Warsaw, however, where he was made Bishop of Kiev. He collected a library of about 250,000 volumes and several thousand manuscripts, to which after 1747 he gave the public free access. This library he bequeathed to the Polish nation, but in 1795, on the final partition of Poland, it was removed to St. Petersburg, where it became the nucleus of the Imperial Library. Zaluski did much toward the awakening of Polish literature. His writings included a *Specimen Historiæ Poloniæ Criticæ* (1733), and a bibliographical chronicle, *Biblioteka historyków*, edited by Muczkowski (1832).

ZA'MA (Lat., from Gk. Ζάμα). In ancient geography, the name of two places about five days' journey southwest of Carthage and somewhat less than 30 miles apart. Inscriptions show that the eastern Zama was near the modern Sidi Amor Djedidi, and the western at Djiama. At one of these places the final battle of the Second Punic War was fought in 202 B.C. The Romans, under the command of the youthful P. Cornelius Scipio Africanus, defeated completely the Carthaginian forces under Hannibal (q.v.). Mommsen holds that the western town, Zama Regia, gave its name to the battle, but this view is not universally accepted.

ZAMACOÏS, thä'mȧ-kō'ēs, EDUARDO (1843–71). A Spanish genre painter, born at Bilbao. He studied chiefly under Madrazo in Madrid, and in Paris under Meissonier, whose art his own somewhat resembles. His works are set in sumptuous interiors, and display great technical dexterity, brilliancy of color, and subtle humor. Many are in the United States, including: "The King's Favorite" and "Sleeping Hunter" (Metropolitan Museum, New York); "Spain 1812—French Occupation" and "Waiting at the Church Door" (Walters collection, Baltimore); and "Fortuny's Model" (Ex-Senator W. A. Clark, New York).

ZAMACOÏS, zȧ'mȧ'kō'ēs', MIGUEL (1866–). A French dramatist and poet, son of Eduardo Zamacoïs, the Spanish painter. He was born at Louvenciennes. He studied at the Beaux-Arts and began his career as a painter. Later he wrote for numerous journals, notably the *Figaro*, and illustrated some of his articles. About 1894 he turned to writing poetry, in which field his work is reminiscent at times of Banville (q.v.). Among numerous plays by Zamacoïs are: *Sang de navet* (1901); *Au bout du fil* (1903); *Bohémos* (1904); *Le gigolo* (1905); *Les bouffons* (1907); *La fleur merveilleuse* (1910); *L'Arche de Noé* (1911).

ZAMAKHSHARI, zä'mȧk-shä'rē (Ar. *Abū 'l-Kāsim Mahmūd ibn 'Umar al Zamakhsharī*) (1074–1143). A noted Arabic philologist and exegete. He was born at Zamakhshar, in Persia. According to the usual custom, he traveled extensively for study and spent considerable time in Mecca, from which he acquired the surname Jar Allah, the neighbor (or client) of Allah. He belonged to the sect of the Mutazilites. (See MOHAMMEDAN SECTS.) His principal works, so far as they have been edited by Europeans, are: a commentary on the Koran, edited by Lees (Calcutta, 1856); an Arabic grammar of classic character, edited by Von Broch (Christiania, 1879); an Arabic-Persian Lexicon, edited by Wetzstein (Leipzig, 1844); the *Golden Necklaces*, a collection of moral sayings which has been frequently translated, e.g., by Fleischer (Leipzig, 1835) and by De Meynard (Paris, 1876). Consult: Carl Brockelmann, *Geschichte der arabischen Litteratur*, vol. i (Weimar, 1898); R. A. Nicholson, *A Literary History of the Arabs* (New York, 1907); C. Huart, *Histoire des Arabes* (Paris, 1913).

ZAMBAL, tsäm'bȧl. A Malay people closely related to the Tagalog but who, because of long-continued opposition to Spanish rule and the less accessible nature of their country, have advanced more slowly toward civilization. They are found chiefly in the Province of Zambales, on the west coast of Luzon north of Manila Bay. See PHILIPPINE ISLANDS.

ZAMBALES, thäm-bä'lȧs. A province of Luzon, Philippine Islands, situated on the west coast of the island (Map: Philippine Islands, C 3). Area, including dependent islands, 2125 square miles. Parallel with the shore rise the

Zambales Mountains, whose highest peak reaches 5453 feet. The rivers are unimportant, the roads few and almost impassable during rains. Rice is the most important crop; corn and sugar cane less so. The live-stock industries are good. There are some mines of copper and coal, and the timber resources are extensive. Territory originally forming the northern part of the province was annexed to Pangasinán in 1904. Pop., 1903, 104,549. The Augustinians began work there in 1584, and the Recollets in 1712.

ZAMBEZI, zăm-bē'zĭ *or* zàm-bā'zē, or **ZAMBESI.** A large river of Africa, the fourth in size on the continent. It rises on the boundary between Portuguese West Africa (Angola) and the Belgian Congo in lat. 11° S., long. 24° E., and flows to the eastern sea in a great double curve forming the letter S (Map: Africa, G 6). First its course lies within Portuguese West Africa, then it crosses the British colony of Rhodesia from north to south and for a short distance separates the latter and German Southwest Africa, after which it traverses Rhodesia in an easterly direction and finally flows through Portuguese East Africa into the Mozambique Channel in lat. 19° S. Its total length is about 1650 miles. The sources are in a marsh of the great plateau, 5000 feet above the sea, close to the sources of the Kassai. The upper course is a low-lying, marshy and unhealthy but fertile valley, about 25 miles wide, which is annually inundated, but after the river has reached the British territory its valley becomes narrow, and its course broken by falls. Shortly after turning eastward it plunges in the great cataract known as the Victoria Falls (q.v.) into a deep transverse rift in the basalt floor, and for the next 40 miles it rushes through a deep and narrow gorge bounded by forest-covered ridges; then for 800 miles it is in general navigable, though broken by rapids as it passes through rocky gorges, and obstructed by sandbanks. The last great interruption is the Kebrabasa Rapids in the Portuguese territory, 400 miles from the sea; from that point to the delta the river is navigable. The delta has an area of several thousand square miles and a coast extension of 100 miles, but the channels are shifting and obstructed. Two of the arms, the Chinde and the Kongoni, are available for navigation; the former carries a depth of 19 feet, the latter 14. Among its chief tributaries are the Shire, which drains Lake Nyassa, and the Kuando. The latter river is also believed to receive water from the Kubango (q.v.) during the wet season, in which case the Kubango becomes the longest tributary of the Zambezi system. Although the total navigable length of the river and its tributaries exceeds 4000 miles, it is of little importance as a commercial route, since the navigable portions are broken into short stretches separated by rapids, and the river is so shallow and obstructed that at low water only small boats can pass. The upper course of the river was first explored by Livingstone in 1854–55. Consult: *Proceedings of Royal Geographical Society* (London, 1890); Coillard, *On the Threshold of Central Africa* (ib., 1897); R. C. F. Maugham, *Zambesia: A General Description of the Valley of the Zambesi River from its Delta to the River Aroangwa, with its History, Agriculture, Flora, Fauna, and Ethnography* (ib., 1910); id., *Wild Game in Zambezia* (ib., 1914).

ZAMBOANGA, thäm'bō-än'gà. A province in the island of Mindanao, Philippine Islands (Map: Philippine Islands, D 7). Its area, including dependent islands, is 3056 square miles. Three peninsulas, inclosing the Dumanquilas and Sibuguey bays, jut into the Celebes Sea. The westernmost of these is traversed by a low range of mountains, whose highest peak is 1752 feet. The climate is the most healthful of the Philippines, with but little variation in temperature and with a pleasant sea breeze. The plain of Zamboanga is the only cultivated portion, where by means of irrigation a little hemp and rice are produced. Gutta-percha is also a product of the province. The southern portion contains the only settlements of note, of which Zamboanga (q.v.) is the capital. The population consists mainly of the Visayan, Subano, and Moro races. Pop., 1903, 44,322.

ZAMBOANGA. The largest town of the island of Mindanao, Philippine Islands, and the capital of the Province of Zamboanga (Map: Philippine Islands, C 7). The present town, built since the American occupation, with a church, fort, and hospital, is surrounded by a plain covered with coconut groves and rice fields. It is an important market for hemp, copra, and gutta-percha, and is a general commercial point between the waters of the Celebes and Sulu groups and has regular steamer connection with Manila. Its climate is healthful. The town was settled in 1635 as a military basis against the pirates and Moros. Pop., 1903, 3281.

ZAMIA, zā'mĭ-ȧ (Lat., fir cone left to decay on the tree, from Gk. ζαμία, *zamia*, ζημία, *zēmia*, harm, damage). A genus of cycads restricted to the tropics and subtropics of the western hemisphere. It comprises about 30 species, which range from southern Florida to Chile. The stem is tuberous, covered by an armor of persistent leaf bases, and bears a crown of large pinnate leaves. The central part of the stem contains much starch, especially in old plants, and a kind of sago or arrowroot is made from it. The cones are usually solitary and terminal, the plant being dicœcious. *Zamia* is regarded as perhaps the most specialized of the cycad genera, the most primitive being *Cycas*, which holds an equally prominent place in the oriental tropics. As in all cycads, there is very little development of woody tissue. The only common species in the United States is *Zamia integrifolia*, the coontie, which abounds in low grounds in southern Florida.

ZAMOJSKI, zȧ-moi'skē. One of the most distinguished families of the Polish nobility.—Jan Zamojski (1541–1605) was born at Skokow, was educated at Strassburg and Padua, and became a leader in Polish affairs. He assisted in the election of Henry of Anjou to the Polish throne (1573) and became grand chamberlain of the King. When Henry returned to France, Zamojski joined the party of Stephen Báthory, and on the latter's election (1575) became Grand Chancellor. He was commander in chief during the war with Russia, 1580–82, and secured favorable terms of peace. On the death of Báthory, in 1586, he threw his influence in favor of the election of Sigismund III, though he himself might have secured the crown. He rendered his country great services by his defense of the borders against the Turks, the Cossacks, and the Swedes. He died at Zamosc in 1605. He was a munificent patron of literature, and himself wrote *De Senatu Romano* (Venice, 1562) and *Testamentum Joannis Zamori* (Mainz,

1606).—ANDRZEJ ZAMOJSKI, COUNT (1716–92), was born at Zdiezun, served for a time in the Saxon army, and reached the rank of major general. On his return to Poland in 1754 he was raised to high offices, becoming Chancellor in 1764. He laid down this post in 1767. He was one of the first nobles to emancipate his serfs. He drew up a code of laws in 1776, the principles of which were incorporated in the constitution of 1791. He died at Zamosc, Feb. 10, 1792. Consult Mazade, *Le comte André Zamoyski et le marquis Wielopolski, deux portraits* (Paris, 1863).—ANDRZEJ ZAMOJSKI (1800–74) was the grandson of the preceding, and studied at Geneva and Edinburgh. In 1823 he entered the Polish civil service, and in 1831 was Minister of the Interior in the revolutionary government. After the failure of the patriotic movement Zamojski returned to his estates, carried on an agricultural paper, started a private bank, introduced steam navigation on the Vistula, and was at the head of a great agricultural association which was regarded with disfavor by the Russian government, and was suppressed in 1862. Zamojski was banished and went to Paris.

ZAMORA, thȧ-mō'rȧ. A town in the Province of Zamora, Spain, 130 miles northwest of Madrid, on the right bank of the Duero, which is here spanned by a magnificent fourteenth-century bridge of 16 pointed arches (Map: Spain, C 2). The town, on the slope of a hill, is picturesquely marked by its church towers. The cathedral is a twelfth-century structure in Romanesque style. La Magdalena (twelfth century) and the parish church of San Pedro and San Ildefonso are worthy of note. The municipal building dates from 1622. The palace of the provincial deputation has a session chamber with many paintings of the early history of Zamora. The public hospital is an important structure. Among the leading manufactures of the city are serges, linens, leather, hats, brandies, and pottery. Pop., 1900, 16,417; 1910, 16,955. Zamora is of ancient but uncertain origin. It figured in the wars between the Christians and the Mohammedans. It was at times the residence of the kings of León and Castile and the meeting place of the Cortes. It was prominent during the War of the Communes.

ZAMOSC, zä'môsch (Russ. *Zamostye*). A district town in the Government of Lublin, Russian Poland, 55 miles southeast of Lublin. It manufactures bent furniture. Pop., 1910, 14,633, chiefly Poles.

ZAMOUSE, zȧ-mōōs'. The West African buffalo (q.v.).

ZAMPIERI, tsäm'pē-ā'rē, DOMENICO. See DOMENICHINO.

ZAMUCUS. See SAMUCAN.

ZANARDELLI, dzä'när-dĕl'lē, GIUSEPPE (1826–1903). An Italian statesman, born at Brescia, and educated in law at the University of Padua. He took part in the rising against Austria in 1848–49, and in 1851–58 was a private tutor at Brescia. In 1860 he was elected to the new Italian Parliament at Turin, and from that time he was a prominent liberal member of the Chamber. When the Left first came into power with Depretis (q.v.) in 1876, Zanardelli accepted the portfolio of Public Works, but resigned in 1877. He was Minister of the Interior in 1878, and in 1881–83 was Minister of Justice, a post he again filled in 1887–91 and in 1897–98. He became Premier at the fall of Saracco in 1901, and held office till October, 1903, when he resigned, dying shortly after.

ZAN'CLE. See MESSINA.

ZANDEH, zän'dē. See NIAM NIAM.

ZANDONAI, dzän'dō-nä'ē, RICCARDO (1883–). An Italian dramatic composer, born at Sacco in Trentino. He received his first instruction from Gianferrari at Rovereto, and from 1898 to 1901 was a pupil of the conservatory at Pesaro. He is the composer of the operas *Il Grillo del Focolare* (1908), *Conchita* (1911; produced in San Francisco, 1912), *Melenis* (1912), *Francesca da Rimini* (1914). A *Messa da Requiem* was produced at the Pantheon in March, 1916. He also wrote some instrumental pieces for orchestra and chamber music.

ZANE, EBENEZER (1747–1811). An American pioneer, born in Berkeley Co., Va. (now West Va.). In 1770 he made the first permanent settlement on the Ohio River (where Wheeling now stands), building there a blockhouse called Fort Henry, which was several times attacked by Indians during the Revolution. He owned the land on which the present Zanesville stands, and assisted in laying out the original settlement there.

ZANELLA, dzä-nĕl'lȧ, GIACOMO (1820–88). An Italian poet and critic, born at Chiampo (Veneto). He was educated at the Seminary of Vicenza, and was ordained in 1843. He taught in the Seminary of Vicenza, then in a lyceum at Venice (1857), later in Padua, where (1866–76) he was professor of Italian literature in the university. His verse, of which the *Conchiglia fossile* is the best, is inspired by simple ideals of religion and morals, by classic memories, and patriotic fervor. In the revolution he was the most prominent example of the prete garibaldin type. His prose works include: *Storia della letteratura italiana* (1880); *Vita de Andrea Palladio* (1880); *Paralleli letterari* (1885). Consult Biadego, *Saggio bibliografico degli scritti a stampa di Giacomo Zanella* (Lucca, 1888); A. Zardo, *Giacomo Zanella nella vita e nelle opere* (Florence, 1905); A. Graf, *Poesia di Giacomo Zanella* (ib., 1910).

ZANESVILLE, zānz'vĭl. A city and the county seat of Muskingum Co., Ohio, 60 miles east of Columbus, at the confluence of the Muskingum and Licking rivers, and on the Baltimore and Ohio, the Zanesville and Western, the Ohio Electric, the Ohio River and Western, the Pennsylvania, and the Wheeling and Lake Erie railroads (Map: Ohio, G 6). It has an attractive situation, flanked by lofty hills, and is well laid out. Among the noteworthy features are the bridges spanning the Muskingum and Licking rivers, the county courthouse, city jail, Soldiers' and Sailors' Memorial Hall, John McIntire Library, high school, and the buildings of the various fraternal organizations. There are six parks. Zanesville is situated in a region engaged in farming, and having extensive deposits of limestone, clay, and coal. Good water power for manufacturing is derived from both rivers. The manufacture of tile, pottery, terra cotta, tubes, and fire-clay products is the leading industry. The Baltimore and Ohio Railroad maintains shops here, and there are also foundries and machine shops, farm-implement works, flouring mills, lumber and planing mills, and manufactories of soap and candles, iron and steel, paving material, malt liquors, etc. Pop., 1900, 23,538; 1910, 28,026; 1915 (U. S. est.), 30,406.

ZAN'GA. A revengeful Moor in Edward Young's tragedy *The Revenge.* The part was made famous by Macready and John Kemble.

ZANGWILL, ISRAEL (1864–). A British author, born of Hebrew parents in London. He was educated at the Jews' Free School, Spitalfields, in the East End of London. He traveled and lectured in Great Britain, Ireland, Holland, Palestine, and the United States. Of the English Men's League for Women's Suffrage he was elected vice president, and he became prominent in the Zionist Movement (q.v.). In literature he met with success in the essay, the humorous sketch, the drama, and the novel, especially the novel depicting Jewish scenes and characters. His Jewish studies comprise mainly: *Children of the Ghetto* (1892); *Ghetto Tragedies* (1893); *The King of Schnorrers* (1894), grotesques and fantasies; *Dreamers of the Ghetto* (1898), containing admirable sketches of great Jewish thinkers, as Spinoza and Lassalle; *They that Walk in Darkness* (1899); *The Mantle of Elijah* (1900); and *Ghetto Comedies* (1907). Among his other writings are: *The Premier and the Painter* (1888); *The Bachelor's Club* (1891); *The Big Bow Mystery* (1892); *The Old Maids' Club* (1892); *Merely Mary Ann* (1893); *Without Prejudice* (1896), collected essays; *The Celibates' Club* (1905); *Italian Fantasies* (1910). Zangwill also wrote verse and he did notable work as a dramatist. He will be remembered especially for *The Melting Pot* (1908), an impressive play dealing with immigration problems. *Children of the Ghetto* was also produced successfully. Among other of his plays, all in published form, are *The War God* (1911), *The Next Religion* (1912), and *Plaster Saints* (1914).

ZANONI, zȧ-nō'nĭ. A mystical historical novel by Bulwer Lytton (1842). A first sketch, entitled "Zicca," appeared in *The Monthly Chronicle* during the preceding year.

ZANTE, zăn'tē *or* zăn'te, now officially designated by its ancient name of Zakynthos. The southernmost Ionian island situated 8 miles south of Cephalonia and 9 miles west of the Peloponnesus (Map: Greece, B 6). Area, 277 square miles. The western part of this beautiful island is characterized by chalk mountains reaching a height of about 2700 feet. The eastern part is a rich plain flanked by the peak of Skopos. The island is subject to earthquakes. Its springs of mineral pitch have been known since the time of the ancient Greeks. The soil is fertile. Two-thirds of the area is in vine. Wine, olives, and fruits are exported. Zante is noted for currants, the shipments of which are, however, not so valuable as formerly. The principal import is Russian wheat. The capital is Zante. Since the earthquake of 1893 the island has not regained its former properous condition. Pop., 1907, 42,502. In ancient times Zacynthos was an independent state; became a member of the confederacy of Delos; passed under the rule of Macedon, and then of Rome; and became identified with the destinies of the Ionian Isles, with which it was annexed to Greece in 1864. At the end of the eighteenth century the island was the centre of Greek artistic life.

ZANTE. The capital and chief port of the Greek island and nomarchy of Zante (Map: Greece, B 6). It is situated on the east shore of the island at the foot of a mountain crowned by a citadel built by the Venetians. It has a good harbor, a custom house, and an arsenal, and manufactures carpets and gold and silver articles. It shares, however, in the general backward condition of the island. Pop., 1907, 13,580.

ZANTHOX'YLUM, (Neo-Lat., from Gk. *ξάνθος, xanthos,* yellow + *ξύλον, xylon,* wood), often spelled *Xanthoxylum.* A genus of more or less prickly trees and shrubs, belonging to the dicotyledonous family Rutaceæ. It comprises about 150 species, natives of temperate and tropical regions, four species occurring in the United States. The northern species is *Z. americana,* known as prickly ash or toothache tree. It is a shrub or small tree whose pinnate leaves suggest those of the ash, and occurs from Quebec to Virginia, and westward to western Ontario, South Dakota, and Kansas. *Z. clava-herculis,* known as Hercules' Club or southern prickly ash, occurs along streams from the coast of southern Virginia to Florida, and westward to Texas and Arkansas.

ZANZIBAR, zăn'zĭ-bär' *or* zăn'zĭ-bär. A sultanate and British protectorate of East Africa (Map: Africa, J 5). The protectorate, proclaimed in November, 1890, in conformity with conventions by which Great Britain ceded Helgoland to Germany and renounced all claims to Madagascar in favor of France, consists of the islands of Zanzibar and Pemba and some adjacent islets. The sultanate was formerly of much greater extent, including on the mainland of Africa a strip of coast 10 miles deep from Warsheikh to Tunghi Bay. This coastal territory was divided among Great Britain, Italy, and Germany in 1890. The area of the protectorate is stated at 1020 square miles. The island of Zanzibar is separated from the mainland by a channel 22½ miles wide at its narrowest part; it is about 48 miles long by 15 broad and has an area of 640 square miles. About 30 miles to the northeast is the island of Pemba (q.v.), with an area of 380 square miles. The east coast of Zanzibar island is steep, forbidding, and difficult of access. The region to the west is generally flat and arid, poorly covered with trees, presenting a Karst formation, and characterized by coral stone. West of this portion is the rich, cultivated part of the island, with rows of hills diversified in sections by swamps. It is well watered with flowing streams. The west coast is easy of approach. It is supplied with bays with deep water near the shores, which are fringed by islets. The climate is generally favorable, fevers threatening only in the interior. The mean annual temperature is 79.7° F. The annual rainfall is about 58 inches in Zanzibar and 83 inches in Pemba. The flora is equatorial, but some of it not well known. Among the fauna are the civet cat, monkeys, python, chameleon, and iguana. The fisheries are productive. Agriculture and trade are the leading pursuits. Sugar cane and manioc are raised. Sorghum and red pepper figure prominently. In the clove industry the protectorate leads the world. In Zanzibar and Pemba together about 60,000 acres are under cloves, and in recent years the annual production has been about 14,000,000 pounds. The coco palm flourishes and contributes largely to the exports. The town of Zanzibar is one of the finest ports in Africa. Trade is mostly with Great Britain. In 1905 the port was visited by ocean-going vessels with a tonnage of 427,113; in 1913, 834,100. The exports are largely cloves, rubber, ivory, copra, and chillies; the imports, rice,

piece goods, and coal. Imports and exports in 1913, £1,103,347 and £1,048,866. The British administer justice and all other branches of authority, only a shadow of power being left to the Sultan. Zanzibar is the capital and only large town (pop., 35,000). The 1910 census showed a population of 197,199; estimate of Dec. 31, 1913, 199,462, of whom 116,307 in Zanzibar island and 83,155 in Pemba. The black population, though mostly Swahili, is very heterogeneous. Europeans number about 250 and East Indians about 10,000; through their hands passes almost the entire trade. Arabs, who number about 10,000, are the principal landlords and employers of labor. About one-half of the inhabitants are former slaves from the adjacent coast, who till the fields and do the domestic service. The ancient race is the Mohammedan Wahadimu, who have been forced back into the forbidding coral districts. Slavery was abolished by compensation in 1897. The prevailing religion is Islam; most of the natives are Sunnis of the Shafi school, while the Sultan and his relatives belong to the Ibadhi sect. There are three Christian missions. Consult: H. S. Newman, *Banani: The Transition from Slavery to Freedom in Zanzibar and Pemba* (London, 1898); W. W. A. FitzGerald, *Travels in the Coastlands of British East Africa* (ib., 1898); R. N. Lyne, *Zanzibar in Contemporary Times* (ib., 1905); J. E. E. Craster, *Pemba: The Spice Island of Zanzibar* (London, 1913).

ZAPARO, sä-pä'rō. An important group of tribes in Ecuador, constituting a distinct linguistic stock, in the country between the Upper Napo and Pastasa, frequently coming down to the Marañon (Amazon). The tribes are continually at war with one another, but unite against a common enemy. They are indolent, good-tempered, and hospitable, hardy, dexterous in throwing the lance, and daring boatmen. They live under roofs raised upon posts, with no conveniences except hammocks for sleeping. A few tribes cultivate the ground. Their weapons are the club, lance, and blowpipe with poisoned arrows. Their language, of which considerable material has been collected, is agreeable in sound and simple in construction. They are variously estimated to number from 10,000 to 20,000. Consult Beuchat and Rivet in *Journal de la Société des Américanistes de Paris*, new series, vol. v (Paris, 1908).

ZAPATA, sä-pä'tä, EMILIANO (c.1869–). A Mexican revolutionary leader, born in the State of Morelos. He was early a small landholder, whose possessions were confiscated during the Diaz régime. He became a political agitator, was banished to Quintana Roo, but lived to return to his native state. At the time of the Madero revolt in 1910, Zapata also took up arms against Diaz and issued the Plan of Ayala, a programme of agrarian reform. From 1911 to 1916 he waged a warfare in the states of Morelos and Guerrero against those who were in control of the capital, successively refusing to join Madero, Huerta, and Carranza, as they would not accept the Plan of Ayala. For a time during 1914 he coöperated with the Convention and Villa (q.v.), but when he occupied Mexico City (November 24), he declared he would set up his own government. The following year he was in possession of the capital for brief periods in March and July. During 1915–16 he had an army of about 10,000 men and was often operating near the capital. At that time he claimed to be fighting to free Mexico of foreigners, to return to the Indians the lands taken from them by the governments of Diaz, Madero, and Carranza, and to give Mexico an honest president (himself), who would render justice to all classes. See MEXICO, *History*.

ZÁPOLYA, zä'pōl-yō. An Hungarian royal family of Slavic descent.—STEPHEN ZÁPOLYA, Voivode of Transylvania, was one of the generals of Matthias Corvinus. He took part in the conquest of the Archduchy of Austria, and was made its Governor. He died in 1499.—His son, JOHN ZÁPOLYA (c.1487–1540), Voivode of Transylvania, was elected King of Hungary by the National party after the death of Louis II at Mohács in 1526. His rival was Ferdinand of Austria. The claimants to the throne waged war against each other at intervals for several years, John Zápolya being supported by the Sultan Solyman the Magnificent. In 1538 the Treaty of Grosswardein was made, by which the kingdom was divided between them. JOHN SIGISMUND ZÁPOLYA, son of John Zápolya (1540–71), was recognized by Sultan Solyman as King of Hungary, but had to be satisfied with Transylvania and eastern Hungary. His subjects joined the reformed religion. He was succeeded by Stephen Báthory. Consult Mihály Horváth, *Kurzgefasste Geschichte Ungarns* (Ger. trans., 2d ed., 2 vols., in 1, Budapest, 1876), and Gyula Andrássy, *The Development of Hungarian Constitutional Liberty* (Eng. trans., London, 1908).

ZAPOTEC, sä'pō-tĕk'. An important ancient cultured nation of southern Mexico, occupying the greater portion of the present State of Oaxaca, where their descendants still number more than 250,000. It was long believed that the Zapotecan linguistic stock included the Mixtec and the Mazatec, but later studies have shown this to be unlikely. They formed an independent state, as civilized as the Aztec, and were sedentary and agricultural, living in villages and cities with houses built of stone and mortar. The ruins of Mitla (q.v.), among the most remarkable on the American continent, are ascribed to the Zapotec, and according to their own tradition were originally sepulchral in purpose. Their records were kept by means of a hieroglyphic calendar, upon the general plan of that in use among the neighboring nations. The modern Zapotec are intelligent, industrious, and progressive. They still hold to many of their ancient beliefs and rites, among which are the burial of money with the dead. Consult Mechling, "The Indian linguistic stocks of Oaxaca, Mexico," in *American Anthropologist*, vol. xiv (Lancaster, Pa., 1912), and for a general review of Zapotecan civilization, Eduard Seler, "Wall Paintings of Mitla," in Bureau of American Ethnology, *Bulletin No. 28* (Washington, 1904).

ZAPOTLANEJO, sä-pōt'lä-nā'hō. A town in the State of Jalisco, Mexico, 22 miles east of Guadalajara. Near the town occurred the battle on the bridge of Calderon, Jan. 17, 1811, in which the Royalist Calleja inflicted a crushing defeat upon the revolutionary forces under Hidalgo (q.v.). Municipal pop., 1910, 20,750.

ZAPUPE, sä-pōō'pä. A Mexican fibre plant belonging to the genus *Agave*. The fibre has been introduced into commerce as a substitute for sisal (q.v.). The plant is strictly tropical and succeeds well under varied conditions of climate and soil. It is produced most abun-

dantly about Vera Cruz, Mexico, and is said to have been in cultivation in Tuxpan since about 1900.

ZARA, zä'rà (Slav. *Zadar*). The capital of the Austrian Crownland of Dalmatia, on the coast of the Adriatic, 130 miles southeast of Triest (Map: Austria, D 4). It is built in the form of an oval, on a narrow promontory, separated from the mainland by a moat, across which is a drawbridge. The ramparts afford a fine promenade to the inhabitants. There is a spacious and well-protected though somewhat shallow harbor. The streets generally are narrow and ill paved, and the drainage defective; the town is not well supplied with water. Of its churches, the most noteworthy are its cathedral, founded by Enrico Dandolo, Doge of Venice, and the church of its patron saint, Simeon. There is a lofty marble column, which is all that is left standing of the ancient Roman temple. The commerce of late has shown considerable increase. Many of the inhabitants are engaged in fishing and in the coasting trade. The chief manufactures are rosoglio, maraschino, leather, silk, and linen fabrics. Pop. (town), 1910, 13,074. Zara is the Iadera, or Diadora, of the ancients. In the Middle Ages Venice and Hungary long contended for the possession of the town, which was a place of commercial importance. In 1202 the Venetians, with the aid of the Crusaders, reduced it, but they subsequently lost it. In 1409 they purchased it from Ladislas, King of Naples, claimant of the crown of Hungary. It subsequently shared the fortunes of Dalmatia (q.v.).

ZARA, zä'rà. The heroine of Congreve's tragedy *The Mourning Bride*, from whose lines in the third act has been derived the proverbial warning, "Hell hath no fury like a woman scorned."

ZARAFSHAN, zä'rȧf-shän'. See ZERAFSHAN.

ZARAGOZA, thä'rà-gō'thà. See SARAGOSSA.

ZARATHUSTRA, zä'rà-thōōs'trà. See ZOROASTER.

ZAREMBA, zà-rĕm'bà, SIGISMUND VLADISLAVOVITCH (1861–). A Russian composer, born at Zhitomir, son of Vladislav Ivanovitch Zaremba, also a composer. He studied with his father (piano) and Sattel and Alois (cello). From 1896 to 1901 he was director of the Imperial Russian Music Society and conductor of the symphony concerts at Voronesh. After that he lived in St. Petersburg. His compositions, which are distinguished by spontaneity and melodiousness, include a suite for string orchestra, a polonaise for full orchestra, a Slavic dance, a string quartet, piano music, romances, etc.

ZARLINO, dzär-lē'nō, GIUSEPPE (1517–90). An Italian composer and musical theorist, born at Chioggia. In 1537 he became a member of the Franciscan Order, and in 1541 went to Venice in order to complete his studies with Willaert. He became *maestro di cappella* at St. Mark's in 1565, and held the position until his death. His extant compositions number only 21. Among these are: *Modulationes* (1566); three *Lectiones pro Mortuis* (1563); and a mass. His theoretical works are: *Istituzioni harmoniche* (1558), in which Zarlino recognizes the natural opposition of the major and minor triads, taken up later by Tartini, and more successfully by Hauptmann, and also gives clear and practical demonstrations of double counterpoint and canon, illustrated by a number of examples in notes; *Dimostrazioni harmoniche* (1571); and *Sopplimenti musicali* (1588). See HARMONY.

ZARNCKE, tsärn'ke, FRIEDRICH (1825–91). A German philologist and historian of literature. He was born at Zahrenstorf, in Mecklenburg-Schwerin, and was educated at the universities of Leipzig, Berlin, and Rostock. In 1850 he founded at Leipzig the *Litterarisches Centralblatt für Deutschland*, in 1852 became privatdocent at the university, and in 1858 was made full professor. His contributions to the study of comparative literature were of especial value, notably in the fields of saga and romance. Among the more important of his numerous publications are: *Der deutsche Cato* (1852); *Sebastian Brants Narrenschiff* (ed., 1854); *Zur Nibelungenfrage* (1854); *Das Nibelungenlied* (ed., 1856; and after); *Mittelhochdeutsches Wörterbuch* (1863), with W. Müller; *Ueber den althochdeutschen Gesang vom heiligen Georg* (1874); *Der Graltempel* (1876); *Der Priester Johannes* (1876–79); *Christian Reuter* (1884); *Kleine Schriften* (2 vols., 1897). Consult Vogt, "Friedrich Zarncke," in *Zeitschrift für deutsche Philologie*, vol. xxv (Halle, 1892).

ZARY'TUS. See BIZERTA.

ZARZUELA, thär'thōō-ā'là. In Spain, a short two-act musical drama of a light order resembling our comic opera or operetta. It is interspersed with a great deal of spoken dialogue. The name is derived from the Spanish town of Zarzuela, where during the seventeenth century the first works of this kind were produced at the royal castle.

ZARZUELA. See CRUZ CANO Y OLMEDILLA.

ZASLAVL, zàs-läv'ly' (Russ. *Iziaslavl*). An ancient town of Volhynia, southwest Russia, about 80 miles west of Zhitomir. It has extensive sugar mills and paper mills. Pop., 1911, 14,448.

ZASULITCH, zà-sōō'lĕch, VIERA IVANOVNA (1851–). A Russian revolutionist. In 1869, though only an acquaintance of one who was indirectly connected with the revolutionary plot of Netchaev, she was arrested and imprisoned for two years, after which she was placed under police surveillance and for several years was sent about from place to place in eastern Russia. In 1876 she was freed from prison, but the flogging of the student Bogolyubov by order of General Trepov, head of the secret police, whom the student refused to salute, aroused her. On Feb. 5, 1878, she called at Trepov's office and shot him, but not fatally. At her trial on April 12 she claimed that her object was to direct the government's attention to the outrage. The jury, of which eight were government officials, unanimously acquitted her. The spectators, mostly of high social standing, met the verdict with approval, and the press commended it. Yielding to public opinion, the government removed Trepov, promoting him to the post of general of cavalry. Four newspapers received warning, political offenses were almost entirely exempted from trial by jury, and on June 11 the Supreme Court of Appeals canceled the acquittal on the ground of informality. In 1880 Zasulitch escaped abroad, and lived chiefly in Switzerland, taking an active part in the Russian revolutionary propaganda. In 1905, encouraged by the amnesty granted by the Czar, she returned to Russia. She wrote on social, political, and literary subjects, her papers being collected in two volumes (1906).

ZAUBERFLÖTE, tsou'bĕr-flē'te, DIE (Ger.,

The Magic Flute). An opera by Mozart (q.v.), first produced in Vienna, Oct. 7, 1791; in the United States, Nov. 21, 1859 (New York).

ZDONSKAWOLA, zdōōn'y'-skȧ-vōl'yȧ. A town in the Government of Kalish, Russian Poland, about 40 miles west of Lodz. It has manufactures of cotton and woolen goods. Pop., 1910, 23,452.

ZE'A, or **KE'A** (Lat. *Cea*, from Gk. *Kía*, *Kia*, *Kéos*, *Keōs*). The northwesternmost island of the Cyclades, 13 miles east of Cape Colonna, 14 miles in length, and 8 in greatest breadth (Map: Greece, F 6). Its surface rises from the coast in terraces, culminating in the centre in Mount St. Elias, about 1700 feet in height. The climate is healthy, and the soil fertile. The products are wine, fruit, barley, cotton, and silk. Attention is paid to the rearing of cattle and silkworms. Pop., 1909, according to Baedeker, 3863. The island anciently possessed four towns, Iulis, Coressia, Carthæa, and Poieëssa, but there is now only one, Zea, situated on the northwest slope of the mountain, about 3 miles from the coast, on the site of the ancient Iulis. Near it is a colossal lion, and there are other less important remains of the ancient city. A few remains are still to be found on the sites of the other three ancient towns. The harbor of Zea, Port St. Nicholas, about 3 miles from the town, admits the largest vessels, and is much used.

ZEA, zē'ȧ. See PIRAEUS.

ZE'A. See MAIZE.

ZEA, sā'ȧ, FRANCISCO ANTONIO (1770–1822). A Colombian naturalist, author, and statesman, born in Medellín and educated at Popayán and Bogotá. In the latter city he became associated with the Spanish botanist Mutis. While a tutor of natural history in the College of San Bartolomé at Bogotá he was sent to Spain and imprisoned for two years at Cadiz for circulating the political pamphlet *Los derechos del hombre* (1795). He was released on condition that he should not return to his country. Upon the recommendation of Mutis he was well received in scientific circles at Madrid, and was granted a pension to continue his studies in Paris. After his return to Madrid in 1801 he was appointed director of the botanical garden, and assumed the editorship of the *Semanario de Agricultura* (1805) and of *El Mercurio de España*. He was repeatedly refused permission to return to his native country, but finally managed to do so in 1815 as a result of his association with the French. With Bolívar (q.v.) he took an active part in the war of independence, founded the *Correo del Orinoco* (1818), became a member and the president of the first Constituent Assembly at Angostura (1819), and was elected Vice President of Venezuela and later of the new Colombian republic (1819). In 1820 he was sent to Europe as Minister to England and France, with instructions to negotiate loans in behalf of the new government. So ruinous were the terms he made that his credentials were canceled, and he retired to England in disgrace. There he died, at Bath, in 1822. His publications include: *Memoria sobre la quina según los principios de Mutis* (1800); *Las ruinas de la Nueva Granada* (1805); *Descripción del Salto de Tequendama* (1805); *Historia de Colombia* (1821); and *Colombia* (1822).

ZEALAND, zē'land, **ZEELAND**, or **SEELAND** (Dan. *Sjælland*). The largest and most important island of Denmark. It lies between the Cattegat and the Baltic, and is separated by the Sound from Sweden, and by the Great Belt from Fünen (Map: Denmark, E 3). Length, 81 miles; extreme breadth, 67 miles; area, 2682 square miles. The surface is low and gently undulating; the coasts, which are rock bound on the southeast, are indented by bays and fiords, the chief of which is the Roskilde-Isefiord in the north. The rivers are small, the largest being only 50 miles long, but there are several lakes. The island is exceedingly fertile. Agriculture and cattle breeding are the principal employments. The chief city is Copenhagen (q.v.). Pop. (including the islands of Möen, Amager, and other neighboring islets), 1911, 1,096,897.

ZEALAND, Dutch **ZEELAND**, zā'länt. A province of the Netherlands, occupying the southwestern region of the country (Map: Netherlands, B 3). Zealand consists mostly of islands, embracing Schouwen, Walcheren, Tholen, and North and South Beveland. They are formed by the estuary of the Scheldt, whose wide arms—the Hond or West Scheldt, and the Ooster Scheldt—traverse the province. Area, 690 square miles. Dikes and dunes line the borders of the province. The islands are extremely low, and for the most part farmed. Grain and vegetables are raised. There are oyster fisheries, some manufactures, and a commerce in grain. Pop., 1910, 233,478; 1912, 236,149. Capital, Middelburg.

ZEALOT (Gk. *ζηλωτῆs*, *zēlōtēs*, an emulator, enthusiastic follower, or admirer, from *ζῆλοs*, *zēlos*, emulation, zeal, from *ζεἰν*, *zein*, to boil, seethe). A term applied by Luke (vi. 15; Acts i. 13) to Simon, one of the 12 Apostles, probably to distinguish him from the better known Simon Peter. In the list in Mark (iii. 18) and in Matthew (x. 4) this Simon is called the Cananæan (*Κανανaῖos*). The two words, zealot and Cananæan, are equivalents, the latter being simply the Greek reproduction, with ending denoting sect, of the Aramaic *Qana'n* from *Qān'*, to become red, to burn, to be zealous. The Zealots were a more or less closely organized party among the Jews, embracing the more fanatical elements of the population, whose watchword was complete political independence of Roman control. Simon, previous to his discipleship, probably had some connection with this party. The details of their early history are unknown. It was their lawless violence that precipitated the great war with Rome (66–70 A.D.) which resulted in the destruction of the Jewish nation.

ZEBRA (African name). The name in general of all the African striped species of the horse family (Equidæ), of which four species are usually recognized, viz., the true or mountain zebra (*Equus zebra*), Burchell's zebra (*Equus burchelli*), Grévy's zebra (*Equus grevyi*), and the quagga (*Equus quagga*). The last-named was only partly striped and is extinct. (See QUAGGA.) The true zebra is now nearly extinct. (See EXTINCT ANIMALS.) It was an inhabitant of South Africa, and especially of mountainous districts, where it roved in small bands. It was the smallest of the group, standing a trifle over 4 feet high at the withers, and had relatively long ears, a comparatively short mane, and a scantily haired tail. Its ground color was white (brownish on the face), and the stripes were black, and arranged as shown on the Plate accompanying the article EQUIDÆ. Originally abundant in Cape Colony,

all that remain of this species are a few carefully protected bands.

The zebra now most often seen in South Africa and in menageries, is Burchell's, which the Boers call "quagga" (q.v.). See also Colored Plate accompanying article HORSE. Many hybrids have been produced between this zebra and both the horse and the ass; but the results are not encouraging. For the interesting phenomena of Ewart's experiments with these hybrids see HYBRIDITY; TELEGONY.

The third species, Grévy's zebra, inhabits the hilly regions from the Victoria Nyanza north and east to Central Somaliland. It is taller and slimmer than the true zebra, and like it is striped down to the hoofs; but in other respects it more resembles Burchell's. It is distinguished from both by the much greater number of stripes, which are very narrow, deep black, and separated by narrow white streaks; the pattern of striping is its own, also, the transverse black lines reaching much farther across the sides, and the oblique stripes on the haunches being short. These zebras prefer hill forests and are known in their region as mountain zebras in distinction from the plains-roving Burchell's. Several varieties have been described and named, as Chapman's, Grant's, Selous's, etc., but all seem referable to this single species, which was probably the one called by the ancients hippotigris. The habits of all zebras are much the same as those of wild asses, or of wild horses; and it is believed that Grévy's zebra comes nearest of all existing Equidæ to some of the more recent extinct horses, as Hipparion. It is, indeed, very difficult to distinguish one of these so-called species from another, or from the horses, except by the variable and transitory external characters. Their flesh is most excellent food, and their hides have value for leather, as well as for making rugs and ornamental articles, and zebra hunting is an attractive sport. Consequently the race is rapidly decreasing.

ZEBRA CATERPILLAR. The larva of a noctuid moth (*Mamestra picta*), named in reference to the colors of the black and yellow striped larva which feeds upon the leaves of many garden fruit bushes, vegetables, and flowers. The moths issue in May and deposit the eggs for the summer generation. The caterpillars from these eggs mature early in June, and a second generation of moths appears in August, the offspring of which are frequently so numerous as to cause considerable damage to autumnal crops. They hibernate as pupæ. When young the caterpillars feed in companies, but when older separate. They are readily destroyed when young by pyrethrum powder, and later by an arsenical spray. See HOP INSECTS.

ZEBRA MOTH. See ZEBRA CATERPILLAR.

ZEBRA PARRAKEET. See PARRAKEET.

ZEBRA SWALLOWTAIL. See SWALLOWTAIL.

ZEBRA WOLF. See DASYURE.

ZEBÚ, sā'bōō. See CEBÚ.

ZEBU, zē'bū. See HUMPED CATTLE.

ZEB'ULUN, or **ZEBULON** (Heb. *Zebūlūn*). The tenth son of Jacob and the sixth of Leah (Gen. xxx. 19–20; xxxv. 23). The allotment of the tribe of Zebulun was in the northern part of Palestine (Josh. xix. 10–16), and appears to have reached to the seacoast (Gen. xlix. 13). The tribe, owing to its remote situation, played a minor part in history; its most notable recorded achievement was the support which it furnished to Deborah (q.v.) in the rising against Sisera (Judg. iv. 6; v. 14–18). When Tiglath-pileser IV (745–728 B.C.) carried off the northern tribes (2 Kings xv. 29), Zebulun was probably included (cf. Is. ix. 1). The territory of Zebulun was the scene of a part of the early ministry of Jesus (Matt. iv. 13).

ZECHARIAH, zĕk'à-rī'à (Heb. *Zĕkaryāh*, or *Zĕkaryāhū*, Yahwe remembers). A frequent Old Testament name. The most notable of those bearing it are: (1) ZECHARIAH, the son of Jehoiada. He was high priest in the first part of the reign of Joash (q.v.), King of Israel (c.797–782 B.C.). The Chronicler represents Joash as straying from the true religion upon the death of his mentor Jehoiada; Zechariah rebukes the apostasy, whereupon he is stoned to death in the temple. The Talmud has traditions upon the subject. It has been supposed that Jesus referred to this martyr in Matt. xxiii. 35, Luke xi. 51, but these passages clearly refer to another Zechariah, son of Berechiah, who was put to death in the manner indicated immediately before the siege of Jerusalem by the Romans. (2) ZECHARIAH, KING OF ISRAEL (740 B.C.). He was the son of Jeroboam II (q.v.) and last of Jehu's dynasty. After six months' reign he was assassinated by Shallum, who usurped the kingdom (2 Kings xv. 8–12). (3) ZECHARIAH THE PROPHET. He was the son of Berechiah, son of Iddo, and one of the prophets who stimulated the rebuilding of the Temple in the time of Darius I Hystaspis (521–485 B.C.). He is mentioned along with Haggai in Ezra v. 1, vi. 14, as inciting to the work upon the Temple. The books of Haggai and Zechariah place this prophetic activity in the second year of Darius, 520 B.C. (Hag. i. 1; Zech. i. 1), while Zech. vii. 1 indicates a further activity of the prophet in the fourth year of Darius (518 B.C.). The message of these prophets was effective, but we know nothing further concerning their careers.

As for the book ascribed to Zechariah, there is no doubt concerning the authenticity of the first eight chapters. These well illustrate the condition of the returned exiles. The prophecies of the second year (chap. i–v) begin with a call to repentance (i. 1–6). There follows a series of eight visions (i. 7–vi. 8), fraught with messages of promise and consolation. The first (i. 7–17) gives assurances that Yahwe will build the temple and enlarge the city. The second (i. 18–21) foretells the destruction of Israel's enemies. The third (chap. ii) reveals the future wonderful growth of the city. The fourth (chap. iii) presents dramatically the legal rehabilitation of Israel in Yahwe's favor in the person of Joshua the high priest, accompanied with a promise of a king. The fifth (chap. iv.) mystically figures the divine grace that is to come through the two anointed men, Joshua and Zerubbabel, the respective priestly and royal leaders of the people. The sixth (v. 1–4) pictures the curse which will miraculously purge the restored community of its sinners. The seventh (v. 5–11) exhibits the removal of the guilt of the land to Babylonia. The eighth (vi. 1–8) shows the divine accomplishment of judgment upon Babylonia. In the prophecies of the fourth year (chap. vii–viii) we have some utterances concerning the observance of fasts. In the ancient prophetic spirit, in reply to an inquiry from certain people concerning the necessity of the fasts connected with the anniversaries of Jerusalem's destruction, Zechariah condemns the godless kind of fasting, and

requires instead justice and mercy between man and man (chap. vii). The prophet took a notable place in the revival of the hopes and work of the Jewish community. He expected a new order of things as the result of the rebuilding of the temple. Over against a certain crabbedness of imagery in the visions we find some noble notes of prophecy in the call to repentance and the discussion of the fasts.

Chapters ix–xiv breathe a different spirit and exhibit another historical environment; accordingly their authorship by the prophet Zechariah is now denied by many scholars. The chief reasons adduced are the following: Chapters i–viii, despite occasional obscurities, reproduce the historical circumstances of the reign of Darius Hystaspis, chapters ix–xiv bear no reference to this epoch, but on the contrary indicate periods of very different circumstances, whose details are in general as obscure as those of the genuine Zechariah are clear. There are references to Assyria (a name applied in later times to Syria), Egypt, the Aramæan states, and especially to the Greeks (ix. 13) as the militant foes of Judaism, which point to a later period than that of the Persian Empire. The Levites receive a leading place alongside the house of David, and there is a stress laid upon ceremonial holiness which is rather typical of the reform of Ezra. The prophets are depreciated, a phenomenon characteristic of the later ages, when spiritual activity was in the hands of the scribes and prophets wrote anonymously; in fact, there is a scrupulous anonymity preserved throughout these chapters. An opposition between Jerusalem and Judah is represented, indicating a period when Jerusalem had regained its original political supremacy, a condition which did not ensue until the time of Nehemiah. The last chapters are apocalyptic, a characteristic of thought obtaining from the time of the Exile, to be sure, although chapters i–viii are devoid of it. The genuine Zechariah is prosaic in style; the subsequent chapters move in poetic diction. Finally, their authenticity does not follow from their present inclusion in the Book of Zechariah, because (as in the case of Isaiah xl–lxvi) the simple facts of anonymity and accidental collocation after a work of a known author would tend to their addition to the preceding book. Indeed a comparison of the identical titles of ix. 1, xii. 1, and Mal. i. 1 (which is properly anonymous; see MALACHI) forces the conclusion that these several prophetic sections were so many anonymous publications once grouped together for this very reason; but the third came to be ascribed by mistake to a prophet Malachi, and the first two were then absorbed by Zechariah.

This appendix to Zechariah may be divided into two sections, ix–xi and xii–xiv. Chapter ix announces a judgment upon the neighboring nations, the advent of the expected King, and Yahwe's interference for the salvation of his people In chapter x Yahwe promises to remove the unfaithful leaders of Israel, and himself to take action for the restoration of all Israel. Chapter xi describes symbolically Yahwe's rejection of the spiritual leaders and his discipline of the people, of whom a remnant is to be saved. Most scholars connect with this section the fragment xiii. 7–9. Chapters xii–xiii present an involved and obscure line of events. Judah and Jerusalem are engaged in a dread struggle with the Gentiles, Judah itself being at first arrayed against the capital. Yahwe interferes, and there follows a period of penitent mourning with a purging of the idols and the prophets from the land. In chapter xiv is given an apocalyptic figure of the last great attack upon Jerusalem, which is at first successful, until Yahwe's personal appearance saves his people. This is accompanied and followed by a transformation of the land of Judah. Finally, all nations are described as going up as worshipers to Jerusalem, a curse resting on those who refuse.

The last three chapters are now generally ascribed to a late post-exilic period. Great uncertainty prevails as to chapters ix–xi. Some hold to their pre-exilic origin with considerable reëditing; the prevailing view assigns them to the post-exilic age; and many scholars regard the whole appendix as a work of the Maccabæan period. But the problems contained in chapters ix–xiv have by no means been satisfactorily elucidated. The figurative language of this section, understood in a Messianic sense, is much employed in the Gospels.

ZEDEKIAH, zĕd'ê-kī'à (Heb. *Sidḳiyyāh*, or *Sidḳiyyāhū*, Yahwe is my vindication). The last King of Judah (2 Kings xxiv. 17; xxv.; 2 Chron. xxxvi. 11 et seq.; Jeremiah, passim). At his first capture of Jerusalem (597 B.C.) Nebuchadnezzar deposed King Jehoiachin, carried him away to Babylon, and left as king in his place his uncle Mattaniah, the third of the sons of Josiah, changing his name to Zedekiah. The best part of the people had been carried off into captivity, and Jehoiachin was still the legitimate king to the people, so that Zedekiah's position was a sorry one. Jeremiah openly announces the divine preference for the exiles, and can see no good in the shadow monarchy of Zedekiah. Upon the withdrawal of the Babylonian army the neighboring states began a conspiracy against Nebuchadnezzar and attempted to seduce Zedekiah; and within Jerusalem there was a strong party led by prophets who were eager to throw off the Babylonian yoke (Jer. xxvii, xxviii). Zedekiah himself is said to have gone to Babylon in his fourth year (Jer. li. 59), probably to vouch for his loyalty. But in 588 B.C. he could no longer resist the pressure of the Patriots, and revolted. He still consulted Jeremiah, who, however, resisted all his advances. Zedekiah thus appears as a well-meaning but weak man, unfitted for his circumstances. After a valiant defense of a year and a half Jerusalem was taken by storm in 586 B.C. Zedekiah with some followers escaped eastward to the Jordan, but was captured, and carried to the presence of Nebuchadnezzar in Syria, where judgment was given upon him for his treason. His sons were slain before him, his eyes were put out, and he was carried in fetters to Babylon.

ed., London, 1888–91); C. F. Kent, *History of the Hebrew People* (2 vols., New York, 1896–97); Julius Wellhausen, *Israelitische und jüdische Geschichte* (7th ed., Berlin, 1914).

ZEDLITZ, tsāt'lĭts, JOSEF CHRISTIAN, BARON (1790–1862). An Austrian poet. He was born at Johannisberg, in Austrian Silesia, and was educated at the Gymnasium of Breslau. He served with distinction in the army, but resigned in 1809 and devoted himself to literary pursuits. In 1837 he received a position in a department of the Ministry for Foreign Affairs at Vienna, and after 1851 he was in the Austrian diplomatic service. He was one of the leaders of the Romantic movement in Austria. His dramas, such as *Der Stern von Sevilla* (1830), and *Kerker und Krone* (1834), a dramatic continuation of Goethe's *Tasso*, are not of great value, but his lyrics and ballads, especially *Nächtliche Heerschau* (1829), are characterized by much originality and grace. His most famous work is *Todtenkränze* (1827), a collection of elegies, but many of his best poems are contained in other volumes, such as *Gedichte* (1832) and *Soldatenbüchlein* (1848). He translated Byron's *Childe Harold* (1836).

ZEDOARY, zĕd'ō-ā-rĭ (Fr. *zédoaire*, Sp., Port. *zedoaria*, from Pers. *zadwār, zidwār, jadwār*, zedoary). The popular name of certain species of *Curcuma* (see TURMERIC), natives of the East Indies, the root stocks (rhizomes) of which are aromatic, bitter, and pungent, and are commonly used in the East like ginger. Their use in Europe and America is limited. The round zedoary of the shops is the product of *Curcuma zedoaria* and *Curcuma aromatica*, natives of both India and China, having palmate root stocks, straw colored within. Long zedoary is produced by *Curcuma zerumbet*, a form of *Curcuma zedoaria*, a native of various parts of the East Indies, having long palmate root stocks, yellow within. See GINGER.

ZEE'LAND. See ZEALAND.

ZEEMAN, zā'man, PIETER (1865–). A Dutch physicist, born at Zonnemaire, Holland. In 1885–90 he studied at Leyden, where he became assistant at the Physical Institute, and lecturer at the university. In 1900 he was appointed professor of physics at the University of Amsterdam. His discovery in 1896 of the phenomenon known by his name (see LIGHT; ZEEMAN EFFECT), brought him the Baumgartner prize at Vienna and the Wilde prize at Paris. In 1902 he received also, with H. A. Lorentz, the Nobel prize in physics. He published: *Messungen über das kerrsche magneto-optische Phänomen* (1893); *Experimentaluntersuchungen über Teile, die kleiner als Atome sind* (1900); *Researches in Magneto-Optics* (1913).

ZEEMAN EFFECT. The name of an interesting phenomenon discovered in 1897 by Dr. P. Zeeman of the University of Amsterdam. He observed that the spectrum of a source of light was changed by the source being placed in a strong magnetic field. Each line in the original spectrum is split up into several lines, when the source is viewed from a direction at right angles to the lines of magnetic force and also when viewed along the lines, but differently in the two cases. The light in these component lines is polarized also. The great importance of the discovery lies in its bearing upon the ultimate cause of the ether vibrations which produce light. Reference should be made to Zeeman's original papers, which have been translated into English in E. P. Lewis, *Effects of a Magnetic Field on Radiation*, "Scientific Memoir Series," vol. viii (New York, 1900). Consult also Cotton, *Le phénomène de Zeeman* (Paris, 1900), and Pieter Zeeman, *Researches in Magneto-Optics* (London, 1913). See LIGHT; SPECTROSCOPY; SUN.

ZEGGERS, DANIEL. See SEGHERS.

ZEISBERGER, tsīs'bĕrk-ĕr, DAVID (1721–1808). A Moravian missionary in America, born in Moravia. He was educated in Herrnhut, Saxony, and in 1738 removed to Oglethorpe's colony in Georgia. In 1740 he settled in Pennsylvania, where he became one of the founders of Bethlehem. From 1743 until his death he labored unremittingly among the Indians, and his service has few parallels in the history of the country. He was greatly beloved and trusted by the tribes among whom he lived, and was made a sachem by the Iroquois and adopted by the Monsey-Delawares. His personal influence was the principal factor in restraining the Delawares from joining their former allies during the Revolutionary War. After the massacre of a band of his converts at Gnadenhutten in 1782, he led the rest of his followers into Michigan, thence into Canada, and in 1798 to the Tuscarawas, where the town of Goshen was founded. He published: *A Delaware and English Spelling Book* (1776); *A Collection of Hymns for the Christian Indians* (1803); and *Sermons for Children* (1803). Since his death have been published his *Dictionary in German and Delaware* (1887) and *Diary of David Zeisberger, 1781–98* (1888). Consult also E. A. De Schweinitz, *Life and Times of David Zeisberger* (Philadelphia, 1870).

ZEISLER, FANNIE. See BLOOMFIELD-ZEISLER.

ZEISS, tsīs, CARL (1816–88). A German optician. He was born at Weimar, was educated for the medical profession, and in 1846 founded the famous optical manufactory at Jena that bears his name. His son entered the business with him, but retired soon after Carl Zeiss's death. The business was incorporated as the Carl-Zeiss-Stiftung in 1880, and it gained an international reputation for the manufacture of optical instruments of all kinds. Consult Auerbach, *Das Zeisswerk und die Karl Zeiss-Stiftung in Jena* (3d ed., Jena, 1907).

ZEISSBERG, tsīs'bĕrk, HEINRICH VON (1839–99). An Austrian historian, born in Vienna and educated at the university of that city. He was professor of history at Lemberg (1865–71), Innsbruck (1871–72), and Vienna (1872–97). From 1891 to 1896 he was director of the Institute for the Study of Austrian History, and in 1896 became director of the Imperial Library. Among his numerous works were *Die polnische Geschichtschreibung des Mittelalters* (1873), *Der österreichische Erbfolgestreit 1457–1458* (1879), *Quellen zur Geschichte der deutschen Kaiserpolitik Oesterreichs während der französischen Revolutionskriege, 1793–1797* (1889), *Belgien unter der Generalstatthalterschaft Erzherzog Karls* (1893–94), *Erzherzog Karl von Oesterreich* (1896).

ZEIST, zīst. A town in the Province of Utrecht, Netherlands, 9½ miles east of Utrecht (Map: Netherlands, D 2). It is the seat of an interesting Moravian community, established here in 1746, which holds property in common and supports a school. Pop., 1910, 8964.

ZEITBLOM, tsīt'blōm, BARTHOLOMÄUS (c.1450–c.1519). A German painter, the chief master of the school of Ulm, where he is on official record from 1484 to 1517. He was born in

Nordlingen and was the pupil and son-in-law of Hans Schüchlein, but, unlike his master, was singularly free from Dutch and Flemish influence. Zeitblom's paintings are distinguished by artistic feeling and clear, cool, delicate color. His single figures are restrained and often beautiful; his treatment of drapery is simple and graceful, but he lacked dramatic power. His principal works include the altarpiece from the church at Heerberg (1497), and four panels from the Eschach altarpiece (1495), depicting "The Two Saint Johns," the "Annunciation," and "Visitation," all in the Royal Gallery, Stuttgart; the great altarpiece with "Scenes from the Passion" and the "History of St. John the Baptist," in the church at Blaubeuren; four panels with the "Legend of St. Valentine," in the Augsburg Gallery; a "Pietà," in the Germanic Museum at Nuremberg; the "Handkerchief of St. Veronica," in the Berlin Gallery, and "St. Margaret," and "St. Ursula," in the Munich Pinakothek.

ZEITGEIST, tsīt'gīst'. See GEIST.

ZEITOUN, zā-tōōn'. A town of Asiatic Turkey, in the Vilayet of Aleppo, in the eastern Taurus Range, 20 miles northwest of Marash. It is built in a deep gorge surrounded by inaccessible crags, and is inhabited almost exclusively by Armenian Christians, who have made the town famous for having maintained its practical independence of Turkey up to recent times. In 1878 the Turkish government succeeded in investing the town and built a fort commanding the position. Even since that year there have been several revolts, the most notable being on the occasion of the Armenian massacres in 1895, when the intervention of the Powers secured honorable terms for the inhabitants. In the massacres of 1915 the Armenian population of Zeitoun was practically wiped out of existence. Pop., variously estimated at from 5000 to 17,000.

ZEITZ, tsīts. A town of the Province of Saxony, Prussia, 23 miles south-southwest of Leipzig, on the right bank of the White Elster (Map: Germany, E 3). There are manufactures of cotton, machinery, perambulators, soap, woolens, sugar, bicycles, furniture, pianos, hosiery, and gloves. In the neighborhood are extensive mineral-oil works and lignite deposits. Pop., 1900, 27,389; 1910, 33,093.

ZELAYA, sā-lä'yä, JOSÉ SANTOS (1853–). A Nicaraguan dictator. He was elected President of Nicaragua in 1894 and held this office till 1909, when he was forced to resign. (See NICARAGUA, *History*.) During his 15 years' administration he made the production of every important commodity in the country a monopoly, and he himself received perquisites or shares of stock, sometimes a controlling interest. The fortune acquired in this way he invested abroad, so that when his downfall came it was secured to him; it was supposed that he had about $500,000 in New York banks. Although he made claims to liberality, Zelaya really suspected and opposed all foreign attempts to gain for his country the advantages of commerce, education, and religious freedom. In 1909 occurred the execution of two American citizens, soldiers in the army of the revolutionary leader Estrada. In a sharp note Zelaya was called to account by the United States government, and shortly afterward, Estrada's efforts succeeding, he fled from Nicaragua, first to Mexico and later to Spain. In November, 1913, he appeared in New York City, his identity being unsuspected by the immigration authorities. The Nicaraguan government at once asked for his extradition, on a charge of murder. A warrant was issued for his arrest, but he had hurriedly left his hotel, and it was not till two weeks later that he was found in an apartment house. Zelaya was placed in the Tombs, but he escaped extradition by promising to return at once to Spain. In the latter country an attempt was made on his life in 1914 by a Nicaraguan who sought personal vengeance. The ex-dictator again came to New York in 1916, with the expectation of returning to Central America, probably to Costa Rica.

ZELENY, zĕl'en-ĭ, JOHN (1872–). An American physicist. He was born at Racine, Wis., and was educated at the University of Minnesota (B.S., 1892; Ph.D., 1906), where he was professor of physics from 1892 to 1915. Meanwhile, he studied also at the University of Cambridge (B.A., 1899). In 1915 he became professor of physics at the Sheffield Scientific School (Yale). His monographs and articles deal with ionic velocities in gases, the conduction of electricity through gases, and similar subjects.

ZELL, tsĕl, MATTHÄUS (1477–1548). The first Protestant preacher of Strassburg. He was born in Kaiserberg, studied at Erfurt and Freiburg, and became preacher at Strassburg in 1518. He supported the Reformation, and when forbidden by the ecclesiastical authorities to occupy the pulpit, preached in the street. Consult his biography by A. Erichson (Strassburg, 1878). His wife, KATHARINA ZELL (died 1562), assisted in her husband's religious work both as a speaker and as a writer, and became widely known as a benefactress of the poor.

ZELLER, tsĕl'ĕr, EDUARD (1814–1908). A German theologian and historian of philosophy, born at Kleinbottwar, in Württemberg. He studied theology at Tübingen and Berlin, and became privatdocent at Tübingen in 1840. His call to a theological chair at Bern in 1847 was the occasion of fierce controversy and opposition from the orthodox. In 1849 he accepted a chair at Marburg; in 1862 became professor of philosophy at Heidelberg, and in 1872 at Berlin. In 1894 he retired from active professional work and settled at Stuttgart. His principal work is *Die Philosophie der Griechen* (1844–52). From the time of its first publication this work was accepted by scholars as one of the best if not the best on the subject. It is truly monumental. Parts of the work have appeared in a fifth edition; others in a fourth; the rest in a third (Eng. trans. of almost the whole work under different titles for each volume, London, 1881 et seq.). This work was briefly summarized in *Grundriss der Geschichte der griechischen Philosophie* (6th ed., 1901; Eng. trans., 1881). His other works are the notable book on the Acts of the Apostles (1854), *Das theologische System Zwinglis* (1853), his essays (1865–84), *Religion und Philosophie bei den Römern* (1866), his edition of the works of D. F. Strauss (1876–78), and *Geschichte der deutschen Philosophie seit Leibniz* (1872; 2d ed., 1875); *Vorträge und Abhandlungen* (1875–84). His early philosophical works were dominated by the Hegelian spirit, but later he broke away and in 1862 demanded a return to Kant. Consult G. S. Hall, *Founders of Modern Psychology* (New York, 1912).

ZELLER, zĕl'lär', JULES SYLVAIN (1820–1900). A French historian, born in Paris and educated at the University of Paris and in Germany. He taught history at Rennes, Bordeaux,

and Strassburg, in 1854 was appointed professor of history at Aix, in 1858 in the Ecole Normale at Paris, and shortly afterwards to a position in the Sorbonne. In 1863 he became Duruy's successor as professor of history in the Polytechnic School and in 1870 rector of the Strassburg Academy. From 1876 to 1888 he was general superintendent of higher education in France. He was a voluminous, but not a particularly accurate or well-balanced historian. His publications include *Ulric de Hutten* (1849); *Les empereurs romains* (1863); *Entretiens sur l'histoire* (1865–69); *Les tribuns et les révolutions en Italie* (1873); and *Histoire de l'Allemagne* (1872–91), his most important work.

ZELLERFELD, tsĕl'lĕr-fĕlt. See CLAUSTHAL.

ZELTER, tsĕl'tĕr, KARL FRIEDRICH (1758–1832). A German composer, born in Petzow-Werder. He studied music with Kirnberger and Fasch and became the leader in Rellstab's Liebhaber-Concerte. From 1791 he assisted Fasch in conducting the Singakademie, and in 1800 succeeded him. In 1807 he organized a school for orchestral practice, and in 1809 the Berlin Liedertafel, the first organization of its kind, for which he composed nearly one hundred male choruses, many of which are still popular. He also founded, in 1819, the Royal Institute for Church Music, of which he was director until his death. Goethe and he were close friends, and their correspondence, *Briefwechsel zwischen Goethe und Zelter in den Jahren 1796–1832*, was edited by Riemer (Berlin, 1833–34), and recently by M. Hecker (Leipzig, 1913). Felix Mendelssohn was his pupil. He also wrote the *Life* of Fasch (1801). Consult L. Sieber, *K. Fr. Zelter und der deutsche Männergesang* (Basel, 1862).

ZEMINDAR, zĕ-mĕn'där (Pers. *zemīndār* from *zemin*, land, and *dār*, hold). The title given in India from Mohammedan times to the landlords who held property as a fief from the government or from a superior lord. Under the British government the zemindar system of tax collection was continued in Bengal, Behar, Orissa, and Madras. Consult Sir H. S. Maine, *Early Historical Institutions* (London, 1875); id., *Village-Communities in the East and West* (ib., 1890).

ZEMSKI SOBOR, zyĕm'skĭ sō-bōr'. The name given to the assembly of the whole country in Russia. It is comparable to the States-General (q.v.) in France. It originated during the time of the struggle between the czars and the great Boyars (q.v.). The last monarch to use it extensively was Peter the Great. The last time it was called was in 1767, when Catharine the Great called it to consider the conditions of the country. Its activities were confined to economic discussions and had no political significance.

ZEMSTVO, zĕmst'fō. A form of district and provincial assembly in Russia created under Alexander II (1864), and endowed with powers of self-government in the fields of local economic and social interests. The zemstvos were established in 34 governments or provinces of Russia proper. They had a representative council and an executive board. The latter comprised all large landowners and representatives of the small landowners (including clergy), residents of towns, and peasants. They devoted themselves to the building of schools and hospitals, the introduction of improvements in agriculture, the establishment of a comprehensive system of fire insurance, combating the drink evil, etc. Their powers were greatly restricted under Alexander III, but they remained, nevertheless, important centres of liberal thought. For their rôle in recent events, see RUSSIA, *History*.

ZENANA, zĕ-nä'nà (Pers. *zenāna*, belonging to women, from *zen*, woman, Gk. *γυνή*, woman). The name applied in India to the female quarters. In Bengal, where is the typical zenana, the dwelling consists of two houses built each round its own court. The one on the street is occupied by the men. In the rear building, which contains the zenana, the first floor is for cow sheds, storage, and cook rooms; above are cells, 10 to 12 feet square, each having a door and a small grated window opening upon piazzas which, in one, two, or three tiers, surround the inner court. The conditions are generally miserable when judged by Western standards, and it has been the special object of the Zenana Mission in India, since 1855, to ameliorate this system and to improve the status of Hindu women.

ZEND AVES'TA. See AVESTA.

ZENGER, JOHN PETER (c.1680–1746). An American publisher. He was born in Germany, went to New York about 1700, and entered the printing business. In 1733 he began to publish the New York *Weekly Journal*, which he made the organ of the popular party in the colony. So much did the government feel his attacks that it was resolved in Council that certain of his papers and two ballads should be burnt by the hangman, while he was arrested on a charge of libel and was imprisoned for about eight months. His friends employed to defend him Andrew Hamilton (q.v.). In the trial the defense admitted the fact of publication, but maintained that since the statements were true there was no libel. The Chief Justice, who presided, contended that "you cannot be permitted to give the truth of a libel in evidence." Hamilton asserted that the jury had the right to determine both the law and the fact. The result was that the jury, imbued with the popular opinion, gave a verdict of not guilty. This triumph of freedom of the press has been termed "the morning star of that liberty which subsequently revolutionized America." Consult Livingston Rutherford, *John Peter Zenger* (New York, 1904).

ZE'NITH (OF. *zenith*, *cenith*, Fr. *zénith*, from OSp. *zenith*, Sp. *zenit*, zenith, from Ar. *samt*, way, from *samata*, to pursue one's way). The name given to that point of the heavens directly overhead. It is defined in astronomy as that point of the celestial sphere where it would be pierced by a plumb line produced indefinitely upward at the place of observation. It is the opposite of nadir (q.v.).

ZENITH TELESCOPE. An instrument especially adapted for the measurement of small differences in the zenith distances of celestial objects. It consists of a vertical column revolving about a vertical axis and carrying a horizontal axis, to one end of which the telescope is attached and to the other a weight to counterpoise the telescope. To this horizontal axis is also attached a striding level. The vertical column carries also a vernier and a clamp. The distinctive features of the instrument are a spirit level and a micrometer. The spirit level is attached by means of a pivot and a bar to the telescope and at right angles to the horizontal axis so that it is free to move in the plane of the telescope and consequently may be inclined to the optical axis at any angle, read off by

means of a vernier attached to the bar carrying the spirit level. When the bubble of the level is in the middle of the tube, this circle, graduated from 0° to 90° in each direction, will give the zenith distance of the star toward which the telescope is directed. The micrometer consists of one or more movable threads carried by a single micrometer screw with a graduated head reading to the required accuracy.

The zenith telescope was invented by Capt. Andrew Talcott, of the United States Engineers (1834), to carry out practically the principle that when the meridian zenith distances of two stars (one north and the other south of zenith), at their upper culminations, are equal, the colatitude is the mean of their north polar distances. This method of finding the latitude is known as Talcott's method. Since two stars having exactly the same meridional zenith distance can rarely be found, two having nearly the same are selected. Refraction is consequently almost eliminated. The telescope is first pointed to the star which first comes to the meridian, and the spirit level is set horizontal. As the star passes the field of view its distance north or south of the central horizontal wire is measured by the micrometer. The instrument is then revolved 180° and the second star observed in the same manner. In revolving the instrument care must be taken that the angle between the level and the telescope is not disturbed. The latitude is then given by the formula

$$\phi = \left(\frac{\delta_s + \delta_n}{2}\right) + \left(\frac{\zeta_s - \zeta_n}{2}\right),$$

where δ_s and δ_n are the declinations of the two stars; and $\zeta_s - \zeta_n$, the difference of their zenith distances, determined by the micrometer measurement. Consult W. Chauvenet, *Manual of Spherical and Practical Astronomy* (Philadelphia, 1863).

ZENJAN, zĕn-jän′. A town of Persia. See ZINJAN.

ZENKER, tsĕŋ′kĕr, FRIEDRICH ALBERT VON (1825–98). A German physician, celebrated for his discovery of trichinosis. He was born in Dresden, and was educated in Leipzig and Heidelberg. Attached to the city hospital of Dresden in 1851, he added, in 1855, the duties of professor of pathological anatomy and general pathology in the surgico-medical academy of that city. In 1862 he became professor of pathological anatomy and pharmacology at Erlangen. Three years afterwards he assumed with Ziemssen (q.v.) the editorship of the *Deutsches Archiv für klinische Medizin*. In 1895 he retired from active service. His important discovery of the danger of trichinæ dates from 1860. In that year he published "Ueber die Trichinenkrankheit des Menschen" (in vol. xviii of Virchow's *Archiv*).

ZE'NO (Lat., from Gk. *Ζήνων, Zēnōn*) (c.488 B.C.–?). An Eleatic philosopher, born at Elea (Velia), a town of Lucania in Southern Italy. He was a favorite pupil of Parmenides (q.v.). At the age of 40 he accompanied his master to Athens, where he resided some time and numbered among his pupils Pericles and Callias. Tradition says that after his return to Elea he joined a movement to deliver the city from the tyrant Nearchus, and that, when the attempt failed, he was captured and put to torture. Of this, however, the evidence is not satisfactory. As a follower of Parmenides he supported his doctrines by indirect demonstration, in which he attempted to point out that belief in the real existence of changing phenomena led to contradiction. He tried to establish the truth of the unity of being by showing that the hypotheses of motion, multiplicity, and sense have inherent contradictions. To the real existence of motion he objected that motion cannot begin, because the moving body cannot arrive at any place from that in which it is until it has passed through the unlimited number of intermediate spaces. Now, as it is at any given moment in a particular place, it cannot leave that position, therefore the flying arrow is in reality at rest. His second argument was the famous proof that Achilles cannot overtake the tortoise because at any moment he only reaches the place previously left by the tortoise; his other arguments are similar. He likewise argued against the reality of space, for, if all that exists were in a given space, that space itself would be included in another space, and so on without limit. Against sense perception he said that if a measure of grain in falling produced a sound, every single grain and smallest fraction thereof must produce a sound; but if the latter be not true, then the whole measure, whose effect can be nothing but the sum of the effects produced by its parts, can produce no sound. Zeno's arguments against the reality of motion were answered by Aristotle in his *Physics*, but the argument still had considerable influence on the development of metaphysics in the latter period.

ZENO (fourth and early third century B.C.). The founder of Stoic philosophy (see STOICS). He was born at Citium, in the island of Cyprus. He is said to have lived to a great age. He was the son of a merchant, and was himself engaged in trade during the earlier part of his life, but according to tradition a shipwreck caused him to reside for a time at Athens, where the works written by the disciples of Socrates in regard to their master filled him with admiration, and he became a pupil of Crates the Cynic. His earliest writings, according to tradition, contained much that savored of the harshness and bluntness of the Cynic doctrine. Failing to find sufficient satisfaction from Cynic philosophy, he turned to the Megarian Stilpo, from whom he learned the art of disputation, and later to Xenocrates and Polemo of the Academy. Not long after 310 B.C. he founded his own school in the Painted Porch (*Ποικίλη Στοά*), at Athens, where, according to Apollonius, he taught for 58 years. Diogenes Laertius mentions a number of works by him, no one of which has been preserved. He and his followers strove to realize the virtuous wise man for whom the idealized Socrates was a model. The ethics of the school, which were strongly influenced by Cynicism, were most productive in that they discriminated carefully between what was simply right and good and what was agreeable. Their physics were strongly in-

fluenced by the teachings of Pythagoras and Heraclitus. The Athenians held Zeno in great regard during his life, and after his death honored him with a tomb built at public expense and a bronze monument, because of the temperance and virtue which he had shown in his own life as well as in his teachings.

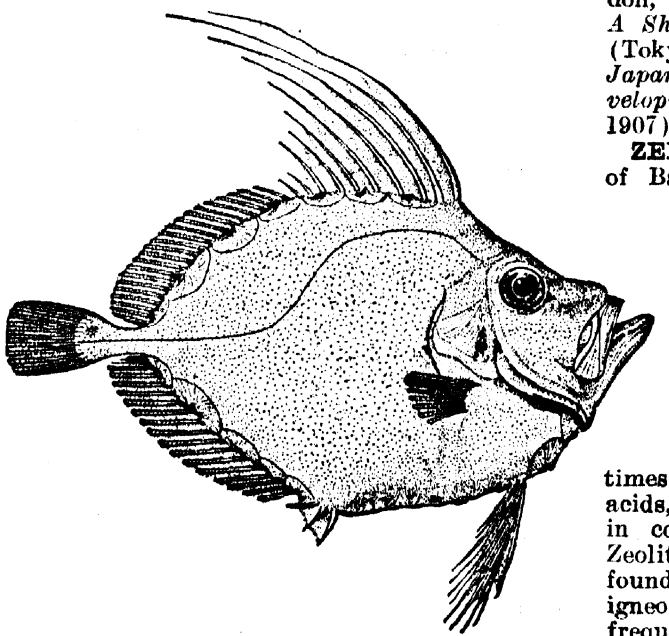
ZENO (426–491). Byzantine Emperor from 474 to 491. He was a native of Isauria. By his marriage with Ariadne, daughter of Leo I, he acquired a powerful position in the Empire as leader of the Imperial guard and the Asiatic troops. In 474 he became regent for his son Leo, after the death of his father-in-law, and in the same year Emperor through the death of his son. In 475–477 he was engaged in repressing the rebellion led by Basilicus, his wife's uncle. At first he was driven from Constantinople, but finally won the victory with the help of the Ostrogoths, whom, however, he was subsequently obliged to fight, until, in 488, he persuaded Theodoric to leave the Eastern Empire for the conquest of Odoacer in Italy. His reign was notable for the peace which he made between the orthodox party and the Monophysites by means of the so-called "Henoticon" of 482. Consult *Cambridge Medieval History*, vol. i (New York, 1911).

ZENO, dzā'nō, Apostolo (1668–1750). An Italian poet and scholar, born at Venice. With Maffei and Vallisnieri he founded, in 1710, the first Italian critical journal, the *Giornale de' letterati d'Italia*. He went to Vienna as Court poet in 1718 at the invitation of Charles VI remaining there till 1729, when he returned to Venice. He was a prolific writer of melodramatic librettos, especially for music by Handel, Pergolesi, Paisiello, and Marcello. His dramas were published in 1744 by G. Gozzi. In the eyes of his own time he was the leading arbiter of literary elegance and scholarly authority. His works include: *Compendio del vocabolario della Crusca* (1705); *Istorici delle cose veneziane* (1718–22); and *Dissertazioni istorico-critiche e letterarie agli istorici italiani* (1752–53). Consult Max Fehr, *A. Zeno und seine Reform des Operntextes* (Zurich, 1912).

ZENO, Niccolò and Antonio. Two Venetian brothers, navigators and adventurers of the fourteenth century. They came of a rich patrician family and late in the fourteenth century (probably between 1375 and 1380) Niccolò went on a voyage into the North Atlantic, where he was wrecked, and remained for some time on the island of "Frislanda," probably one of the Faroe group, although believed by some to be Iceland. Later, in company with Antonio, he is said to have visited Engroneland (Greenland). On their return they reported rumors of an island far to the west, where dwelt a civilized people who possessed Latin books and could not speak the Norse tongue. Their country he called Estotiland, variously claimed to be Labrador, Newfoundland, and New England. Farther to the south, he said, lived tribes of cannibals, and still farther people with great towns and splendid temples. Niccolò died in the north about 1391, and Antonio returned to Venice with an account of their voyages and the stories they had heard, together with a map they had constructed of the regions mentioned. The manuscript and the map lay unnoticed in the family palace in Venice until 1558, when a descendant published them under the title, *Dei commentarii del viaggio*. The whole question of these voyages, the truth of their stories, etc., has been the subject of much discussion. Consult: Placido Zurla, *Dissertazione intorno ai viaggi e scoperte settentrionali di Nicolò e Antonio Fratelli Zeni* (Venice, 1808); *The Voyages of the Venetian Brothers, Niccolò and Antonio Zeno*, edited and translated for the Hakluyt Society by R. H. Major (London, 1873); Justin Winsor, *Narrative and Critical History of America*, vol. i (Boston, 1889); F. W. Lucas, *Annals of the Voyages of the Brothers Niccolò and Antonio Zeno* . . . (London, 1898).



ZENOʹBIA (Lat., from Gk. *Ζηνοβία*). Queen of Palmyra (q.v.). She was the wife of Odenathus, lord of Palmyra, who had been recognized in 264 A.D. as King and Imperator in the East by the Roman Emperor Gallienus (q.v.), and whose sway extended over almost all the eastern provinces. In 267 Odenathus and his son Herodes were murdered, and a younger son, Vahballathus, succeeded his father, though the actual government was in the hands of Zenobia, who ruled as an independent sovereign, caring little for the Roman emperors, with whose armies she repeatedly came into conflict. She even attempted to establish her dominion in Egypt, but in this she failed. When Aurelian came to the throne in 270 he at first continued to recognize the title and rights of Vahballathus, and even permitted Zenobia to assume the title of Augusta. In 271 Vahballathus died, and Zenobia continued to rule, in the name of her two younger sons. Attempting to extend her power over Asia Minor, she drew upon herself the anger of Aurelian, who marched against her with a large army and, after twice defeating her troops, besieged her in Palmyra (early in 272). (See Aurelianus, Lucius Domitius.) Her hopes of being relieved by the Persians and Arabians being disappointed, she attempted to escape by flight, but was captured (spring of 272). Before the conqueror her courage failed, and she saved her own life by imputing the blame of the war to her counselors, especially the celebrated Longinus (q.v.), who was accordingly put to death. Zenobia was led in triumphal procession at Rome, and was presented by her conqueror with large possessions in the Villa of Hadrian, near Tibur (Tivoli), where she passed the rest of her life. She was a woman of great courage, spirit, and beauty. With purity of morals in private life, she combined prudence, justice, and liberality in her administration. Her literary acquirements were considerable; she spoke Latin, Greek, Syriac, and Coptic. Consult Ware's historical romance, *Zenobia* (New York, 1837), often reprinted; and the article "Septimius, 17," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

ZENOBIA, OR THE FALL OF PALMYRA. An historical romance by William Ware (1837),

contributed to the *Knickerbocker Magazine*, New York.

ZE'NO OF SI'DON (c.150–c.78 B.C.). An Epicurean philosopher, and after about 100 B.C. leader of the school. In his old age he had both Cicero and Philodemus as pupils at Athens, Several of Philodemus's writings, recovered at Herculaneum, give us the best idea of Zeno's attitude that it is possible to possess in default of his works. His additions to Epicurean philosophy concerned the nature of inductive reasoning. Cicero confirms this by his reference to him in *De Natura Deorum*, i, 34, where he calls him one of the most logical of the Athenian philosophers.

ZENOP'SIS (Neo-Lat., from Gk. Ζην-, *Zēn-*, stem of Ζεύς, *Zeus*, Zeus, Jupiter + ὄψις, *opsis*, appearance). A genus of small pelagic, silvery fishes of the John Dory family (Zeidæ), naked

ZENOPSIS OCELLATUS.

except for several bony and spinous bucklers. The single species known (*Zenopsis ocellatus*) inhabits the North Atlantic, and is extremely rare.

ZE'NOS, ANDREW CONSTANTINIDES (1855–). An American biblical and classical scholar, born of Greek parents in Constantinople, Turkey. He was educated at Robert College in his native city and at Princeton University. He was pastor of the Presbyterian Church at Brandt, Pa., in 1881–83, and afterwards held chairs at Lake Forest University (1883–88), Hartford Theological Seminary (1888–91), and McCormick Theological Seminary, Chicago, where he became professor of biblical theology in 1894. He published an edition of Xenophon's *Anabasis* (1888), with F. W. Kelsey; a translation of Socrates's *Ecclesiastical History* for Schaff's "Post Nicene Fathers" (1890); *Elements of Higher Criticism* (1895); *Compendium of Church History* (1896; rev. ed., 1915); *The Teaching of Jesus Concerning Christian Conduct* (1905); *Standard Bible Dictionary* (1909), with M. W. Jacobus and E. E. Nourse.

ZEN-SHU, zĕn-shōō' (Sinico-Japanese, from Chin. *ch'aan-tsung*, from *ch'an*, from Skt. *dhyana*, contemplation, meditation + Chin. *tsung*, school, sect). The Japanese name of a Buddhistic sect, founded in China in 520 A.D. by Bodhidharma, the twenty-eighth Indian and the first Chinese Buddhist patriarch, and in one development of Bodhidharma's doctrines introduced into Japan in 729, and in another in 1168. Those who belong to this school are known as Quietists, because their way of attaining to the degree of enlightenment that leads to Nirvana consists not in good works, but in fixed contemplation. "Look carefully within and you will find the Buddha," is the central idea of the system. Bodhidharma himself is said to have sat gazing at a wall in this form of introspection for nine years, until his lower extremities rotted off. There are three principal divisions of the Zen-shu in Japan—the Rin-zai, Soto, and Obaku. In 1897 their temples numbered 20,824; in 1911, 20,833. For the Chinese features of the sect consult Joseph Edkins, *Chinese Buddhism* (London, 1880), and for the Japanese, Bunyu Nanjō, *A Short History of the Twelve Japanese Sects* (Tokyo, 1887); W. E. Griffis, *The Religions of Japan* (New York, 1895); and Knox, *The Development of Religion in Japan* (New York, 1907).

ZENTA, zĕn'tŏ. A town in the County of Bács-Bodrog, Hungary, on the right bank of the Theiss, 120 miles south-southeast of Budapest (Map: Hungary, F 4). Pop., 1900, 28,588; 1910, 29,654, mostly Magyars. It is celebrated for the victory of Prince Eugène over the Turks in 1697.

ZE'OLITES (from Gk. ζέειν, *zeein*, to boil + λίθος, *lithos*, stone). A family of minerals including hydrated silicates of alkalies or alkaline earths, which frequently contain aluminium and sometimes magnesium. They are all soluble in acids, and most of them gelatinize in acids in consequence of the silica being liberated. Zeolites are all secondary minerals and are found largely in cavities and fissures in basic igneous rocks, as basalt, diabase, etc., and less frequently in granite and gneiss. According to Dana, they may be divided into six groups, as follows: the mordenite, including ptilolite and mordenite; heulandite, including heulandite, brewsterite, and epistilbite; phillipsite, including phillipsite, harmotome, stilbite, gismondite, laumontite, and laubanite; chabazite, including chabazite, gmelinite, levynite, analcite, faujasite, and edingtonite; natrolite, including natrolite, scolecite, mesolite; and thomsonite, including thomsonite and hydronephelite. The zeolites are soft, ranging from 3.5 to 5.5 on the scale of hardness. Several, including natrolite and thomsonite, take a fine polish, and have occasionally been cut as gems. When heated by means of the blowpipe, the zeolites swell up or boil.

ZEPH'ANI'AH (Heb. *Ṣĕphanyāh* or *Ṣĕphanyāhū*, Yahwe hides or defends). The prophet whose work is contained in the ninth book of the Minor Prophets. Nothing is known of him personally except that he was the descendant in the fourth generation of Hezekiah, and, since this name is not common, it has been supposed by some, without distinct historical warrant, that this Hezekiah was the King of Judah. Zephaniah is said to have prophesied in the reign of Josiah, King of Judah (c.637–608 B.C.). From the allusions to political events and social conditions in the book it appears that the prophet's activity must have fallen before the Reformation in Josiah's eighteenth year. (See JOSIAH.) If

the occasion of his prophesying was the expected invasion of the Scythians, as seems probable, he began to deliver oracles in the year 625 B.C. The book may be divided into three parts: (a) Chapter i, containing an announcement of a general destruction of the world, which, however, is directed more particularly against the idolaters and apostates in Jerusalem and Judah. (b) In the second part (ii. 1–iii. 7) the prophet urges to repentance as the only means of escaping the threatened doom, which will bring destruction also to the Philistines, to Moab, Ammon, Ethiopia, and even to Assyria. Turning again to Jerusalem he dwells upon the evils found therein, especially the corruption of her judges and great men. (c) The third part (iii. 8–20) is of a conciliatory character. The purified remnant will dwell in safety in their own land, and a blissful future is in store for both land and people after the reproach now resting upon them shall have been removed. The authenticity of the book has been questioned, and it at least shows traces of editing long subsequent to the period with which it deals. The language is forcible and picturesque, and the contrast between the sombre tone of the first two chapters and the buoyant one of the last is striking evidence of the writer's mastery of style. Consult: F. A. Strauss, *Vaticinia Zephaniæ* (Berlin, 1843); F. Schwally, in *Zeitschrift für alttestamentliche Wissenschaft* (Giessen, 1890); A. B. Davidson, "Nahum, Habakkuk, and Zephaniah," in the *Cambridge Bible for Schools and Colleges* (Cambridge, 1896); S. R. Driver, "Nahum—Malachi," in the *Century Bible* (London, 1906); Max Heller, in *Die Religion in Geschichte und Gegenwart* (Tübingen, 1913).

ZEPHANIAH, Apocalypse of. See Apocrypha, *Old Testament Apocrypha.*

ZEPHAROVICH, tsā'fȧ-rō'vĭch, Victor, Knight von (1830–90). An Austrian geologist and mineralogist, born in Vienna. He studied in Vienna and at the mining academy of Schemnitz, Hungary, was employed as section-geologist in the Imperial Geological Institution in Vienna in 1852–57, then was appointed professor of mineralogy in the University of Cracow, in 1861 at Graz, and in 1864 at Prague, where he established a mineralogical institute (1880). He made valuable contributions to mineralogy and crystallography. His works include *Mineralogisches Lexikon für das Kaisertum Oesterreich* (2 vols., 1859–72) and *Krystallographische Wandtafeln* (1877).

ZEPPELIN, tsĕp'e-lēn' *or* zĕp'e-lĭn, Ferdinand, Count von (1838–). A German airship inventor and builder. He was born on July 8, 1838, at Constance, Baden, and was educated at the Stuttgart Polytechnikum, at the military school at Ludwigsburg, and in the University of Tübingen. He became a cavalry officer in the Württemberg army in 1858, and in 1863 went to the United States, where he fought with the Union army in the Civil War. While in America he made his first ascent in a captive balloon at St. Paul, Minn. In 1866 he served with the Württemberg troops against Prussia, but in 1870–71 followed his King on the side of Prussia against France. At the beginning of the war Count Zeppelin led a famous reconnaissance into the French territory, and later was present at the battles of Froeschwiller and Sedan, and at the siege of Paris. In 1887–90 he was a member of the Bundesrath for Württemberg, and after 1887 assisted also in the reorganization of the German army. He retired from the army as lieutenant general in 1901. In 1892 Count Zeppelin built a dirigible balloon of great size, able to carry several passengers. In 1900 he succeeded in making three ascensions on the shore of Lake Constance, but the airship was wrecked. With new funds, raised in part by a lottery, he constructed an airship at Friedrichshafen in 1905, but was unable to drive it against the wind. However, an attempt made in October, 1906, was successful. In 1909 a Zeppelin manufactory of airships was incorporated at Friedrichshafen. In the same year Count Zeppelin made a record flight in his dirigible *Zeppelin III* from Friedrichshafen to Berlin, and on July 8, 1913, celebrated his seventy-fifth birthday by steering his twentieth airship, the *Zeppelin L–5*, on its maiden voyage. During the European War the Zeppelins made many raids upon England, and the factory at Friedrichshafen turned out scores of airships. Count Zeppelin was awarded the Iron Cross in 1915, and in the same year was elected to the First Chamber of Württemberg. Consult R. P. Hearne, *Zeppelins and Super-Zeppelins* (New York, 1916). See Aëronautics, *Zeppelin Airships,* and *German Dirigibles;* Military Aëronautics, *Dirigibles;* War in Europe.

ZERAFSHAN, zĕr'ȧf-shän', or Zarafshan (gold distributor). A river of Russian Turkestan. It rises at the foot of an enormous glacier in one of the Pamir (q.v.) valleys on the west boundary of Ferghana, and flows westward through the Territory of Samarkand into Bokhara. About the city of Samarkand it is diverted into many irrigating canals, being much reduced, and after suffering a similar loss at the city of Bokhara it is lost in the desert before reaching the Amu Darya, of which it would otherwise be a tributary. It is about 400 miles long.

ZERAM', *Port. pron.* zȧ-rän'. See Ceram.

ZERBST, tsĕrpst. A town of the Duchy of Anhalt, Germany, 68 miles southwest of Berlin, on the river Nuthe, a tributary of the Elbe (Map: Germany, E 3). Close by is the beautiful ducal castle, built in the seventeenth century, containing the archives of Anhalt from 941 on. The church of St. Nicholas, begun in the eleventh century, is a fine specimen of Gothic architecture. The chief manufactures are articles in gold and silver, and silk, plush, cloth, wax, soap, machinery, chemicals, stoneware, and carriages. There are breweries famous for their bitter beer. Pop., 1900, 17,094; 1910, 19,210. Zerbst is of Slavic origin. The town dates from 1007. From 1603 to 1793 it was the capital of the Principality of Anhalt-Zerbst.

ZERDA, zĕr'dȧ. See Fennec.

ZERMATT, tsĕr-mät'. A celebrated mountain resort in the southern part of the Canton of Valais, Switzerland, situated on the left bank of the Visp at an altitude of 5315 feet (Map: Switzerland, B 2). It is the starting point for ascents of the Riffelberg and the Gorner Grat, which are connected by an electric mountain railway with Zermatt, as well as of the Matterhorn (q.v.) and the entire Monte Rosa group. Pop., 1910, 786.

ZERO (Fr. *zéro,* from It., Sp. *zero,* from Ar. *ṣifr, ṣafr,* cipher, from *ṣafira,* to be empty). In mathematics, a symbol written 0, and signifying the absence of quantity or number. The common symbol is not found before the seventh century, in India. The term is also applied to

the infinitesimal. (See INFINITY AND THE INFINITESIMAL; NEGATIVE QUANTITY.) In thermometry the term is applied to certain fundamental points of temperature on the thermometer scale. In the earliest thermometers (q.v.) the zero point was fixed at the normal temperature of a healthy man, and any variation from this point was indicated on an arbitrary scale. The temperature of spring water was also selected as a fundamental point. A mixture of snow and salt furnished the zero point on Sagredo's thermometer, where the temperature of the hottest summer day was denoted by 360. Fahrenheit also used the mixture of ice and salt to determine the zero in his thermometer, while Réaumur put his zero at the temperature of melting ice. About the same time De l'Isle constructed thermometers in which the zero was the temperature of freezing water, and also instruments where the zero was at the boiling point. The zero of the modern centigrade thermometer is fixed at the temperature of melting ice.

ZERO, ABSOLUTE. See THERMOMETRY.

ZERRAHN, tsĕr-rän', CARL (1826–1909). A German-American musician and conductor, born at Malchow, Mecklenburg. He studied music in Hanover and Berlin, and came to America during the Revolution of 1848. Here he became first flute in the Germania Musical Society, which gave concerts in the principal cities of the United States. From 1854 to 1898 he was conductor of the Handel and Haydn Society, Boston. For years he gave at his own financial risk the only orchestral classical concerts in Boston. In 1865 he was appointed conductor of the Harvard Symphony concerts, serving until they were discontinued in 1882. He was elected conductor of the Oratorio Society of Salem, Mass. (1868), and as the conductor of many musical festivals held throughout New England exercised an important influence. He also became a professor at the New England Conservatory of Music. Zerrahn was especially successful in the presentation of oratorios and the management of large choruses. See CHORAL SOCIETIES.

ZERUB'BABEL, or **ZERUBABEL** (Heb., from Babylonian *Zaru Babil*, seed or offspring of Babylon). The Governor of Jerusalem at the time when the second temple was built. He was probably born in Babylon. In Ezra iii. 2, 8, and Hag. i. 1, he is called the son of Shealtiel, who was a son of Jehoiachin. He may have been the immediate successor of Sheshbazzar or Sin-apal-uzur, the Shenazar of 1 Chron. iii. 18, who was one of the sons of Jehoiachin and was the first Governor of Jerusalem appointed by Cyrus. According to III Esdras, Zerubbabel was one of Darius's pages who was granted permission to return to Jerusalem and build the temple as a reward for his cleverness in argument. The story is probably without any historic foundation. Through the influence of Haggai and Zechariah the people of Jerusalem were induced to build a new temple more fit to be the house of Yahwe than the simple shrine which had probably served that purpose since the destruction of Solomon's temple by Nebuchadnezzar in 586 B.C. The erection of the new sanctuary was begun in 520 B.C., and the temple was dedicated in 516 B.C. During the years it was building the prophets cherished the hope that its completion would usher in a new era of prosperity for Jerusalem and that Zerubbabel would become King of the restored commonwealth. Even in Babylonia the Jews seem to have shared these expectations, and Haldai was sent to Jerusalem, at the head of a deputation, with gold that was made into a crown and held in readiness for the day of coronation. Visions of Zechariah show that in prophetic circles there was some anxiety lest this expected restoration of the Davidic dynasty might interfere with the growing importance attached to the high-priestly office. It is the opinion of some scholars that the temple was rebuilt, not chiefly by exiles who may have returned from Babylonia in the days of Sheshbazzar, since Haggai and Zechariah make no mention of it, but by the Judæans, who were the descendants of the people left in the land when Nebuchadnezzar carried away some of the more important families. As Zerubbabel is not named in the account of the dedication (Ezra vi. 15 sqq.), it has been supposed that he was recalled by Darius, who may have feared the effect of having a descendant of the old Davidic dynasty as Governor in Jerusalem. It is probable, however, that Zerubbabel went to his grave without ever having sat on the throne of his forefathers, and no descendant of David ever seems to have occupied that throne after the fall of the dynasty in 586 B.C.

ZER'UMBET. See GINGER.

ZESEN, tsā'zen, PHILIPP VON (1619–89). A German poet and romancer. He was born at Priorau, near Dessau, studied at Wittenberg and Leipzig, and in 1643 founded at Hamburg the *Deutschgesinnte Genossenschaft*, a literary society the members of which tried in somewhat naïve and extreme fashion to purify the German language of barbarisms. Until 1683, when he settled in Hamburg, Zesen lived the life of a wanderer, and was well known in several courts of Europe. His works on German grammar and versification, though not without contemporaneous influence, are now forgotten, but one of his novels of adventure, *Die adriatische Rosemund* (1645; edited by Jellinek, 1899), has considerable merit. Vol. xiii of Müller's *Bibliothek deutscher Dichter des 17. Jahrhunderts* (Leipzig, 1837) gives a good selection from his works. Consult Gebhart, *Untersuchungen zur Biographie P. Zesens* (Strassburg, 1888); Dissel, *P. von Zesen und die Deutschgesinnte Genossenschaft* (Hamburg, 1890).

ZET'LAND. See SHETLAND ISLANDS.

ZETTERSTEDT, tsĕt'ĕr-stĕt, JOHAN VILHELM (1785–1874). A Swedish naturalist, born in East Gothland. He was educated at Lund, where he became successively tutor of botany (1810), assistant in the natural-history department (1812), and professor of botany (1839). His works include *Dissertatio de Fœcundati-*

one Plantarum (1810–12); *Orthoptera Sueciæ* (1821); *Fauna Insectorum Lapponica* (1828); *Monographia Scatophagarum Scandinaviæ* (1835); *Insecta Lapponica* (1838–40), and *Diptera Scandinaviæ Disposita et Descripta* (14 vols., 1842–60).

ZETZSCHE, tsĕch'she, KARL EDUARD (1830–94). A German mathematician and physicist, born in Altenburg. He studied in Dresden and Vienna, and in 1856 entered the Austrian telegraph service. In 1858 he became teacher in the industrial high school at Chemnitz, and in 1876 professor of telegraphy in the Polytechnic Institute at Dresden. In 1880 he was appointed telegraph engineer in the Imperial Post Office at Berlin, and in 1887 retired from public service. He wrote: *Die Kopiertelegraphen, Typendrucktelegraphen und die Doppeltelegraphie* (1865); *Die elektrischen Telegraphen* (1869); *Katechismus der elektrischen Telegraphie* (6th ed., 1883); *Abriss der Geschichte der elektrischen Telegraphie* (1874); *Die Entwickelung der automatischen Telegraphie* (1875); *Handbuch der elektrischen Telegraphie* (together with Frölich, Henneberg, and Kohlfürst) (1877–95). Consult Voretzsch, *Zur Erinnerung an K. E. Zetzsche* (Altenburg, 1894).

ZEUGLODON, zū'glō-dŏn (Neo-Lat., from Gk. ζεύγλη, *zeuglē*, strap or loop of a yoke, from ζευγνύναι, *zeugnynai*, to join + ὀδούς, *odous*, tooth). An extinct whale, the earliest known fossil cetacean, found in Eocene deposits of various parts of the world. It was a great serpent-like creature with body 50 to 70 feet long and from 6 to 8 feet in diameter at the thickest part of the trunk. The head was 4 feet long, the trunk 10 feet, and the tail had a length of 40 feet. The skull was elongated and flattened, resembling that of the crocodile, and the blowhole was near its middle. The teeth were like those of the Carnivora, from which the cetaceans are supposed to have evolved, in that they were disposed in three series (incisors, 3; canines, 1; and molars, 5), and the molars were peculiar in that they had longitudinally compressed, serrated crowns and were attached by double roots. The vertebræ of the tail were much larger than those of the trunk. The limbs consisted of small paddles, like those of the fur seal, just back of the head, and of very much reduced hind limbs, which are supposed to have been hidden under the skin and to have been totally useless. Zeuglodon bones are common in the Eocene marls of the Gulf States of North America, and they are known also from the Eocene deposits of various parts of Europe, Asia, Africa, Australia, and New Zealand. This wide distribution indicates that the animal was a powerful swimmer and capable of a very cosmopolitan existence. Consult: S. P. Woodward, *Outlines of Vertebrate Palæontology* (Cambridge, 1898); F. A. Lucas, "Animals of the Past," in American Museum of Natural History, *Handbook Series*, No. 4 (New York, 1913). See CETACEA; WHALE.

ZEUGLODON TOOTH.

ZEUNE, tsoi'ne, JOHANN AUGUST (1778–1853). A German geographer and philanthropist, born at Wittenberg. In 1802 he taught geography in his native city, and then in Berlin from 1803 until 1810, when he became professor of geography in the university. In 1806 he founded an institution for the blind in Berlin, which became well known. He wrote: *Gäa, Versuch einer wissenschaftlichen Erdbeschreibung* (1808; 3d ed., 1830); *Ueber Basaltpolarität* (1809); *Belisar, über den Unterricht der Blinden* (1808; 4th ed., 1834); a translation of the *Nibelungen* into modern German (1813; 2d ed., 1836); *Ueber Schädelbildung* (1846).

ZEUNER, tsoi'nĕr, GUSTAV (1828–1907). A German physicist and engineer, born at Chemnitz. He received his education at the School of Mines, Freiberg, became teacher first in the industrial school at Chemnitz, later in the School of Mines, Freiberg, and in 1855 professor of mechanics and engineering in the Polytechnic Institute at Zurich, and was director of that institution in 1859–68. From 1871 to 1873 he was director and professor of mechanics and mining engineering in the School of Mines at Freiberg, then was called in the same capacities to the Polytechnic Institute in Dresden, the organization of which he completed. He resigned from the directorship in 1890 and from the professorship in 1897, when he retired. He became chiefly known for his work in connection with thermodynamics and steam engines, and wrote: *Die Schiebersteuerungen mit besonderer Berücksichtigung der Lokomotivsteuerungen* (1858; 6th ed., 1904; trans. into French and English); *Grundzüge der mechanischen Wärmetheorie* (1860; 3d ed., under the title *Technische Thermodynamik*, 1887–90; 5th ed., 1906); *Ueber das Wanken der Lokomotiven* (1861); *Das Lokomotivenblasrohr* (1863); *Abhandlungen aus der mathematischen Statistik* (1869). He also edited, together with Weisbach and Bornemann, the *Zivilingenieur* (1853–57).

ZEUS. See JUPITER.

ZEUS (JUPITER) OTRIC'OLI. The antique bust of Zeus found at Otricoli, and now in the Vatican Museum. Only the mask survives, the back of the head being cut away. It is of Carrara marble and probably the work of a Greek sculptor in Italy after an original of the Hellenistic age. It is of leonine aspect, majestic and dignified, but lacks the serenity of the Phidian epoch. See Plate with article JUPITER.

ZEUSS, tsois, JOHANN KASPAR (1806–56). The founder of modern Celtic philology, born at Vogtendorf, near Kronach in Oberfranken. He studied at Munich from 1832 to 1839, was a teacher in the Gymnasium there, and then became professor of history in a secondary school in Speyer. In 1847 he was called to a professorship in the Lyzeum at Bamberg. His *Grammatica Celtica* (1853; 2d ed. by Ebel, 1868–71) was one of the greatest philological achievements of the century. His other works include *Die Deutschen und die Nachbarstämme* (1837; new ed., 1904); *Die Herkunft der Bayern von den Markomannen* (1839); *Traditiones possessionesque Witzenburgenses* (1842); *Die freie Reichstadt Speier vor ihrer Zerstörung* (1843). Consult Glück, *Erinnerung an Kaspar Zeuss* (Munich, 1857); E. Kuhn, *Johann Kaspar Zeuss* (ib., 1906).

ZEUTHEN, tsoi'ten, HIERONYMUS GEORG (1839–). A Danish mathematician, born at Grimstrup. He studied at Copenhagen University (Ph.D., 1865) and under Chasles in Paris. From 1886 to 1910 he was professor at Copenhagen University and at the Polytechnic Institute. For many years (1871–89) he edited the *Tidsskrift for Mathematik*, which exerted a wide influence. He contributed numerous math-

ematical treatises to the publications of Copenhagen University and the journals of scientific societies. In his special fields he gained an international reputation.

ZEUX'IS (Lat., from Gk. *Zeũxis*). A famous Greek painter who flourished near the end of the fourth century B.C. He is called a native of Heraclea, though which of the cities of that name is meant cannot be determined. He visited Athens and Lower Italy, but seems to have made his headquarters during a considerable time at Ephesus. He took up the new chiaroscuro of Apollodorus of Athens and developed it, excelling rather in his coloring and expression than in fineness of drawing, in which he was surpassed by Parrhasius (q.v.). His human figures were criticized by some for their large heads and limbs, though others praised these qualities. Among his famous works were an "Alcmena" given to Agrigentum, a "Pan" presented to Archelaus, and a youthful "Hercules" strangling the serpents in the presence of the anxious Alcmena and Amphitryon. His "Helen" was painted as a present for the people of Crotona, after he had decorated the temple of Hera Lacinia near that city. Lucian describes in detail a painting representing a female centaur suckling her young, while in the background the wild father aroused and frightened his children by holding over them a lion's cub. Zeuxis seems to have studied to find new and strange situations. It is noticeable that great monumental groups, like those of Polygnotus, do not appear in his works. The nearest approach is perhaps found in his "Zeus Surrounded by the Gods." He belonged to the new school of artists who painted smaller works for private patrons, rather than decorations for public halls. See Pliny, *Historia Naturalis*, XXXV, 61–64; Quintilian, xii, 10, 4.

ZEVI, or **ZEWI,** zā'vē. SABBATHAI. See MESSIAH.

ZGIERZ, zgyĕrzh. A manufacturing town in the Government of Piotrkow, Russian Poland, about 10 miles north of Lodz. It is noted for its extensive woolen and cotton mills. Pop., 1910, 23,208.

ZHITLOVSKY, zhĭt-lŏf'skĭ, CHAIM (1865–). A Jewish writer and communal worker, born at Vitebsk, Russia. His *Thoughts on the Historical Fate of Judaism* (1887) first attracted attention to him. Among his works in Yiddish are: *The Jewish Nation and the Jewish Language*, a series of articles published in 1903; *Socialism and Nationalism* (1907); and *Philosophy: What It Is and How It Developed* (1910), the first systematic exposition of philosophy in the language. His writings were collected in four volumes in 1912. Zhitlovsky was the first expounder of Jewish nationalism and he was also one of the founders of the Jewish Socialist Labor party. From 1907 he lived in New York, where in 1909 he founded the monthly *Das Neue Leben*.

ZHITOMIR, zhĭt'ō-mēr'. The capital of the Government of Volhynia, west Russia, situated at the confluence of the Kamenka with the Teterev, 85 miles west-southwest of Kiev (Map: Russia, C 4). Zhitomir is noted for its manufacture of gloves, and produces also bent-wood furniture, ready-made clothes, and tobacco. It carries on a brisk trade in agricultural products and timber. Pop., 1911, 92,600, chiefly Jews and Poles.

ZHUKOVSKY, zhụ-kŏf'skĭ, VASILY ANDREIEVITCH (1783–1852). A Russian poet, born in the Government of Tula. He first attracted attention, when, in the campaign of 1812, he turned to patriotic verse. Zhukovsky introduced to his countrymen the Romantic literature of England and Germany, some of which he rendered in unexcelled verse. For this he is generally considered the founder of the Romantic movement in Russia; but he more properly belonged to the sentimental school of Karamzin (q.v.), whom he gratefully acknowledged his literary master. In his original poems and translations Zhukovsky showed such mastery over form that even Pushkin could do no more in this direction. Selections from his verse are available in English in John's *Specimens of the Russian Poets* (1821-23).

ZICHY, zĭch'ē, EUGEN, COUNT (1837–1906). An Hungarian explorer, born at Mihály. After studying in Germany and traveling there and in England, he gave his attention particularly to the canalization of the Hungarian lowlands and, as president of the Home Industry Association, was very active in promoting the development of trade. In 1892 and in 1895–96 he visited the Caucasus and Central Asia, and in 1897–98 Siberia, China, Tibet, and Mongolia. He published *Voyages au Caucase et en Asie centrale* (1897), and the participants in his third expedition issued *Dritte asiatische Forschungsreise des Grafen Eugen Zichy* (6 vols., 1900–06).

ZICHY, zĭch'ē, GÉZA, COUNT VON VÁSONYKEÖ (1849–). An Hungarian pianist and composer, born at Sztára. Although deprived of his right arm at the age of 15 by an accident while hunting, he nevertheless took up music as a profession, chiefly under the guidance of Liszt, and as a virtuoso with the left hand created a sensation on his first appearance in 1878. Thereafter he appeared frequently, but only for charitable purposes. During the great European War he played throughout Austria and Germany to prove to the disabled what could be accomplished with only one arm. The foremost critics agree that Zichy's playing can be measured only by that of the greatest virtuosos of his time. The amount he realized for various charities is estimated at several millions of marks. He became president of the Hungarian National Conservatory, and from 1891 was intendant of the Royal Opera House and the National Theatre at Budapest. His compositions include the operas *Alár* (1896) and *Meister Roland* (1899), choral works, studies and solo pieces for the left hand, and songs.

ZICHY, MIHÁLY, COUNT (1826–1906). An Hungarian painter and illustrator. He was born at Zala, Somogy County, studied under Marastoni at Budapest and Waldmüller in Vienna, and in 1847 removed to St. Petersburg, where he was appointed Russian court painter in 1859. One of his best historical canvases on a large scale is "Empress Elizabeth of Austria at the Coffin of Francis Deák," in the National Museum at Budapest, which contains several other works by him. He is also represented in the Alexander III Museum, St. Petersburg. Zichy likewise painted genre and symbolical scenes, but is best known for his illustrations of great Hungarian writers, particularly Madach (*Tragedy of Man*) and Arany (*Ballads*). He was a fine draftsman, and possessed a vivid imagination and some realistic power, but was inclined to the sensational.

ZIDON. See SIDON.

ZIEGLER, tsē'glēr, CLARA (1844–1909). A German actress, born in Munich. Having made her début at Bamberg in 1862, she contracted engagements successively at Ulm, Munich, and at the Stadttheater in Leipzig, where she scored triumphs, especially as Brunhilde (Hebbel's *Nibelungen*), Isabella (*Bride of Messina*), Maid of Orleans, and Elisabeth (Laube's *Essex*). In 1868–74 she was a member of the royal theatre in Munich and in 1876 married her former instructor, Adolf Christen. Thereafter she appeared in starring engagements on nearly all the principal stages of Germany, Holland, and Russia. Her other rôles were Iphigenie, Medea, Sappho, Penthesilea, Judith, and Thusnelda (Halm's *Fechter von Ravenna*), and she also impersonated successfully characters in high-class comedy. As a playwright she produced the comedies *Flirten* (1895), *Furcht vor der Schwiegermutter* (1897), and *Der Türner von Sankt Peter* (1897). For her biography, consult Mayerhofer (Bamberg, 1887).

ZIEGLER, JAKOB MELCHIOR (1801–83). A Swiss cartographer, born in Winterthur. He studied mathematics and natural sciences at Geneva and Paris. From 1828 to 1834 he was teacher of mathematics in Winterthur, and in 1834 became inspector of forests. He was known for his excellent surveying and map making of the mountainous regions of his native country. He published: *Topographische Karte der Kantone Sankt Gallen und Appenzell* (1852); *Atlas über alle Teile der Erde nach Karl Ritters Lehre* (1864); *Hypsometrischer Atlas mit Erläuterungen und Höhenverzeichnissen; Hypsometrische Karte der Schweiz* (1866); *Topographische Karte der Insel Madeira* (1856); *Topographische Karte des Kantons Glarus* (2d ed., 1869); *Topographische Karte des Unterengadin* (1873); *Ueber das Verhältnis der Topographie zur Geologie* (1876). Consult Geilfuss, *Leben des Geographen J. M. Ziegler* (Winterthur, 1884).

ZIEGLER, THEOBALD (1846–). A German philosopher, born at Göppingen, Württemberg. He studied at Tübingen, taught at several Gymnasia, and was professor at Strassburg from 1886 to 1911, when he retired. His most important writings include: *Studien und Studienköpfe aus der neuern und neuesten Litteraturgeschichte* (1877); *Lehrbuch der Logik* (2d ed., 1881); *Geschichte der Ethik* (2 vols., 1881–86; 2d ed., 1892); *Sittliches Sein und sittliches Werden* (1890; Eng. trans., 1892; Russ. trans., 1895); *Die soziale Frage eine sittliche Frage* (1891; 6th ed., 1899); *Das Gefühl* (1893; 5th ed., 1912); *Geschichte der Pädagogik* (1895; 3d ed., 1909); *Die geistigen und sozialen Strömungen des 19. Jahrhunderts* (1899; 4th ed., 1911; Russ. trans., 1903; Dutch trans., 1912); *Friedrich Nietzsche* (1900); *Der deutsche Student am Ende des 19. Jahrhunderts* (1895; 12th ed., 1912); *Allgemeine Pädagogik* (4th ed., 1913); *Schiller* (2d ed., 1909); *David Friedrich Strauss* (2 vols., 1908); *Ueber Universitäten und Universitätsstudium* (1913); *Menschen und Probleme* (1914); *Der Krieg als Erzieher* (1914).

ZIEHEN, tsē'en, GEORG THEODOR (1862–). A German psychologist and psychiatrist, born at Frankfort-on-the-Main. From 1881 to 1885 he studied at Würzburg and Berlin, taking degrees in philosophy and medicine. After some years of hospital and educational experience he became professor and director of the psychiatrical clinic at Utrecht in 1900, was called in 1903 to Halle, and in 1904 went to Berlin as professor of psychiatry and nervous diseases. Besides serving as an associate editor of the *Zeitschrift für Psychologie und Physiologie der Sinnesorgane*, he published: *Leitfaden der physiologischen Psychologie* (1891; 10th ed., 1914); *Das Centralnervensystem der Cetaceen* (1892, with Kükenthal); *Psychiatrie* (1894); *Das Centralnervensystem der Monotreme und Marsupialier* (1897–1905); *Psychophysiologische Erkenntnistheorie* (1898); *Psychotherapie* (1898); *Handbuch der Anatomie des Centralnervensystems* (1899–1913); *Ueber die allgemeinen Beziehungen zwischen Gehirn- und Seelenleben* (1902); *Die Geisteskrankheiten des Kindesalters* (1902–06); *Das Gedächtnis* (1908); *Principien und Methoden der Intelligenzprüfung* (1909); *Handbuch der Gehirnkrankheiten im Kindesalter* (1912); *Erkenntnistheorie auf psychophysiologischer und physikalischer Grundlage* (1913); *Zum gegenwärtigen Stand der Erkenntnistheorie* (1914); *Die Grundlagen der Psychologie* (1915).

ZIELINSKY, zyĕ-lyĭn'skĭ, THADDÄUS (1859–). A Russian classical scholar, born at Kiev. He studied at the universities of Leipzig, Munich, and Vienna. In 1881–83 he traveled in classic lands, and in 1887 became professor of classical philology at the University of St. Petersburg. His publications include: *Die letzten Jahre des zweiten punisches Krieges* (1880); *Die Gliederung der altattischen Komödie* (1885); *Cicero im Wandel der Jahrhunderte* (1897; 3d ed., 1912); *Das Clauselgesetz in Ciceros Reden* (1904); *Das Ausleben des Klauselgesetzes* (1906–); *Die Antiken und Wir* (1903; Eng. trans., *Our Debt to Antiquity*, 1909); *Der konstruirte Rhythmus in Ciceros Reden* (1913). Zielinsky was the pioneer in the study of rhythm in Latin prose. For a criticism of his work consult *The Year's Work in Classical Studies*, ix, 61–65 (London, 1915).

ZIEM, zĕ'ĂN', FÉLIX (1821–1911). A French landscape painter. He was born at Beaune (Côte d'Or), studied at the art school of Dijon, and later traveled in Italy and the Orient. He was a precursor of Impressionism and was the last of the Romantic school to portray the life and color of Mediterranean and Oriental countries. His specialty was Venice, and he rendered in prismatic and iridescent colors the singular charm of Adriatic scenery; but his style lacks variety. He also painted charming flower pieces. Ziem is excellently represented in the Luxembourg and the Petit Palais in Paris. He is also represented in the Metropolitan Museum, New York, the Walters Gallery, Baltimore, and other collections of the United States. Consult his biography by Fournier (Beaune, 1897), and *F. Ziem*, in "Les Peintres Illustres" (Paris, n. d.).

ZIEMSSEN, tsēm'sen, HUGO WILHELM VON (1829–1902). A German physician, born in Greifswald. He studied there, at Berlin, and at Würzburg. In 1863 he was called to Erlangen as professor of pathology and director of the clinic, and in 1874 to Munich as director of the general hospital. He made advances in electrotherapeutics, introduced the cold-water treatment for typhoid fever and lung inflammation, and became an authority on diseases of the larynx and digestive canal. Among other works he published *Klinische Vorträge* (1887–1900). In collaboration with prominent specialists he published his great *Handbuch der speciellen Pathologie und Therapie* (17 vols., 3d ed., 1886 et seq.) and the *Handbuch der allgemeinen Ther-*

apis (4 vols., 1880–84), both translated into English. He edited with Zenker (q.v.) the *Deutsches Archiv für klinische Medizin.*

ZIETEN, tsē'ten (**ZIETHEN**), HANS 'JOACHIM VON (1699–1786). A Prussian general, one of the ablest of Frederick the Great's soldiers. He was born on the estate of Wustrau, in Brandenburg. His fame was acquired in the first two Silesian wars. As colonel of the celebrated regiment of Hussars he made his way as far as Stockerau, near Vienna, and afterwards covered the retreat of Prince Dietrich of Anhalt into Silesia (1742). During the second war he became major general and made his famous march through the enemy's country to Jägerndorf in order to join the Margrave Charles (1745). He then won the battle of Hohenfriedberg. In 1756 the King appointed him lieutenant general, and during the Seven Years' War he attained the height of his fame. At Reichenberg, Prague, Kolin, and Leuthen he came off victorious, and at Torgau he accomplished the supreme feat of storming the heights of Siptitz. Consult the biographies by Hahn (5th ed., Berlin, 1878) and Count zur Lippe-Weissenfeld (ib., 1880).

ZIGZAG (Fr. *zigzag*, from Ger. *zickzack*, variant reduplication of *Zacke*, prong, tooth). A decoration characteristic of the Norman style of architecture. It consists of one or more mouldings running in zigzag lines, and is used with great effect on the faces and soffits of arches, especially the stepped arches of church portals. The zigzags are sometimes undercut as well as decorated with various surface patterns.

ZILEH, zē-lē' (ancient *Zela*). A town in the Vilayet of Sivas, Asiatic Turkey, about 30 miles west-southwest of Tokat. The hill, called by Strabo the Mound of Semiramis, is crowned by the ruins of a mediæval castle. In ancient times the town was the seat of the temple of Anaïtis (q.v.) and was inhabited and ruled by priests. Pop., 20,000.

ZILLER, tsĭl'lĕr, TUISKON (1817–82). A German educator, born at Wasungen, in Saxe-Meiningen. He studied philology and law at the University of Leipzig. In 1854 he was made professor of philosophy and pedagogy at Leipzig, and soon became one of the leading representatives of Herbartian theory. In 1861 he founded a pedagogical seminary at Leipzig, and in 1868 his pupils established with his help the Society for the Scientific Study of Pedagogy. He was a pioneer in pedagogy, and as such had a profound influence upon later students of the new science. Among his publications were: *Einleitung in die allgemeine Pädagogik* (1856; 2d ed., 1901); *Grundlegung zur Lehre vom erziehenden Unterricht* (1865; 2d ed., 1883); and *Allgemeine philosophische Ethik* (1880; 2d ed., 1886). Consult Lange, *Tuiskon Ziller* (Leipzig, 1884), and Fröhlich, *Die wissenschaftliche Pädagogik Herbart-Ziller-Stoys* (Vienna, 1892).

ZIMB, zĭmb *or* zĭm (Ar., fly). A fly exceedingly destructive to cattle in Abyssinia. It probably belongs to the same family as the tsetse (q.v.) and is little larger than a bee, but thicker in proportion, the wings broader and without color or spot. The zimb is found only where the soil consists of a rich black loam; but all the inhabitants of the seacoast along the southern shores of the Red Sea, and southward beyond Cape Guardafui, are compelled to remove their cattle in the rainy season to the nearest sands, in order to prevent their destruction by this pest. The elephant and rhinoceros protect themselves from its attacks by rolling in mud, which, when dry, coats them as with a kind of armor.

ZIMBABWE, zĕm-bäb'wâ (Bantu, stone houses). The name of the very remarkable ruins in Southeastern Mashonaland, in lat. 20° 16′ 30″ S. and long. 31° 10′ 10″ E., also called Great Zimbabwe, to distinguish them from the numerous minor Zimbabwes scattered through the country. The ruins, which cover a large area, are situated upon a high plateau, 3300 feet above sea level, and consist of a circular structure placed upon a moderate eminence and a strongly fortified acropolis on the top of a neighboring kopje, with a considerable mass of ruins in the valley between. The circular structure, which seems to have served as a fort, is 280 feet in diameter and is surrounded by a stone wall built of small granite blocks laid, as in all buildings of this type, without mortar. The height of the wall varies from 35 to 15 feet, and its thickness from 16 to 5 feet. It is pierced by three entrances and the interior is divided into compartments by inner walls. In an inclosure at the southeastern end stand two solid conical towers, one 32 feet high, the other much smaller. A small valley filled with a great mass of ruins and débris below the circular structure is probably what remains of a city. On the opposite side of the valley is a kopje crowned with the ruins of an ancient citadel or acropolis, approached by a narrow way strongly fortified at every step. The hill is of great natural strength, being protected on one side by gigantic boulders, and on the south by a precipice from 70 to 90 feet high; the only accessible side is protected by a massive wall, 13 feet thick at the top and 30 feet high in places. Like that of the circular structure below, the interior of the acropolis is divided by walls into labyrinthine compartments. From one of these a stairway leads to a series of caves in which were found a furnace for smelting gold, a number of small crucibles with particles of gold still adhering, and a soapstone ingot mold. These ruins are the most important of a long series of similar ruins along the whole length of the west side of the Sabi River. As to the date of these ruins there is much difference of opinion. On the one hand it is held that there is no reason to believe the ruins over a few centuries old, while on the other there are those who think that the builders were Orientals of a remote past. It can hardly be doubted, in the light of recent discoveries, that in this auriferous district was the biblical Ophir whence King Solomon is said to have derived large quantities of the precious metal. The strong fortifications of their ruined cities indicate that these colonies were surrounded by a hostile population. The archæological evidence tends to show that the ancient builders and miners were Semites, and probably South Arabians, though the country and its valuable products seem to have been known to the Phœnicians and Egyptians as well. At the present day mining operations are extensively carried on in the district, and a large amount of gold is produced. The ruins of Great Zimbabwe were discovered by Karl Mauch in 1871; they were explored by Theodore Bent in 1891, and since by several explorers. Consult: J. T. Bent, *The Ruined Cities of Mashonaland* (London, 1892); Peters, *Im Goldland des Altertums* (Munich, 1902);

Hall and Neal, *Great Zimbabwe* (New York, 1905); Randall-MacIver, *Mediæval Rhodesia* (London, 1906), and R. N. Hall, *Prehistoric Rhodesia* (New York, 1910).

ZIMBALIST, zĭm'bȧ-lĭst, EFREM (1889–). A Russian violinist, born at Rostov on the Don. His first instruction he received from his father, an orchestral conductor. In 1901 he entered the Imperial Conservatory at St. Petersburg, where he studied the violin with Leopold Auer. In 1907 he graduated, winning the gold medal and a scholarship of 1200 roubles. In 1907 he made his début at Berlin with the Brahms concerto, creating a sensation, not so much by his remarkable technic as by the maturity of his art. Within a year he was enthusiastically received throughout Europe, and he had a like welcome in the United States, where he appeared for the first time in 1912 with the Boston Symphony Orchestra. In 1914 he married the singer Alma Gluck (q.v.).

ZIMISCES. See JOHN I, ZIMISCES.

ZIMMERMANN, tsĭm'er-män, JOHANN GEORG VON (1728–95). A Swiss philosopher. He was born at Brugg, in what is now the Canton of Aargau. He studied at Göttingen, and after traveling in Holland and France, settled at Brugg in 1754 as town physician. He wrote on experimental medicine *Von der Erfahrung in der Arzneikunst* (1764), but is remembered chiefly for his treatises on solitude, *Ueber die Einsamkeit* (1755, revised 1784–85), and on national pride, *Vom Nationalstolz* (1758), both of which made a great impression in their time and were widely translated and admired. He became Court physician at Hanover in 1768 and attended Frederick the Great in his last illness (1786), publishing on this episode several books that throw more light on the doctor's vanity than on the royal patient's character. Among these is *Ueber Friedrich den Grossen und meine Unterredungen mit ihm* (1788). Consult: *Zimmermanns Briefe an einige seiner Freunde in der Schweiz* (ed. by Rengger, Aarau, 1830); Eduard Bodemann, *Johann Georg Zimmermann: ein Leben* (Hanover, 1878), and Rudolf Ischer, "Neue Mitteilungen über Zimmermann," in *Euphorion*, vol. viii (Leipzig, 1901).

ZIMMERMANN, ROBERT VON (1824–98). An Austrian philosopher, born at Prague. He was educated at the universities of Prague and Vienna, in 1852 he was called to Prague as professor of philosophy, and in 1861 to Vienna, where he became a member of the Academy of Sciences in 1869. He was the founder of the so called æsthetics of form, and an opponent of the Hegelian school. Among his works are: *Leibniz und Herbart* (1849); *Ueber das Tragische und die Tragödie* (1856); *Aesthetik* (2 vols., 1856–65), his chief work; *Anthroposophie im Umriss* (1882).

ZIM'MERN, HELEN (1846–). An English author and translator. She was born in Hamburg, Germany, but was taken to England at the age of four. After 1887 she lived in Italy. In 1868 she began to write for various journals and reviews, and won almost immediate success. Many of her sketches were afterwards collected in book form, but it was rather as a translator and interpreter of Continental authors than as a story-teller that she became widely known. Her publications are: *Stories in Precious Stones* (1873); *Schopenhauer: His Life and Writings* (1878); *Half Hours with Foreign Novelists* (1880); *Tales from the Eddas* (1882); *The Epic of Kings* (1882), from Firdusi; *Maria Edgeworth* (1883); *The Hansa Towns* (1889); a translation of the *Comedies of Goldoni* (1892); the *Pentamerone*, translated (1893); translations from Nietzsche and Lessing; *Sir Laurence Alma Tadema* (1902); *Tripoli and Young Italy* (1912); *Italian Leaders of To-Day* (1915).

ZINC (Fr. *zinc*, from Ger. *Zink*, zinc; connected with Ger. *Zinn*, AS., Eng. *tin*, and OHG. *zein*, twig, leaf of metal). A well-known metallic element. Isolated, it was unknown to the ancients, but coins of brass, of which zinc is a constituent, have been found dating 110 A.D. Basil Valentine mentions zinc in several of his writings, but it was not until 1520 that Paracelsus first described zinc as a metal and assigned it to the class of semimetals. Its character as a distinct substance was not fully recognized until the seventeenth century, and even Lemery, 1675, refers to zinc as identical with bismuth. The metal has been reported native in small quantities near Melbourne, Australia, and in the United States in northeastern Alabama. The principal ores are the carbonate, or *smithsonite;* the oxide, or *zincite;* the oxide in combination with iron and manganese oxides, or *franklinite;* the anhydrous silicate, or *willemite;* the hydrated silicate, or *calamine;* and the sulphide, or *sphalerite*, usually called *blende*. Less commonly zinc occurs as aluminate, arsenate, phosphate, and sulphate.

The sulphide is far more important as an ore in the United States than the oxidized ore minerals (commonly grouped together under the name *calamine*). About two and three quarters times as much *blende* as *calamine* was smelted in the United States in 1914. In the same year the principal zinc-producing States were, in the order of the recoverable zinc content of their ore, Missouri, New Jersey, Montana, Colorado, Wisconsin, and Idaho.

Zinc (symbol, Zn; atomic weight, 65.4) is a bluish-white metal with a density of about 7. in the solid state and 6.5 in the liquid state. It melts at 419° C. (786° F.) and boils in the neighborhood of 1000° C. (1832° F.). It is brittle at ordinary temperatures, but becomes malleable between 100° and 150° C. (212° to 302° F.). Commercial zinc has a coarse laminar texture; it is moderately hard, difficult to file, and when bent after fusion emits a crackling noise similar to tin. The metal is commonly known in the trade as spelter. It comes into commerce chiefly in the form of sheets and is used in the arts, especially in the manufacture of brass, German silver, and other alloys (see ALLOY); also for desilverizing lead by the Parkes process, for galvanizing iron sheets for roofing, etc., and iron wire for telegraphs (see GALVANIZED IRON); for electrical batteries, as a chemical reagent, etc. Zinc dust, the "blue powder" of the smelters, is metallic zinc in a very finely divided form. It is used chiefly as a reducing agent in the manufacture of dyestuffs or other organic compounds, and as a substitute for zinc shavings in the precipitation of gold. Zinc combines with oxygen to form a monoxide (the *nix alba*, "philosophical wool," or "flower of zinc" of the alchemists, and the *tutia* or *pompholyx* of the ancients). The commercial product, known as zinc white, is an almost white pulverulent solid used in large quantities as a pigment. In Europe it is made by burning metallic zinc, but in the United States it is made directly from zinc ore. Zinc oxide is also used in medicine for

special ointments. Among other commercial zinc compounds is the chloride (*oleum lapidis calaminaris*), first described by Glauber in 1648. It is prepared by treating scrap zinc with hydrochloric acid and evaporating the resulting solution to crystallization. This salt is used in medicine as a caustic, and is a disinfectant and deodorizer. It finds extensive application as a preservative of timber, the chloride in the form of a solution being forced by pressure into the pores of the wood; it is also employed for weighting cotton goods. The bromide and the iodide are both official in the Pharmacopœia, the former used in the treatment of epilepsy and the latter for scrofula. Zinc sulphate, originally known as "white vitriol," and found native as goslarite, was described by Basil Valentine. This salt may be obtained by roasting sulphide ores to form zinc sulphate, which is afterwards dissolved out with water, and then evaporated to crystallization. It is a white powder used in medicine as an astringent; it is also used in dyeing and calico printing, in the manufacture of varnishes and drying oils, for painting, and for the preparation of zinc-white and other zinc compounds.

Metallurgy. Commercial zinc is produced almost entirely by a smelting (dry) process, although there was in 1916 under construction at least one plant designed to produce a large yearly tonnage of metal by electrolysis of solutions leached from the ore. Zinc salts, the sulphate or the chloride, however, are extracted from ores or furnace products in the wet way, by chemical solution and subsequent crystallization. The salts so produced are largely used as such, and not treated for the metal. The underlying principle of the dry process, as applied to ores or oxidized furnace products, is to convert the zinc into the form of oxide or anhydrous silicate by calcination or roasting, and then to reduce these oxidized compounds by heating with carbon in retorts, the volatilized metal being condensed and collected in receivers attached to the retorts. Briefly summarized, the treatment of zinc ores consists of three separate and distinct operations: (1) concentration of the ore to yield a high-grade product; (2) roasting of the concentrated ore to yield a dehydrated or oxidized material; (3) reduction of the ore and distillation and condensation of the zinc vapor. In nearly all cases zinc ores require a preliminary concentration (see ORE DRESSING) before smelting, in order to remove the impurities that are mechanically associated with the ore.

Concentrates of the calamine type are usually calcined before smelting in order to remove water and carbonic acid, both of which exert an objectionable oxidizing action on the zinc vapor during the distillation. Formerly small shaft furnaces, similar to lime kilns, were used for calcination (of raw ore), but in modern practice reverberatory furnaces, equipped with rakes operated by hand or by mechanical devices, are used. Revolving cylindrical furnaces also have been used. Blende concentrates are roasted in order to expel the sulphur, which if left in the ore would not yield metallic zinc in the subsequent smelting operation. From the chemical relationships involved it is known that one unit weight of sulphur left in the ore holds back two units of zinc during the distillation. Hence it is important to roast the ore thoroughly. It has been found practicable to roast down to a sulphur content of about 1 per cent. Special kilns, reverberatory furnaces, revolving cylindrical furnaces, or special muffles are used for the roasting, the last named being specially valuable for the utilization of the expelled sulphur dioxide gases to make sulphuric acid. The zinc in the ore having been converted into oxide by calcination or roasting, the extraction of the metal is accomplished by strongly heating this oxide in retorts with carbon, which reduces the oxide to metal. This metal as soon as reduced is immediately volatilized and, passing from the retort, is condensed in suitable vessels attached to the exterior of the retort. The various types of distillation furnaces in use at the present day are all built in the form of long rectangular chambers of refractory brick covered with an arch springing from the long side walls. This chamber is generally divided by a longitudinal wall which permits the working of two groups of retorts, one on each side of the furnace. These side walls are built in the form of window frames, or pigeon holes, for the ready insertion or removal of retorts. In position, these retorts are nearly horizontal, having the front end slightly lower than the back, in order that the corrosive slags may drain to the cooler portion where the chemical action is diminished, also to facilitate charging and discharging of upper rows of retorts. Sufficient space is left between the retorts to allow the flames to circulate around them. Chief among the various retorts used for distilling the zinc are: (1) large Silesian muffles, "D" shape in cross-section; (2) medium-sized Westphalian "D"-shaped muffles; and (3) relatively small Belgian elliptical or circular tubes; the last named being the kind usually employed in the United States.

The size, number, and arrangement of retorts in a furnace vary greatly. An example of a modern furnace shows retorts 50 inches long and 8 inches in diameter to the number of 1008, arranged in six horizontal rows of 84 retorts on each side. Another example shows retorts of the same dimensions arranged in six rows of 72 on each side.

In the very old furnaces solid fuel was burned in direct contact with the retorts. Later, the solid fuel was first transformed into combustible gas in an exterior fireplace, or in a separate gas-producer, before being burned around the retorts. In modern furnaces gaseous fuel, either natural gas or manufactured gas, is used, which, together with the air needed for combustion, is first independently preheated in checker-work regenerators before being burned. Once in 24 hours a charge of ore, weighing about 50 pounds, is placed in each retort, together with the requisite quantity of coal or coke, to reduce the zinc oxide to metallic zinc. The volatilized metal is condensed in conical clay receptacles, which are luted to the front of each retort. In some cases metal prolongs are used to secure additional condensation. The molten metal is collected from time to time and cast into slabs, each weighing about 50 pounds. The purity of the metal is determined mainly by the character of the ore used and the temperature of distillation. Certain grades known to the trade are exceptionally pure by reason of the exceptional purity of the ore used. Furthermore, a selection on the basis of purity may be made by segregating the metal collected in different stages of the distillation process. The principal impurities in commercial spelter are lead and iron. The market price of the metal is based mainly upon its lead

and iron content, since only the purer grades can be used for making very ductile brass (such as is necessary in the manufacture of cartridge cases, etc.) and for certain other purposes.

In 1915 there was produced in the United States 489,519 short tons of primary spelter. In the same year the principal zinc-smelting States in the order of their output were Illinois, Oklahoma, Kansas, West Virginia, and Pennsylvania.

In Medicine. Zinc is represented in medicine by several salts, all of which are poisonous in some degree. Given in large quantities, zinc salts are actively emetic and are useful in cases of poisoning where it is desired to empty the stomach rapidly. In small doses they are tonic and astringent. Some of the most important preparations are: zinc acetate, a local astringent; zinc chloride, a favorite astringent in catarrhal diseases of the mucous membrane; zinc oxide, often applied locally in the form of a salve; and zinc sulphate, an emetic. Other preparations are the bromide, the carbonate, the iodide, the phenolsulphate, the sulphocarbolate, the stearate, and the valerate.

ZINC ETCHING. See PHOTO-ENGRAVING, paragraph *Line-Cut Process.*

ZINC ETHYL. See ORGANOMETALLIC COMPOUNDS.

ZINC'ITE. A mineral zinc oxide crystallized in the hexagonal system. It has a subadamantine lustre and is deep red in color. It occurs with other zinc minerals, especially franklinite and willemite, at the various mines in Sussex Co., N. J. Artificial crystals of zincite have been found as furnace products in Silesia, and also at the zinc furnaces at Newark, N. J., and Bethlehem, Pa. It is a valuable ore of zinc when found in sufficient quantity, and is commonly known as red oxide of zinc. Zincite, when found with willemite and franklinite, has sometimes been made into paper weights and similar objects. It does not, however, take a high polish.

ZIN'DER, or SINDER. A town of French Sudan (Map: Africa, E 3). It is an important trading station on the route across the Sahara from Tunis through Air, and was occupied in 1899 by the French. Pop., about 10,000.

ZINGARELLI, zĕn'gȧ-rĕl'lē, NICOLO ANTONIO (1752–1837). An Italian composer, born in Torre del Greco, near Naples, where he studied at the Loreto Conservatory. In 1785 his opera *Alsinda* was produced with success, and in 1792 he was appointed maestro at the Milan Cathedral. He was maestro of St. Peter's, Rome, from 1804 until 1811, when, because of his refusal to permit a Te Deum to be sung in commemoration of the birth of Napoleon's son, he was arrested and taken to Paris. Napoleon received him very graciously, commissioned him to write a mass for the Imperial chapel, and permitted him to return to Italy. During his absence Janniconi had succeeded him at St. Peter's, and he went to Naples, where in 1813 he became director of the Royal College of Music, and (1816) succeeded Paesiello as maestro at the Cathedral. He wrote not less than 34 operas, 38 masses, 5 oratorios, and many smaller sacred and secular compositions.

ZINGARI, tsĕn'gȧ-rē, GLI (It., The Gypsies). An opera by Leoncavallo (q.v.), first produced in London, Sept. 16, 1912; in the United States, Oct. 30, 1913 (San Francisco).

ZINGERLE, tsĭng'ĕr-le, IGNAZ VINZENZ (1825–92). An Austrian poet and philologist. He was born at Meran and was educated at Trent and Innsbruck, and at the Seminary of Brixen. In 1848 he was appointed a teacher in the Innsbruck Gymnasium, and from 1859 to 1890 was professor of the German language and literature in the university. He published many works bearing on the history and literature of Tirol, of which the more important are: *Sagen aus Tirol* (1850; 2d ed., 1891); *Tirol, Natur, Geschichte und Sage im Spiegel deutscher Dichtung* (1852); *Kinder- und Hausmärchen* (1852–54); *Sitten, Brauche und Meinungen des Tiroler Volkes* (1859); and also wrote *Die deutschen Sprichwörter im Mittelalter* (1864); *Die Alliteration bei mittelhochdeutschen Dichtern* (1864); and *Das deutsche Kinderspiel im Mittelalter* (1873); and issued an edition of *König Laurin* (1850). His verse includes: *Frühlingszeitlose* (1848); *Von den Alpen* (1850); and *Gedichte* (1853). Of his tales in prose, *Der Bauer von Longvall* (1874) met with especial favor.

ZINGIBER, zĭn'jĭ-bĕr. See GINGER.

ZINGIBERACEÆ, zĭn-jĭb'ĕr-ā'sē-ē (Neo-Lat. nom. pl., from Lat. *zingiber,* from Gk. ζιγγίβερις, *zingiberis,* ginger). The ginger family. A family of tropical, mainly Asiatic monocotyledonous mostly perennial herbs, with fleshy rootstalks or tuberous roots, embracing about 25 genera and 275 species. Several genera contain plants of economic value, as ginger, curcuma, grains of Paradise, cardamoms, and various important fibres. See GINGER.

ZINGIS KHAN. See GENGHIS KHAN.

ZINJAN, zĭn-jän', or **ZENJAN.** The capital of the Province of Khamseh, northwest Persia, at an elevation of 5000 feet on the highroad from Teheran to Tabriz, over 200 miles northwest of the former city (Map: Persia, C 4). It is surrounded by gardens and has an extensive bazar. The town is the former stronghold of the Babi sectarians. (See BABISM.) Pop., 25,000.

ZIN'NIA (Neo-Lat., named in honor of J. G. *Zinn,* a German botanist of the eighteenth century). A genus of plants of the family Compositæ, comprising about 16 species indigenous to Mexico, and the southern portions of the western United States. They are chiefly annuals which flower freely until fall. The numerous branches are each terminated by a single head of flowers. The best-known species is the garden zinnia (*Zinnia elegans*), with variously tinted single and double flowers. Other species sometimes cultivated are *Zinnia pauciflora,* with red-purple rays, and *Zinnia angustifolia,* with showy orange-colored flowers. They prefer deep, rich, loamy soils, and sunny situations.

ZINTGRAFF, tsĭnt'gräf, EUGEN (1858–97). A German African explorer. He was born at Düsseldorf, where he studied first law and afterwards natural science. In 1884 he accompanied an Austrian expedition to the Lower Congo, and in 1886 he headed an expedition sent by the German government to explore Kamerun in West Africa. He established the station of Barombi on Elephant Lake in 1888, and from there undertook a remarkable march to the Binue, crossing for the first time the forests which separate Kamerun from the interior, establishing the station of Baliburg, and arriving again at Barombi in January, 1890. After a short rest in Germany

he returned to Kamerun, where he carried out a successful attempt to regulate trade. In 1893–94 he traveled in Zanzibar, German and Portuguese East Africa, and the Transvaal.

ZINZENDORF, tsĭn'tsen-dôrf, NIKOLAUS LUDWIG, COUNT VON (1700–60). Founder of the reorganized Moravian Church or United Brethren. He was born at Dresden, May 26, 1700, and was educated by his grandmother. Spener, the head of the Pietists, was a frequent visitor at her house, and his conversation and the devotional exercises in which Zinzendorf took part influenced his character while a mere child. In 1710 he went to Halle, where he spent six years, under the special care of Francke, the philanthropist. (See FRANCKE, A. H.) In 1716 he was sent to Wittenberg, where pietism was in less repute than at Halle; but he adhered to his early religious impressions. From 1719 to 1721 he traveled through Holland and France, everywhere seeking those of religious sympathy with his views. On his return to Dresden he was appointed a member of the Saxon State Council. But political life was little to his mind, and he purchased an estate in Upper Lusatia, where he wished to build up a quietistic community. While residing there he accidentally met a wandering carpenter named Christian David, a member of the old sect of Moravian Brethren. David described the persecutions to which the sect was exposed, and Zinzendorf invited them to settle on his estate; the colony received the name of Herrnhut. In 1734 Zinzendorf went under a feigned name to Stralsund to pass an examination in theology, and was ordained a minister of the Lutheran Church. In 1736 he was banished from Saxony on a charge of introducing dangerous novelties in religion. He repaired to Holland, where he founded a Moravian colony, and afterwards to Esthonia and Livonia, where he also founded colonies. In 1737, at the request of King Frederick William I of Prussia, he was ordained bishop of the Moravians. In the same year he went to London, where he was received with much consideration by Wesley. In 1741 he went to North America, and founded the celebrated Moravian colony at Bethlehem, Pa. He labored earnestly to promote unity among the German settlers in the colony, but unsuccessfully. He returned to Europe in 1743, and for the next twelve years he traveled through Great Britain, Holland, Germany, and Livonia, but made Chelsea, England, his headquarters. In 1747 he was permitted to visit Herrnhut, and in 1755 to return there permanently. He died at Herrnhut May 9, 1760. Zinzendorf was the author of more than 100 works in verse and prose. His writings are often incoherent or mystical. His *Diary* was published in Herrnhut (1907). A good collection of his hymns is by Knapp (Stuttgart, 1845).

ZI'ON (Heb. *Ṣiyyōn*). The name of the acropolis of the Jebusites, taken by David, who made it his residence and strengthened and extended it (2 Sam. v. 6–9; 1 Chron. xi. 4–8). Christian tradition has located Zion upon the western and higher of the two hills on which Jerusalem is built, and this view is still adhered to by some scholars. But identification with the southern end of the eastern or temple hill, called the Ophel hill, agrees better with the natural conditions, the Old Testament references, and Jewish tradition, and excavations on this hill have made this view practically certain. In course of time the name Zion lost its narrower significance, and, in the prophets, often stands for Jerusalem, while "daughter of Zion" means the Jewish people. See JERUSALEM.

ZION CITY. A city in Lake Co., Ill., 42 miles north of Chicago, on the Chicago and Northwestern Railroad. There are manufactories of lace goods, electrical supplies, office supplies, candy, milling and baking supplies, and bricks. Pop., 1910, 4789.

ZIONISM. See ZIONIST MOVEMENT.

ZIONIST MOVEMENT. A movement which has for its object—to quote Dr. Theodore Herzl, the founder of modern Zionism—"the creation of a home secured by public rights for those Jews who cannot or will not be assimilated by the country of their adoption." It is in part a consequence of the anti-Semitic agitation. (See ANTI-SEMITISM.) The misery caused by the relentless policy of persecution adopted by Russia against a Jewish population now estimated at nearly 6,000,000 souls presents in itself a problem for which apparently the Zionists alone have proclaimed a comprehensive solution.

Ever since their dispersion faithful orthodox Jews have found consolation in the religious hope that the promises of the ancient prophets will finally be realized, that the Messiah will appear to lead the children of Israel back to the Holy Land of their fathers. The religious nature of this Messianic Zionism has, in fact, been the ground for strong opposition to the present movement on the part of those who, like Dr. Adler, late Chief Rabbi of England, have denounced it as an attempt to forestall Divine Providence.

The history of the Jews, however, shows that the Messianic faith was not incompatible with active attempts at repatriation. Thus Bar-Kokba (q.v.) (117–138 A.D.) based his all but successful revolt against the Romans on the Messianic prophecy, and was supported in his claims by the great Rabbi Akibah. At later periods a number of Pseudo-Messiahs were created by the restlessness or mysticism of their times, reacting upon the despair of the Jewish people. See MESSIAH.

The most remarkable of all the Pseudo-Messiahs was Sabbathai Zewi, whose self-proclamation at Smyrna (1660) threw the Jewish people into a state of hysteric excitement which long outlasted his downfall, and was not entirely allayed until the influence of Moses Mendelssohn (q.v.) a hundred years later turned Jewish hope into a new direction.

Under the influence of the Mendelssohnian

school, and the growing tendency towards toleration, the old Messianic mysticism gave way before the passion with which the Jews turned towards the acquisition of Occidental culture, in the hope of being permitted to become integral parts of the nations among which they lived. The new Jewish culture originating in this period developed, however, a new and broader race consciousness, and correspondingly an historical and sentimental interest in Palestine, which manifested itself in efforts at colonization by philanthropists such as Moses Montefiore and by associations such as the "Alliance Israélite Universelle," which efforts were encouraged by a number of British statesmen. After the Russian riots of 1881 and the enactment of the barbarous May Laws, a great impetus was given to the colonization movement by the formation of the international society Lovers of Zion (Chovevei Zion, Odessa, 1882), which, aided by the Rothschild family, and by Baron de Hirsch and his Jewish Colonial Association, succeeded to the extent that there were in Palestine 25 Jewish colonies by 1898 and 43 by 1915.

The planting of isolated colonies in Palestine failed to hold the general interest of the Jewish people. As a relief for the condition of the Eastern Jews, the colonies in Palestine and elsewhere are insignificant. The Mendelssohnian ideals of culture, too, had apparently failed as a solution of the vexed Jewish problem. Continental Judaism was in despair, when in the spring of 1896 there appeared from the pen of Dr. Theodore Herzl, a Viennese journalist and playwright, simultaneously in English, French, and German, a pamphlet entitled "The Jewish State." It was therein proposed that Palestine should be obtained from the Sultan of Turkey, the holy places made extraterritorial, and a Jewish autonomous state, the organization and government of which were set forth in detail, established under Turkish suzerainty and the guarantee of the Great Powers.

This was the beginning of the present Zionist movement. As a result of the profound sensation created by this pamphlet, the first Zionist Congress was held at Basel, Switzerland, in August, 1897, when 200 delegates represented Jews of all nationalities and all political and religious convictions. The political programme adopted at this congress, the basis upon which the movement now rests, begins as follows: "Zionism aims at establishing for the Jewish people a *publicly recognized* and *legally secured* home in Palestine." Among the means to be adopted for the attainment of this end, the programme specifies "the promotion of the settlement of Jewish agriculturists, artisans, and tradesmen in Palestine," and "preparatory steps for the attainment of those governmental grants which are necessary for the achievement of the Zionist purpose." Subsequent Zionist congresses were held in 1898 (when the Jewish Colonial Trust, the financial instrument of Zionism, was founded), in 1899, 1900, 1901, and thereafter biennially until 1913, all in Basel except those at London in 1900, The Hague in 1907, Hamburg in 1909, and Vienna in 1913.

Dr. Herzl, before his death in 1904, had a number of audiences with the Sultan of Turkey, who summoned him to Constantinople twice in 1902. Though sympathetically disposed, the Sultan did not offer such concessions as Dr. Herzl, standing firmly on the Basel platform, could accept. For a time, about 1908, Zionist leaders believed the Young Turk movement and proposals for larger autonomy for Turkish provinces promised success for their cause, but subsequent events showed a prevailing tendency towards stronger national control.

Before the 1903 congress an offer was made to the Zionists by the British government of a grant of land in British East Africa for the purpose of an autonomous Jewish settlement, under Jewish local administration and general British control. A committee appointed to investigate reported unfavorably to the seventh congress, which declared, "It [the congress] rejects either as an end or as a means all colonizing activities outside of Palestine and its adjacent lands." The element not accepting this principle formed, under the leadership of Israel Zangwill, the Jewish Territorial Organization. This investigated and rejected British grants in various places and now devotes itself to assisting Jewish immigrants to America.

The Zionist movement has aroused and continues to hold the devotion of a large part of the Jewish people. There are at present 500,000 paying members of the Zionist organization, which consists of more than 1000 constituent societies. The Federation of American Zionists, formed in 1898, reported (1915) the number of American Zionist societies as 412. The reformed clergy as a class and the great financiers have shown strong opposition to Zionism; on the other hand, many leaders of thought and literary men are prominently identified with the movement. The great war threw the active leadership of the movement into American hands. Direction was exerted by the Provisional Committee for General Zionist Affairs, with Louis D. Brandeis as chairman.

ZIRCON, zĕr'kŏn (from Ar. *zarkūn*, cinnabar, vermilion, from Pers. *zargūn*, golden, yellow, from *zar*, Skt. *hiranya*, gold + *gūn*, Av. *gaona*, color). A mineral zirconium silicate crystallized in the tetragonal system. It is yellowish to brown in color, frequently ranging to shades of violet-gray, and is met with in crystalline rocks, especially granular limestone, various schists, gneiss, syenite, and granite. It is found

in the alluvial sands in Ceylon, in the Ural, and in various localities in Norway, Bohemia, France, Italy, and elsewhere in Europe; also in Australia. In the United States it occurs in Maine, New York, New Jersey, Pennsylvania, and largely in North Carolina, Colorado, and California. The mineral finds use in the manufacture of the incandescent mantles of Welsbach burners. The transparent varieties, especially those from Ceylon, are cut into gems and are called variously jargon or jargoon, jacinth, or true hyacinth.

ZIRCO'NIUM (Neo-Lat., from *zircon*). A metallic element found as a new earth in the mineral zircon by Klaproth in 1789, and first obtained in the impure metallic state by Berzelius in 1824. It occurs in combination with silica in the mineral zircon, and also in certain rarer minerals, including eudialyte, fergusonite, and polymignite. The impure metal, contaminated with oxide or carbide, is obtained by reducing the silicate with carbon in an electric furnace. The amorphous form is obtained by heating potassium zirconifluoride with sodium under fused potassium chloride in an iron vessel. When 97–98 per cent metal is rolled into rods which serve as terminals of an electric arc in an atmosphere of hydrogen under reduced pressure, fusion takes place, yielding a product of 99.8 per cent purity. Zirconium is also produced by reducing zirconia with metallic calcium.

Zirconium (symbol Zr; atomic weight, 90.6) is either a black amorphous powder or a lustrous gray brittle crystallized solid. The crystallized variety has a specific gravity of 6.40; its melting point is above 1300° C. (2372° F.) and resembles white cast iron. The amorphous variety readily combines with oxygen at ordinary temperatures to form the dioxide known as zirconia, while the crystalline type requires a white heat to effect the same combination. Zirconia, ZrO_2, is a white tasteless powder that has been used instead of lime in the oxyhydrogen flame, and with thoria, yttria, and other rare earths for the mantle of the Welsbach burner and the Nernst lamp. The oxide combines with strong bases to form zirconates.

ZIRKEL, tsĭr'kel, FERDINAND (1838–1912). A German mineralogist, born at Bonn. He was at first interested in mining, visited Iceland in company with Preyer in 1860, and after being employed for two years in the Geological Institution at Vienna, became professor, successively at the universities of Lemberg (1863), Kiel (1868), and Leipzig (1870), where he was also made director of the Mineralogical Museum. He traveled for study in France, Italy, and Scotland; came to America in 1874 to examine the great collections of minerals made during the exploration of the fortieth degree of latitude, and in 1894–95 pursued scientific investigations in Ceylon and India. He retired in 1909 and lived thereafter at Bonn. His more extensive writings include: *Reise nach Island im Sommer 1860* (with Preyer, 1862); *Lehrbuch der Petrographie* (1866; 2d ed., 1893–95); *Die mikroskopische Beschaffenheit der Mineralien und Gesteine* (1873); "Microscopical Petrography," in *Report of the United States Geological Exploration of the Fortieth Parallel* (1876); and *Ueber Urausscheidungen rheinischer Basalte* (1893). After the death of Naumann he edited the new issues of his *Elemente der Mineralogie* (14th ed., 1901).

ZIRKNITZER SEE, tsĭrk'nĭts-ĕr zā, or **CZIRKNITZER SEE.** A small lake in Carniola, Austria-Hungary, 28 miles east-northeast of Triest. It lies in a depression of the limestone plateau known as the Karst (q.v.), where distinct valley systems are wanting, the drainage being subterranean. The lake, which ordinarily has an area of 10 square miles and a mean depth of 20 feet, communicates through openings with subterranean reservoirs or caverns, some of which are in hills above the lake level. In autumn, when the rainfall is slight, the lake is completely drained into the reservoirs lying below its level, and its bed is speedily covered with rich herbage. With returning heavy rains the surrounding higher reservoirs are filled and discharge suddenly through the subterranean passages into the lake, so that the latter rapidly regains its volume and may even inundate the country. These changes are, however, very irregular. Sometimes the lake does not disappear for several years; once (1834–35) it remained dry over a year. It is rich in fish, which disappear and return with the water.

ZISKA, zĭs'kà, Boh. **ZIŽKA,** zhĭzh'kà, JOHN (c.1378–1424). A famous leader of the Hussites. He was born at Trocnoy, near Budweis, Bohemia. He became a page to King Wenceslas of Bohemia, and spent his youth at Prague. In 1410 he took part as a volunteer on the side of the Teutonic Knights in the great battle of Tannenberg. Later he fought against the Turks and at the battle of Agincourt. Returning to Bohemia, soon after the burning of John Huss, he became prominent among the leaders of the Hussites. In 1419 the Hussites took up arms against the Emperor Sigismund, and Ziska displayed extraordinary activity in organizing their forces, soon becoming leader. He built a mountain stronghold which he named Tabor, whence the extreme party among the Hussites took the name of Taborites (q.v.). In 1420 he took up a strong position near Prague on an eminence since known as the Zizkaberg, and with a few thousand men beat off an army of 30,000 (July 14). On November 1 he won a victory over the Emperor Sigismund and again on Jan. 8, 1422, he was victorious at Deutschbrod. His course was everywhere marked by the destruction of monasteries, the burning of priests' houses, and the introduction of the communion with both elements. (See UTRAQUISTS.) As the leader of the Taborites, Ziska waged a relentless war against the section of the Hussites known as the Calixtines. In 1424 it is said that Sigismund proposed an arrangement with the Hussites, by which full religious liberty was to be allowed and Ziska, who had an interview with the Emperor on the footing of an independent chief, was to be appointed Governor of Bohemia and her dependencies, but if this is true, the war-worn old chief did not live long enough to complete the treaty, for while besieging the castle of Přibyslav he was seized with the plague, and died Oct. 11, 1424. He was buried in a church at Czaslav, and his iron war club was hung up over his tomb. From early boyhood Ziska had been blind in one eye and he lost his other eye in 1421. As he has become a popular hero, it is difficult in many parts of his life to separate fact from fiction. Meissner was the author of an epic poem on Ziska which had more than a dozen editions; and George Sand wrote a prose *Life.* Consult W. W. Tomek, *Johann Ziska* (Ger. ed., Prague, 1882).

ZITELMANN, tsĭt'el-män, KONRAD (1854–97). A German poet and novelist who wrote under the pseudonym of Konrad Telmann. He was born at Stettin, and studied law and political science at the universities of Leipzig, Heidelberg, Berlin, and Greifswald. After 1878 he lived in Mentone and Rome, devoted to literary pursuits. He possessed a strong lyric and narrative gift. His works (about 80 vols.) include: *In der Einsamkeit* (1876), *Meereswellen* (1884), and *Aus der Fremde* (1889), volumes of verse; *In Pommern* (1875), *Lichter und Schatten* (1884), *Sphinx und andere Novellen* (1886), *Dissonanzen und Accorde* (1888), collections of short stories; and *Götter und Götzen* (1884), *Moderne Ideale* (1886), *Dunkle Existenzen* (1886), *Vom Stamm der Ikariden* (1891), *Lucretia* (1896), *Gottbegnadet* (1897), etc., novels. *Unter dem Strohdach* (1892) is his best novel, while *Margarete* (1875), *Lebensfragmente* (1884), and *Auf der Sireneninsel* (1890) are among his best stories.

ZITH'ER (Ger. *Zither, Cither,* OHG. *zitera, cithar,* from Lat. *cithara,* from Gk. κιθάρα, *kithara,* lyre). A musical instrument, the modern representative of the ancient *cithara* (q.v.). In its modern form it is derived from a peasant instrument of the German Alps. It is a flat, stringed instrument, with a shallow resonance box, provided with a sound hole and 36 or more strings. On the side nearest the player is a fretted fingerboard, while near the right end is a low bridge. Above the fingerboard are five melody strings made of metal and tuned: a', a', d', g, c. These are stopped with the left hand and plucked by means of a ring with a projecting spur, worn on the thumb of the right hand. The accompaniment strings, tuned in fourths, are made of gut or silk and are plucked by the first three fingers of the right hand.

ZITTAU, tsĭt'tou (Slav. *Zitawa*). A town of the Kingdom of Saxony, 49 miles southeast of Dresden, near the Bohemian frontier, on the left bank of the Mandau, near its confluence with the Neisse (Map: Germany, F 3). The town has the notable Byzantine church of St. John, finished in 1837; a splendid courthouse, one of the finest in Saxony, finished in 1845; and a good library, in conjunction with a museum. Zittau is the centre of the linen and damask manufacture of Saxony. There are bleach fields, dye works, and paper, oil, and saw mills, and there are manufactures of machinery, bicycles, woolens, felt goods, window shades, chemicals, and wooden wares. The town also possesses valuable forests which yield a large revenue. Pop., 1910, 37,084.

ZITTEL, tsĭt'el, KARL ALFRED VON (1839–1904). A German geologist and paleontologist, born at Bahlingen, Baden. After studying at Heidelberg and in Paris, he was employed by the Geological Institution in Vienna, qualified there as docent at the university in 1863, and in the same year became professor of mineralogy at the Polytechnic School in Karlsruhe, whence he was called to the chair of paleontology at Munich in 1866. He took part in Rohlfs's expedition to Egypt and the Libyan desert in 1873–74. His publications comprise: *Paläontologische Studien über die Grenzschichten der Jura- und Kreideformation* (2 vols., 1868–70); *Aus der Urzeit: Bilder aus der Schöpfungsgeschichte* (1872; 2d ed., 1875); *Handbuch der Paläontologie* (4 vols., 1876–93), with Schimper and Schenk, an important work on this branch of science; *Beiträge zur Geologie und Paläontologie der Libyschen Wüste* (1883); *Die Sahara* (1883); *Geschichte der Geologie und Paläontologie bis Ende des 19. Jahrhunderts* (1899). In 1899 he was made president of the Bavarian Academy of Sciences and head custodian of the scientific collections of Bavaria.

ZITUNI (*Mod. Gk. pron.* zĭ-tē'nĭ). See LAMIA.

ZIŽKA, JOHN. See ZISKA.

ZIZKOW, zhēzh'kŏf. A town of Bohemia, Austria, an eastern suburb of Prague. It has manufactories of matches, metal goods, and ammunition. Pop., 1900, 59,326; 1910, 72,173. Zizkow was made a separate town in 1898.

ZLATOPOL, zlä'tŏ-pŏl. A town in the Government of Kiev, South Russia, about 50 miles southwest of Tcherkasy. It manufactures flour. Pop., 1910, over 12,000.

ZLATOUST, zlä'tŏ-ụst'. A district town in the Government of Ufa, East Russia, situated in the Ural Mountains, 270 miles northeast of Ufa (Map: Russia, J 3). It lies in an extensive mining region and has large crown works for the manufacture of guns and ammunition. Pop., 1910, 34,245.

ZMAJ, zmäj. See JOVANOVIC.

ZNAIM, tsnīm. A town of Moravia, Austria, on the Thaya, 48 miles north-northwest of Vienna (Map: Austria, E 2). The town contains an old castle of the margraves of Moravia. There are manufactures of pottery and textiles. Pop., 1900, 16,261; 1910, 18,835. At Znaim an armistice was concluded between the Austrians and the French after the battle of Wagram (1809), leading to the Treaty of Schönbrunn.

ZO'AN. The Hebrew name of the Egyptian city of Tanis (q.v.).

ZO'AR (Heb. *ṣō'ar*). One of the ancient cities of Palestine. In Gen. xiv. 2, 8 the present text reads: "The King of Bela, which is Zoar," and it has, therefore, been supposed that Bela was its original name. But it is probable that the text originally read: "Bela, the King of Zoar." According to the narrative in the fourteenth chapter of Genesis, it was attacked in the expedition of the four kings against five. (See AMRAPHEL.) It was one of the five "cities of the plain," and, with the others, was doomed to destruction, but was spared, at Lot's intercession, to afford him a refuge (Gen. xix.). In the account of the death of Moses it is mentioned as visible from Pisgah (Deut. xxxiv. 3). In Isaiah and Jeremiah it appears as a town of Moab (Isa. xv. 5; Jer. xlviii. 34). Zoar probably lay in the vicinity of the other four cities at the southern end of the Dead Sea, but its exact location is unknown. Eusebius and Jerome describe a place Zoara, at the south end of the Dead Sea, as a Roman garrison with many inhabitants. Stephen of Byzantium calls it a large village and fortress, and it is subsequently spoken of as the see of a bishop. It is given on the Madeba map (sixth century) southeast of the Dead Sea. The Crusaders found it under the name Segor, and describe it as pleasantly situated and having many palm trees. Abulfeda, the Arabic historian, also makes frequent mention of a place Zoara, adjacent to the Dead Sea. Consult Peter Thomsen, *Loca Sancta* (Halle, 1907); G. A. Smith, *Historical Geography of the Holy Land* (16th ed., London, 1910). Thomsen and others have identified it with *Hirbet* and *Kal'at el Safiye,* but this is doubtful. See SODOM AND GOMORRAH.

ZOAR COMMUNITY. A communistic so-

ciety established in America by a colony of Germans calling themselves Separatists. It was originally composed of about 400 members, who had suffered persecution in Württemberg as dissenters from the Established church, and who in 1817 emigrated to America, where they were kindly received by the Quakers of Philadelphia, who aided them in effecting a settlement in Tuscarawas Co., Ohio. The Separatist emigration had been primarily for the purpose of securing religious liberty. The idea of establishing a commune was not entertained until after the settlement in Ohio. Early in 1819 articles of agreement for a community of goods were signed. During the earlier years of the life of the society many new members were added from Württemberg; the community attained its greatest number of members, some 500, about 1832. About 1885 they owned over 7000 acres of land, a few shops and factories, and property valued at about $1,000,000, and carried on a considerable commerce with the outside world. The growth and prosperity of the society was, however, largely due to the ability and shrewdness of its leader, Joseph Michael Bäumeler (q.v.). Decline had begun with his death in 1837. In 1898 the question of dissolution was formally discussed, and on March 10 a decision was reached binding all to a division of the property among the 222 members. This act of distribution abolished the communistic feature of the society, but the municipal incorporation of the Society of Zoar remains intact. The cause of the dissolution was the growth among the younger members of a desire for individual ownership. Consult Charles Nordhoff, *The Communistic Societies of the United States* (New York, 1875), and W. A. Hinds, *American Communities and Coöperative Colonies* (2d ed., Chicago, 1908).

ZOBEIR, zō-bār′, or **ZUBAIR,** zu-bār′, IBN AL 'AWAM. Cousin of Mohammed, and one of the earliest converts to Islam. He belonged to the 10 of whom Mohammed predicted that they would surely enter the garden of Allah, the other nine being Abu Bekr, Omar, Othman, Ali, Talha, Abdu'l Rahman, Sa'd ibn Abu Wakkas, Sa'id ibn Zaid, and Abu Obaidah ibn Jarrah. On the death of the prophet Zubair and Talha favored Ali, but through Omar's influence Abu Bekr was chosen. After Omar had been mortally wounded by the Christian assassin Firduz, he appointed Zubair as one of a council of six to elect a successor. He supported Ali during Othman's reign, but after the murder of Othman, he sided with Talha and Ayesha in attacking Ali. He fell in the "battle of the camel," so called because the struggle was fiercest around Ayesha's camel, on the 9th of December, 656; and his tomb is still shown 2 miles from the present Basra (q.v.), probably where the old city stood. His son Abdallah was a rival of the Umayyads, and was recognized for a while as a caliph by a large part of the Moslem world. See ABDALLAH IBN ZUBAIR. Consult Julius Wellhausen, *Das arabische Reich* (Berlin, 1902), and C. I. Huart, *Histoire des Arabes* (Paris, 1912).

ZOBEIR RAHAMA, zō-bār′ rä-hä′mä (1830–). An Egyptian pasha. In 1860 he had become one of the leading Arab ivory and slave traders on the White Nile and in the Bahr el Ghazal, in which territory he gathered about him a large army of blacks and practically ruled the country. He defeated an expedition sent in 1869 to the Bahr el Ghazal, and was himself made Governor of that district. For conquering Darfur in 1874 he was made a pasha, but when he went to Cairo in 1876 he was prevented from returning. Later he offered to restore order in the Sudan, and in 1884 General Gordon urged that he be sent back, as his successor, to stop the Mahdist movement. After the reconquest of the Sudan he was permitted to return in 1899.

ZO'BO (Tibetan *mdzopo*, male of the *mdzo*, zobo). A hybrid between the yak (q.v.) and the humped cattle (q.v.) of India. It is not unlike an English ox. It is common in the western parts of the Himalaya, and is valued as a beast of burden, as well as for its milk and its flesh.

ZO'DIAC (OF. *zodiac, zodiaque*, Fr. *zodiaque*, from Lat. *zodiacus*, from Gk. *ζωδιακός, zōdiakos*, zodiac, relating to animals, from *ζῴδιον, zōdion*, dimin. of *ζῷον, zōon*, animal, from *ζῆν, zēn*, to live; so called because the constellations were figured as animals). The name given by the ancients to an imaginary band extending round the celestial sphere, having as its middle line the ecliptic or apparent path of the sun. It was fixed at about 16° in width so as to include the orbits of the sun and of the five planets (Mercury, Venus, Mars, Jupiter, and Saturn) which were then known; and as, of these planets, Mercury has by far the greatest inclination of orbit to the ecliptic, and the value of that element in his case is only 7°, the width given to the zodiac was amply sufficient for the required purpose. But when the era of planetary discovery commenced in the beginning of the nineteenth century, the first three which were discovered (Ceres, Pallas, and Juno) at once destroyed the idea which had been long seated in men's minds, that no planets existed beyond the limits of the zodiac, by exhibiting orbits inclined to the ecliptic at no less angles than 11°, 35°, and 13°; and a large number since observed have been found to wander beyond the zodiac, from which circumstance they have, along with the three above mentioned, been denominated ultra-zodiacal planets.

The stars in the zodiac were grouped into 12 constellations, to each of which 30°, or $\frac{1}{12}$th of the whole circle, was assigned, though it often did not fill up that space, but was only situated in it; and this equable division into signs was of great advantage in defining the positions of the sun and planets at any epoch.

The constellations, with the appropriate symbols of the corresponding signs, are as follows:

Aries (*Ram*) ♈	Libra (*Balance*) ♎
Taurus (*Bull*) ♉	Scorpio (*Scorpion*) ♏
Gemini (*Twins*) ♊	Sagittarius (*Archer*) ♐
Cancer (*Crab*) ♋	Capricornus (*Goat*) ♑
Leo (*Lion*) ♌	Aquarius (*Water-bearer*) ♒
Virgo (*Virgin*) ♍	Pisces (*Fishes*) ♓

As one half of the ecliptic is to the north, and the other to the south of the celestial equator, the line of intersection of their planes is a diameter of each, and the two points in which this line meets the celestial sphere are known as the equinoctial (q.v.) points. The comparative immobility, with respect to the ecliptic, of these points, suggested at once the employment of one or other of them as a point from which to reckon celestial measurements of stars' positions, and accordingly that point at which the sun crosses the equinoctial from south to north was fixed upon, and called the first point (or commencement) of Aries (q.v.). After the sun had advanced eastward through this sign—i.e., 30° along the ecliptic—he entered the sign of Taurus, continuing his course onward through the others

in the order in which they are given above, again crossing the equinoctial southward at the point where he emerged from Virgo and entered Libra. This was the case with the sun during the time of Hipparchus (q.v.), but though the equinoctial points move very slowly, yet they do so with great uniformity, and the westerly motion of 50″ annually which they describe along the ecliptic has at the present time separated the sign Aries from the constellation Aries, and caused the former to correspond almost to the constellation Pisces. This gradual retrogression of the signs through the constellations of the zodiac will continue till they accomplish, in about 25,800 years, a complete circuit; after which period the sign and constellation of Aries will again coincide, as they did in the time of Hipparchus. The zodiac and its constellations afford merely a convenient mode of reference to the positions of the stars.

The zodiac is probably Babylonian in origin. The figures seem to have been based on the resemblance of the lines connecting the stars in the zodiacal constellations to certain pictorial outlines which form the substratum of the Assyro-Babylonian cuneiform alphabets (see CUNEIFORM INSCRIPTIONS), while animal figures and outlines were chosen for animistic reasons. The greater number of the modern zodiacal constellations are identical with the Babylonian, although two or three seem to be of Occidental origin. The signs of the zodiac were carried from Babylonia to Greece, whence they spread throughout the ancient civilized world, and found their way back, along with much other astronomical science, to India and the Far East. Consult: P. Jensen, *Die Kosmologie der Babylonier* (Strassburg, 1890); Morris Jastrow, *Religion of Babylonia and Assyria* (Boston, 1898); E. M. Plunket, *Ancient Calendars and Constellations* (London, 1903).

ZODI'ACAL LIGHT. A faint luminosity extending outward from both sides of the sun along the ecliptic. It is visible only after sunset or before sunrise. It is easily seen to reach 90° or 100° from the sun; and in favorable circumstances of observation in the tropics it has been recorded as encircling the sky completely. Where this latter observation has been made, a particularly bright spot has been noticed in the zodiacal light, located directly opposite the sun's position below the horizon. This bright spot is called by the German name *Gegenschein*, or counterglow, from its being opposite the sun.

No thoroughly satisfactory explanation has yet been found for this rather puzzling phenomenon. Some think it merely a very extended outer envelope of the sun, inclosing the corona (q.v.) and extending very far beyond it into space. A more plausible theory supposes the whole thing to be caused by a ring of small particles revolving about the sun nearly in the ecliptic plane. Such a ring would have an analogue in Saturn's ring, and in the zone of planetoids (q.v.). And solar light reflected from the countless particles of the ring would give the faint luminosity both of the zodiacal light and the *Gegenschein*. But the theory of this phenomenon is still debatable.

ZO'Ë (Lat., from Gk. Ζωή) (c.978–1050). A Byzantine empress, the last of the Macedonian dynasty. She was the daughter of Constantine VIII, by whom she was married to the patrician Romanus Argyrus. The latter came to the throne in 1028, but was assassinated by Zoë and her favorite chamberlain, Michael the Paphlagonian (1034). The Empress thereupon married her accomplice, who reigned as Michael IV until 1041. After his death the Empress elevated to the throne his nephew, Michael V, but was imprisoned by the latter. Released with her sister in 1042, Zoë deposed and blinded the young Michael. She then, after sharing the throne for a few months with her sister Theodora, gave the Imperial power to a third husband, Constantine IX Monomachus. Consult Edward Gibbon, *Decline and Fall of the Roman Empire*, edited by J. B. Bury, vol. v (London, 1912).

ZOËGA, tsō-ā'gà, GEORG (JÖRGEN) (1755–1809). A Danish archæologist and numismatist, born at Daler, in Jutland. He studied at the University of Göttingen, and after teaching and traveling in Italy became a Catholic in 1783, and settled at Rome, where he was appointed Danish Consul General in 1798, and died in 1809. His studies of coins and manuscripts were of great value. His publications include: *Nummi Ægyptii Imperatorii* (1787); *De Origine et Usu Obeliscorum* (1797); a work in Italian, *I bassirilievi antichi di Roma* (2 vols., 1808); and the notable *Catalogus Codicum Copticorum Manuscriptorum* (1810), which was his greatest work. Consult F. G. Welcker, *Zoëgas Leben* (2 vols., Stuttgart, 1819); A. D. Jörgensen, *Georg Zoëga* (Copenhagen, 1881).

ZOËTROPE, zō'ē-trōp (from Gk. ζωή, *zōē*, life + τρόπος, *tropos*, a turning). An optical instrument most often seen in the form of a toy, to exhibit pictures with the appearance of motion. See KINETOSCOPE; MOVING PICTURES, and for illustration, Fig. 10 under ILLUSION. See also STROBOSCOPE.

ZOILUS, zō'ĭ-lŭs (Lat., from Gk. Ζώϊλος). A Greek rhetorician, born at Amphipolis, in the third century B.C. On account of the severity with which he assailed the fabulous element in Homer, he was called Ὁμηρομάστιξ (Homer's Scourge). Dionysius of Halicarnassus, however, ranks him among the best critics. None of his works is extant. Consult Spindler, *De Zoilo Homeromastige qui Vocatur* (1888–89); U. Friedländer, *De Zoilo Aliisque Homeri Obtrectatoribus* (Königsberg, 1895); J. E. Sandys, *A History of Classical Scholarship*, vol. i (2d ed., Cambridge, 1906).

ZOISITE (named in honor of Baron von Zois, the discoverer of the mineral). A mineral hydrated silicate of aluminium and calcium crystallized in the orthorhombic system. It has a vitreous or pearly lustre, and is gray to brown, and sometimes green or red in color. It occurs chiefly in crystalline schists, especially those containing the amphiboles, and also in granite. It is found in Norway, Scotland, Austria, Saxony, Switzerland, and in the United States. A rose-red variety, sometimes used for ornamental purposes, is found in Norway, and is called thulite, after Thule, an ancient name for Norway.

ZOLA, zō'là', EMILE (1840–1902). A French naturalistic novelist, born in Paris, April 2, 1840. His father was a Venetian with Greek blood in his veins. Zola studied at the Lycée Saint-Louis, but after twice failing to get his bachelor's degree, he entered in 1862 the publishing house of Hachette in Paris, and began to write for the newspapers. He had written a number of novels and tales, his first book being the *Comtes à Ninon* (1864), when in 1869 he undertook to relate in a series of connected volumes what he called the "Physiological His-

tory of a Family under the Second Empire." To this family he gave the name of Rougon-Macquart. The first novel of the series, *La fortune des Rougon*, was not published until 1871, after the fall of the Empire. Other novels of the series, *La curée* (1870), *Le ventre de Paris* (1873), *La conquête de Plassans* (1874), *La faute de l'Abbé Mouret* (1875), and *Son Excellence Eugène Rougon* (1876), succeeded each other until 1876 without arousing much attention. But the seventh novel of the series, *L'Assommoir* (1878), achieved instantaneous success. It was a powerful picture of life among the working class of Paris and of the evil effects of alcoholism.

Zola's pictures were realistic beyond anything hitherto known in French literature. The ugly side of life was presented with fullness and a boldness of vocabulary from which French masters of realism had always shrunk. Zola was attacked as well as praised. In defending himself he claimed to have ushered in a new literary school, which he called naturalistic. His novels were described by him and the followers whom he soon gathered about him as documents intended to give to the public a complete picture of French contemporary society. The success of *L'Assommoir* was repeated in 1880 by *Nana*, and later by several other novels of the series, notably by *Germinal* (1885). The whole series consisted of 20 volumes, the last two of which, *La débâcle*, dealing with the unreadiness of France for the Franco-German War, and *Le Docteur Pascal*, were published in 1892 and 1893.

This series contains Zola's most remarkable productions. It is very uneven; it must be admitted that some of the volumes, *Pot-Bouille* (1882), e.g., which claims to be a picture of the life of the middle class, present hardly anything that is not nauseating and at the same time tedious. Others, *Germinal*, *La terre* (1887), *La bête humaine* (1890), *L'Argent* (1891), *La débâcle* (1892), are works of power. Not one of these is free from features known as objectionable. Passages which seem to be quite unnecessary to the development of the story would indicate that Zola took pleasure in introducing descriptions no other writer would have dared attempt. While presenting to the public the productions of his creative imagination, Zola considered it his duty to develop his literary theories and to attack those of his opponents; this was done in a number of volumes of literary criticism, the most important of which were *Le roman expérimental* (1880) and *Les romanciers naturalistes* (1881), so that it is not very difficult, through a comparison of his theoretical utterances with his practical performances, to see whether Zola achieved exactly what he claimed to do. The enemy against which he directed his sharpest attack is romanticism; the intellectual faculty he seems most to descant against is imagination; and yet any one who analyzes the literary elements of his style, and carefully examines the successive events in the development of his plots, is led to the conclusion that Zola never entirely shook off the influence of the romantic school, and especially of its master, Victor Hugo. He was himself carried away by his creative imagination more often than he kept it under control.

After concluding the series of the Rougon-Macquart, Zola undertook successively two new series: the Three Cities, *Lourdes*, *Rome*, *Paris*, published between 1894 and 1898, and finally the Four Gospels, *Fécondité* (1899), *Travail* (1900), *Vérité* (1902), and *Justice*. *Justice* remained unfinished at his death. Zola was ambitious also of winning success on the stage, but this ambition was not fully gratified.

Had Zola died before the year 1898, he would be remembered solely as a literary character. The date which marks the beginning of his career as a public man is that of the letter to President Faure by which he threw himself into the thickest of the fight connected with Alfred Dreyfus (q.v.). Zola was convinced not only that Dreyfus had been unjustly sentenced, but also that the methods employed to secure his conviction and to shield others, whom Zola considered the real criminals, constituted in themselves crimes deserving of the highest punishment. His letter of January 13, known by the title "J'Accuse . . ." (I accuse), words which were repeated a number of times in the body of the letter, denounced these acts and called for their speedy and exemplary punishment. He at the same time dared the French government to prosecute him. Prosecution was begun, however, and his trial by jury in Paris lasted from February 7 to Feb. 23, 1898. Zola was convicted of libeling the military authorities, and sentence was passed upon him imposing a fine of 5000 francs and six months' imprisonment. Zola appealed to the Court of Cassation, which on April 2 quashed the proceedings and ordered a new trial. This new trial took place at Versailles in July, and Zola was again condemned, but meanwhile he fled to England, where he remained hidden till June 4, 1899, writing *Fécondité*. A few months later, a bill granting amnesty to all offenders connected with the Dreyfus case having been brought forward by the Waldeck-Rousseau cabinet and passed by the two houses, Zola, who had kept up his fight, returned to France, where he was received by his friends and admirers as one of the greatest and most eloquent defenders of human rights. On Sept. 29, 1902, Zola was suffocated by gas from a defective flue. He received a public funeral. His remains were transferred, with great pomp, to the Pantheon in 1908. Most of Zola's works can be had in an excellent English translation by Vizetelly.

ZÖLLNER, tsĕl'nĕr, HEINRICH (1854–). A German composer and musical conductor, born at Leipzig, son of Karl Friedrich Zöllner. He studied jurisprudence and from 1875 music at the Leipzig Conservatory under Reinecke, Jadassohn, Richter, and Wenzel. In 1878 he became musical director at the University of Dorpat, and in 1885 was appointed conductor of the Cologne Männergesangverein, the Wagner-Verein,

and the Musical Society. With a picked male chorus, in 1889, he made a most successful tour through the principal cities of Italy. In 1890 he was elected conductor of the New York Deutscher Liederkranz. He accepted a call to Leipzig in 1898 to succeed Kretzschmar as musical director of the Paulinerchor, a university male choral union. In 1907 he went to Berlin as professor at Stern's Conservatory, and in 1908 to Antwerp as conductor of the Flemish opera. His works include the operas *Frithjof* (1884), *Faust* (after Goethe, 1887), the "Kriegsduologie" *Im Jahre 1870*, consisting of two two-act operas, *Bei Sedan* (1895) and *Der Ueberfall* (1895); the musical comedy *Das hölzerne Schwert* (1897); *Die versunkene Glocke* (1899); and *Der Schützenkönig* (1902); *Zigeuner* (1912). His choral works are *Die Hunnenschlacht* (1880); *Das Fest der Rebenblüte; Columbus; Hymnus der Liebe; Heldenrequiem*, for soprano solo, male chorus, and orchestra; the cantata *Die neue Welt*, which won the international prize at Cleveland, Ohio, in 1892; and a symphony.

ZÖLLNER, JOHANN KARL FRIEDRICH (1834–82). A German astronomer and physicist, born in Berlin. He studied at the universities of Berlin and Basel, and became in 1866 assistant professor and in 1872 professor of physical astronomy in Leipzig. In 1872 Zöllner developed the theory that comets are not incandescent through heat, but glowing with electricity. He also made observations in regard to the solar constitution, and was one of the first with Huggins to apply the open-slit method to the study of solar prominences (1869). In 1870 he made observations for determining the solar temperature by investigating the intensity of the solar radiations at their source. He also made photometric observations of the Mercurian phases, determined the albedo (reflective capacity) of several of the planets, and observed their thermal conditions. He wrote: *Grundzüge einer allgemeinen Photometrie des Himmels* (1861); *Photometrische Untersuchungen* (1865); *Ueber die Natur der Kometen* (1871; 3d ed., 1883); *Prinzipien einer electrodynamischen Theorie der Materie* (1876); *Wissenschaftliche Abhandlungen* (4 vols., 1878–82). He also edited Schuster's *Gibt es unbewusste und vererbte Vorstellungen?* (1879). In the latter part of his life he also turned his attention to spiritualistic and hypnotic studies. For his astronomical discoveries, consult F. Körber, *Karl Friedrich Zöllner* (Berlin, 1899), and A. M. Clerke, *History of Astronomy during the Nineteenth Century* (London, 1908).

ZÖLLNER, KARL FRIEDRICH (1800–60). A German composer, born at Mittelhausen, Thuringia. He studied music under Schicht at the Thomasschule in Leipzig, became an instructor of vocal music at the Ratsfreischule in 1820, and two years later established a musical institute with his friend Hemleben. In 1833 he founded the Zöllner-Verein, a male chorus society. In 1859, 30 of these societies held a grand musical festival at Leipzig, and after his death united and formed the Zöllner-Bund. In 1868 a monument was erected to his memory in the Rosenthal, Leipzig. He deserves to be especially remembered for his compositions for male chorus, but his works include motets, songs for mixed chorus, and songs with piano accompaniment.

ZOLLVEREIN, tsôl'fĕr-ĭn' (Ger., customs union). Any customs union between several countries, for the purpose of establishing uniform customs tariffs between imports to and exports from the countries within the union and countries outside, while duties between the several contracting countries are reduced below the usual rate or abolished altogether. The term as generally used has reference to the German Zollverein, which was initiated in 1818 and culminated in 1871 in the general customs union of the new German Empire.

The necessity of meeting English competition in manufacture induced Prussia to take the lead in a movement to suppress the burdensome tariffs between the German states. By the law of May 26, 1818, Prussia abolished all internal customs, and enacted a general tariff, to be levied only at the boundaries of the kingdom. On Jan. 18, 1828, Bavaria and Württemberg agreed to adopt a single tariff system, and to divide the net proceeds of the duties in proportion to their respective populations. A little later, Feb. 14, 1828, Prussia and Hesse-Darmstadt entered into a union based on the same principle. On Sept. 24, 1828, the Middle German Handelsverein was formed by Saxony, the Saxon duchies, Hesse-Cassel, Brunswick, Oldenburg, the minor Thuringian states, Hanover, Bremen, and Frankfort, for the purpose of preventing the union of the two former. This Middle German Union differed greatly from the two other unions, in that it allowed each of the contracting states to levy such import duties as it chose, except on some enumerated articles which were admitted free.

This movement suggested to Prussia the bold plan of uniting the three unions of the south, north, and middle into a single German Zollverein. On May 27, 1829, a commercial treaty was effected between the North German and the South German unions. Each granted to the other mutual free trade for products of the several states, a uniform duty of 25 per cent on certain manufactured articles, and it was agreed that there should be a gradual approximation of both systems of duties. On the 22d of March, 1833, the union of the North and the union of the South adopted a system of complete customs and commercial union, which was to go into effect Jan. 1, 1834, for a period of eight years, and might be renewed every 12 years, unless denounced by either party to the agreement. Saxony and the states of Thuringia united in 1833 into a Zollverein having a common tariff of export, import, and transit, and establishing free trade between the contracting states except for certain enumerated articles.

In 1834 Hanover, which had taken an active part in the formation of the union of the Middle German states with Brunswick, Oldenburg, and some other states, organized a rival association to the Prussian Zollverein under the name of the Steuerverein, which fixed duties much lower than those of the Zollverein. The rivalry of the Steuerverein did not check the growth of the Zollverein. In 1835 Baden and Nassau came into the union; in 1836, Frankfort; in 1841, Brunswick, which seceded from the Steuerverein; and in 1842, Luxemburg. The Zollverein concluded treaties during these years with England, Holland, and Belgium.

Austria has consistently opposed the increasing power of Prussia by trying to block every commercial union proposed by the latter Power. Prussia on its part wished to exclude Austria

from any part in the proposed all-German Zollverein to be formed by the union of the Zollverein and the Steuerverein. Several states became dissatisfied with the attitude of Prussia, and at length Bavaria, Saxony, Württemberg, and Baden made the ratification of the treaty between the Zollverein and the Steuerverein contingent upon the admittance of Austria into the new customs federation. After much negotiation, during which Austria threatened to form a rival union with the states of the South, Prussia was induced to sign on the part of the Zollverein a treaty granting certain commercial concessions to Austria. This treaty was to go into effect Jan. 1, 1854, for 12 years.

In 1861 a new difficulty arose when France proposed to the Zollverein complete reciprocity and freedom of transit, freedom from export duties, and treatment as the most favored nation. Prussia alone conducted the negotiations, without consulting the other states of the Zollverein. On March 29, 1862, Prussia signed the convention with France, and some time after invited the other members of the Zollverein to stand by the treaty. Saxony, by reason of its commercial interests, accepted the treaty. Bavaria, Württemberg, Hanover, Nassau, and Hesse-Darmstadt, on the contrary, refused to accept the treaty and went with Austria, which renounced all idea of commercial union in 1864, and in 1865 Prussia definitely excluded that state from the Zollverein. During the war between Austria and Prussia in 1866, the political allies of Austria—Bavaria, Württemberg, Baden, Nassau, and Frankfort—kept the terms of the Zollverein with Prussia, so that there was exhibited the curious spectacle of countries engaged in open hostilities living under the same tariff system and maintaining free exchange. After the War of 1866 Prussia forced upon Württemberg, Baden, and Bavaria a new pact which substituted for the conference of delegates from the sovereign and independent states (Zollkonferenz) an in-and-out assembly consisting of a Zollbundesrat, representing the states, and a Zollparlament, composed of the North German Reichstag and representatives from the South German states. Instead of the unanimous vote for enacting new regulations, a mere majority of each assembly was made sufficient. The representation of the states was not equal, Prussia having 17 out of 58 representatives in the Zollbundesrat and a preponderating influence in the Zollparlament. Besides, Prussia had the presidency of the Zollbundesrat, with the right to make treaties of commerce in the name of the union with foreign Powers. This union was replaced by the Zollverein, the German Empire of 1871.

In 1872 Alsace-Lorraine was included in the German Zollverein under the Imperial government, and in 1888 the free cities of Hamburg and Bremen joined. The new German customs union embraces all the states of Germany, though its limits do not conform exactly to the limits of the Empire, the so-called free ports (parts of Bremen and Hamburg) being excluded, while the Grand Duchy of Luxemburg and the Austrian communities of Jungholz and Mittelburg form part of the union. Duties on exports were abolished in 1873.

Among other instances of customs unions may be mentioned the South African Customs Union established in 1889 and including Cape Colony, Orange Free State, Basutoland, and British Bechuanaland. More recently attempts have been made to bring about a closer commercial union between the several parts of the British Empire. In 1887, at the colonial conference, Hofmeyr, of Cape Colony, for the first time developed a scheme for a uniform extra-differential duty upon all foreign imports into Great Britain. In 1891 this idea was brought before the House of Lords by Lord Dunraven. In 1894 the Ottawa Conference discussed the matter at some length. Beginning in 1899 Mr. Joseph Chamberlain strongly advocated cementing the bonds of the Empire by a system of preferential tariffs. This movement for colonial preference became a definite Unionist policy in 1906 and was advocated by all the colonial premiers at the Imperial Conference of 1907. Actual legislation, however, had not been reached in 1916. It has been suggested that the United States form a customs union with the South American states, Mexico, and Central America, and Mr. Blaine while Secretary of State, 1889–92, attempted to bring about closer commercial relations by means of reciprocity treaties. No appreciable results have thus far been accomplished.

ZOMBOR, zôm'bôr. A royal free town of Hungary, capital of the County of Bács-Bodrog, situated on the Francis Canal, about 120 miles south of Budapest (Map: Hungary, F 4). The chief industries are the manufacturing of flour and matches. Pop., 1910, 30,552.

ZONA, zō'nȧ. See HERPES.

ZONA LIBRE, thō'nȧ lē'brā (Sp., free zone), or FREE ZONE. A name formerly applied to a strip of territory extending across the northern boundary of Mexico. Its purpose was to meet the competition of the American towns across the border, by remitting all Federal duties and reducing tariff rates for certain classes of goods consumed within the territory.

ZON'ARAS, JOANNES (Lat., from Gk. *Ἰωάννης Ζωναρᾶς*). A Byzantine annalist of the first half of the twelfth century. He lived at Constantinople, where he was commander of the Imperial guard and private secretary to Alexius I. In the reign of John Comnenus he became a monk at Mount Athos, where he devoted himself to writing. His most important work is the *Chronicon* or *Annales*, which relates the history of the world from the creation to 1118, the date of the death of Alexius I. He drew upon Josephus, Xenophon, Plutarch, and many other sources; but the chief value of his works, in view of the fact that his contemporary record is meagre, is in that he follows the first 20 books of Dio Cassius, which are known to us only in this way. He also is supposed to have written an *Exposition of the Apostolical Canons*. A *Lexicon*, edited by Tittmann (1808), is falsely attributed to him. The *Chronicon* was edited by Dindorf (Leipzig, 1868–75). Consult Karl Krumbacher, *Geschichte der byzantinischen Litteratur* (2d ed., Munich, 1897).

ZONE (Fr. *zone*, from Lat. *zona*, from Gk. *ζώνη*, *girdle*). A subdivision of the earth's surface, determined by certain astronomical conditions. The boundary lines of the zones are parallels of latitude, so that a zone includes

all of the earth's surface lying between two given parallels of latitude. The torrid zone lies between the parallels of 23° 28′ N. and 23° 28′ S. This number corresponds to the inclination of the earth's orbital plane to the equatorial plane; the sun is always vertically overhead over some point within that zone.

The polar or frigid zones lie between the poles and the parallels of 66° 32′ N. and S. Within them the solar rays always strike the earth very obliquely, and great cold results. The temperate zones lie between the polar and torrid zones. See CLIMATE; EARTH; ECLIPTIC; SEASONS; SOLSTICE; TROPIC.

ZONE. See COSTUME, ECCLESIASTICAL, *Eastern Vestments.*

ZONE, IN MATHEMATICS. See SPHERE.

ZONTA, zŏn'tȧ. See GIUNTA.

ZO'ÖGEOG'RAPHY, or GEOGRAPHICAL ZOÖLOGY. See DISTRIBUTION OF ANIMALS; GEOGRAPHY.

ZOÖLOGICAL GARDEN. The rapid decrease of wild life throughout the world, and the increasing desire of mankind to know the living wild animals, has led to the development of three distinct types of vivaria. The term "zoo" commonly indicates a small and unpretentious menagerie, located in a public park. A zoölogical garden usually is a compact establishment occupying from 20 to 60 acres of park land in a city, easy of access, but with relatively limited areas for its animals. A zoölogical park usually occupies from 100 to 260 acres of picturesque land and water in the suburbs of a city, where the hardy animals are provided with areas amid natural surroundings appropriate to their wants, and the tropical species are housed in heated buildings. The movement which began in Paris in 1804, in the Jardin des Plantes, has culminated in the magnificent gardens of Berlin, London, Amsterdam, Antwerp, Vienna, Copenhagen, Hamburg, Frankfort, Cologne, Dresden, Breslau, Hanover, and Rotterdam. Even remote cities, such as Cairo, Calcutta, Tokyo, Melbourne, Buenos Aires, and Rio de Janeiro, have established zoölogical gardens for the free exhibition of living animals. Excepting the Jardin des Plantes, in Paris, and the Royal Garden at Vienna, all European gardens are owned, maintained, and operated by zoölogical societies, or stock corporations, which pay no dividends, and charge admission to all visitors not members. In most cases, however, the cities benefited have furnished public park lands free of rental, and free of control other than respecting the cutting of trees. Funds are derived from the annual dues of members, gate receipts, lease of restaurants and other privileges, and the sale of animals. The Zoölogical Society of London had in 1915 a membership of more than 4800 fellows who paid annual dues of $15. The Amsterdam Society contained 4500 members who paid $10 each, and the Royal Zoölogical Society of Antwerp led all with a membership of 7000, yielding an annual income of $70,000.

In America the public desire for better acquaintance with wild creatures had, up to 1903, resulted in two regularly established zoölogical gardens, at Philadelphia and Cincinnati; two zoölogical parks, at New York and Washington; and municipal zoos in the public parks of nearly 20 other cities. The establishments in Lincoln Park, Chicago, and in Highland Park, Pittsburg, are the largest and most important of the municipal zoos. Of the four most important zoölogical institutions in the United States, that of the Philadelphia Zoölogical Society was the pioneer, having been founded in 1871. The equipment of buildings and other improvements in this fine garden, and the animal collections there, rank very high. The Cincinnati garden is a great credit to Cincinnati, and is as large a garden as can expect adequate support in a city below the size of a great metropolis.

The New York Zoölogical Park represents one of the latest and greatest undertakings in vivarium development and maintenance. A private corporation, called the New York Zoölogical Society, having in 1915 about 2000 members, made in 1895 an agreement with the city of New York to expend $250,000 of its own funds on buildings and other installations for live animals, to supply perpetually all the animal collections, and admit the public without charge on all days save Mondays and Thursdays. In return the city gave a free site, agreed to pay for all ground improvements and additional buildings, furnished free water and police protection, and an annual maintenance fund, but gave the society absolute freedom in management. The land granted by the city consists of 264 acres in Bronx Park, by far the largest area occupied anywhere in a city for exhibition of live animals. The funds of the Zoölogical Society are derived from the annual dues of members ($16,000), and larger membership fees, and special subscriptions. The park is a fair illustration of the American idea of an institution for the exhibition of wild animals, which in space and comfort for the collections should stand midway between the zoölogical garden and the great private game preserve. Its outfit of buildings, dens, aviaries, and open ranges is magnificent, and its landscape effects are beautiful. For the hardy animals green turf, water, rocks, shade, and sunlight have been liberally provided. This experiment has been regarded as successful, and its influence is noticeable. The institution was in 1916 conceded the foremost place in the line of zoölogical gardens, the London Zoo occupying the second place and the garden at Berlin the third.

The National Zoölogical Park, at Washington, was established by Congress in 1889 through the initiative of William T. Hornaday, and the joint efforts of G. Brown Goode, S. P. Langley, James B. Beck, then United States Senator from Kentucky, and Senator Knute Nelson, then a member of the House of Representatives. It is under the direction of the Secretary of the Smithsonian Institution, and is supported by Congressional appropriations. Through the lack of a comprehensive general plan of development, the Congressional sympathy and support, which only such a plan and its gradual fulfillment can enlist, have been weak, and development has been retarded. Its animal collections, however, are in admirable condition, and contain many rare and valuable species.

Beddard, *Natural History in Zoölogical Gardens* (Philadelphia, 1905); Gustave Loisel, "Zoölogical Gardens and Establishments of Great Britain, Belgium, and the Netherlands," in Smithsonian Institution, *Annual Report, 1907* (Washington, 1908); Carl Hagenbeck, *Beasts and Men* . . . ; abridged translation by Elliot and Thacker (New York,

1911); Ellen Velvin, *From Jungle to Zoo* (ib., 1915).

ZOÖLOGICAL PARK. See ZOÖLOGICAL GARDEN.

ZOÖLOGICAL PARK, NATIONAL. See SMITHSONIAN INSTITUTION; ZOÖLOGICAL GARDEN.

ZOÖLOGICAL STATION. An institution for the study of living animals. Such stations are of three principal sorts: marine, fresh water, and inland. The first to be developed was the marine station, the great importance of the study of marine animals and the comparative expensiveness of apparatus for marine investigation leading to the establishment of great laboratories on the seashore. The most famous and finest of the marine laboratories is the one founded by Anton Dohrn (q.v.) at Naples in 1870. The Berlin Academy of Sciences and the German government aided in building this institution, and granted it an annual subsidy of $40,000. Tables are rented by various European governments and societies and by the many educational institutions. In the United States the earliest zoölogical laboratory was that founded in 1873 by Louis Agassiz on the island of Penekese, in Buzzard's Bay, Mass. Later Alexander Agassiz founded a private laboratory at Castle Hill, Newport, R. I., and in 1877 Prof. W. K. Brooks, of Johns Hopkins University, opened a provisional laboratory first at Fort Wool, Va., then at Crisfield, Md., and in 1880 at Beaufort, N. C. In 1889 the United States Fish Commission established a station at Beaufort. The Marine Biological Laboratory was founded at Woods Hole, Mass., by the Woman's Education Association of Boston, and in 1890 a large public marine laboratory was founded by the Brooklyn Institute at Cold Springs Harbor, L. I., and the Tortugas Zoölogical Laboratory under A. G. Mayer was founded later. On the Pacific coast the Leland Stanford University has established a laboratory at Pacific Grove. In Europe there are laboratories in the Isles of Solovetsky in the White Sea, at Tromsö, Norway, and at other points on the Scandinavian peninsula; at Copenhagen, at Helgoland, at Kiel, at St. Andrews, Scotland, at Port Erin (Isle of Man), at Plymouth, at Wimereux (near Boulogue), at Saint-Vaast-le-Hogue (Tatihou Island), at Roscoff (Finistère), at Villefranche (near Nice), and at many other points. Fresh-water zoölogical stations in America include those established at Havana, on the Illinois River, by the Illinois State Laboratory of Natural History; on Winona Lake, by the University of Indiana; at Sandusky, Ohio, on Lake Erie, by the Ohio State University; and at Put-in-Bay, on Lake Erie, by the United States government. In 1915 the New York Zoölogical Society founded under the direction of C. W. Beebe, at Georgetown, British Guiana, the first tropical zoölogical station for the investigation of evolutionary problems. See LABORATORY.

ZOÖLOGY, zō-ŏl'ō-jĭ (from Gk. ζῷον, *zōon*, animal + -λογία, *-logia*, account, from λέγειν, *legein*, to say). The science which treats of animals. It is divided into morphology and histology, physiology and psychology, reproduction and embryology, systematic zoölogy or classification, paleontology, zoögeography, evolution, and bionomics.

The earliest zoölogist was Aristotle (384–322 B.C.). Down to the period of Ray and Linnæus he was the only naturalist worthy of the name. His works, *The History of Animals*, *The Generation of Animals*, and *The Parts of Animals*, contain, besides errors of fact or opinion, many singularly correct statements. He recognized some of the more important groups, which he called genera. Such were the Malakia or cephalopods, Malacostraca or soft animals with shells (the higher crustacea), Entoma (insects, arachnids, myriapods, and the higher worms), etc. He also dissected the cuttlefish, octopus, and other animals.

Zoölogy as a descriptive science dates from the time of Linnæus (q.v.), but it was not until the rise of comparative anatomy, embryology, morphology, paleontology, and the evolution theory that it became a well-grounded science. The predecessors of Linnæus were Malpighi, Leeuwenhoek, Swammerdam, Redi, and W. Harvey (q.v.). Harvey in 1616 discovered the use of the heart and the mode of the circulation of the blood in arteries and veins, and from his observations on the development of the chick declared that all living things arise from an egg by a gradual process of growth and differentiation (epigenesis). The invention of the microscope by the Janssens (1590–1600) and its improvement during the seventeenth century enabled Malpighi to discover the organs named after him. Leeuwenhoek (q.v.) discovered the blood corpuscles, striated muscle fibres, dentinal canals, epidermal cells, and described certain infusoria, rotifers, and Hydra. Swammerdam dissected insects and snails, and worked out the metamorphosis of certain insects. Redi was the first to combat the notion of spontaneous generation (q.v.), while Hamen (1677) discovered the sperms of animals. The history of zoölogy may be roughly divided into four periods:

(1) Towards the end of the seventeenth century Ray, basing his ideas of the classification of animals mainly on the work of Aristotle, was the first to arrive at some conception of species and of specific characters. But it is Linnæus to whom we are indebted for binomial nomenclature; and the first genuine though very imperfect classification of animals (q.v.) dates back to the *Systema Naturæ*, the tenth edition of which appeared in 1758. He recognized genera, orders, and classes, dividing the animal kingdom into six of the latter. As the result of his influence, his own pupils, and also Pallas, did much to advance zoölogy, while the anatomists and physiologists of this period were Camper, Wolff, Spallnazani, Hunter, and Vicq d'Azyr, the latter of whom proposed the term "comparative anatomy," also previously used by Leibnitz. Lamarck (1744–1829) divided animals into vertebrate and invertebrate, and reorganized the latter division, founding the classes of Infusoria, Radiata (Echinodermata), Annelida, Arachnida, and Crustacea. He was far in advance of any other zoölogist from the time of Linnæus to that of Cuvier. Geoffroy Saint-Hilaire also advanced our knowledge of the vertebrates by establishing the orders Monotremata and Marsupialia, the latter forms having been distributed among the rodents and primates.

(2) Cuvier (q.v.) was the founder of comparative anatomy and vertebrate paleontology, while Lamarck founded invertebrate paleontology. Cuvier's work as a comparative anatomist, showing the importance of structure as the basis of all classifications, was most important. In dividing the animal kingdom into four branches,

he led the way for the recognition of the more numerous phyla constituting the animal world. Early in the nineteenth century Geoffroy Saint-Hilaire advanced embryology, and founded the doctrines of the unity of organization and of homologies, which paved the way for the theory of descent. Vicq d'Azyr established the principle of serial homology. Bichat was one of the founders of histology. France at this time led the scientific world, though Germany had her Blumenbach, who founded anthropology, her Döllinger, the teacher of later embryologists, Tiedemann, Bojanus, and Carus. Meckel, in his time the leading German anatomist, studied at Paris with Cuvier, as did Milne-Edwards, while Owen felt his influence.

The great activity shown by Cuvier in building up the Jardin des Plantes led to the French exploring expeditions sent out from 1800 to 1832 to all parts of the globe, resulting in enlarged views regarding the number and distribution of species, and their relations to their environment. The zoölogists of these expeditions were Bory de Saint-Vincent, Savigny, Péron, Lesueur, Quoy, Gaimard, Le Vaillant, Eydoux, and Souleyet. From 1823 to 1850 England fitted out exploring expeditions under Beechey, Fitzroy, Belcher, Ross, Franklin, and Stanley, the naturalists of which were Bennett, Owen, Darwin, Adams, and Huxley. Russian explorations (1803–29) were accompanied by Tilesius, Langsdorff, Chamisso, Eschscholtz, and Brandt, all of them of German birth and education. The United States Exploring Expedition under Wilkes (1838–42) was, in scientific results, not inferior to any previous ones, the zoölogists being Dana, Couthuoy, and Peale. Of a later voyage under Ringgold, Stimpson was the naturalist, but the rich final results were lost by fire. At or near the close of this period, from Germany, Humboldt, Spix, the Prince of Wied, Natterer, Perty, Reugger, Tschudi, Schomburgk, Burmeister; from France, De Azara, D'Orbigny, Gay, Castelnau; and from Denmark, Lund, traveled at their own expense, an evidence of the spirit of scientific research then dominating the centres of civilization. Their followers were Wallace, Bates, Semper, Belt, Miklucho-Maclay, Przhevalski, the brothers Sarasin, and many others. The voyage (1872–76) of the *Challenger* (q.v.) was momentous in its results, which are published in 30 quarto volumes, mostly containing reports on the zoölogical results contributed by the leading systematic zoölogists of the nineteenth century.

(3) A third period has been distinguished (1) by the discovery by Schleiden and by Schwann (1838) that all organisms are formed of cells, and by the studies of Dujardin, of Mohl, and of Schultze on the nature of protoplasm (q.v.), proving that the cell is the unit of organization, and that protoplasm is the basis of life; (2) by the application of histological discoveries and methods to embryological research; and (3) by the use of the doctrine of evolution as a working theory to account for the common origin of animals from a single simple primitive organism. The first great steps in the explanation of the mode of reproduction and development were the discovery of spermatozoa by Hamen, a student of Leeuwenhoek, and that of the mammalian egg by De Graaf in 1673. The old theory of preformation was overthrown and that of epigenesis, or formation by the differentiation of the egg-protoplasm, was established by Wolff in 1759. In 1829 Von Baer showed that all mammals develop from eggs, while Coste, Valentin, and Jones proved that these eggs are homologous with those of the lower vertebrates. The real nature of fertilization was not finally settled until Barry in 1843 observed the union of ovum and spermatozoön in rabbits, and Kölliker in 1846 proved that spermatozoa develop from the cells of the testes. The next important advance was the discovery in vertebrates by Von Baer of the germ layers; Huxley identified two of these layers in the cœlenterates. Later steps were the recognition by the brothers Hertwig of the mesoblast and the cœlomic cavity, the observations of Lang and Sedgwick on metameric segmentation, and the homology of the blastopore in the embryos of all many-celled animals. All these discoveries gave an impetus to morphology (q.v.) and established it on a thorough and broad basis of facts. Von Baer also showed that the tissues arise from embryonic cells, their formation going on simultaneously with the process of differentiation and development of organs. He thus discovered what is known as Baer's law, i.e., that the development of the individual is an epitome of that of the class to which it belongs; and that while the embryos of the animals he studied are at first very similar, they diverge more and more as growth and differentiation advance. These laws did not suggest to him the theory of the blood relationship of the vertebrate and other classes, but led him, as it afterward did Agassiz, to support Cuvier's view that the animal kingdom was divided into four distinct, unrelated branches or subkingdoms, and that consequently there was no unity of type, as Cuvier asserted in his famous debate with Geoffroy Saint-Hilaire before the French Academy of Sciences.

The school of transcendental anatomists founded by Oken (1807) and Goethe (1739–1832), succeeded by Carus and Owen, resulted in the so-called vertebrate theory of the skull; which, though crude and speculative, yet had its philosophical raison d'être. Although the skull of vertebrates, as first shown by Huxley, is not truly a series of modified vertebræ, yet, as in worms and especially in arthropods, the head of vertebrates is segmented, as shown by the serial homology of the embryonic gill arches and of the cranial nerves. Moreover, Goethe, as did Lamarck, recognized the significance of vestigial structures, and Goethe made the truly scientific prediction of the presence of the premaxillary bone in the head of man, the supposed absence of the homologue of that bone having been before his time supposed to be a decisive feature separating man from the apes. Owen's *Report on the Archetype and Homologies of the Vertebrate Skeleton* (1846) was the outcome of this pre-evolutionary method and point of view. The old doctrine of archetypes and plans of creation reached its culmination in this book, in which, without reference to the lowest vertebrates and to the early mode of development of animals of this type, Owen (q.v.) considered that the shoulder and pelvic arches were modified ribs, the shoulder arch belonging to the occipital vertebra, and the limbs themselves being diverging appendages or uncinates. Yet this theory was the fault or erroneous way of thinking of the period in which he lived, and Owen was the greatest of English comparative anatomists, his works giving a great impetus to zoölogy.

The first epochal step in unraveling the mor-

phology of the arthropod classes was taken by Savigny (1816), who showed that the mouth parts of insects, crustaceans, etc., were modified limbs, and this gave a clue to the segmental nature of the head of these animals, which is composed of a number of segments, different in each class, as shown by the later researches of embryologists. Savigny also taught that as a rule a segment bears but a single pair of appendages, while Audouin showed that the form of the arthropodan body was due to the atrophy of certain segments, or parts of segments, and the correlated hypertrophy of others. Other important advances in classification and anatomy were made by the labors of H. Milne-Edwards, the successor of Cuvier, who established the principle of the division of physiological labor, separated the Tunicata from the Mollusca, divided vertebrates into those with and without an allantois, and confirmed De Blainville's separation of amphibians from reptiles.

During the middle of the nineteenth century the great German anatomist, Müller, made extensive investigations on the embryology and metamorphoses of the echinoderms, revolutionized the classification of the fishes, and placed physiology on a new and higher basis. Meanwhile Vaughan Thompson (1836), by his discovery of the nauplius larva of the barnacles, had shown that instead of being worms they were genuine, but greatly degraded, crustaceans. In 1848 Leuckart broke up the Radiata of Cuvier, and separated the Cœlenterata from the echinoderms, regarding them as a distinct branch or type. Wiegman transferred the Rotifera from the Protozoa to Vermes; Siebold (1848) having established the group of Protozoa, showed their one-celled structure, and founded the type of Arthropoda; while Rudolphi, Leuckart, and Siebold pointed out the wormlike nature of the flatworms, now referred to a separate phylum.

The animal nature of sponges was not proved until after the middle of the nineteenth century, through the researches of Lieberkühn, Carter, Clark, and finally Haeckel, who, however, placed them with the cœlenterates, while their true position as a distinct phylum was assigned them by Hyatt. Through the investigations of Morse the Brachiopoda were removed from the Mollusca, as also were the Molluscoidea, and regarded as more nearly allied to the Annelida. Louis Agassiz (q.v.), one of the foremost zoölogists of his time (1807–73), greatly advanced our knowledge of the cœlenterates, among his discoveries being that of the hydroid nature of Millepora. He worked on the embryology of the fishes and reptiles, his great work on fossil fishes bringing order out of a chaotic mass of unclassified material. He also indicated the chief faunal divisions of North America. From the middle of the nineteenth century there has been published an uninterrupted series of monographic anatomical and embryological works on single animals in the line of those of Réaumur, Lyonnet, Strauss-Durckheim, and Herold, among which should be indicated those of the numerous students of Johannes Müller and Leuckart; the works of Agassiz and his students; of Huxley and his pupils; and of Lacaze-Duthiers and his successors.

Among the most remarkable and fruitful advances in embryology is Kovalevsky's (q.v.) discovery (1866) of the presence of the notochord and hollow nervous system in the embryo and larva of ascidians, which resulted in the removal of the Tunicata from the Molluscoida, and afterward from the worms, to the neighborhood of the vertebrates; and in the establishment of the phylum of the Chordata, as well as the breaking down of the distinction between vertebrates and invertebrates; these, with the later researches of Semper, indicating the origin of vertebrates from some primitive annelid worm. The fact that the embryos of all animals above the Protozoa pass through a gastrula stage led Haeckel to suppose that this hypothetical gastrea was the ancestral form of all the many-celled animals.

The two founders of modern histology were Kölliker and Leydig. The former, besides his early discovery of the mode of development of sperm cells, and the proof he afforded of the existence of animal cells destitute of a cell wall, gave a great impulse to the general histology of vertebrates, and the latter to that of the invertebrates, especially the sense organs. Their pupils and successors, by the invention of refined methods and the use of reagents, especially by the invention of the microtome, have pushed fruitful investigations in embryological and morphological directions, greatly extending our knowledge of reproduction and cell division, and laying the foundation for future special research in comparative physiology, especially of the brain, and in psychology, bearing especially on reflex, instinctive, and mental actions.

The studies of the earlier histologists and embryologists led to the foundation of cytology, or cell science, and to a realization of the complex nature of protoplasm; work in which Fleming, Strasburger, E. Van Beneden, the two Hertwigs, Roux, Boveri, Conklin, Lillie, Wilson, and others took a leading part. On the results of their labors are based the theory elaborated by Weismann that the particles of the chromatin of the nuclear substance (chromosomes) are the bearers of heredity. A new department of cytology is that of the mechanics of development (q.v.), which is in the line of mechanical or dynamic evolution, taught by Lamarck, H. Spencer, Ryder, Cope, Hyatt, Roux, and others.

The metamorphoses of animals, especially those of insects, were in the beginning described by Lyonnet, Roesel, De Geer, Réaumur, and others, and in recent times by Fritz Müller, who pointed out the fact that the caterpillar and maggot form of larva are secondary, the most generalized and primitive insects not undergoing a metamorphosis. Müller also worked out the metamorphosis of certain Crustacea, and our knowledge of the larval forms of these animals has been greatly extended by Dohrn, Brooks, Smith, and others, with the result that the nauplius stage is now regarded as also an acquired one, and not a primitive feature. The most notable advance in our knowledge of the exact mode of metamorphosis in the most highly specialized insects, especially the flies, was made by Weismann in 1864. His demonstration of the making over of the body by the histolysis of the larval tissues, and the formation of the tissues of the adult from imaginal buds, brought about the final overthrow of the preformation notion. Through the labors of Barrande, Beecher, and others, the larval stage of trilobites and of *Limulus* is recognized to be a third arthropod larval type, the protaspis, perhaps the most primitive and trochosphere-like of all.

The problem of the ancestry of insects, the

solution of which is based on our knowledge of larval forms and of the anatomy of primitive types, has been attacked by Brauer, Packard, Lubbock, Sylvestri, and others. Indeed, the latest results of work on the arthropods tends to show that this vast assemblage of forms is polyphyletic, and recently it has been subdivided into several phyla, each having a separate origin from some unknown worm allied to existing annelids, and each with a different type of structure. The heterogeneous group of Vermes has also been disintegrated into several phyla. These changes have in great part been necessitated by the advance made by the two Hertwigs, Lankester, and others in our knowledge of the cœlomic or body cavity of different zoölogical groups.

Fresh attention is now being paid to a study of the life history of the Sporozoa (q.v.). The story of the manner in which the germs are conveyed from one host to another, told by Grassi, Ross, and others, is one of the triumphs of modern zoölogy and medical skill. Here likewise the discovery of phagocytes by Metschnikoff, also by Kovalevsky, and of their action in destroying disease germs or bacteria, and Metschnikoff's theory of inflammation, are among the most notable advances made in the nineteenth century.

As to vertebrate morphology the most important advances made during the last half of the nineteenth century are those contributed by Huxley, Gegenbaur, O. Hertwig, and others. While Huxley demolished the old view that the vertebrate skull consists of modified vertebræ, the skull elements being in reality dermal bones derived from scales, the German anatomists named, as well as Dohrn, Locy, and others, have shown that the head of vertebrates is made up of segments, as proved by the actual segments revealed in the embryo of the lower vertebrates, by the segmental arrangement of the muscles (myotomes), of the arteries, and of the cranial nerves. Apropos of the segmental arrangement of the organs of the vertebrate head, Loeb, as well as Schrader, from the point of view of experimental physiology, claim that no localization of functions exists, either in the brain or in the spinal cord of the cold-blooded vertebrates, and that the reactions observed are "only segmental reflexes, just as in the annelids and arthropods."

Another problem attacked by morphologists in late years is that of the origin of vertebrate limbs. Gegenbaur derived them from the archipterygion or primitive portions of the shark's fins; while Thatcher, Mivart, Balfour, Dohrn, and Wiedersheim have traced them back to the two primitive fin folds of the lowest vertebrates. Here also belongs Dohrn's principle of change of function, one lying at the basis of the mechanical evolution of limbs and other organs. Another research started by Baldwin Spencer is the origin of the pineal gland and its nature as a third or median eye, a feature with little doubt inherited from amphioxus by the ganoid fishes, amphibia, reptiles, mammals, and even man, whose so-called pineal body or gland was by the ancient anatomists supposed to be the seat of the soul. Its complex homologies were indicated by Gaup in 1901. And here might be mentioned the great advances in the anatomy of the brain both of arthropods and of vertebrates, particularly the recent thorough-going researches of Golgi on the rods of Corti, and of Ramón y Cajal on the minute anatomy of the cerebellum; all such very special work laying the foundations for modern physiology and psychology, and resulting in the neurone theory established between 1890 and 1900.

On the whole the most remarkable single discovery in zoölogy, and one of great moment to anthropology, is the detection of the remains of the Pithecanthropus by Dubois (in 1891–92) in the late Tertiary strata of Java.

The aim and methods of modern paleontology, which is in reality the study of the ancestors of the forms now living, has come to be one of the main supports of the theory of descent. And this not only for the reason that it has revealed to us the remains of numerous extinct groups, families, and orders, connecting those previously supposed to be wide apart, but because our museums now contain rich series of forms illustrating not only the geological succession, but also the gradual, and at times sudden, modifications and evolution of series of types from the generalized to the specialized. The chief factors also of this process of divergent evolution are quite clearly seen to have been geological and climatic changes, and the use and disuse of organs. Examples are the genealogy of the horse family, partly worked out by Huxley, Gaudry, Kovalevsky in Europe, and more perfectly, owing to the greater completeness of the series, by Marsh and Osborn in America. Other groups, as the Camelidæ, etc., have had their ancestry elucidated by Cope, Osborn, Scott, Wortman, and others. The phylogeny of the ammonites and nautiloids has been elaborated by Hyatt, that of Brachiopoda by Beecher and others.

Among the Crustacea, two orders, the Phyllocarida and the Syncarida, have been recognized by Packard, and the latter group also recognized by Ortman, as being generalized forms which have given rise to the higher groups represented by the modern shrimps, lobster, and crabs.

Perhaps the most important paleontological discovery in the last half century, as regards arthropod animals, is that of the appendages of trilobites, which we owe to Walcott, Matthew, and especially to Beecher. Finally, the view has of late years been rendered clear that nearly every class of invertebrate animals originated in Precambrian times; the vertebrates with limbs and lungs, Amphibians and reptiles, appearing near the close of the Paleozoic age, while birds and mammals diverge from some reptilian stock in the early Mesozoic.

(4) The fourth period is that of evolution and bionomics. The history of evolution (q.v.) is now a twice-told tale. How much we are indebted to Darwin (q.v.), Wallace (q.v.), Herbert Spencer (q.v.), and others has been recounted elsewhere. It remains only to point out some salient features in the history of the theory of descent and its modifications during the nineteenth century. A noticeable circumstance in the history of the rise and spread of the doctrine is the way in which the once almost forgotten or misunderstood views of Lamarck (q.v.) have been either unearthed or hit upon independently by others, as Cope, Hyatt, Jackson, Eimer, etc., proving that the Lamarckian factors of change of environment, use and disuse, even if we throw out use-inheritance as applied to mutilations, etc., may be primary agencies in modifying organisms and in bringing about not only varieties and species, but also families, orders, classes, and even phyla.

Natural selection also has its foundation in the struggle for existence and competition. And here it is interesting to observe that Darwin and Wallace, who independently thought out the selection idea, both acknowledge their indebtedness to Malthus's "Essay on Population" (1798) for the idea which dominates their theory. It is not, perhaps, generally known that Malthus on his part freely acknowledged in the opening pages of his essay his indebtedness to Benjamin Franklin for the motif of his work. In 1755, in his *Observations Concerning the Increase of Mankind and the Peopling of Countries*, Franklin enunciated the principle of struggle for existence, and the evil effects of overcrowding if any single species were allowed to multiply unchecked by competition with other forms. "There is, in short," he says, "no bound to the prolific nature of plants and animals, but what is made by their crowding and interfering with each other's means of subsistence. Were the face of the earth vacant of other plants, it might be gradually sowed and overspread with one kind only, as, e.g., with fennel, and were it empty of other inhabitants, it might in a few ages be replenished from one nation only, as, e.g., with Englishmen." (Sparks's edition of the *Works of B. Franklin*, vol. ii, p. 319.)

The theory of descent has aroused attention and given a decided impulse to the study of bionomics, ethology, or the habits and instincts of animals and their relations to the world around them. The pioneers in this captivating phase of biology were Huber, Réaumur, Reimarus, Siebold, and Leuckart, and, to come down to later times, Lubbock, Romanes, Wyman, Plateau, Forel, Fabre, Moggridge, Cook, G. W. and E. G. Peckham, Loeb, Weismann, and Wheeler deserve special mention.

One great difference between plants and animals is that the latter move from one place to another; and how animals orientate themselves and the means or sense organs by which they move in reference to surrounding objects or organisms, find their food, or their mates, has engaged and is now engaging much attention. Here might be cited recent work on the otocysts of the invertebrates, and the views now held as to the origin of the vertebrate ear and the lateral sense organs of fishes and salamanders from organs of orientation in the worms. The mechanics of locomotion worked out by the older anatomists and physiologists have, by the ingenious inventions and use of photography, been greatly extended by Marey.

Finally, our knowledge of the physiology of nerves and ganglia, as well as of the brain, of the more specialized animals and of man, has had its bearings on comparative psychology, and under the influence of the experiments of Loeb, Bethe, and others we are coming into a position to discriminate between simple physiological or reflex acts and instinctive acts, and to compare them with the acts of human reason. And here again we see that plants and animals approximate, in that the reflex acts of the lowest animals, those without nerves or ganglia, are akin to the restricted movements of certain plants.

As is well known, Darwin's theory of selection is based on his assumption of the universal tendency to variation, a phenomenon he did not at the outset attempt to explain. The Lamarckian factors of change of the conditions of life, of climate, and soil, are what we rely on to account for variations, as indicated by Darwin later in life, strongly insisted on by Herbert Spencer, by Sachs, Semper, Kerner, and their successors. Within the past few years the study of variation, from a general as well as statistical point of view, has already reached very considerable proportions. According to the results obtained by J. A. Allen, Wagner, Wallace, and others, a very large proportion of existing varieties and species are local, geographical, or climatic forms, due to migration, geographical changes, and resulting isolation. Bateson has collected all the known cases of discontinuous variations, and many species, as claimed by Galton, also by De Vries, owe their origin to sports or aberrations. Statistical variations, consisting of the minute measurements of multitudes of individuals, all tend to show that the variations are due to local differences in climate, soil, temperature, the nature of the medium, etc., with the result that the doctrine of the essential unfixity of species, the high degree of unstable equilibrium of organisms, is a fundamental fact, with which the biologist has more and more to deal.

Ray Lankester, *Treatise on Zoölogy*, part v (ib., 1906); *Darwin and Modern Science* (Cambridge, 1909), by various authors; Parker and Haswell, *Textbook of Zoölogy* (new ed., 2 vols., New York, 1910); Shipley and MacBride, *Zoölogy* (3d ed., ib., 1915). For a different viewpoint: H. F. Osborn, *From the Greeks to Darwin* (New York, 1893); W. K. Brooks, *The Foundations of Zoölogy* (ib., 1894); W. A. Locy, *Biology and its Makers* (ib., 1908); and L. C. Miall, *The Early Naturalists* (London, 1912).

ZOÖPHYTE, zō'ō-fīt (Gk. *ζῳόφυτον, zōophyton*, zoöphyte, animal plant, from *ζῷον, zōon*, animal + *φυτόν, phyton*, plant). A term employed by Cuvier to designate the lowest primary division of the animal kingdom, which includes many animal organisms that are fixed to a definite spot or rock, shell, etc., and have the form of plants. The group was a very artificial one, and the term gradually fell into disuse and is no longer employed except as a semipopular term to describe hydroids, corals, sea anemones, and some other forms, which superficially bear some resemblance to flowers.

ZO'ÖSPORE (from Gk. *ζῷον, zōon*, animal + *σπορά, spora*, seed), or "swarm-spore." The ciliated, motile spores common among the algæ and aquatic fungi. See SPORE.

ZOQUE, sō'kā. A Mexican tribe of low culture occupying portions of eastern Tabasco and the adjacent districts of Chiapas and Oaxaca, and, together with the neighboring Mixe and one or two other tribes, constituting the Zoquean linguistic stock. They were formerly a numerous and formidable people, brave, savage, and addicted to cannibalism, but are now reduced to less than 3000, described as agricultural and industrious, but stupid, coarse featured, and great drunkards. Like other tribes of Mexico, they retain many of their ancient beliefs and customs under a thin veil of civilization. Consult Sánchez, *Gramática de la lengua Zoque* (Mexico, 1877), and Grasserie, *Langue Zoque et langue Mixe* (Paris, 1898).

ZORN, tsôrn, ANDERS LEONHARD (1860–). A Swedish figure, landscape, and portrait painter, and an etcher. He was born at Mora,

Dalarne, of peasant stock, and studied for six years at the academy in Stockholm, intending at first to become a sculptor. From 1882 to 1885 he was in London, where he studied etching with Axel Haig, and exhibited water colors at the Royal Academy and at the Royal Society of Painters in Water Color. In 1887 he was awarded a medal and the Legion of Honor at the Paris Salon, and in 1888 "Fisherman from St. Yves," his first oil painting, was purchased for the Luxembourg Museum. In 1889 he received a gold medal at the Paris Salon. Although he traveled extensively in Spain and Italy, and frequently visited America, he resided, for the most part, at the home of his birth, Mora. Here he devoted himself, with unsurpassed spontaneity and exuberant vitality, to painting his favorite subject, the female nude of the Swedish peasantry. He delights in portraying the unstudied, unsophisticated freedom of healthy and unconscious animalism. An Impressionist only in so far as he depicts the passing movement and the instantaneous play of light and shadow, he avoids the flat appearance, rendering tactile values in an almost sculptural manner. As a portraitist he stands among the foremost painters of his time, combining a sturdy uncompromising naturalism with an extraordinary power of characterization, and a masterly subservience of detail to a broad general effect. His many portraits include one of himself in the Uffizi (1888); King Oscar of Sweden (1898); King Charles of Sweden (1898); the remarkable "Harald Wieselgren"; "Maja" (1900, National Gallery, Berlin); the celebrated "Coquelin Cadet"; "Portrait of the Artist" (Stockholm Museum); and "The Toast." Well-known figure compositions are: "Baking in Mora" (1889); "Night Effect" (Gothenburg); "Summer in Sweden" (National Gallery, Berlin); "Midsummer Night Dance at Dalecarlia" (1897, National Museum, Stockholm). Later are: "Dagmar"; "Matins on Christmas Day"; "Watering the Horse"; "Nude" (Metropolitan Museum, New York); "Startled" (1912). As an etcher Zorn achieved an individual and lasting reputation, especially in his series of remarkable portraits, including those of Renan, August Strindberg, Paul Verlaine, Anatole France, Rodin, and the "Portrait of the Artist and his Wife." The two plates, "The Bather Seated" and "Edo," are nude studies of exquisite beauty and restraint. In the realm of sculpture also Zorn displays a masterly technique in such works as "Alma," a graceful nude; the statue of Gustavus Vasa at Mora; "Grandmother" (1892), and "Faun and Nymph" (1896, bronze statuette). Consult: Aloys Deltiel, *Le peintre-graveur illustré XIXe et XXe siècles*, vol. iv (Paris, 1909); J. N. Laurvik, *Anders Zorn* (New York, 1913); A. E. Gallatin, in *Whistler's Pastels and other Modern Profiles* (ib., 1913).

ZORNDORF, tsôrn'dôrf. A village of Prussia, in the Circle of Königsberg, noted as the scene of a victory gained by Frederick the Great of Prussia over a Russian army under General Fermor, Aug. 25, 1758. The battle was decided by two splendid cavalry charges under General Seydlitz and ended in a panic rout of the Russians, who lost nearly 24,000 men out of a total strength of 50,000. The Prussians, who numbered 37,000 men, lost somewhat more than 11,000 men.

ZOROASTER, zō'rō-ăs'tẽr (Lat. *Zoroastres*, from Gk. *Ζωροάστρης*, from Av. *Zaraθuštra*). The prophet of ancient Iran, a representative of the faith of the Magi (q.v.), and a great religious teacher of the East. The tenets of his creed are preserved in the Avesta (q.v.), in the Pahlavi literature (q.v.), and in later writings, and they are still kept up by the small community of Ghebers (q.v.) in Persia and by the Parsis (q.v.) in India. The fact that Zoroaster was a historical character, not a mythical personage, is now generally accepted.

Much uncertainty formerly prevailed regarding his date because of the statements of some of the classical authors that he flourished 6000 years before the Christian era, but these reports were due to a misunderstanding of the Persian chronology, which recognizes the existence of Zoroaster's spiritual essence or unborn substance at an era corresponding approximately to such a date in the world's history, although his birth did not take place till much later. On the basis of the traditional chronology of the Parsis, as found in the Bundahishn and elsewhere in Pahlavi literature, the probable dates of Zoroaster's birth and death may be reckoned as falling respectively about 660 B.C. and 583 B.C. Many scholars, however, accept 1000 B.C. as the approximate date when Zoroaster flourished.

The etymology and precise meaning of Zoroaster's name, *Zarathushtra* in the Avesta, is not wholly certain, although the last element (Av. *uštra*) means camel. The place of his birth is now generally accepted as being in the northwestern part of Persia, Azerbaijan (q.v.), to the west of the Caspian Sea, although a great part of his religious activity must have been in eastern Iran. Tradition makes Azerbaijan (corresponding to the *Airyana Vaējah* of the Avesta) the home of his father, Pourushaspa, and it connects incidents of Zoroaster's early life with Lake Urumiah, which answers to *Caēcista* in the Avesta, and associates the religious devotee also with Mount Savalan. Various cities, however, are mentioned directly or indirectly as his birthplace or as connected with him, and the ancient town of Rei (Av. *Raγa*, the Rhages of the Book of Tobit), near the modern Teheran, is said to have been originally the home of his mother, Dughedha. Legend has gathered a number of miracles about Zoroaster's birth and childhood, and tradition leaves space for a period of religious preparation from his fifteenth to his thirtieth year, when he received a revelation of the faith and came forward as an opponent and reformer of the superstitious beliefs and heresies that existed in the old creed. Seven visions of heaven, the divine being, and the archangels were revealed to Zoroaster in the following 10 years of his life. He then is said to have undergone the final test by a temptation from the evil spirit Ahriman (q.v.), but came off triumphant from the encounter with the archfiend. If we follow tradition we may identify, with some degree of likelihood, the scenes of these supernatural and actual experiences. They tend to show that Zoroaster traveled over a considerable part of Iran, for mention is made of his having been at one time in Seistan and even in Turan. The place where he made his first convert, his cousin Maidhyoi-maonha, or Medyomah, after the conflict with the spirit of evil, is probably the district of the great forest of reeds near the southwest shore of Lake Urumiah.

Zoroaster's first real success, however, was achieved when he converted King Vishtaspa (Av. *Kavi Vištāspa*). This was accomplished in the prophet's forty-second year, or 618 B.C., if we accept the traditional chronology. As it is generally believed that Vishtaspa ruled in eastern Iran, Bactria, Seistan, and Khorasan, fresh support is given for the claim that Zoroaster's teaching was largely in the east, even though he arose in the northwest of Persia, and his creed ultimately spread over all Iran. After the King's conversion the religion was adopted by the Queen, Hutaosa, who has the same name as Atossa, the wife of Hystaspes, father of Darius (qq.v.), although there is absolutely no historic ground for identifying Vishtaspa and Hutaosa with Hystaspes and Atossa, as has been done on the basis of identity of names. The nobles of the court likewise adopted the religion of Zoroaster, and we may trace the history and propaganda of the faith down to the time of the prophet's death, which occurred in 583 B.C., at the age of 77, if we accept and correctly interpret the traditional chronology. Zoroaster's end seems to have been a violent one, and to have taken place during the invasion of Iran by Turan when Arejat-aspa, or Arjasp, of the latter hostile country, waged a religious war against Vishtaspa. Firdausi (q.v.) and other later writers locate the scene where Zoroaster was slain at Balkh or Bactria (q.v.).

ZOROASTRIANISM, zō'rō-ăs'trĭ-an-ĭz'm. The designation generally employed to denote the ancient religion of Persia prior to the Mohammedan conquest of Iran. Other terms are sometimes substituted, such as Mazdaism from its supreme god, Magism from its ancient priests, and Parsiism from its modern adherents. The historical development of the religion will be found briefly sketched under the separate titles AVESTA; GHEBERS; MAGI; PAHLAVI LANGUAGE AND LITERATURE; PARSIS; ZOROASTER.

One of the most striking features of Zoroaster's faith, as taught in his metrical psalms or *Gāthâs* (q.v.), is a pronounced but modified dualism. It is pronounced because belief in a constant warfare between the good and evil principles that pervade the world is everywhere present. Ahura Mazda or Ormazd (q.v.), the Lord Wisdom, the supreme god of Iran, created the universe and rules it; Angra Mainyu or Ahriman (q.v.), the Spiritual Enemy, or devil, invaded the world and ever disorders it. To the latter being, or rather to the evil principle whose wicked spirit he embodies, the name Druj, Deceit, Fiend, is also given. The dualism is modified because it regards the power of evil as limited in time. Although nature is divided and rent asunder by the two conflicting principles, nevertheless man, as a free agent, will bring about the ultimate triumph of right by choosing right and extending the power of good for the overthrow and annihilation of evil. This result in the end will establish the good kingdom (Av. *vohu xšaθra*), after the general resurrection. To accomplish this end is the aim of the prophet's teaching; and the views which he maintains of the contending forces of right and wrong, the empires of light and darkness, are remarkable for their sharpness and logical precision.

According to Zoroaster's belief the heavenly hierarchy that rules the realm of good is headed by the god Ormazd. Six attendant spirits, besides lesser divine beings, join with him in administering the kingdom. These six presiding divinities, who with Ormazd make up his court, are called Amesha Spentas, Immortal Holy Ones, the later Persian Amshaspands. They represent personifications of virtues, good thought, righteousness, wished-for kingdom, harmony on earth, salvation, immortality. The allegory beneath their names and the various domains in the physical world—animal life, fire, metals, earth, water, plants—over which they preside, are easy to recognize and not difficult to understand. Next in rank to these, and but little if at all below them, stands a company of angels, Yazatas, Worshipful Ones, who guide the force of nature and perform the duties incumbent upon their offices in the divine organization. Chief among these is Mithra (see MITHRAS), a personification of light and truth. Atar, the fire, Apo, the waters, and several idealized representations of the sun, moon, and stars, together with a variety of lesser divine creations, fulfill the heavenly decrees in the management of the universe. To offset these, on the side of evil, is a vast host led by Ahriman and composed of a disordered rabble of archfiends, fiends, demons, and evil spirits, who contend against the well-organized ranks of the good and strive to destroy the soul of man. Foremost among this troop is the demon Aeshma-daeva, whose name is generally considered to be reflected in the fiend Asmodeus (q.v.), of the Apocryphal Book of Tobit. The names and number of the hosts of evil are legion; it would be idle to try to enumerate them.

The struggle between these two conflicting kingdoms forms the history of the universe whose duration lasts for a world period of 12,000 years. The Pahlavi Bundahishn gives us a notion of the Zoroastrian ideas of cosmology and chronology. Ormazd and Ahriman are coexistent, though not coeternal, in the realm of light and darkness. Space primevally separated them. Time began with their conflict. During the first 3000 years the universe existed only in a spiritual state; everything was represented by its *fravaši*, or heavenly prototype, in a transcendental form. Ahriman, not knowing this, arose from the abyss of darkness, but when he beheld the light he was dazzled and driven back, baffled by its radiancy and splendor. He at once created the infernal hosts to wage war against the realm of light. In the second 3000 years Ormazd created the world and primitive man in a material form to fight against the powers of evil. During the third 3000 years, which is the historic period of the world known to Zoroaster, Ahriman invades the earth, mingles evil with good, marring all till the coming of Zoroaster drives him and the demons for a time away. The last 3000 years are millennial periods. Each of these three millennia is presided over by a prophet or savior, to be born from the seed of Zoroaster. The final one of these shall preside at the general resurrection, when the world shall be renewed and eternity shall begin. It is then that the powers of evil, united for a

final struggle, shall be utterly routed by the forces of good; wickedness shall vanish at this final crisis, and righteousness shall reign supreme as Zoroaster foretold. See SAOSHYANT.

The essence of Zoroaster's moral and ethical teachings may be summed up in the three cardinal Avestan words *humata, hūxta, hvaršta*, good thoughts, good words, good deeds, which form the watchword of the faith of the modern Parsis and Ghebers. The idea of goodness implies largely the choice of the good religion of Mazda and following its precepts, in preference to devil worship, or the cult of the demon. This implies scrupulously preserving the purity alike of body and soul, and is chiefly to be obtained through religious observances and ceremonial rites that are extreme in their exactions. The elements of earth, fire, and water, moreover, must be carefully shielded from defilement, especially from contact with dead matter. It was this prescription which led to the peculiar Zoroastrian method of exposing the dead bodies on Dakhmas or Towers of Silence (q.v.), to be devoured by dogs and birds—a custom which the modern Zoroastrians quite strictly observe. Furthermore, the care of useful animals, particularly of the cow and the dog, is enjoined; and the importance of agricultural pursuits as a religious duty is strongly inculcated. There are many minor observances and beliefs found, especially in the Avestan *Vendīdād*, that recall the Pentateuch. These features and others were noticed by the classical writers, such as Herodotus, Plutarch, and Strabo, as characteristic of the Persian religion. The main points of Zoroaster's philosophy may be gathered from the Gathas and supplemented by other portions of the Avesta and Pahlavi literature. A summary of the orthodox beliefs of the ancient Zoroastrians will be found in Yasna 12, which is sometimes called the Avestan creed.

Comparisons of Zoroastrian with other religions show more resemblances to Judaism and Christianity than to other Oriental faiths, and the possibility of mutual influences, direct and indirect, has been the subject of much discussion. The affinities of the religion of Iran with the ancient faith of India, e.g., with regard to likenesses between the divine ideas of Mithra and Mitra, Verethraghna and Vritrahan, and the like, or in the cult of Haoma and Soma (q.v.), or in the differences between Ahura-Asura, Daeva-Deva, are striking, and point back to the period of common Indo-Iranian or Aryan unity. Parallels also have been sought between ancient Babylonian and Zoroastrian beliefs, which may be due in part to the proximity of the two peoples. With regard to primitive ideas, moreover, we may recognize in the Zoroastrian faith and in some of its ceremonies a few traits that recall possible survivals of primitive animism, spiritism, fetishism, and ancestor worship. As a rule, however, the ideality and lofty spirituality of Zoroaster's teachings have been generally recognized; and the efficiency of the faith as a working religion may be seen in the fruits which it has borne in various ways through history and in its present followers, the Parsis and Ghebers.

ZORRILLA, FRANCISCO DE ROJAS. See ROJAS ZORRILLA.

ZORRILLA, thôr-rēl'yȧ, MANUEL RUIZ (1834–95). A Spanish statesman, born at Burgo de Osma. He studied at Valladolid, became an advocate, and in 1856 was elected to the Cortes, where he joined the Progressists. In 1866 he took part in an uprising which led to his banishment until the revolution of 1868. In that year he was made Minister of Commerce and Public Instruction under Serrano. In 1869 he became Minister of Justice and in 1870 president of the Cortes. He was instrumental in the election of Amadeus of Savoy to the throne, was Minister of Public Works in his first cabinet, and in 1871 formed a Progressist cabinet. He was the chief adviser of Amadeus till the latter's abdication in 1873. After the accession of Alfonso XII (December, 1874) he retired to France, and later to Geneva, whence for 18 years he directed the plots of the Republican conspirators. In 1884 he was sentenced to death, in contumaciam, for his part in the military rising of March, 1884. At last he tired of the struggle, gave up his leadership, and was permitted to return to Spain.

ZORRILLA Y MORAL, thôr-rēl'yȧ ē mō-rȧl', JOSÉ (1817–93). A Spanish poet and playwright, born in Valladolid Feb. 21, 1817. He composed and published his incomplete poem, *Granada* (1852), in Paris. Always in straitened circumstances, he went to Mexico to try his fortunes in 1855, and, going back to Spain for a visit in 1866, was cut off from returning to Mexico by the disasters that befell Maximilian. From 1871 to 1883 he suffered want, though the theatres, as he complains in his *Recuerdos del tiempo viejo* (1880), were making fortunes by his plays. His last years were freed from want by a government pension of 30,000 reals. He died at Madrid Jan. 23, 1893.

The *Soledad del campo* and the *Indecisión* are his most important lyric works. But he shows

to greatest advantage in his various *leyendas*, in which he has embodied the history of Spain. Poetic eloquence, descriptive force, patriotism, religious fervor, and strong idealism characterize his legends, and these qualities are found already in the *Cantos del trovador* (1840–41). The *Granada* (1852) would, if completed, be the great epic of modern Spain.

Zorrilla's first play, written in collaboration with García Gutiérrez, was the *Juan Dándolo* (1839). A long series of plays followed, and of these the best are *El zapatero y el rey; Traidor, inconfeso y mártir; A buen juez mejor testigo;* and *Don Juan Tenorio.* The *Don Juan Tenorio* treats the tradition which Tirso de Molina's *Burlador de Sevilla* had made famous on the Spanish stage. Zorrilla's Don Juan differs from the general conception of that scoundrel in that he is made to die repentant. The *Don Juan Tenorio* is so great a favorite of the Spanish race that it is given an annual two-weeks' run at the Festival of All Hallows.

Consult the *Obras dramáticas y líricas de D. José Zorrilla* (4 vols., Madrid, 1895); *Galería Dramática: Obras Completas* (4 vols., ib., 1905); *Ultimos versos inéditos y no coleccionados* (ib., 1908); A. de Valbuena, *José Zorrilla, estudio crítico-biográfico* (ib., 1889); and Enrique Piñeyro, *El Romanticismo en España* (Paris, 1900).

ZOS'IMUS (Lat., from Gk. Ζώσιμος). A Greek historian who flourished in the time of the Emperor Anastasius I (491–518 A.D.). His *New History*, in six books, dealing with the history of the Roman Empire to the capture of Rome by Alaric, 410 A.D., is extant. Inasmuch as Zosimus's work is a continuation of that of his predecessor Dexippus, the earlier history, from Augustus to the year 270, is sketched briefly in the first 36 chapters of the first book. The rest of the period is treated in detail. From internal evidence it seems clear that Zosimus was still engaged on the work (which was not completed), after 501. Zosimus finds the cause of the decline of Rome's power in the neglect of the earlier faith of the Romans which attended the progress of Christianity. As a pagan he assails the various Christian emperors, especially Constantine. His work is our chief source for the history of the fourth century, and on the whole may be trusted. It is best edited, with prolegomena, by Mendelssohn (Leipzig, 1887).

ZOS'IMUS. Pope 417–418. He was a Greek by birth. The main interest of his pontificate lies in his relation to the Pelagian controversy. The African bishops had condemned the opinions of Pelagius (q.v.), and this judgment had been ratified by Pope Innocent. In the interval, however, Pelagius appealed to the Pope; and his disciple, Celestius, came in person to Rome, where he presented a confession of faith in his own justification. Zosimus was induced by the specious explanations of Celestius to suspend judgment, and even to write to the African bishops, recommending a reconsideration of the case. On further examination of Celestius Zosimus became aware that he had been deceived; and, even before the reply of the African bishops, confirmed and renewed their original condemnation of the Pelagian doctrine. His letters are found in Migne, *Patrologia Latina*, xx.

ZOS'TEROPS. See WHITE EYE.

ZOUAVES, zōō-āvz'. A body of troops in the French army whose organization dates from 1830, when two battalions were formed by General Clausel from a tribe of Kabyles dwelling in Algeria. The name of the tribe was Zouaoua, which in French gave rise to the term "zouave." The organization of these tribesmen as a part of the French army was brought about to establish a friendly feeling between them and the conquerors, and inasmuch as they had been for years mercenary soldiers, they were considered an important addition to the army. French officers were placed in charge and a certain number of French soldiers were included in the companies, which were formed into two battalions. The mingling of the French and natives did not prove satisfactory, and after 1839 none of the latter were recruited, though regiments of Algerian tirailleurs were subsequently (1842) formed. The Moorish costume originally adopted was retained, and the zouaves, who were recruited from veterans of exceptional physique and courage, achieved a high reputation, serving not only in Africa, but also in the Crimea, Italy, Mexico, and more recently in Tunis and Tongking. The zouaves accordingly became an integral part of the French army and before the great war were organized into three regiments of five battalions each, divided into four companies, the total strength being somewhat in excess of 13,000 men. There were in addition 10 skeleton battalions of zouaves in the Algerian territorial reserves. The papal or pontifical zouaves, under the command of General Lamoricière, served in Rome from 1860 to 1870, and played an important part in resisting the Italian occupation of Rome. In the United States during the Civil War some northern volunteer regiments adopted the zouave uniform and were known as zouaves.

ZRINYI, zrē'nyē, MIKLÓS (NICHOLAS), COUNT VON (1508–66). A Hungarian general. He distinguished himself at the siege of Vienna (1529) and afterward in the campaigns against John Zápolya and Sultan Suleiman. After 1542 Governor of Croatia and Slavonia, he successfully defended that territory against the Turks for many years, and in 1563 was appointed commander in chief of the royal forces on the right bank of the Danube and commandant of Szigetvar. When Suleiman, at the head of an army of 65,000 men, attacked that fortress in 1566, Zrinyi offered a most stubborn resistance. Although his garrison consisted of only 2500 troops, he managed to hold his own from August 6 till September 7. Neither the Sultan's promise to make him Governor of the whole of Illyria and hereditary possessor of Bosnia, nor the threat to kill his only son George, whom Suleiman pretended to hold as a prisoner, could induce him to surrender. On September 5 the Turks succeeded in setting fire to the outer castle, whereupon Zrinyi took refuge in the inner castle, and when this also was fired on the 7th, met his death fighting heroically at the head of his force now reduced to 600. More than 20,000 Turks had been killed during the siege, and Sultan Suleiman died on September 4 in a paroxysm of rage at the terrible repulses he encountered. The tragic end of Zrinyi was graphically described by his great-grandson Miklós (1616–64) in the epic *Szigeti veszedelem* (The Fall of Sziget, 1651). It was also repeatedly made the subject of dramatic productions, notably by Theodor Körner.

ZRINYI, MIKLÓS, COUNT (1616–64). A Hungarian hero and poet, born at Csákvár. He traveled in Italy in 1635–37, served on the Croatian frontier against the Turks, and in

1645 fought against the Swedes in Moravia. In 1647 he was made Ban (Governor) of Croatia, and during the subsequent years of his life won fame by his successes against the Turks. His poetical works, *Adriai tengernek Sirenája* (The Siren of the Adriatic), appeared in 1651, but a famous epic was left in fragments. These were collected by Arany and Antal Vékóny, and published as the *Zrinyiad*.

ZSCHOKKE, chŏk'e, HEINRICH (1771–1848). A German-Swiss novelist and miscellaneous writer, born in Magdeburg. He studied in the University of Frankfort-on-the-Oder, where he became privatdocent, and wrote his novel *Abällino* (1794), which was successfully dramatized. Then he traveled for a time and kept a boarding school at Reichenau, in Switzerland. In 1798 he removed to Aarau, where he filled with energy and sound judgment several public and diplomatic offices. Besides editing several popular periodicals, Zschokke published the lucid and rationalistic religious manual, *Stunden der Andacht* (1806, twice translated, 1843 and 1862), and several popular studies in Bavarian and Swiss history, of which *Des Schweizerlandes Geschichten* (1822) was translated in 1855. Zschokke wrote also many novels and tales, from which three selections have been translated (Philadelphia, 1845; New York, 1848; London, 1848). *Der tote Gast* (1817), *Das Goldmacherdorf* (1817), *Addrich im Moos* (1826), and *Der Freihof von Aarau* (1826), are his best stories. His *Works* have been collected in 35 volumes (1854). He published an autobiographical *Selbstschau* (1842; Eng. trans., London, 1845). Consult Emil Zschokke, *Heinrich Zschokke: ein biographischer Umriss* (3d ed., Berlin, 1876); Max Schneiderreit, *H. Zschokke: seine Weltanschauung und Lebensweisheit* (Berlin, 1904).

ZSIGMONDY, shĭg'mŏn-dē, RICHARD (1865–). A German chemist. He was born in Vienna, and was educated at the Technical School in Vienna and at the University of Munich (Ph.D., 1889). From 1897 to 1900 he was scientific associate in the famous glass works in Jena, and then for seven years was engaged in private study and writing. In 1908 he was called to the chair of inorganic chemistry at Göttingen. He made a special study of colloid chemistry, on which subject he is an authority. His books *Zur Erkenntnis der Kolloide* (1905) and *Lehrbuch der Kolloidchemie* (1912) are well known, the former having been translated into English as *Colloids and the Ultramicroscope* (1909).

ZSOMBOLYA, zhŏm'bōl-yŏ. See HATZFELD.

ZUBAIR. See ZOBEIR.

ZUBLY, zŭ'blē', JOHN JOACHIM (1725–81). A Swiss-American clergyman, born at Saint-Gall, Switzerland. He was ordained to the Presbyterian ministry about 1744, subsequently emigrated to America, and in 1760 became the first regular pastor of the Independent Presbyterian Church in Savannah, Ga. He was an active member of the Provincial Congress of Georgia in 1775, and was sent as one of Georgia's delegates to the Continental Congress that year. Though opposed to the acts of the British ministry in favor of armed resistance, he opposed independence and a Republican form of government, and, after being detected in a questionable correspondence with Sir James Wright, the royal Governor of Georgia, he fled from Congress, and became an open Loyalist in Georgia. In 1777 he was banished from Savannah, and his property was confiscated. He then lived in South Carolina for a time, and after Wright was reinstated as Governor of Georgia returned to Savannah, where he remained until his death. His publications include: *The Real Christian's Hope in Death* (1756); *The Stamp Act Repealed* (1766); *An Humble Inquiry into the Nature of the Dependency of the American Colonies upon the Parliament of Great Britain and the Right of Parliament to Lay Taxes on the Said Colonies* (1769); and *The Law of Liberty* (1775).

ZUBR, zōō'b'r. See BISON.

ZUCCARO, tsōōk'ká-rō, TADDEO (1529–66). An Italian painter, born at Sant' Angelo in Vado, near Urbino. In 1548 he began fresco painting for Julius III, Paul IV, and other notables. He was a mannerist of the post-Raphaelite school, and his frescoes in the Palazzo Farnese at Caprarola, near Viterbo, show him at his best.

FEDERIGO (c.1542–1609), his brother and pupil, was born at Sant' Angelo, and became the most popular painter of his generation. He completed the "Last Judgment" begun by Vasari in the dome of the cathedral of Florence, and was commissioned by Gregory XIII to carry out Michelangelo's designs for the decoration of the Pauline Chapel. As the result of a quarrel he left this task and visited Flanders, Holland, and in 1574 England, where he portrayed Queen Elizabeth, Mary Stuart, and many high personages. In 1582 he painted several huge frescoes for the Doge's Palace in Venice, and on his return to Rome completed his work in the Pauline Chapel. From 1585 to 1588 he was engaged in decorating the Escurial for Philip II. In 1595 he founded the Academy of San Luca at Rome. His frescoes are exaggerated in effect, with enormous grotesquely contorted figures.

ZUCCHETTO, tsụ-kĕt'ō. See COSTUME, ECCLESIASTICAL, *Vestments, General*.

ZUEBLIN, zū'blĭn, CHARLES (1866–). An American sociologist, born at Pendleton, Ind. He attended the University of Pennsylvania (1883–85), graduated at Northwestern University (Ph.B., 1887) and at Yale (B.D., 1889), and later studied at Leipzig (1889–91). Zueblin founded the Northwestern University Settlement in 1891, engaged in university extension work in 1892, and until 1908 taught sociology at the University of Chicago, where he became professor in 1902. His writings include: *American Municipal Progress* (1902; rev. ed., 1916); *A Decade of Civic Development* (1905); *The Religion of a Democrat* (1908); *Democracy and the Overman* (1910).

ZUG, zōōg *or* tsụg. A small canton of Switzerland (Map: Switzerland, C 1). Area, 92 square miles. It is mountainous in the southeast and mostly flat in the northwest. The canton comprises the Lake of Aegeri and the larger part of the Lake of Zug. The chief occupations are stock breeding, dairying, and the manufacturing of cotton, silk, and paper products. The constitution provides for an elected Legislative Assembly (one member to every 350 inhabitants) and an elected Executive Council. Proportional representation, the initiative, and the referendum are in force. Pop., 1910, 28,013, largely German-speaking Roman Catholics. Capital, Zug (q.v.). The town of Zug with a part of the surrounding territory was acquired by the house of Hapsburg in 1264 and was annexed by the Swiss Confederation in 1352. At the forma-

tion of the Helvetic Republic (1798) it became a part of the Forest Cantons. It was constituted an independent canton in 1803.

ZUG. The capital of the Canton of Zug, Switzerland, 19 miles by rail south of Zurich, at the northeast corner of the Lake of Zug (Map: Switzerland, C 1). The town, a pleasant summer resort having an elevation of about 1400 feet, affords a fine view of the Bernese Alps and is quaint in appearance. There are a fifteenth-century Gothic church of St. Oswald, the church of the Capuchins, an historical museum, a museum of antiquities, and a fine late-Gothic town hall. Cotton goods, enamel wares, and wood carvings are shipped, and there is an important fish-breeding establishment. In the vicinity of Zug is the Bee Museum of Switzerland. Pop., 1900, 6508; 1910, 8038.

ZÜGEL, tsụ'gel, HEINRICH (1850–). A German genre and animal painter. He was born at Murrhardt, Württemberg, studied at the art school in Stuttgart, and worked independently at Munich from 1869. In 1894 he was appointed professor in the Karlsruhe Academy, and the next year in the Academy of Munich. Zügel came to be recognized as the foremost German cattle painter of his day. Beginning with soft harmonious tones, he gradually adopted a broad powerful technique. Among his principal paintings are: "Sheep in the Woods" (1872, Leipzig Museum); "Sheep in an Alder Grove" (1875, National Gallery, Berlin); "Runaway Steer"; "Summer Sun" (1888, Rudolfinum, Prague); "Expectation" and "Cows on the Moor" (Pinakothek, Munich); "The Outcast" (Dresden); "Oxen Fording a Stream" (Metropolitan Museum, New York). He received great gold medals at several international expositions, and was made honorary member of the principal German academies.

ZUHAIR, zụ-hâr', IBN ABI SULMA RABIA AL MUZANI. One of the great Arabic poets before Mohammed. He lived in the sixth century. His son, Ka'b ibn Zuhair, was also a poet, and a panegyrist of Mohammed. Zuhair is distinguished by his serious character, the moral tendency of his poetry, his contempt for extravagant eulogies, and his avoidance of rare and unintelligible words much affected by his contemporaries. One of his poems found a place in the Moallakat (q.v.), others have been published by Ahlwardt, *The Diwans of the Six Ancient Arabic Poets* (London, 1870); with the commentary of al Alam by Carlo Landberg, *Primeurs arabes* (Leyden, 1889); and by K. Dyroff, *Zur Geschichte der Ueberlieferung des Zuhairdiwans* (Munich, 1892).

ZUIDER ZEE, zoi'dēr zā. See ZUYDER ZEE.

ZUKERTORT, tsụk'ẽr-tôrt, JOHANNES HERMANN (1842–88). A Polish chess-master, born at Lublin, Russian Poland. In 1867 he began to edit the *Neuen Berliner Schachzeitung*, with the German expert Anderssen. Zukertort's first notable public chess playing was in London, in 1872, and in 1878, at the Paris International Tournament, he won the first prize. He defeated Rosenthal in 1880, Blackburne in 1881, and at the London Tournament of 1883 he won first place over Steinitz and a large field of other chess-masters. Steinitz defeated him, however, in America, in 1885. He displayed at all times remarkable skill in simultaneous games and in play without the board. Besides conducting the English *Chess Monthly*, he wrote *Sammlung der auserlesensten Schachaufgaben* (1869); and published, with Jean Dufresne, *Grösstes Schachhandbuch* (2d ed., 1873), and *Leitfaden des Schachspiels* (1869; 5th ed., 1897).

ZULOAGA, sōō'lō-ä'gȧ, FÉLIX (1814–76). A president of Mexico, born at Alamos, in Chihuahua. In 1854 he was sent against the rebels in Ayutla, and in the following year was captured, but gained the favor of Comonfort, the Liberal leader, who, when he became President, intrusted to him the military operations in the Sierra de Querétaro, employed him in the two campaigns of Puebla, and made him Councilor of State. In 1857 he declared against the new constitution and in favor of giving Comonfort dictatorial power, but as Comonfort hesitated, Zuloaga's troops occupied the capital (January, 1858). Comonfort went into exile and Zuloaga was declared President. Soon afterwards began the "War of Reform" between his followers of the Church and military parties and the Liberals under Juárez (q.v.). In December, 1858, Zuloaga was overthrown, and though he was afterward reinstated, he was at length declared an outlaw. When the French invaded Mexico Zuloaga did not assist them but went to Europe. He returned in 1864, and in the following year joined in an unsuccessful plot to overthrow Maximilian and establish Santa Anna.

ZULOAGA, thōō'lō-ä'gȧ, IGNACIO (1870–). A Spanish figure and portrait painter. He was born at Eibar in the Basque Province of Vizcaya, the descendant of a noted family of craftsmen. His father, PLACIDO ZULOAGA, a damascener of international reputation, founded a school for the revival of that industry in Eibar. DANIEL, his uncle, revived the art potteries at Segovia, and his great-grandfather was director of the Armory of Madrid. At 18 he went to Paris for five years. He did not, however, attend any of the academies, and practically taught himself, but he studied with passionate devotion the old Spanish masters, of which he acquired a representative collection. In 1898 he exhibited at the Salon for the first time, and in 1899 won instant fame with his portrait group "Daniel Zuloaga and his Daughters" (Luxembourg Museum, Paris). He traveled much, usually in the most remote regions of Spain, portraying with remarkable individuality and keen characterization, unexcelled since Goya, popular Spanish types—gypsies, bull fighters, beggars, fruit vendors, water carriers, and dancers. His work is vivacious, nervously alert, striking in composition, and powerful, even brutal, in the interpretation of human emotions. His color scheme is rich and varied, excelling especially in sombre harmonies. His effects are obtained with a broad, sure brush. With Sorolla (q.v.) Zuloaga ranks as the most important and influential representative of the Spanish art of his time. He is represented in most public European collections, and at the Hispanic Society, New York, by a portrait of himself, by "The Gypsy Bull Fighter's Family," and by "Mlle. Lucienne Bréval as Carmen" (on loan at the Metropolitan Museum of Art). In 1909 a representative collection of his paintings was exhibited at the Hispanic Society. Consult: Christian Brinton, *Modern Artists* (N. Y., 1909); Miguel Utrillo and Others, *Five Essays on the Art of Ignacio Zuloaga* (ib., 1909); *Catalogue of Paintings by Ignacio Zuloaga, Exhibited at the Hispanic Society of America* (ib., 1909).

ZULU, zōō'lōō. Kaffir tribes of Bantu stock, South Africa, divided into five groups: Ama-

Fonga, Ama-Azwazi, Ama-Zulu, Ama-Ponda, and Ama-Kosa. They are a well-proportioned, muscular, powerful, and active people above middle height. (See Colored Plate DARK RACES OF AFRICA, with article AFRICA.) They depend for their sustenance both on the cultivation of millet and on cattle raising. The house is a framework of poles, beehive in form, thatched and plastered. These huts are grouped together in a circular *kraal*, with the cattle in the centre. Among other arts, they make millet beer, tan hides, smelt iron, and weave basketry. Their weapons are the assegai, knobkirri, and shield. Polygamy and wife purchase are customary. They have an extensive folklore. For history, see ZULULAND. Consult Fritsch, *Die Eingeborenen Süd-Afrikas* (Breslau, 1872); Kropf, *Das Volk der Xosa-Kaffern* (Berlin, 1889); Grout, *Isizulu, Revised Edition of a Grammar of the Zulu Language* (London, 1893); Roberts, *Zulu-Kafir Language Simplified for Beginners* (3d ed., ib., 1895); id., *English-Zulu Dictionary* (2d ed., ib., 1895); also Callaway, *Nursery Tales, Traditions, and Histories of the Zulus* (Natal, 1868).

ZULULAND, zōō'lōō-lănd. A country forming the northeast part of the Province of Natal, Union of South Africa (Map: Cape of Good Hope, K 6, 7). The area of Zululand is stated at 10,424 square miles. The country is about 185 miles in greatest length and 105 miles in greatest breadth; its coastline of 210 miles possesses no harbors. Behind coastal sandhills is a low plain in which are several shallow lagoons (5 to 30 miles in width), which communicate with the sea. Inland from the coastal plain is a region of hills and plateaus, which ascend to the Drakensberg, and which in Zululand attain an altitude of about 5000 feet. The country is well forested and well watered. The chief streams include the Pongola, Umkuri, Umgavuma, Umfolosi, and Umlatusi. The climate is semitropical along the coast, where malaria is prevalent, and temperate in the highlands. The fauna includes many of the common South African mammals as well as venomous snakes and crocodiles. The inhabitants are chiefly the brave Zulu (q.v.), who are primarily herdsmen, raising large numbers of cattle and sheep, but who also cultivate the soil to some extent, producing crops of maize, millet, sweet potatoes, tobacco, and beans. Along the coast sugar, tea, and coffee are raised by whites. The total area under cultivation in 1911 was reported at 49,645 morgen (105,076 acres). Some anthracite is mined and various ores have been found, but the mineral resources are still undeveloped. Pop., 1911, 219,606. Whites numbered 2120 (0.97 per cent); Bantu, 214,969 (97.89); mixed and other colored 2517 (1.14). There are no large towns. Zululand is governed in respect of provincial matters by the provincial council of Natal, and otherwise by the Union Parliament, in the Lower House of which it is represented by one member. Administration of their own affairs by the natives is permitted as far as possible by the British. The local British executive is a civil commissioner resident at Eshowe.

Towards the end of the eighteenth century the Zulu tribes, to the number of a few thousand, inhabited the valley of the Umfolosi. About that time a strict military organization was introduced among them by the paramount chief Dingiswayo, and his successor, Chaka, introduced an irresistible mode of attack, in which the old missile weapon was replaced by the short stabbing assagai. Chaka became master of the greater part of southeastern Africa, extending from the Limpopo to Cape Colony, and including Natal, Basutoland, and a large part of the Orange River and Transvaal colonies. He was anxious to establish a political connection with the Cape and English governments, and made, in 1825, a grant of land in Natal to an English officer. He was murdered in 1828 and was succeeded by his brother, Dingaan, who became involved in a war with the Boers by causing a party of settlers to be massacred in February, 1838. In December of the same year he was decisively defeated, and subsequently murdered. He was succeeded by his brother, Panda, during whose reign peaceful relations prevailed between the Zulus and the Natal government. In 1872 he was succeeded by his son, Cetewayo, who soon became a grave danger to the neighboring British colonies. At the beginning of 1879 the British made war on him. On January 22 a British army met with a great disaster at Isandlana (Isandula). Prince Louis Napoleon, who had entered the British service, was slain in a reconnoissance on June 1. On July 4 the Zulus were completely defeated at Ulundi and on August 28 Cetewayo was captured. He was restored to his rank in 1883. The district south of the Tugela, however, Great Britain reserved for itself, and another part on the northeast was also set off, so that the King was limited to the middle portion of the land. Cetewayo was deposed again before the close of 1883. He died the next year and was succeeded by his son, Dinizulu, who granted a strip of land in the west to the Boers, in which they established the "New Republic," and extended their control to the Umlatusi and St. Lucia Bay. In 1886 the British recognized the New Republic. In return the Boers pledged themselves to vacate the rest of Zululand and renounce recognition of Dinizulu's protectorate. The New Republic was annexed to the South African Republic in 1888, the remainder of Zululand having been declared a British crown colony in 1887. In 1888 Dinizulu attempted an insurrection, but was taken prisoner and exiled to St. Helena. He was later, however, sent back to his country. In 1907 he was charged with treason and murder and was sentenced to four years' imprisonment, but was released by Premier Botha in 1910. He was pensioned by the government and moved to the Transvaal. After 1889 small districts in the north, including those of the chiefs Sambana and Umtegiza, were added to British Zululand. On Dec. 30, 1897, the whole Province of Zululand, including Tongaland, was annexed to Natal.

(ib., 1913).

ZUMALACÁRREGUI É IMAZ, thōō-mä'lä-kär'rā-gē ā ē-mäth', TOMÁS (1788–1835). A Spanish Carlist leader. He was born at Ormáiztegui, in the Basque Province of Guipúz-

coa. He served against Napoleon, leaving the study of law at Pamplona to enter the army. He was loyal to Ferdinand VII, but in 1832, being suspected as a Carlist, was dismissed from the army. In October, 1833, he was called to lead the Carlist forces in the Basque provinces. He was the ablest of the Carlist leaders, and won many successes against the Cristinos, displaying marked talents as a guerrilla leader, as well as fine capacity for leading large bodies of men. On June 15, 1835, while besieging Bilbao, he received a gun-shot wound and died 10 days afterward. Consult M. A. S. Hume, *Modern Spain* (ib., 1906).

ZUMBUSCH, tsụm'bụsh, KASPAR VON (1830–1915). A German sculptor, born at Herzebrock, Westphalia. He studied in Munich and in Rome under Halbig. He won the competition for a monument to Maximilian II of Bavaria (unveiled 1875) and in 1873 was called to Vienna as professor in the academy. His most important works are a statue of Count Rumford, Munich; and the monuments to Prince August of Prussia (Bellevue Park, Berlin), Beethoven (1880, Vienna), Maria Theresa (1889, ib.), Field-Marshal Radetzky (1892, ib.), and to Emperor William I (1896, Wittekindsberg, Westphalia). He also modeled many funeral monuments, decorative works, and portrait busts, including one of Wagner.

ZUMPT, tsụmpt, AUGUST WILHELM (1815–77). A German classical scholar, born at Königsberg, nephew of the following. Educated at the University of Berlin, he spent his life in teaching at the Joachimsthal (1837–38), the Friedrich Werder (1838–51), and the Friedrich Wilhelm (1851–77), gymnasia of that city. His work dealt chiefly with Roman epigraphy. His publications include an edition of *Rutilius Namatianus* (1836–46); *Honorum Gradus sub Imperatoribus Hadriano et Antonino Pio* (1843); *Ueber die Entstehung und historische Entwickelung des Kolonats* (1843); an edition of the *Monumentum Ancyranum* (with Franz, 1845); *Commentationes Epigraphicæ ad Antiquitates Romanas Pertinentes* (2 vols., 1850–54); *Studia Romana* (1859); *Das Kriminalrecht der römischen Republik* (1865–69); *De Monumento Ancyrano Supplendo* (1869); and *Der Kriminalprozess der römischen Republik* (1871).

ZUMPT, KARL GOTTLOB (1792–1849). A German classical scholar, born in Berlin. After studying at Heidelberg and Berlin, he was appointed professor of the classics in the Joachimsthal Gymnasium, and later became professor of history in the military school. In 1827 he was appointed extraordinary professor of Roman literature in the University of Berlin, and in 1837 became professor. His *Latin Grammar*, first published in 1818, passed through many editions; he also edited Quintilian (1831), Quintus Curtius (1849), certain of Cicero's writings, and published, among other works, the following: *Annales Veterum Regnorum et Populorum, Imprimis Romanorum* (1819; 3d ed., 1862); *Ueber den Stand der Bevölkerung und die Volksvermehrung im Altertum* (1841); *Ueber die bauliche Einrichtung des römischen Wohnhauses* (2d ed., 1851); *Ueber den Bestand der philosophischen Schulen in Athen und die Succession der Scholiarchen* (1843); and *Die Religion der Römer* (1845). Consult A. W. Zumpt, *De C. Zumptii Vita et Studiis Narratio* (Berlin, 1851).

ZUMSTEEG, tsụm'shtāk, JOHANN RUDOLF (1760–1802). A German composer, born at Sachsenflur, in the Odenwald. Under the instruction of the kapellmeister Poli and others, he developed into a brilliant 'cellist and composer. He succeeded Poli, in 1792, as court kapellmeister at Stuttgart, where he produced eight operas, of which *Die Geisterinsel* and *Das Pfauenfest* are best known. A schoolmate and intimate friend of Schiller's, he composed choruses to the poet's *Räuber*. He is known chiefly as the first German composer of ballads and the precursor of Löwe. His *Leonore*, *Des Pfarrers Tochter von Taubenheim*, *Ritter Karl von Eichenhorst*, *Die Büssende*, and *Ritter Toggenburg* are of lasting merit, as are also his songs and romances.

ZUÑI, zōō'nyē. The largest of the Pueblo villages, situated on a small stream about 40 miles southwest of Fort Wingate, near the west boundary of New Mexico. The inhabitants, who constitute a distinct linguistic stock, call themselves Ashiwi and are identical with the people of Cibola of the earliest Spanish explorers. They are peaceable, industrious in their native arts, agricultural, and extremely tenacious of their ancient beliefs. In their house building, agriculture, pottery, weaving, social organization, and ceremonial observances they resemble the Pueblos generally, of whom they and the Hopi (q.v.) may be considered the most typical tribes. Their authentic history began in 1539, when they were first visited by Estevan, the negro vanguard of Marcos de Nizza. Estevan was killed and the Spaniards fled southward. At a later period they were brought under subjection and missionary influence, but in the great Pueblo revolt of 1680 they drove out or massacred the missionaries and other Spaniards and remained independent of Spanish authority until 1692. They numbered in 1910 about 1667. Consult M. C. Stevenson "The Zuñi Indians," in Bureau of American Ethnology, *Annual Report*, vol. xxiii (Washington, 1905), and F. H. Cushing, *Zuñi Folk Tales* (New York, 1901). See PUEBLO, and accompanying Plate showing Zuñi Pueblo. For examples of their handicraft see Colored Plates under BLANKET and POTTERY.

ZUNZ, tsụnts, LEOPOLD (1794–1886). A distinguished Jewish scholar. He was born at Detmold, and after studying in Göttingen and Berlin, accepted in 1820 a post as preacher in Berlin; while there he was also one of the editors of the *Spenersche Zeitung*. In 1835 he became preacher in Prague, but in 1839 returned to Berlin to take charge of the normal school there, and in 1845 was a member of the commission appointed for the investigation of the congregational and educational interests of the Jews. In 1818 he published *Etwas über die rabbinische Litteratur*, which was the inauguration of the scientific study of the Jewish rabbinical writings, and exerted a wide influence. He founded the *Zeitschrift für die Wissenschaft des Judentums* (1822–23). His most important work was *Die gottesdienstlichen Vorträge der Juden* (1832; 2d ed., 1892), an investigation of the religious homily and of biblical exegesis as embodied in rabbinical literature. Other important works were: *Die Namen der Juden* (1836); *Zur Geschichte und Litteratur* (1845); *Die synagogale Poesie des Mittelalters* (1855); *Die Ritus des synagogalen Gottesdienstes geschichtlich entwickelt* (1859); and *Litteraturgeschichte der synagogalen Poesie* (1865; appendix, 1867). Consult S. Maybaum, *Aus dem Leben von Leopold Zunz* (Berlin, 1894).

ZURBARÁN, FRANCISCO DE (1598–1662). A Spanish religious and portrait painter. He was born at Fuente de Cantos, Estremadura, and studied with Juan de las Roelas at Seville. Independently he developed a strong realistic style, with solid modeling and fine draftsmanship, and marked light and shade effects. His earliest-known works are a "Conception" (1616) and a series of pictures for the Convent of Santa María de las Cuevas (now in the Seville Museum), including the "Virgin Extending her Mantle over a Group of Carthusian Monks," "St. Bruno Conversing with Pope Urban II," and the remarkable "St. Hugo Surprising an Unlawful Feast in the Refectory," which, however, bears evidences of having been completed at a later date. A series of "Scenes from the Life of St. Peter," painted in 1625 for the cathedral of Seville, established his reputation. Other important paintings of this period are: the four panels representing scenes from "The Life of St. Buenaventura," in the Louvre, Berlin, and Dresden museums, showing him at his best; "The Ecstasy of the Beatified Alonso Rodríguez" (1630), perhaps his masterpiece; the "Apotheosis of St. Thomas Aquinas" (1631, Seville Museum), a grandiose altarpiece, rich and effective in color; the series for the Carthusian Monastery at Jérez, and the 13 paintings in the monastery of Gaudalupe (1639), including the splendid "Portrait of Padre Gonzalo de Illesca." Through the friendship of Velazquez Zurbarán received the title of Painter to the King in 1638, and in 1650 he was employed to decorate a room in the palace of Buenretiro with the "Labors of Hercules"; but only four panels, now in the Prado, were completed. Important paintings by Zurbarán, other than those named, are "The Crucifixion," the "Beatified Enrique Suzon," and "St. Francis of Assisi," all in Seville Museum; a series of saints, including the fine "St. Anselm," in the Cadiz Museum; the "Immaculate Conception" (Budapest). What Velazquez (q.v.) did for the court Zurbarán did for the cloister, in his religious pictures and his splendid series of monks' portraits. Excellent examples of the latter are in the Academy of San Fernando, Madrid, the Louvre, the Berlin Gallery, and other European galleries, in the Hispanic Society, New York, and in other American collections. In later life his work shows a tendency to become hard and dry in execution. Consult: C. G. H. Gallichan, *Record of Spanish Painting* (New York, 1904); Narcisso Sentenach y Cabañas, *Painters of the School of Seville*, Eng. trans. by Mrs. Steuart Erskine (London, 1911); José Cascales y Múñoz, *Francisco de Zurbarán: su época, su vida y sus obras* (Madrid, 1911).

ZURICH, zōō'rĭk (Ger. *Zürich*). A canton of Switzerland (Map: Switzerland, C 1). Area, 666 square miles. The northern part of Zurich is mostly undulating. The southern part is traversed by several parallel ranges of mountains running from northwest to southeast and inclosing deep and narrow valleys. The canton belongs to the basin of the Rhine and is watered by the Thur, the Töss, and the Sihl. It comprises a large part of the Lake of Zurich. The soil is not very fertile, but is carefully cultivated and supplies about one-half of the cereals needed for domestic consumption. The vine is cultivated extensively in the northeastern as well as in the lake region. The manufacturing industries give occupation to about 50 per cent of the population. Especially developed are the cotton and silk industries, but the manufactures of machinery, paper, leather, straw goods, and embroideries are also important. The government of Zurich is democratic. The legislative power is vested in the legislative assembly, elected in the ratio of one member for every 1500 inhabitants. The executive council is also elected directly. The initiative and referendum are in force. Pop., 1900, 431,036; 1910, 500,679, almost entirely German-speaking Protestants. Capital, Zurich.

ZURICH. The capital of the Canton of Zurich, and the largest city in Switzerland, situated at the northern end of the Lake of Zurich, 25 miles north-northeast of Lucerne (Map: Switzerland, C 1). Altitude, 1506 feet. The site is exceptionally attractive. The beautiful lake, the richly gardened shores, and the snow-crested Alps in the background, afford a great variety of inspiring scenery. The Limmat, which discharges from the lake, separates the larger town on the right—the Grosse Stadt—from the smaller on the left—the Kleine Stadt. Bordering the latter on the northwest is the Sihl, a small stream which empties into the Limmat within the city.

The old, traditional town, with its narrow, steep streets and its high, dark houses, lies on both banks of the Limmat. The rest of the city has spacious thoroughfares and splendid buildings. The lake quays in the Kleine Stadt are very attractive. Near their northern end is the fine Tonhalle, a popular modern concert building and pleasure palace. In the vicinity of their southern end is the beautiful Belvoir Park. Near the Tonhalle, the stately main street of the city—the Bahnhofstrasse—leads from the lake north to the railway station. Adjacent to the fine Münster Bridge is the Wasserkirche (1479–84) on the right bank, containing the city library with 130,000 volumes and over 5000 manuscripts. It preserves many valuable objects, including the Codex Vaticanus. The Grossmünster, chiefly built about 1090–1150 and 1225–1300, is close by. It is Romanesque, with Gothic features. Zwingli was pastor of this church, and his statue stands here. Farther north is the Rüden, with the national educational exhibition and the Pestalozzi cabinet. The Frau Münster, chiefly of the thirteenth and fourteenth centuries, is on the left bank of the Limmat; its high altar was consecrated in 1170. The modern church of Our Lady is a magnificent basilica. The church of St. Peter (in part thirteenth century) holds the tomb of Lavater, who was its pastor. The town hall, in German Renaissance, dates from 1694. The university (see ZURICH, UNIVERSITY OF) and the famous federal polytechnic school are in the northern part of the Grosse Stadt. The splendid polytechnic building was erected in 1861–64 from designs by Semper. Towards the south is the Künstlergut, with some good pictures of the local Artists' Union.

On the tongue of land, formed by the confluence of the two rivers, are the decorative grounds of the Swiss National Museum. The Platz Promenade is here—a majestic avenue lined with trees, and bordering the Limmat. The museum is of great interest. The magnificent edifice, in mediæval style, dates from 1898 and is filled with historical and art-industrial objects from all ages. It is the chief museum of Switzerland. Its collection of stained glass is considered the best in the world.

Zurich also possesses a gymnasium, an industrial school with a museum, an agricultural school, a school of forestry, the cantonal high school, an ethnographical museum, a botanic garden with a fine collection of Alpine plants, and an astronomical observatory. The cantonal hospital, an orphan asylum, and numerous other charitable institutions are found here. Zurich is the most important commercial and manufacturing city of Switzerland. Its chief product is silk, but it produces also large quantities of cotton goods and machinery. Pianos, paper, soap, and candles are also manufactured. Pop., 1900, 150,726; 1910, 192,011.

The district which now forms the Canton of Zurich passed from the rule of the Romans to that of the Alemanni about the beginning of the fifth century. About a century later the Alemanni were subdued by the Franks. After the partition of the Frankish dominions in the Treaty of Verdun in 843, the district was included in the Kingdom of Germany. The town of Zurich early became prosperous as the seat of richly endowed ecclesiastical foundations and early in the thirteenth century, after having been for a time under the rule of the house of Zähringen (q.v.), appears as a free Imperial city. The peoples of Zurich allied themselves with Schwyz and Uri in 1291, and in 1351 their state became a canton of the Swiss Confederation. Zwingli began here his reformation in 1519. Zurich was the scene of two battles in 1799, in which the French under Masséna were first defeated and then victorious. The Treaty of Zurich between Austria, France, and Sardinia was signed in 1859. See ITALY, *History*.

ZURICH, LAKE OF. A lake of north Switzerland, chiefly within the Canton of Zurich (Map: Switzerland, C 1). It is crescent-shaped and very elongated, with a length of 25 miles and a maximum width of 2½ miles, narrowed in one place to less than 1 mile. It has a depth of 470 feet, receives the Linth at its southeastern end, and discharges into the Aar through the Limmat. Its banks rise in gently sloping hills covered with vineyards and dotted with numerous villages, and the scenery is very charming.

ZURICH, UNIVERSITY OF. A Swiss university founded in 1832. Its endowment amounts to over 1,500,000 francs. In 1872 a law was passed legalizing the attendance of women. Since 1892 women have been allowed to teach in the university. The university consists of the following faculties: (1) theology, (2) law, (3) medicine, (4) veterinary medicine, (5) philosophy, the last divided into the sections of philosophy-philology-history and mathematics-natural sciences. The university had in 1913 an attendance of 1504 students. The university library, including the city, canton, law, and medical libraries, contains over 116,000 volumes, 600 MSS., and 190,000 dissertations and pamphlets.

ZURITA Y CASTRO, thōō-rē'tȧ ē käs'trō, JERÓNIMO (1512–80). A Spanish historian and humanist, born at Saragossa. He was sent in 1543 by the Inquisitor General on a mission to the Emperor Charles V, then absent in Germany, was made a secretary to the Inquisitor in 1547, and in 1548 was nominated contador general of the inquisition in Aragon, and also historian of the kingdom. In the meantime he began publishing his monumental *Anales de la corona de Aragón* (6 vols., 1562–80). This work was remarkable for its departure from the old uncritical method of the chroniclers. It was reedited in 1585, 1610, and 1669, and in 1604 a volume of indexes was published. Zurita published also *Indices Rerum ab Aragoniæ Regibus Gestarum ab Initiis Regni ad Annum MCDX* (1578 and 1582, including an account of the Normans in Sicily).

ZUTPHEN, zŭt'fĕn. A town in the Province of Gelderland, Netherlands, situated at the confluence of the Berkel and the navigable Yssel, 19 miles by rail northeast of Arnheim (Map: Netherlands, E 2). Portions of the mediæval fortifications may still be seen. The twelfth-century Gothic church of St. Walpurgis well merits attention. The old chapter house has a small but valuable library dating from mediæval times. There is an active trade in grain, but the chief trade is in the timber floated down the rivers from southern Germany. Zutphen has some tanneries and manufactures of textiles, and there are paper and oil mills. Pop., 1910, 20,673. North of Zutphen is the interesting and successful Nederlandsch Mettray, a Protestant agricultural and reformatory colony for boys, founded in 1851.

ZUYDER ZEE, zoi'dĕr zā, or **ZUIDER ZEE.** A large arm of the North Sea, penetrating deeply into the northwestern part of the Netherlands (Map: Netherlands, D 2). It consists of an oval inner portion 44 miles long and about 30 miles broad, separated by a strait about 10 miles wide from the horn-shaped outer portion, which in turn is separated from the North Sea by a line of sandy islands. Northeast of Ameland Island the sea is connected by the shallow channel known as the Wadden with the estuary of the Ems. The total area of the sea, including the Wadden, is 2027 square miles. The largest river flowing into it is the Yssel, an arm of the Rhine. The Zuyder Zee was originally an inland lake, the outer portion being dry land connecting the present peninsulas of North Holland and Friesland, and having a continuous coast line now indicated by the outer line of the Friesian islands. The lake received the river Yssel, and had a narrow outlet between the present islands of Vlieland and Terschelling. Several severe storms, the principal occurring between the years 1219 and 1287, caused the North Sea to break through the line of dunes at several places and inundate the lowlands between it and the lake. This origin explains the remarkable shallowness of the Zuyder Zee, especially of the outer portion, where large sand and mud flats are exposed at low tide. The mean depth of the inner portion is under 12 feet and the maximum 19, while over large areas the depth is 3 feet or less at low tide. The strait connecting the inner and outer portions, and the main channels leading into the open sea have, however, a depth of 30 to 40 feet. Since the Zuyder Zee is accordingly unimportant for navigation, the main ship route to Amsterdam being through canals leading directly from the North Sea, since the fisheries have also declined, and since the character of the bottom promises fertile soil, it has been proposed to reclaim the inner sea by damming and draining it. Commissions have investigated it at various times and bills have been introduced providing for it, but in 1916 the work had not been started.

ZVENIGORODKA, zvȧ'nyĕ-gȧ-rôt'kȧ. A district town in the Government of Kiev, Russia, 125 miles south of Kiev (Map: Russia, D 5). Pop., 1910, 21,442.

ZWEIBRÜCKEN, tsvī-brụk'en (Fr. DEUX-PONTS). A town of the Rhenish Palatinate, Bavaria, on the Schwarzbach, 66 miles southwest of Mainz (Map: Germany, B 4). It is well built, its principal building being the Alexanderskirche, with the ducal burial vaults. The chief manufactures include silk plush, steam engines, and agricultural machinery, paper, chains, and leather. Pop., 1910, 15,250. It was the capital of the Duchy of Zweibrücken, which arose in the Middle Ages and existed down to 1799.

ZWEMER, zwā'mēr, SAMUEL MARINUS (1867–). An American missionary, traveler, and scholar, born at Vriesland, Mich. He graduated at Hope College, Holland, Mich. (1887), and at New Brunswick (N. J.) Theological Seminary (1890). Ordained to the Reformed Church ministry, he was a missionary at Busrah, Bahrein, and other stations in Arabia from 1891 to 1905. He also traveled extensively in Asia Minor, and was elected a fellow of the Royal Geographical Society of London. Besides editing the *Moslem World* and the *Quarterly Review* (London), he wrote: *Arabia, the Cradle of Islam* (1900); *Topsy Turvy Land* (1902), with his wife, Mrs. Amy E. Zwemer; *Raymond Lull* (1904); *Moslem Doctrine of God* (1906); *The Moslem World* (1908); *The Unoccupied Mission Fields* (1910); *The Moslem Christ* (1911); *Zigzag Journeys in the Camel Country* (1912); *Childhood in the Moslem World* (1915); *Mohammed or Christ?* (1916).

ZWICKAU, tsvīk'ou. A town in the Kingdom of Saxony, situated on the left bank of the Zwickau Mulde, 20 miles by rail southwest of Chemnitz (Map: Germany, E 3). It is a quaint old city. The Gothic church of St. Mary, dating from 1453 and restored in 1885, is a notable structure. Other features of Zwickau are the house where Schumann was born, several fine old edifices, and the ancient château used as a penitentiary. There are a mining school and a collection of paintings. Machinery, automobiles, paper, and glass are among the varied productions. The adjacent coal mines are extensively exploited. Pop., 1900, 55,825; 1910, 73,538.

ZWIEDINECK VON SÜDENHORST, tsvē'dē-nĕk fŏn zụ'den-hōrst, HANS (1845–1906). An Austrian historian, born in Frankfort. He was educated at Graz, where in 1885 he was appointed professor of history. He completed Adam Wolf's *Oesterreich unter Maria Theresia, Josef II. und Leopold II.* (1882–84). Independently he published *Dorfleben im 18. Jahrhundert* (1877); *Die Politik der Republik Venedig während des dreissigjährigen Krieges* (1882–85); *Die öffentliche Meinung in Deutschland im Zeitalter Ludwigs XIV.* (1888); *Deutsche Geschichte im Zeitraum der Gründung des preussischen Königtums* (2 vols., 1890–94); *Deutsche Geschichte von der Auflösung des alten bis zur Gründung des neuen Reichs* (3 vols., 1895–1905). The last two appeared in the *Bibliothek deutscher Geschichte*, which the author began to issue in 1887. He also wrote *Venedig als Weltmacht und Weltstadt* (1899); *Maria Theresia* (1905); and edited the *Zeitschrift für allgemeine Geschichte* (Stuttgart, 1884–88).

ZWINGLI, tsvĭng'lē, ULRICH or HULDREICH (1484–1531). The leader of the Protestant Reformation in Switzerland. He was born at Wildhaus, in the Toggenburg valley, where his father was the magistrate of the village, a man of substance, who gave his son the best available education. Zwingli was directed from an early stage to the liberal humanistic methods of study, and formed his taste and judgment in this enlightened school. He spent two years at the University of Vienna and then studied at Basel, where he took his bachelor's degree at 20 and his master's degree at 22. In 1506 he was made parish priest at Glarus and held this place for 10 years. Glarus was one of the most important centres for the recruiting of young men for the various armies of Europe, and Zwingli entered into this foreign service as a field chaplain. This experience gave him at once an intimate acquaintance with Swiss public life and a settled conviction that the service in foreign armies was ruining the character of his countrymen. His opposition to this service, and to a proposed French alliance, at last forced him to leave Glarus. At Einsiedeln, where he became priest in 1516, he found new opportunities for study and began to shape his views on the questions afterward to be of most importance in the Reformation. His conclusions on these matters were reached quite independently and before Luther had begun to express himself publicly.

In comparison with other Reformation leaders Zwingli appears primarily as the man of plain common sense, repelled by the abuses of the Church, inclined to remove from the daily practice of religion whatever seemed to interfere with the purity of original Christianity as he understood it, but, on the other hand, steadily opposing every form of fanaticism. His first opportunity to express his views of reform came, as it did with Luther, on the preaching of an indulgence. Zwingli was requested by the Bishop of Constance to preach against the abuse, and he did it with such effect that the commissioner was obliged to leave the canton. In 1519 he accepted a call to become priest of the people at the Grossmünster in Zurich, a place of much importance, where his novel method of preaching according to the Scripture itself rather than according to formulas derived from the Fathers attracted the widest interest. Thus supported by the temporal authorities, Zwingli was enabled to continue his studies and to enlarge the circle of his connections in such ways as would best contribute to the advance of the ideas of the Reform. No thought of a permanent separation from Rome seems to have occurred to him as yet, but his language in regard to the papal power and the usages of the Church became increasingly liberal. An exhortation to support the position of Luther, written in 1520, is probably his work, and may be regarded as the first open declaration of hostility to Rome. Instead of laying down certain general principles and bringing the issue directly on these, Zwingli began to suggest definite measures of reform, speaking of the diminution of tithes, the revision of the breviary, the folly of fasts, the evils of image worship, and above all the right and duty of the priests to marry openly, rather than to live, as he frankly confessed he was himself doing, in secret concubinage. The Swiss Diet was slow to accept these suggestions, but they commended themselves at once to the great body of the people, and this approval was soon reflected in the action of the cantonal and general governments.

As a theologian Zwingli did not make any pretense to special originality. He believed himself to be in substantial agreement with Luther, and accepted heartily the efforts of Philip of Hesse and others to bring about an effective alliance of

the two movements; but Luther was unsympathetic, for he had convinced himself that the Swiss reformers were moving along the line which had led already to the social upheaval in Germany and to the extravagances of the Anabaptist party. The famous conference at Marburg in 1529 between the leading theologians of the German and the Swiss parties failed, because, on the test question of the Eucharist, Luther refused to make any admission which might have seemed to commit him to a spiritual or figurative interpretation of the doctrine of the sacraments. Zwingli was not afraid to trust the common sense of men to make a sound use of their right of interpretation, so long as they should admit the supreme authority of Scripture. Moreover, he did not dread, as Luther did, the formation of alliances to strengthen the position of the reformed faith. He saw Switzerland surrounded by eager enemies who were doing all they could to foment the dissent between the Catholic Forest Cantons and the other members of the Confederation, and he felt that these two objects, the integrity of the Confederation and the reform of religion, must go hand in hand. It was on this account that, man of peace as he was, he threw himself with all his energy into the internal quarrel. Zurich became the active agent of the Confederation in combating the Forest Cantons, and Zwingli took the side of the war party. Twice, in 1529 and in 1531, bloody encounters ensued, the first time to the advantage of the Confederation, but the second time to their total defeat. Zwingli had supported his principles by his action and had gone into the campaign of Kappel (q.v.) as a fighting chaplain. His death on the field of battle, Oct. 11, 1531, was the logical outcome of his teaching and was the seal of the permanent religious cleavage between the Catholic and the Protestant cantons.

Bibliography. The *Life* of Zwingli was written shortly after his death by his friend and associate, Myconius (ed. Neander, in *Vitæ Quatuor Reformatorum*, 1841). His complete works were published by Schuler and Schulthess (Zurich, 1828–61); a new edition, *Latin Works and Correspondence*, is edited by S. M. Jackson, translated by H. Preble and others (vol. i, New York, 1912). Consult also: Raget Christoffel, *Huldreich Zwingli: Leben und ausgewählte Schriften* (Elberfeld, 1857; Eng. trans. by John Cochran, Edinburgh, 1858); Rudolf Stähelin, *Huldreich Zwingli: sein Leben und Wirken nach den Quellen dargestellt* (2 vols., Basel, 1895–97); G. Finsler, *Zwingli-Bibliographie* (Zurich, 1897); Samuel Simpson, *Life of Ulrich Zwingli, the Swiss Patriot and Reformer* (New York, 1902); S. M. Jackson, *Huldreich Zwingli, the Reformer of German Switzerland*, in "Heroes of the Reformation" (2d ed., ib., 1903); J. P. Whitney, "The Helvetic Reformation," in *Cambridge Modern History*, vol. ii (ib., 1903).

ZWOLLE, zwŏl'e. The capital of the Province of Overyssel, Netherlands, on the Zwarte Water, 53 miles east-northeast of Amsterdam (Map: Netherlands, E 2). Its most notable structures are the Gothic St. Michael's Church (1406), with a famous organ, and the town hall. The town is an important centre of railway and canal trade, with manufactures of iron, rope, salt, and cotton. Pop., 1910, 34,224. The neighboring monastery of Agnietenberg was for 64 years the home of Thomas à Kempis (q.v.). Zwolle was an important Hanseatic town and joined the United Provinces in 1580.

ZYGADENUS, zĭg'à-dē'nŭs *or* zī'gà-. See EUTHYMIUS ZYGADENUS.

ZY'GOMYCE'TES. One of the two great divisions of Phycomycetes (q.v.), distinguished from the other group (Oömycetes, q.v.) by being isogamous. See ISOGAMY.

ZYG'OPHYLLA'CEÆ (Neo-Lat. nom. pl., from *Zygophyllum*, from Gk. *ζυγόν, zygon*, yoke + *φύλλον, phyllon*, leaf). A family of dicotyledonous plants, containing about 150 known herbs, shrubs, and trees, chiefly natives of subtropical countries. The most important genus is *Guaiacum* (q.v.). The abundance of species of *Zygophyllum* and some other genera constitutes one of the most striking features of North African and Arabian deserts. The flowers of *Zygophyllum fabago* are employed as a substitute for capers, under the name of bean capers. The best-known representative of this order in the United States is the creosote bush (*Larrea mexicana* or *Covillea glutinosa*), common from Texas to California.

ZYGOTE, zī'gōt *or* zĭg'ōt. A general name applied to the cell which is the product of fertilization in plants. It includes both zygospore (the product of similar sexual cells) and oöspore (the product of dissimilar sexual cells).

ZY'MASE (from Gk. *ζύμη, zymē*, leaven). An enzyme, or more probably, a system of enzymes, that carries on alcoholic fermentation. Büchner first established the enzymotic nature of alcohol fermentation in 1897 and suggested the term zymase. Zymase includes at least a thermolabil colloidal enzyme, a thermostable coenzyme, and primary or secondary phosphates. In fact, detailed study is showing that the factors involved in zymase action are numerous and very complex. Alcoholic fermentation is carried on by many plants besides yeasts. It is common even among flowering plants under anaërobic conditions. It is not known whether the systems of enzymes producing it are identical in all cases.

ZYMOGEN, zī'mŏ-jĕn. See ENZYME.

ZYMOT'IC DISEASE (Gk. *ζυμωτικός, zymōtikos*, causing to ferment, from *ζύμωσις, zymōsis*, fermentation, from *ζυμοῦν, zymoyn*, to ferment, from *ζύμη, zymē*, leaven, from *ζέειν, zeein*, to boil). An old term for a disease supposed to be caused by fermentation of a substance received into the body, and formerly applied to smallpox, typhoid fever, plague, influenza, etc. Under the influence of the new science of bacteriology the zymotic was transformed into the zymotoxic theory of infectious disease, and the former term has largely fallen into disuse. See DISEASE, GERM THEORY OF; MIASMA; NOSOLOGY.

ZYR'IANS. A Finno-Ugrian tribe, numbering 30,000, living on the headwaters of the Dvina and Petchora, in Russia, where they are settled along the navigable streams. They are brachycephalic, the index being 82.2. Hunting is the chief occupation, but as traders they visit the fairs of North Russia over a wide radius. They are now Russianized, and the old nature worship formerly practiced has almost passed away, one trace of it being the sacrifices of animals before the churches.
